## INTRODUCTION

This report summarizes data compiled from the original records/reports that were filed with the Office of Vital Statistics (VS) as required by law. These include records/reports of live births, deaths, fetal deaths, marriages, dissolutions of marriage, and induced terminations of pregnancy. Standard forms recommended by the US Public Health Conference on Records and Statistics are for the most part used for records of live birth, death, and fetal death.

Responsibility for filing birth records lies with the physician, midwife, or other attendant. Funeral directors, or other persons acting as such, are legally charged with filing death and fetal death (20 or more weeks of gestation) records. These documents are then submitted to local registrars who, in turn, forward them to VS. Marriage and dissolution records are received by VS directly from the various courts. Reports of induced terminations of pregnancy are received from the facilities or individuals who perform such procedures.

### **HISTORICAL BACKGROUND:**

This marks the 88th year of the statewide collection of birth and death records, which began in 1917. Marriage and dissolution records have been filed with VS since June 1927.

### **COMPLETENESS AND QUALITY OF DATA:**

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late documents. A few records/reports are received after tabulation and thus are not included. These records/reports represent a very small fraction of the total, and their omission does not materially alter the facts presented. The quality of data presented in this Annual Report is directly related to the completeness, accuracy, and processing associated with the source documents, registration procedures, and statistical reporting systems.

### **AVAILABILITY OF DATA:**

This publication can be accessed at <http://www.flpublichealth.com/VSBOOK/VSBOOK.aspx>. In addition to these published tables, charts, and graphs additional supplemental tables showing selected data in greater detail are also included on this website. Special statistical data files are available upon request on a fee-for-service basis.

### **RESIDENT AND RECORDED EVENTS:**

Data on births and deaths are tabulated according to both the usual "place of residence" (events occurring to Florida residents regardless of the place of occurrence) and the "place of occurrence" (events occurring in Florida regardless of the usual place of residence). The former are referred to as "resident" events and the latter as "recorded" events. Prior to 1933 only recorded data are available.

Varying interpretations of the "usual place of residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence shown on the record is normally accepted without question. For births and fetal deaths, the mother's residence is always used.

Data on marriage and dissolution of marriage records and reports of induced terminations of pregnancy are by place of occurrence only; there is no interstate exchange of these records/reports. However, Florida dissolutions of marriage are granted only to legal residents.

## **POPULATION:**

The resident midyear July 1 population estimates for 1970 to 2005 used in this Annual Report were obtained from the Florida Legislature's Office of Economic and Demographic Research pursuant to s. 216.135, Florida Statutes. This office provides revised estimates each year for 1960 to 2030. Prior estimates and especially future projections are revised as newer information becomes available.

Previous population projections for some racial groups between 1991 and 1999 underestimated the number of persons actually counted in these groups in the 2000 Census. Estimates from 1991 to 1999 were adjusted in relation to data available from the 1990 and 2000 Census. Without these adjustments, rates would appear to dramatically plummet between 1999 and 2000 for no reason other than incomparable population estimates.

The 2000 Census allowed each person to record all races representing their racial heritage. This differed from previous censuses where each respondent had to select a single race. The National Center for Health Statistics (NCHS) developed a "bridging" methodology to convert the multiple-race groups into single-race categories, permitting race data to be displayed comparably over time.

## **RACE:**

Since 1989, the National Center for Health Statistics (NCHS) has classified live births and fetal deaths according to the race of the mother only. As a result of this change and for purposes of comparability, vital statistics data in this report have been modified and are based on the race of the mother for all live birth and fetal death data. In examining trends for related indicators such as infant deaths, low birthweight, and unwed births, it is important to use the same race methodology throughout the time period being analyzed. As a result of the change in methodology from the use of the race of the child/fetus to the use of the race of the mother, some of the nonwhite births or fetal deaths (based on the race of child/fetus) will now be classified as white births (based on the race of the mother). This change may result in a slight decrease in the white infant death rate and an increase in the nonwhite infant death rate.

According to the U.S. Census Bureau, "Race and Ethnic questions are among the most technically complex and publicly controversial questions asked in the decennial census." Over the past three decades, the Census Bureau's definitions and coding procedures have changed. The 1970 Census for Florida showed a population that was 15.3 percent black and 0.4 percent for all other nonwhite races. The 1980 Census showed 13.8 percent black and 2.2 percent for all other nonwhite races. This increase in the other nonwhite races results mainly from changes in the Census Bureau's definitions. After 1980, the Census Bureau corrected its data and many persons, primarily white Hispanics who had been listed as "others", were reclassified to white. Revised 1980 data for Florida had 13.8 percent black and 0.8 percent for all other nonwhite races.

Race entries usually are tabulated as stated on the birth, death, fetal death and marriage certificates. However, designations such as "Hispanic" are generally classified as "white." Designations such as "bi-racial," "nonwhite," or "mixed" are classified as "other entries." The 2000 Census permitted multiple responses to be made for the question regarding race. When the Florida Office of Vital Statistics revised its birth certificate for the 2004 data year and its death certificate for the 2005 data year, the new certificates also permitted multiple responses to be made for the race question. There are 15 race designations from which any number may be chosen. For tabulation purposes, frequency counts for each of the 15 designations indicate that only a single selection was made. When the single category "other" was selected and a black Hispanic designation was specified, the race was classified as "black." Otherwise, "other" with a Hispanic designation was classified as "white." Data tables displaying "white," "nonwhite," "black," or "other" include tabulations of single selections only. Multiple selections of races are tabulated under the "other/multi-race" category.

## **UNKNOWN:**

Data in this publication may include persons whose age, race, gender, or resident county/city may be unknown or not reported. As a result, the totals for these data may be greater than the sum of the components.

**CAUSE OF DEATH:**

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and NCHS. Standardized codes are assigned from the International Classification of Diseases (ICD). To keep abreast of changes in medical knowledge, the ICD is revised approximately every 10 to 15 years. Revisions and years used in Florida are:

<u>Revision</u>	<u>Years</u>	<u>Revision</u>	<u>Years</u>
Second .....	1917-1920	Seventh .....	1958-1967
Third .....	1921-1929	Eighth .....	1968-1978
Fourth .....	1930-1940	Ninth .....	1979-1998
Fifth .....	1941-1948	Tenth.....	1999-
Sixth .....	1949-1957		

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or in which the changes from one revision to another were minor.

The Tenth Revision contains major modifications in many sections. Under the Tenth Revision, a disease category such as "pneumonia/influenza" may be redefined so that more or fewer deaths are included in that classification. To permit more accurate comparisons, NCHS coded a sample of 1996 US deaths by both the Ninth and Tenth Revision rules. The results were grouped by major causes and, for each of these; the number of Tenth Revision deaths was divided by the number of Ninth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Malignant Neoplasm is 1.0068. This means the Tenth Revision coding of 10,000 death certificates will produce about 68 more Malignant Neoplasms than the Ninth Revision coding would. The comparability ratios for 113 selected causes of death may be found on pages xi through xiii.

**AGE-ADJUSTED DEATH RATE (AADR):**

The Age-Adjusted Death Rate (AADR) is a summary rate of deaths that facilitates the comparability of rates for areas or population subgroups with different age distributions. These rates are presented as per 1,000 or 100,000 population. The AADRs published in this report are the rates that would have been observed if the age-specific death rates for the given year had prevailed in a population whose age distribution was the same as that of the standard population. Through 1960 the population of the United States in 1940 was used as a standard for computation of the AADRs using the direct method. For 1970 and forward, the projected 2000 standard million population of the United States is used as a standard for computation of the AADRs using the direct method. The specified age intervals are under 1, 1-4, 5-14, 15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, and 85 years or older for the years 1970 through 2005.

**COMPUTATIONS AND FOOTNOTES:**

The following procedures and symbols are used throughout this report:

- (1) All rates and ratios are rounded to the nearest tenth.
- (2) All rates and ratios that calculate to less than 0.05 are printed as "0.0."
- (3) Undefined/anomalous rates/ratios (those with denominators of zero) are printed as "—."
- (4) Statistically unreliable rates and ratios are those with denominators less than 100.
- (5) For 1990 and forward, Age-Adjusted Death Rates (AADRs) are standardized using the direct method of standardization, to the US 2000 standard million population.
- (6) "NA" is an abbreviation for not available.

## RATES AND FORMULAE

**Age-adjusted death rate (AADR):** Number of deaths occurring among a population adjusted to the projected 2000 standard million population of the United States using the direct method. An AADR is used to control for differences when comparing two or more populations or the same populations over time.

Sum of the products of age-specific death rates with standard population proportion

**Age-specific rate:** Number of events occurring to a specific age group per 1,000 or 100,000 population of the specified age group.

$$\frac{\text{Number of events to specific age group} \times 1,000 \text{ (or } 100,000\text{)}}{\text{Estimated midyear population of specific age group}}$$

**Cause specific death rate:** Number of deaths due to a specific cause per 100,000 population.

$$\frac{\text{Number of deaths from a specific cause} \times 100,000}{\text{Estimated midyear population}}$$

**(Crude) birth rate:** Number of live births per 1,000 population.

$$\frac{\text{Number of live births} \times 1,000}{\text{Estimated midyear population}}$$

**(Crude) death rate:** Number of deaths per 1,000 population.

$$\frac{\text{Number of deaths} \times 1,000}{\text{Estimated midyear population}}$$

**(Crude) divorce rate:** Number of divorces per 1,000 population.

$$\frac{\text{Number of divorces} \times 1,000}{\text{Estimated midyear population}}$$

**(Crude) marriage rate:** Number of marriages per 1,000 population.

$$\frac{\text{Number of marriages} \times 1,000}{\text{Estimated midyear population}}$$

**Fetal death rate:** Number of fetal deaths (20 weeks or more gestation) per 1,000 live births plus fetal deaths.

$$\frac{\text{Number of fetal deaths} \times 1,000}{\text{Number of live births} + \text{number of fetal deaths}}$$

**Fetal death ratio:** Number of fetal deaths (20 weeks or more gestation) per 1,000 live births.

$$\frac{\text{Number of fetal deaths} \times 1,000}{\text{Number of live births}}$$

**General fertility rate:** The total number of births in a year per 1,000 female population, aged 15-44 years.

$$\frac{\text{Number of live births} \times 1,000}{\text{Estimated midyear female population aged 15-44 years}}$$

**Infant mortality rate:** Deaths to individuals less than one year old per 1,000 live births.

$$\frac{\text{Number of infant deaths} \times 1,000}{\text{Number of live births}}$$

**Maternal mortality rate:** Number of deaths due to complications of pregnancy, childbirth, abortion, or the puerperium (ICD-10: A34, O00-O99) per 10,000 live births.

$$\frac{\text{Number of maternal deaths} \times 10,000}{\text{Number of live births}}$$

**Natural increase:** The difference between the number of live births and the number of deaths.

$$\text{Number of live births} - \text{number of deaths}$$

**Neonatal mortality rate:** Deaths to individuals less than 28 days old per 1,000 live births.

$$\frac{\text{Number of deaths} < 28 \text{ days} \times 1,000}{\text{Number of live births}}$$

**Percent live births to unwed mothers:** Percent of unwed live births to the total number of live births.

$$\frac{\text{Number of live births to unwed mothers} \times 100}{\text{Number of live births}}$$

**Percent low birth weight:** Percent of live births weighing less than 2,500 grams to the total number of live births.

$$\frac{\text{Number of low weight live births} \times 100}{\text{Number of live births}}$$

**Percent very low birth weight:** Percent of live births weighing less than 1,500 grams to the total number of live births.

$$\frac{\text{Number of very low weight live births} \times 100}{\text{Number of live births}}$$

**Perinatal mortality rate:** Fetal deaths (20 weeks or more gestation) plus neonatal deaths (occurring in the first 27 days of life) per 1,000 live births plus fetal deaths.

$$\frac{\text{Number of fetal deaths} + \text{number of neonatal deaths} \times 1,000}{\text{Number of fetal deaths} + \text{number of live births}}$$

**Post-neonatal mortality rate:** Number of infant deaths of age 28 through 364 days per 1,000 live births.

$$\frac{\text{Number of infant deaths aged 28 through 364 days} \times 1,000}{\text{Number of live births}}$$

**Note:** Although totals may include persons whose age, race, gender, or resident county/city is unknown, the process of "imputation" (using an algorithm to assign a known value to an unknown value) is not used to assign age, race, gender, or resident county/city in calculating any rate, ratio, or percentage.

# Population

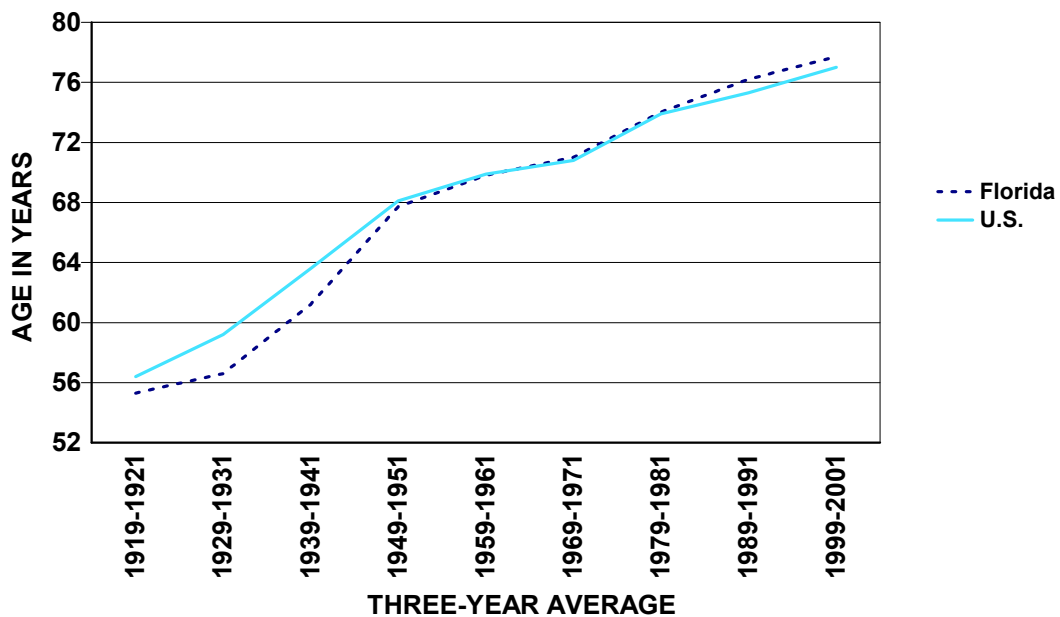

## POPULATION

- Historically, midyear population projections have been used as the basis for various rate calculations. Based on the 2000 Census, population estimates for 1991 through 2002 underestimated the nonwhite population and have been adjusted accordingly. Further, race questions on the 2000 Census permitted multiple responses rather than just a single response as in past decennial censuses. As a result, shifts occurred from the traditional white-only and black-only categories to a multiple-race category. The National Center for Health Statistics developed a “bridging” methodology allowing for the re-assignment of multiple-race responses so present population estimates could be compared with previous estimates. The midyear estimates for 2003 through 2005 reflect the adjustments described previously. These estimates were used for rate calculations in this Annual Report.
- In 2005, Florida’s population rose to a record high of 18,018,497. This represents a 2.3 percent increase from the 2004 population of 17,613,367.
- The population has risen 38.3 percent since 1990 and 83.1 percent since 1980. It has more than doubled (263 percent) since 1970 and more than tripled (360 percent) since 1960.
- In 2005, whites accounted for 80.9 percent of the population, and nonwhites accounted for 19.1 percent of the population.
- Increases in the population occurred for both whites and nonwhites. White males increased by 1.3 percent and white females increased by 1.4 percent. Nonwhite males increased by 6.3 percent and nonwhite females increased by 6.9 percent.
- Floridians aged 65 years and older made up 17.0 percent of the population. Those aged 14 years and younger comprised 18.6 percent.
- The number of persons 75 years old or older was 1,580,678 or 8.8 percent of the population.
- A person born in Florida in 2005 can expect to live 78.9 years. This value decreased slightly from 79.0 in 2004.
- Life expectancy increased for white females and for nonwhite females, but decreased for white males and nonwhite males. However, white females still have the highest life expectancy of the four groups and nonwhite males have the lowest life expectancy.

1. The < 1 age group estimate is the sum of persons < 1 in each county. When the number of resident births minus resident infant deaths in a county exceeds the 0-4 age group estimate from the Office of Economic and Demographic Research, then the county's <1 age group estimate is 1/5 of the 0-4 age group from the Office of Economic and Demographic Research. Otherwise, the county's <1 age group estimate is the number of resident births minus the number of resident infant deaths from the Bureau of Vital Statistics.

2. The 1-4 age group for each county is the Office of Economic and Demographic Research 0-4 age group estimate minus the <1 age group estimate.

Source: The Florida Legislature, Office of Economic and Demographic Research, July 1 estimates or births and infant deaths from the Bureau of Vital Statistics.

1. The < 1 age group estimate is the sum of persons < 1 in each county. When the number of resident births minus resident infant deaths in a county exceeds the 0-4 age group estimate from the Office of Economic and Demographic Research, then the county's <1 age group estimate is 1/5 of the 0-4 age group from the Office of Economic and Demographic Research. Otherwise, the county's <1 age group estimate is the number of resident births minus the number of resident infant deaths from the Bureau of Vital Statistics.

2. The 1-4 age group for each county is the Office of Economic and Demographic Research 0-4 age group estimate minus the <1 age group estimate.

1. Starting in 2004, "trimester prenatal care began" is calculated as the time elapsed from the date of the last menstrual period to the date of the first prenatal care visit. Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

2. Births with unknown information as to when prenatal care began are excluded from the denominator.

\* Starting in 2004, "trimester prenatal care began" is calculated as the time elapsed from the date of the last menstrual period to the date of the first prenatal care visit. Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

1. Starting in 2004, "trimester prenatal care began" is the time elapsed from the date of the last menstrual period to the date of the first prenatal care visit. Prior to 2004, these data were obtained by direct question that noted the trimester the mother began prenatal care. Consequently, these data are not comparable to data from prior years.

2. Births with unknown information as to when prenatal care began are excluded from the denominator.

# **Fetal and Infant Deaths**

## FETAL AND INFANT DEATHS

- The number of resident fetal deaths (stillbirths occurring at 20 or more weeks of gestation) increased in 2003 and 2004, but decreased in 2005. The ratio of resident fetal deaths to resident live births also decreased in 2005.
- Resident fetal deaths decreased among whites and nonwhites from 2004 to 2005.
- Of the 1,650 fetal deaths, 16.4 percent occurred to mothers residing in Miami-Dade County.
- Of all resident fetal deaths, 66.3 percent were to mothers of Non-Hispanic or Non-Haitian origin, 18.7 percent were to mothers of Hispanic origin, 4.7 percent were to mothers of Haitian origin and 10.2 percent were to mothers whose ethnicity was unknown.
- About one of every 12 fetal deaths occurred to a mother who was 18 years old or younger.
- In 2005, the overall number of resident neonatal deaths (under 28 days) increased, but the rate remained constant. The number decreased for whites but increased for nonwhites.
- The neonatal death rate increased from 2000 through 2002, and then decreased in 2003 and again in 2004. It remained constant in 2005. The 2005 rate of 4.5 per 1,000 live births represents less than half the rate of 1980 (9.7).
- The nonwhite neonatal death rate (8.0 per 1,000 live births) is more than twice the white rate (3.3 per 1,000 live births).
- The resident infant mortality rate increased slightly from 7.2 deaths per 1,000 live births in 1998 to a rate of 7.3 in 1999, decreased to 7.0 in 2000, and increased back to 7.3 in 2001. It increased to 7.5 in 2002 and remained at 7.5 in 2003. In 2004 the rate dropped to 7.0, but increased again to 7.2 in 2005.
- The resident infant mortality rate has dropped 25.0 percent since 1990 and is about half the rate of 1980.
- The resident infant mortality rate for nonwhites (12.5 per 1,000 live births) is more than double the infant mortality rate for whites (5.3 per 1,000 live births).
- Of all resident infant deaths, 73.3 percent were to infants of Non-Hispanic or Non-Haitian origin, 22.9 percent were to infants of Hispanic origin, and 3.3 percent were to infants of Haitian origin.
- Of the total resident deaths occurring within the first year of life, 63.0 percent were less than 28 days old. Furthermore, 36.7 percent were less than one day old.
- The leading causes of resident infant deaths in 2005 were Perinatal Period Conditions, Congenital Anomalies, Unintentional Injuries (Accidents), and Sudden Infant Death Syndrome. These causes accounted for 79.0 percent of all resident infant deaths.

# Deaths

## DEATHS

- The International Classification of Diseases Tenth Revision (ICD-10) was used for coding the 1999 through 2005 underlying cause of death. Changes from the previously used ICD-9 to the ICD-10 revision can make year-to-year comparisons misleading. ICD-10 contains major changes, so a greater or fewer number of deaths are now assigned to certain causes than under ICD-9 rules. Causes which changed the most include Alzheimer's disease, syphilis, and pneumonia. See the Introduction section for further explanation and detailed comparability ratios.
- Age-Adjusted Death Rates (AADR) through 1969 were calculated using the 1940 standard million population. For 1970 and forward, AADR calculations used the projected 2000 standard million population.
- In 2005, Florida resident deaths increased slightly to 170,300, an increase of 1.1 percent from 2004.
- The overall resident death rate per 1,000 persons decreased slightly. The rate remained constant for white males, but decreased for white females and for nonwhite males and females.
- Of all resident deaths; 88.9 percent were to persons of Non-Hispanic or Non-Haitian origin, 10.2 percent were to persons of Hispanic origin, and 0.7 percent were to persons of Haitian origin.
- Cremations outnumbered burials among whites by 54.6 percent to 31.2 percent. The opposite was true among blacks where burials outnumbered cremations 71.0 percent to 20.2 percent. Among persons of other races, cremations outnumbered burials 47.1 percent to 36.6 percent.
- Heart disease was the leading cause of death and almost three of every 10 deaths were due to this cause.
- Malignant Neoplasm (Cancer) was the second leading cause of death. It accounted for almost one of every four deaths.
- Unintentional Injury (Accident) was the leading cause of death for individuals aged 1-4, 5-9, 10-14, 15-19, 20-24, 25-34, and 35-44 age groups. This cause accounted for 34.2 percent of the deaths among persons 1-44 years of age.
- There were 8 fewer HIV deaths in 2005 than in 2004 representing a 0.5 percent decrease.
- The resident HIV death rate for nonwhite males (37.3 per 100,000 persons) is higher than the rates for white males, white females and nonwhite females combined.
- HIV was the fifth leading cause of death among persons 25-34 years old. It was the fourth leading cause of death in persons 35-44 years old and among persons 45-54 years old. It accounted for 6.8 percent of the total deaths among 25-54 year olds.
- The homicide death rate decreased for white males and females and for nonwhite females, but increased for nonwhite males. The rate for nonwhite males was more than double the combined rate for white males, white females, and nonwhite females.
- The major external causes of death (Unintentional Injury, Suicide, and Homicide) accounted for 7.1 percent of all resident deaths.
- Malignant Neoplasm (Cancer) was the leading cause of death for individuals aged 45-54, 55-64, and 65-74. This cause accounted for 35.0 percent of deaths among person 45-74 years of age.

\*Due to change from the 9th to the 10th revision of the International Classification of Diseases (ICD), 1995 categories have been adjusted to be comparable with 2005. National comparability ratios are presented above (and on pages xi-xiii) to adjust for discontinuities between ICD-9 and ICD-10 categorizations and coding.
