## Differences Between Mini DisplayPort & Thunderbolt

DisplayPort is more commonly found on devices in the Mini DisplayPort format. Mini DisplayPort & Thunderbolt connectors look identical on the outside, but are two distinct technologies serving different purposes.

	Mini DisplayPort	Thunderbolt
How to tell the difference	All Mini DisplayPort ports have this logo: 	All Thunderbolt ports have this logo: 
Display connectivity	Mini DisplayPort is exclusively a display connectivity interface. It is used to connect devices such as an Ultrabook, laptop, tablet or MacBook to high resolution displays.	Thunderbolt supports DisplayPort connectivity as well as other types of connections. It can be used to connect devices such as an Ultrabook, laptop, tablet or MacBook to high-resolution displays. DisplayPort capable monitors can be connected to a Thunderbolt port using a Thunderbolt cable.
Bi-directional data transfer & external device support	It does not allow for bi-directional data transfer and external device support.	Thunderbolt is a dual-channel interface, with one channel dedicated to non-video data. Thunderbolt supports external high-performance peripherals such as RAID arrays, professional audio and video capture devices.
