Chapter 4 - DDR4 System memory

C

The Systemboard of TX/RX2560 M1, D3289, offers 24 DDR4 slots with up to 2.133MHz.

768GB DDR4 LRDIMM (12x 64GB 4R per CPU)

384GB DDR4 RDIMM (12x 32GB 2R per CPU)

The memory area is divided into 4 channels per CPU with 3 slots each

up to 2.133 MHz with 1DPC R-DIMM (depending on CPU*)

up to 2.133 MHz with 2DPC LR-DIMM (depending on CPU*)

up to 1.866 MHz with 2DPC (depending on CPU*)

1.600 MHz with 3DPC

DDR4 memory is operated at 1.2V

Registered and load reduced DIMM cannot be operated together in one Server.

* = means: some CPU types support less than 2.133MHz, please check the details in the chapter "CPU"

S26361-F3694-E10	Independent Memory Mode
Independent Channel Mode allows all channels to be populated in any order. All channels must run at the same interface frequency. But each channel may run at different DIMM timings (RAS latency, CAS latency, and so forth). The slowest memory module defines to bus speed.	
Configuration: minimum 1 memory module per CPU, maximum 12 memory modules per CPU	
S26361-F3694-E1	Rank sparing mode
BIOS preconfiguration for rank sparing. Spare of other ranks on the same channel. Spare Rank is not shown in System Memory.	
Configuration: minimum 2x 1R/2R or 1x 4R memory modul(es) per CPU, maximum 12 memory modules per CPU	
S26361-F3694-E2	Performance Memory Mode
BIOS preconfiguration for maximum Performance. Four identical memory modules will be equipped in each slot of each channel to achieve highest memory performance. Always a multiple of 4 identical modules must be configured per CPU. All four modules are active and full capacity can be used.	
Configuration: minimum 4 memory module or 8 memory module or 12 memory modules per CPU	
S26361-F3694-E3	Mirror Channel Mode
BIOS preconfiguration for Mirror mode. Four identical memory modules are always equipped in one memory bank to use the mirrored channel mode. Only two modules contain active data, the remain two modules contain mirrored data.	
Configuration: minimum 4 memory module or 8 memory module or 12 memory modules per CPU	

Resulting memory capacity / Rank Sparing Mode, 1 Channel populated

Independent channel mode**Rank sparing mode --- 1-Rank Memory modules (R-DIMM)**

Rank sparing mode --- 2-Rank Memory modules (R-DIMM)

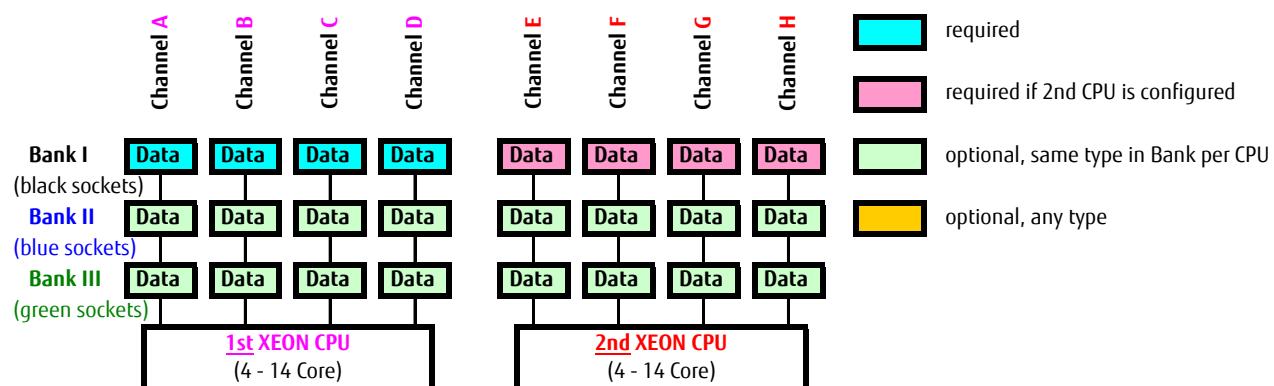

Rank sparing mode --- 4-Rank Memory modules (LR-DIMM)

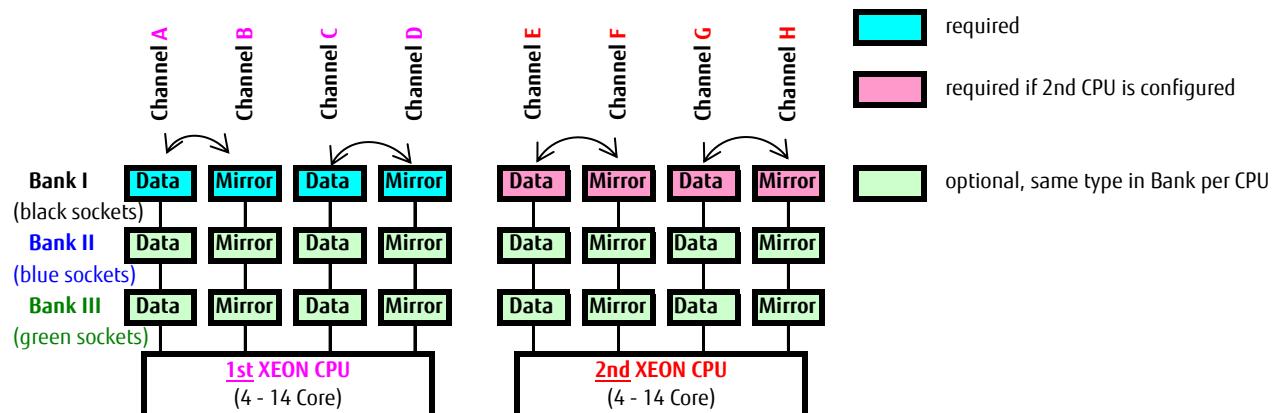

Rank Spacing Mode requires identical modules (same capacity and technology) within the same channel. The available memory for applications will vary depending on configuration. Please refer to the spreadsheet above "Effective Memory capacity with active Rank Spacing Mode". Population rule for Rank Spacing mode is to achieve max. available memory, e.g. 6 DIMMs will be spread across two channels, each with 3DPC

Performance Channel Mode

Mirror Channel Mode

Mirrored Channel Mode requires identical modules on channel A,B, C, D (1st CPU) or channel E, F, G and H (2nd CPU) 50% of the capacity is used for the mirror => the available memory for applications is only half of the installed memory. If this mode is used, a multiple of 4 identical modules has to be ordered.
