Foreword to the quartett product list

quartett Immunodiagnostika, Biotechnologie + Kosmetik Vertriebs GmbH welcomes you as one of our new business partners as well as all of our previous loyal clients. You are now member of quartett's worldwide customers.

Founded as a family-run company in 1986, quartett ensures for more than 30 years consistent quality of products.

In the end 80's quartett offered radioimmunoassay and enzyme immunoassay kits from different manufacturers in the USA. In the beginning 90's the company changed its strategy from offering products for routine diagnostic to the increasing field of research and development. Setting up a production plant in 1997 supported this decision.

The company specialized its product profile in manufacturing and modification of synthetic peptides with HPLC purity > 95 % including protease inhibitors or peptides for antibody production.

Second expertise of quartett is the production of a variety of reagents for histology, cytology and immunohistochemistry including > 8000 antibodies and detection systems.

All products are exclusively manufactured in Germany without outsourcing any production step. Nowadays, we expand into all other diagnostic and research fields and supply our customers in universities, government institutes, pharmaceutical and biotechnological companies, hospitals and private doctor offices.

But we are not only limited to provide our customers with consumable chemicals. Since quartett already offered cosmetic peptides, in 2011 we started working in the cosmetic field creating YOUmeDERM® care products.

We have set ourselves the task to provide the best quality solutions in all spheres of research. quartett owns a production site that is certified according to EN ISO 9001:2008 & EN ISO 13485:2012 + AC:2012 and works in compliance with GMP conformity. Our quality management guarantees products of highest quality. Over the past decades we have steadily improved and enhanced our capabilities to satisfy your expectations.

Service and support of our valued customers are our daily businesses. A network of worldwide distributors guarantees global customer supply. We participate at international exhibitions, such as MedLab in Dubai, Medica in Germany and various congresses for pathologists. Furthermore, we are represented by distributors at exhibitions we are not able to attend.

After so many years it is again time to say thanks to each of our clients and business partners for trusting in us. Without them we were not as successful as we are and we are proud to have each of you in our quartett family.

Welcome to quartett! Be part of us!

2. Immunohistochemical Detection Systems

quartett offers a wide range of immunohistochemical detection systems designed for your specific needs in routine as well as in research laboratories. It can be chosen between alkaline phosphatase (AP) or horseradish peroxidase (HRP) as enzymes and between a broad range of different chromogens. All detection systems find application in manual and automated staining systems. The kits contain all necessary reagents you will need for an appropriate and brilliant staining result.

Our product portfolio includes six types of detection systems:

- ▶ **ProTaq[®] Essencial** is based on the Labeled Streptavidin / Biotin (LSAB) method.
- ▶ **ProTaq[®] Suprema PolyColor2** is a 2-step polymer based ultra sensitive detection system without biotin.
- ▶ **ProTaq[®] Suprema PolyColor3** is a 3-step polymer based ultra sensitive detection system without biotin. Sensitivity is increased due to antibody enhancer.
- ▶ **ProTaq[®] Suprema Double Stain** kits are polymer based systems for the detection of two antigens simultaneously.
- ▶ **ProTaq[®] Suprema Triple Stain** kits are polymer based systems for the detection of three antigens simultaneously.

ProTaq[®] Essencial - High quality at fair prices!

ProTaq[®] Suprema - Higher sensitivity - lower background

Advantages **quartett** is offering to its customers:

- ▶ Each single reagent can be re-ordered separately.
- ▶ Superior quality at very competitive costs.
- ▶ Reliability due to German production.

2.1. Streptavidin / Biotin Systems - ProTaq[®] Essencial

ProTaq[®] Essencial kits are based on the Labeled Streptavidin / Biotin (LSAB) method. All systems are performed for the detection of primary antibodies obtained from mouse and rabbit on frozen and paraffin tissues. All reagents in these kits are prepared for working perfectly together. ProTaq[®] Essencial kits are the best solution, if you are looking for a detection system with optimal result / price ratio.

2.2. Polymer Systems - ProTaq[®] Suprema PolyColor

ProTaq[®] Suprema PolyColor kits are polymer based ultra sensitive detection systems. Containing no biotin the kits are unaffected by endogenous biotin resulting in lower background staining. The systems are faster and more sensitive than it can be reached by any LSAB method. This method allows the detection of two or three different antigens simultaneously, and it is cost effective due to the possibility of higher primary antibody dilutions. All systems are performed for the detection of primary antibodies obtained from mouse, rabbit, rat or goat on frozen and paraffin tissues. All reagents in these kits are prepared for working perfectly together. ProTaq[®] Suprema kits are available with enhancer (**ProTaq[®] Suprema PolyColor3**) as well as without enhancer (**ProTaq[®] Suprema PolyColor2**).

2.3. Polymer Systems - ProTaq[®] Suprema DoubleStain

ProTaq[®] Suprema DoubleStain kits are polymer based ultra sensitive systems for the detection of two different antigens on one tissue slide. A further advantage next to reduction of preparation time is the possibility to review the co-expression of two target proteins on the same tissue.

Containing no biotin the kits are unaffected by endogenous biotin resulting in lower background staining. All systems are performed for the detection of primary antibodies obtained from mouse, rabbit, rat or goat on human frozen and paraffin tissues. **quartett** offers chromogens providing the following color combinations:

- ▶ ProTaq[®] DAB (brown) & ProTaq[®] Permanent Red (red)
- ▶ ProTaq[®] BCIP/NBT (violet) & ProTaq[®] AEC (red)
- ▶ ProTaq[®] DAB (brown) & ProTaq[®] Fast Red (red)

2.4. Polymer Systems - ProTaq[®] Suprema TripleStain

ProTaq[®] Suprema TripleStain kits are polymer based ultra sensitive systems for the detection of three different antigens on one tissue slide. A further advantage next to reduction of preparation time is the possibility to review the co-expression of three target proteins on the same tissue.

Containing no biotin the kits are unaffected by endogenous biotin resulting in lower background staining. All systems are performed for the detection of primary antibodies obtained from mouse, rabbit or goat on human frozen and paraffin tissues. **quartett** offers chromogens providing the following color combinations:

- ▶ ProTaq[®] DAB (brown) & ProTaq[®] Permanent Red (red) & ProTaq[®] Green (green)
- ▶ ProTaq[®] DAB (brown) & ProTaq[®] Permanent Red (red) & ProTaq[®] DAB Nickel (black)

3.1. Histological / Cytological Stains

3.1.1. Stain Solutions

quartett offers all necessary reagents for **Hematoxylin & Eosin (H & E) staining** commonly used in histology. Hemalum, which is an oxidation product of hematoxylin, colors nuclei of cells blue. The nuclear staining is followed by counterstaining with an aqueous or alcoholic solution of eosin Y, which colors other eosinophilic structures in various shades of red, pink and orange.

Picture top left: Human tonsil stained with ProTaq[®] Harris Hematoxylin.

Papanicolaou technique developed by George Papanikolaou is the staining method of choice in cytological applications. It is used to differentiate cells in preparations of gynaecological smears, sputum, brushings, washings, urine, cerebrospinal fluids, abdominal fluids, pleural fluids, synovial fluids, seminal fluids, fine needle aspiration material, tumor touch samples, or other materials containing cells. The classic form of Pap stain involves five dyes in three solutions:

1. Hematoxylin nuclear stain is used to stain cell nuclei.
2. First OG-6 counterstain: Orange G is used to stain keratin.
3. Second EA (Eosin Azure) counterstain which is comprising of three dyes.

3.1.2. Fast Stains

ProTaq[®] Cytospeed Staining Kit and **ProTaq[®] Histospeed Staining Kit** are fast-acting variations of the May-Grünwald-Giemsa stain.

The Cytospeed kit is useful for cytology of fluids and cytopunctates whereas the Histospeed kit is used in histological studies of tissue sections. Both kits are in ready-to-use format for extemporaneous examinations. The examination is carried out in emergency preoperative situations. The results are gained in 15 to 50 seconds and will permit a surgical strategy. The following results are obtained: nuclei - violet to red; cytoplasm: acidophilic - pink and basophilic - blue; collagen - light pink; erythrocytes - light brown.

3.2. Buffer

quartett offers all popular buffers for immunohistochemical, histological, cytological and biochemical applications enabling time saving procedures during usual laboratory routine. We guarantee highest quality of all ingredients and precision of the pre-set pH value.

The buffers are available in different formats:

- ▶ **Ready-to-use buffers** guarantee the largest security and easiness during usage without any requirements to the laboratory capacity.
- ▶ **Concentrated buffers** are space-saving and have a longer shelf-life. Concentrates have to be diluted with aqua dest. and can be used directly afterwards.
- ▶ **Pre-mixed salts** need the least storage capacity combined with easy handling and immense accuracy. These buffers can be stored at room temperature and are ready to use immediately after having dissolved the salts in aqua dest..

Have not found the buffer you are looking for, or wishing a different package size? Please get in contact with us. We are pleased to realize your request.

3.2.1. Buffer Bags with Pre-mixed Salts

quartett presents a new generation of buffers that provide lots of benefits in contrast to buffers already existing on the market. Buffers are not supplied as a solution anymore, but as powder / pre-mixed salts shrink-wrapped in colored bags.

Advantages:

- ▶ Storage at room temperature
- ▶ Little space is required
- ▶ Prevention of confusion due to color-coded bags that help to distinguish between different buffers
- ▶ Eco-friendly due to reduced use of packing material
- ▶ Longer shelf life
- ▶ Easy handling: Mix powder of one bag with 1 liter aqua dest. and the buffer is ready to use.

3.2.2. Citrate Buffer / Citrate EDTA Buffer / EDTA Buffer

Citrate buffer is commonly used in immunohistology for epitope demasking procedures. These procedures are used to reverse the loss of antigenicity of epitopes that may appear while working with formalin-fixed paraffin embedded tissues. Formalin causes the formation of protein cross-links resulting in false negative or weak staining. It is the most widespread demasking solution for antibodies. We offer citrate buffer with different pH values ranging from pH 6.0, which is commonly used for antigen retrieval, to pH 7.5 with additional **EDTA** to enhance decalcification of tissue. In some applications EDTA alone is used for epitope demasking. Citrate buffer can also be used as an eluent for affinity chromatography, but also for tissue culture.

All buffers and concentrates should be stored at 2 - 8 °C.

3.2.3. Michel's Buffer

Michel's buffer is used as a storage medium for tissue being immunofluorescent tested. Especially for preservation of skin biopsy specimens to be examined by direct immunofluorescent testing for demonstration of tissue-fixed immunoglobulins. It can be used as transport medium for specimens for immunofluorescence studies. ProTaq[®] Michel's Fixative is recommended for fixation (see chapter 3.7.).

3.2.4. Phosphate Buffered Saline / PBS

Phosphate buffered saline (PBS) is a commonly used buffer for biological and immunohistochemical applications. PBS is used for all processes that need a salt concentration close to physiological condition, adapted to histological or cell culture techniques required pH value. PBS finds mainly application as a washing buffer in histology, serology, cell culture, biochemical assays (ELISA, RIA) and for protein purification. In many cases this function can be enhanced by adding detergents (e.g. Tween20). Due to detergents it can be used as a background reducing agent for immunoassays. Phosphate buffer should not be used in enzyme assays where competition for phosphate groups, or complex formation with a metal ion is essential for the enzyme activation.

All buffers and concentrates should be stored at 2 - 8 °C.

3.2.5. TRIS Buffered Saline / TBS

TRIS (Tris(hydroxymethyl)aminomethane) is an organic compound that is widely used as a component of buffer solutions. **TRIS buffered saline (TBS)** has many applications because it is isotonic and non-toxic. It is used as diluent and wash buffer in ELISA, Western blotting and general immunoassay procedures. In immunohistochemistry it is used for reducing high background staining or if alkaline phosphatase conjugated antibodies are used. TBS finds commonly application in dilution of secondary antibodies or streptavidin-AP conjugates. Additives, such as Tween20, enable additional functions. **TRIS-HCl buffer** is used for specific cases of immunohistochemical staining and to prepare TBS buffers.

All buffers and concentrates should be stored at 2 - 8 °C.

3.2.6. TRIS EDTA Buffer / TRIS EDTA Citrate Buffer

TRIS (Tris(hydroxymethyl)aminomethane) is an organic compound that is widely used as a component of buffer solutions. **TRIS EDTA buffer (TE buffer)** and **TRIS EDTA Citrate buffer (TEC buffer)** are commonly used in epitope demasking procedures. These procedures are used to reverse the loss of antigenicity of epitopes that may appear while working with formalin-fixed paraffin embedded tissues. Formalin causes the formation of protein cross-links resulting in false negative or weak staining.

All buffers and concentrates should be stored at 2 - 8 °C.

3.2.7. Buffer for Electrophoresis

Following products give a selection of buffers used in electrophoresis to separate DNA fragments or proteins.

TAE buffer (TRIS Acetate EDTA buffer) is used as a running buffer and as a component in agarose gel. TAE has a lower buffer capacity than TBE and can easily become exhausted, but linear double stranded DNA runs faster in TAE. TAE buffer offers advantages in DNA cloning experiments: ligation (covalently link) of DNA to a cloning vector (plasmid) is possible. DNA samples from TAE buffer are suitable for this purpose, while DNA from TBE buffer is not.

402003599	TAE Buffer	TRIS Acetate EDTA Buffer	500 ml	10 l	Concentrate	8.3	0.04 M TRIS, 0.02 M Acetate, 0.001 M EDTA

TBE buffer (TRIS Borate EDTA buffer) is the most chosen buffer for DNA and RNA polyacrylamide gel electrophoresis or for DNA automated sequencing gel. It can be used with non-denaturing or denaturing gels. TBE finds also application in agarose gel but is not recommended for preparative gels for recovery of nucleic acids as it has strong inhibition effects on many enzymes.

TG buffer (TRIS Glycine buffer) is the most common running buffer in non-denaturing homogeneous and gradient polyacrylamide gel electrophoresis (PAGE) of proteins and can be used in Western Blotting. For Western Blotting addition of 20 % methanol is required.

TG-SDS buffer (TRIS Glycine SDS buffer) containing the denaturing agent sodium dodecyl sulphate (SDS) is used in protein electrophoresis under denaturing conditions (SDS-PAGE). The separation of proteins is based on their sizes, because the agent SDS overlays the protein charges.

3.3. Antigen Retrieval

The demonstration of antigens in FFPE tissue sections can be improved by pretreatment with antigen retrieval solutions. These reagents break protein cross-links formed by formalin fixation and thereby uncover hidden antigenic sites / epitopes. Antigen retrieval is not needed for immunostaining of fresh frozen sections, because it is to break the cross-links formed by formalin fixation. Two commonly used techniques exist: Heat Induced Epitope Retrieval (HIER) and Proteolytic Induced Epitope Retrieval (PIER).

Heat Induced Epitope Retrieval (HIER) requires heating devices, such as microwave, pressure cooker, steamer or water bath. Tissue Float Bath (Cat.-No. 990100710 or 990100720) is suitable for HIER (see chapter 4.2.). Key factors to consider are:

1. Temperature of retrieval solution ~ 95 °C
2. Incubation time > 10 minutes, usually ~ 20 minutes
3. Choice of pH value.

Cat-No.	Product Name	Method	Deliveries / Stock solution	Working solution	Format	Main Component	pH	Application

Proteolytic Induced Epitope Retrieval (PIER) uses enzyme digestion. Key factors to consider are:

1. Concentration of enzyme ~ 0.05 - 0.1 %
2. Incubation time > 5 minutes, usually 10 - 15 minutes
3. Incubation temperature usually 37 °C.

3.7. Fixatives

Fixation is necessary to retain structural organization of cells and tissues for subsequent staining. Wide ranges of fixatives are commonly used. The correct choice of method depends on the nature of antigen being examined and on the properties of the antibody used.

Organic solvents, such as alcohols and acetone remove lipids and dehydrate the cells, while precipitating the proteins on the cellular architecture.

Cross-linking reagents, such as formalin form intermolecular bridges, thus creating a network of linked antigens. Cross-linkers preserve cell structure better than organic solvents, but may reduce the antigenicity of some cell components, and require the addition of a permeabilization step, to allow access of the antibody to the specimen.

Decalcification is the removal of calcium ions from bone and other hard tissues, such as teeth, in routine histological processes making it flexible and easy for pathological investigation. It is necessary to obtain soft sections as it can be processed like any other soft tissue of the body. **quartett**'s portfolio includes different decalcifier which have been found useful for various purposes. Choosing a decalcification solution depends on three main factors:

1. Type of sections to be cut.
2. Type of staining to be performed.
3. Speed of process required.

5. Molecularbiology and In-situ-Hybridization

5.1. Fluorescence-In-situ-Hybridization (FISH)

FISH is a molecularbiological method to detect chromosomal aberrations, such as deletions, translocations, inversions, insertions, amplifications and aneuploidies. Therefore, it is a major tool in cytogenetic, tumor diagnosis and human chromosomal research.

Artificially produced, fluorescence labeled DNA probes bind by complementary base pairing to specific target DNA sequences *in situ*. This is called hybridization. **ProTaq[®] jellyFISH probes** are used to visualize genomic DNA in formalin-fixed paraffin-embedded sections, in living cells, in metaphase chromosome spreads and interphase nuclei by fluorescence microscopy.

7. Peptides

Peptides are short chains of amino acid monomers linked by peptide bonds. The shortest peptides are dipeptides, consisting of 2 amino acids, followed by tripeptides, oligopeptides up to polypeptides.

quartett with its expertise has the knowledge to produce any kind of compound with a high quality standard according to your specifications.

7.1. Enzyme Inhibitors

quartett is pleased to offer a broad range of **protease inhibitors** as well as **protease and phosphatase inhibitor cocktail kits**. All products are synthetic and manufactured according to EN ISO 9001:2008 & EN ISO 13485:2012 + AC:2012 which guarantees highest quality.

7.1.1. Protease Inhibitors

Significance of protease inhibitors: Isolation of proteins and peptides from a biological matrix and their characterization is an important tool in research and development. Their processing is often accompanied by loss of activity and loss of yield caused by enzymatic decomposition due to proteases (proteolysis). Proteolysis needs to be efficiently inhibited *in vivo* and *in vitro* by protease inhibitors. Inhibition of proteolytic activity is also important to study regulatory mechanisms of proteolytic processes, such as apoptosis, hormonal regulation, or blood coagulation.

Classification: Protease inhibitors are classified on the basis of type of protease they inhibit, or by the mechanism of inhibition. Four main classes are described: serine -, cysteine -, aspartic -, and metalloproteases.

7.1.3. Protease and Phosphatase Inhibitor Cocktail Kits

quartett provides **phosphatase inhibitor cocktails kits** as well as **combined cocktails kits** containing phosphatase and protease inhibitors for studying processes that require the protection of proteins from dephosphorylation and proteolysis.

Significance of protease inhibitors: See chapter 9.3.1. (page 242).

Significance of phosphatase inhibitors: Protein phosphorylation performed by protein kinases is a key regulatory mechanism that controls protein activity, interactions, localization, degradation as well as processes of signal transduction, cell cycle, apoptosis, metabolism and others. The reverse reaction (dephosphorylation) is the removal of phosphate from the protein which is performed by protein phosphatases. In research and development, the analysis of cellular processes including protein phosphorylation requires the inhibition of cellular protein phosphatases by suitable inhibitors. The inhibition of phosphatases enables the study of target proteins in the phosphorylation state.

Classification: Similar to protease inhibitors the phosphatase inhibitors are classified on the basis of type of phosphatase they inhibit, or by the mechanism of inhibition. Four main classes are described: alkaline phosphatases, serine / threonine phosphatases, tyrosine phosphatases as well as tyrosine phosphatases with dual specificity for serine and threonine residues.

9.1. YOUmeDERM® Care Products

YOUmeDERM® hand balm & hand lotion

Finest hand care for stressed skin

Next to supply with chemicals **quartett** feels responsible for the health of its customers. Due to daily handling in the laboratory with gloves and aggressive substances, such as disinfectants or solvents, hands get dry and rough which is the basis for skin illnesses. Prevalence and incidence of skin illnesses increase each year. Since the hands are the most important tools in working life, the skin needs a special protection and care. Any moisture loss during work has to be replaced.

YOUmeDERM® Handlotion and **YOUmeDERM® Handbalm** are counted among the group of YOUmeDERM® care products. Both are natural products made of finest coconut butter and natural oils, such as sesame oil. The handmade care products enter perfectly the intercellular spaces between cornea cells and generate the barrier layer of the corneum stratum with its high content of phytosterol and linoleic acid. The skin's own rebuilding processes are stimulated, barrier as well as cornification disorders are prevented, and increased elasticity is provided. Containing tocopherol it is fighting free radicals, thus preventing the skin additionally. Both products protect stressed irritated hands against any moisture loss and leave a pleasant soft skin feeling. Combined with a light fragrance of bergamot YOUmeDERM® products create an oasis of regeneration for your hands.

YOUmeDERM® anti age cream

Moisturizer that counteracts visible signs of aging

YOUmeDERM® anti age intensive care moisturizer with hyaluronic acid and macadamia ternifolia seed oil was especially developed for mature skin. Being rich in oleic acid, palmitoleic acid and palmitic acid, the fatty acid composition of macadamia oil is similar to human skin and therefore very suitable for dry, sensitive skin. While growing older the natural amounts of palmitic acid decrease in the bilayers of the stratum corneum - thus the cream helps counteracting the visible signs of aging. Macadamia oil is rich in vitamin A, B, E and minerals. So vitamin E in macadamia oil can protect against free radicals, which accelerate aging of skin. Hyaluronic acid (HA) is a glycosaminoglycan widely distributed in human tissues where it serves as a connective tissue organizer and water holding substance. During aging the content of HA in the skin decreases, which may contribute to loss of freshness, moisture and elasticity followed by the development of wrinkles. The ability of HA to hold water may help to restore the skins elasticity, whereby an anti-wrinkle effect is achieved.
