APPENDIX E - POWER

LAKE ERIE REGULATION STUDY

REPORT

TO THE

INTERNATIONAL JOINT COMMISSION

BY THE

INTERNATIONAL LAKE ERIE REGULATION

STUDY BOARD

(UNDER THE REFERENCE OF 21 FEBRUARY 1977)

JULY 1981

SYNOPSIS

This Annex is part of Appendix E - Power. Appendix E contains the economic evaluation of Lake Erie regulation plans 25N, 15S and 6L in terms of their effects on the generation of hydroelectric power on the connecting channels of the Great Lakes and on the St. Lawrence River. It also contains a description of the methodology that was developed for the purpose of carrying out this evaluation.

The purpose of Annex D is to document the computer programs that were used for the determination of power output at each of the power plants. The documentation also provides sufficient user instructions to permit the economic evaluation results to be readily reproducible.

The annex consists of four parts, one for each power system. Each part was prepared by a different agency, which was represented by a member or associate on the Power Subcommittee, and is independent of the other parts. Consequently the format of the presentation of the programs and the detail of the user instructions will vary from one part to another.

Magnetic tapes of the computer software and data as well as a listing of its contents are filed with the Buffalo District Office of the Corps of Engineers and the Canada Centre for Inland Waters in Burlington.

The members or associates of the Power Subcommittee, their affiliated agency, and the power system for which they were responsible are as follows:

Name	Agency	Power System
J. M. Spratt	Ontario Hydro	Ontario
R. Brisbois J. C. Rassam	Hydro Quebec	Quebec
A. Hollmer	Power Authority of the State of New York	New York State
B. G. DeCooke	U.S. Army Corps of Engineers Detroit District	Upper Michigan

ANNEX D - COMPUTER PROGRAMS

PART 1 - ONTARIO SYSTEM

TABLE OF CONTENTS

SECTION 1.0

General Description

The power output from the Ontario System was analyzed by a series of three major FORTRAN IV computer models that simulated the determination of energy and peak capacity as described in Appendix E. These will be referred to in this annex as the St. Marys, Niagara, and St. Lawrence computer programs.

In addition, a summary program was used to summarize system totals for daytime, nighttime, and monthly total average output (MW), total energy output (MWh), and peak output (MW). The summary program uses as input data, a current masterfile tape generated as part of the output of the three computer models. In this way, data is transferred from the models to create a summary listing.

The above four basic programs plus three additional programs were used to run the Lake Erie Regulation Study and the Diversion and Consumptive Uses Study. The additional programs were special cases of the original program modified to meet the required conditions.

One modified program for the Lake Erie Regulation Study was developed. The modified program, replaced the original St. Lawrence program when Category 3 conditions were run. (See Table 1A for the programs required to run the Lake Erie Regulation plans.)

Two modified programs for the Diversion and Consumptive Uses Study were developed. The modified programs, replaced the original Niagara program when diversion scenarios 6, 9, 12 and 13 conditions were run. (See Table 1B for the programs required to run the Diversion and Consumptive Uses diversion scenarios.)

Once the original programs ha' been replaced with the modified versions, all user instructions are common for any run except where noted in the manual. Each alternative requires the St. Marys program, a Niagara program, a St. Lawrence program and the Summary program. Of course, any one of the St. Marys, Niagara or St. Lawrence programs may be run with the Summary program to produce results for part of any alternative required.

Magnetic Tape Description

The seven computer programs are listed in their respective sections of this report and are provided on a labelled tape 'LERSPRG', reel number 52857, blocked in the order - St. Marys (STMARY), Niagara (NIAG1), Niagara 12 and 13 (NIAG2), Niagara 6 and 9 (NIAG3), St. Lawrence (STLPRG), St. Lawrence Category 3 (STLPRG3) and Summary (SUMMARY). This tape has been created on the Ontario Hydro Univac 1100/82 computer at 6250 fpi.

An additional two data tapes are provided containing all data sets required for the Lake Erie Regulation Study and the Diversion and Consumptive Uses Study. These labelled tapes 'LERSDATA' and 'DUCDATA' are on reel numbers 32969 and 29655 at 6250 fpi. Table 1C and 1D provides a summary of the location of each individual data file required to run each Lake Erie Regulation Study plan and each Diversion and Consumptive Uses diversion scenario.

A current masterfile tape is also provided. The current masterfile tape contains all records of the data required for the Summary program from all past runs of the St. Marys, Niagara, and St. Lawrence programs. This data is in binary form blocked under like titles for each regulation scheme. The format of this data is described under Section 2.4 Summary Program Reports. The unlabelled masterfile tape 'NEWMASTER' is reel number 27141 and is at 1600 fpi.

The most current masterfile must be assigned to each batch run. This is described in each section under program execution. The output from the batch runs results in the creation of a new masterfile to be used as the most current masterfile for the next batch run or for input to the Summary program. In this way, the masterfile tape is continually updated by each batch run to contain the most current data for any Regulation Scheme with like titles. In the case where no like title already exists, a new record is written onto the current masterfile. In order to run the Summary program, data covering the same period of record for each of the St. Marys, Niagara, and St. Lawrence programs must exist on the current masterfile from past runs, blocked under identical heading titles.

If using an equivalent Univac System, instructions in the Univac Exec 8 Control Language are provided under Program Execution Runstream for each program described above. If using a different computer system, compatible operating software must be written by the user. In this case, this report will be a guide for the various operations required.

SECTION 2.1

ST. MARYS RIVER PROGRAM - INPUTS

.0 Control Cards are of 4 types, see Tables 2 and 3 for format and amples.

a) Header Card: This must be the first card in the deck. It contains a description which will be written on each page of the output and also identifies the run on the masterfile tape. This description serves as the title and must be the same in the three programs - St. Marys, Niagara and St. Lawrence, for each scheme run.

Cols 1-16 - Description of data.

b) Lake Huron Data Cards: These cards follow the header card. One card contains the monthly Lake Huron levels for one year, the maximum number of years being 100.

Cols 1-4 - Year
Cols 11-15 - Lake Huron Level for January (ft x 100)
Cols 16-20, 21-25, ---, 66-70, - Lake Huron levels for other months.

c) Lake Superior Data Cards: These cards follow the sentinel card which follows the Lake Huron data cards. Two cards contain the monthly Lake Superior levels and outflows for one year, the maximum number of years being 100.

First Card - contains data for January to June.

Cols 1-4 - Year
Cols 5-6 - '01'
Cols 11-15 - Lake Superior Level for January (ft x 100)
Cols 16-20 - Lake Superior outflow for January (cfs/10)
Cols 21-25 - 26-30, ---, 66-70, - Remaining Lake Superior Levels and outflows.

Second Card - contains data for July to December.

Cols 1-4 - Year
Cols 5-6 - '07'
Cols 11-15, 16-20, ---, 66-70, - Lake Superior levels and outflows.

d) Sentinel Card: One after Lake Huron cards and one after Lake Superior cards.

Cols 1-4 - '9999'

ST. MARYS RIVER PROGRAM - OUTPUTS

1.0 A report containing a line for each month with the following information:

Date (year and month))
Lake Superior Level (ft)) Input
Lake Superior Outflow (cfs))
Lake Huron Level (ft))
Great Lakes Headwater Elevation (ft)
Great Lakes Tailwater Elevation
Great Lakes Head (ft)
Great Lakes Output (MW)
Total Output (MW)

2.0 Duration listings for each month for the following:

Lake Superior Level (ft)
Lake Superior outflow (cfs)
Lake Huron Level (ft)
St. Marys River total output (MW)

3.0 Duration listing of the total energy output for each year.

4.0 An updated master file containing the calculated monthly total outputs. The format of this tape is described in the summary program input section.

Samples of the output results are attached. (See Section 5.0.)

ST. MARYS PROGRAM - PROGRAM EXECUTION RUNSTREAM

In order to execute the St. Marys program on the Univac Computer System, a batch mode runstream must be created as a fastrand file and executed under batch mode. Table 4 provides a copy of a batch runstream and each card is described below. In general, lower case letters are used to indicate the items which change from run to run.

1.0 Batch run statement:

@RUN,P xddddd, xxxxxx/DSR Code, qualifier, max time, max pages.

where the run statement is set up as per Exec 8 control language standards where 'p' is batch priority, 'xddddd' is run-identification, 'xxxxxx' is account number, DSR code identifies the user, qualifier identifies your system workspace, maximum time and maximum pages default values are specified.

2.0 The program tape is assigned by:

@ASG,S prog., U9S, ppppp

where 'prog' is the program tape name, 'ppppp' is the program tape number. 'S' specifies a 6250 fpi density option for a labelled tape, and 'U9S' gives the equipment type for this tape density.

3.0 The input master tape is assigned by:

@ASG,TJ old., U9V, ddddd

where 'old' is the old master tape name and 'ddddd' is the old master tape number. This tape must have been created as the output tape in a previous run of one of the Lake Erie Regulation programs. 'TJ' specifies an unlabelled 1600 fpi tape and 'U9V' gives the equipment type.

4.0 The output master tape is assigned by:

@ASG,TJ new., U9V

where 'new' represents the tape name which will appear on the tape label and on the returned 'buff-card'. This tape will be used as the input master tape to the next run of one of the Lake Erie Regulation Programs.

5.0 The input data tape is assigned by:

@ASG,S datatape., U9S, xxxxx

where 'datatape' is the lable name of the tape containing the data file to be executed and 'xxxxx' is the tape reel number.

6.0 The print tape is assigned by:

@ASG,TJ print., U9V

where 'print' is the name of the printfile tape to be used to contain the printable output.

7.0 The input master tape is identified to the computer as Fortran unit 8 by:

@USE 8., old.

8.0 The output updated master tape is identified as Fortran unit 9 by:

@USE 9., new.

9.0 A temporary fastrand file is created to hold the program elements to be copies from the program tape by:

@ASG,T stm.

where 'stm' is the name of the fastrand file.

10.0 If the program does not occupy file 1, of the program tape, then the tape must be positioned by:

@MOVE prog., nn

where 'nn' represents the number of files to skip over on the program tape.

11.0 The St. Marys program elements are copies into the temporary file by:

@COPY, G prog., stm.

12.0 A temporary fastrand file is created to hold the data input file to be copied from the data tape by:

@ASG,T data.

where 'data' is the name of the data file.

13.0 If the data file required from the data tape does not occupy file 1, the tape may be moved 'nn' records to the proper file required by:

@MOVE datatape., nn

where 'nn' represents the number of files to skip over on the data tape.

14.0 The data element for the St. Marys program run is copied into temporary file 'data' with the following statement:

```
@COPY,G datatape., data.
```

15.0 The program tape and data tape are freed from the system by the following statement:

```
@FREE   prog.
@FREE   data.
```

16.0 The printable output is transferred from direct printing onto a high speed printer, to magnetic tape record by the following statement:

```
@BRKPT PRINT$/print
```

where 'PRINT$' is the system printfile assigned by the Univac System to every run and may be directed to devices other than a high speed printer.

17.0 The St. Marys program is executed by the following statement:

```
@XQT stm.XQT
```

18.0 The run data file is added to the execution, to be read into the program as input by:

```
@ADD data.
```

19.0 The printape transfer of all printable output is completed by the statement:

```
@BRKPT PRINT$
```

20.0 The printape is printed on the high speed printer by the following command:

```
@PRINT print.
```

21.0 The runstream is ended by:

```
@FIN
```

The result of a run executed in the above manner is a hardcopy printout of the program output, a magnetic tape containing the hardcopy for future printing, and a new magnetic tape masterfile containing the required output used from this run as input data for the summary program using the title established as the header card in the input data card deck. For any particular scheme each of the three programs - St. Marys, Niagara, and St. Lawrence, should have the same title in their header cards. Then, when the Summary program is run, the title specified will be this common title. The Summary program will search for this common title on the input masterfile tape.

SECTION 2.2

NIAGARA RIVER PROGRAM - INPUTS

1.0 Control cards are of 8 types with 7 types in the first deck, and one type in a separate deck: See Tables 5, 6, 7 and 8 for examples.

2.0 First Deck

(a) Heading Card

The first card in the first deck.

Cols 2-16 Heading which appears on each page of the output and is used also to identify the data used in the master file tape.

(b) Report Option Card

The second card sets the various options and report types available in the program.

Col 1 Report number. The number inserted here provides various types of output. For a listing of the options see Table 9.

Col 3 ITW. This variable gives the option of inputting Lake Ontario elevations as the second data deck (ITW=1) or not inputting Lake Ontario elevations (ITW=0). In which case, the program calculates Beck Tailwater elevation based on a Lake Ontario mean Level of 244.5 feet.

Col 5 IP constant always set=1.

Col 7 Month start option. Normally this is set to 1 to indicate data starts at January.

Col 9-10 Month End option. Normally set to 12 to indicate December.

Col 12-13 ISCH. Flag to indicate which Lake Erie Regulation Study plan or which Diversion and Consumptive Uses diversion scenario is currently being run:

ISCH = -1 for 1958 plan

ISCH = 0 for 6L plan

ISCH = 1 for Base Case and 25N plan

ISCH = 2 for D.C.U. diversion scenario

Col 15-18 VARI. Variation in flow diversion between Canada and the United States. This is set to 5 000 cfs, so that Canada's share becomes + 2 500 and the US share is - 2 500 cfs.

(c) Falls Flow Daytime Card

Cols 1-80 Daytime monthly average Niagara Flow allotment as defined under the Treaty. One value for each month in open format.

(d) Falls Flow Nighttime Card

Cols 1-80 Same as Card C but for nighttime falls flow conditions.

(e) Lake Erie Outflow Adjustment Card

Cols 1-80 Monthly average adjustment to Lake Erie outflows as defined under methodology report Table F-4 in open format.

(f) Material Dock Elevation Card

Cols 1-80 Monthly average Material Dock elevations in open format. Normally set equal to a constant 561.0 for each month for Lake Erie Regulation study.

(g) Data Cards

Two cards for each year for a maximum of 100 years.

1st Card

Cols 1-4 Year.

Cols 5-6 '01' indicating that the card contains data for the months between January to June.

Cols 11-15 Lake Erie Level for January in feet x 100 read as (F5.2).

Cols 16-20 Lake Erie Outflow for January in cfs/10 (F5.0).

Cols 21-70 Lake Erie levels and Outflows for February to June.

2nd Card

The same as the first card but covering the months July to December.

Cols 5-6 '07' indicating that the data begins at the month July.

3.0 Second Deck

If Column 3 of Card B in the First deck indicates a '1', then the program expects a second input deck giving Lake Ontario levels for the data period given in the first deck. See Tables 7 and 8 for an example.

(a) Lake Ontario

Cols. 1-4 Year

Cols. 11-15 Lake Ontario Level for January written as feet x 100 (F5.2).

Cols. 16-70 Lake Ontario levels for February to December.

The total number of years of data in the second data set must be the same as in the first data set.

4.0 Current Master File

This tape file is input for the same purpose as described under the operating instructions.

Samples of the output results are attached. (See Section 5.0.)

NIAGARA RIVER PROGRAM - OUTPUTS

Under the report option IR=2 as described in Input Data, 2 B Table 9 the following output is generated by the program.

1.0 Input Data Variables Summary

A single sheet report summarizing the options and variables used on the input cards as follows:

Report Type
Plot Type
Flow over Niagara Falls daytime/nighttime by months
Monthly Flow Adjustments
Monthly Material Dock Elevations

2.0 General Chronological Calculations

A report producing one page per year of input data containing the following information.

Year/Month
Tourist Season/Non Tourist Season
Daytime/Nighttime
Lake Erie Outflow
Lake Erie Adjusted Outflow
Grass Island Pool Inflow
Canadian Flow Diversion for Power
PASNY Flow Diversion for Power
Decew Flow Diversion
Beck and Cascades Flow
Beck Flow
Ontario Power Flow
Canadian Niagara Power Flow
Canadian Energy Output in MW for: Decew, Beck,
OP, CNP, and System Total

3.0 Duration Listings by Months for the Following

Lake Erie Outflow (cfs)
Overall System Peak (MW)
Daytime Energy (Av. MW - Operating Hours)
Nighttime Energy (Av. MW - Operating Hours)
Total System Energy (Av. MW - Operating Hours)
Annual Daytime Total Energy (MWh)
Annual Nighttime Total Energy (MWh)
Annual System Energy (MWh)

4.0 Chronological Peak Outputs (MW)

A report giving Peak Output for the following Stations: OP, CNP, Decew, Beck, Total System, Adjusted Total (Total-75 MW).

5.0 An updated master file containing the calculated monthly total outputs for daytime, nighttime, and peak energy.

NIAGARA RIVER PROGRAM - PROGRAM EXECUTION RUNSTREAM

In order to execute the Niagara program on the Univac Computer System, a batch mode runstream, similar to the one discussed under the St. Marys program, must be developed. Table 10 provides a copy of the batch runstream required.

The batch runstream is identical to that used for the St. Marys program with the following exceptions:

(a) If the ITW switch in the data indicates that Lake Ontario levels are to be read in, two temporary data files with two different names must be copied from the data tape, one for each of two decks described under inputs.

(b) If Lake Ontario levels are used, they must be assigned a Fortran Unit number by inserting the following statement after the tape copy:

@USE 10., filename.

where '10' is the logical Fortran read statement number and 'filename' is the temporary filename assigned to the Lake Ontario levels file.

(c) The execute statement for the Niagara program is:

@XQT NIAG1.LOAD

SECTION 2.3

ST. LAWRENCE RIVER PROGRAM - INPUTS

1.0 Control Cards are four types, See Tables 11 and 12 for examples.

(a) Heading Card

The first card in the first deck.

Cols. 1-16 Heading which appears on each page of the output and is used also to identify the data used written on tape.

(b) Adjustment Card

The second card in the deck.

Cols. 1-6 Adjustment to Lake Ontario Level for each 'month' or part 'month'.
in feet, with two decimals (F6.2).
use '-' sign, if it is reduction, otherwise '+' or addition is assumed.

Cols. 7-12 Adjustment to Lake Ontario Outflow for each 'month' or part 'month'.
in CFS (I6), no multiplying factor is assumed.
use '-' sign for reduction, otherwise '+' or addition is implied.

NOTE: An adjustment card is always necessary. For the Lake Erie Regulation Study and Diversiosn and Consumptive Uses no adjustments are necessary, insert a blank card or set the values equal to zero.

(b-1) Category 3 Flag Card

For St. Lawrence runs under Category 3, the program 'STPLRG3' is used which requires an additional card at this point.

Cols. 1-2 Flag 'IFFF' for Category 3:

IFFF=1 for Adjusted Base Case and 6L plan
IFFF=2 for 25N plan
IFFF=3 for 15S plan

(c) Data Cards

Two cards for each year for a maximum of 130 years.

1st Card

Cols. 1-4	Year
Cols. 5-6	'01' indicating that the card contains 7 sets of values - for January, February, March, April 01-15, April 16-30, May and June.
Cols. 11-15	Lake Ontario Level for January. in ft x 100 (F5.2) should be between 235.00 and 250.00 ft.
Cols. 16-20	Lake Ontario Outflow for January. in cfs/10 (I5) should be between 150,000 and 350,000 cfs.
Cols. 21-80	Ontario Levels and Outflows for February to June.

2nd Card

Similar to first card except that the values are for different months.

Cols. 5-6	'08' indicates that the card contains 7 sets of values - for July, August, September, October, November, December 01-15, December 16-31.

(d) Sentinel Card

Cols. 1-4	'9999' - This must be the last card in the deck.

ST. LAWRENCE RIVER PROGRAM - OUTPUTS

1.0 A report containing the following on each line:

Date)
Lake Level (Ft.))Input
Lake Outflow (cfs))
Head water level (ft)
Daytime average output (MW)
Daytime energy (MWh)
Nighttime energy (MWh)
Peak output (MW)
Monthly average (MW)

Fourteen of these sets are produced for each year.

2.0 Duration listings for each of the 14 periods in a year for the following:

Lake level (ft)
Head Water Level (ft)
Lake Outflow (cfs)
Daytime output (MW)
Nighttime output (MW)
Peak output (MW)
Average monthly output (MW)

3.0 There is also a duration listing of the total energy outputs for each year. In calculating this the first value for April and December is used for the first 15 days, the second for the remaining period. Allowance is made for leap year.

4.0 A tape with the daytime, nighttime and peak output for each month for Saunders GS. The average values of two April and December readings are used. This tape is used as input to a program which produces a report of the total monthly output by summing the Niagara, Saunders and St. Marys outputs.

Samples of the output results are attached. (See Section 5.0.)

ST. LAWRENCE RIVER PROGRAM - PROGRAM EXECUTION RUNSTREAM

ıe following cards are required in the runstream for the St. Lawrence *rogram. In general,* lower case letters are used to indicate the items hich change from run to run, see Table 13 for an example runstream.

.0 The program tape is assigned by:

ASG,S prog., U9S,ppppp

here 'ppppp' represents the number of the program tape (or MIT).

!.0 The input master data tape is assigned by:

@ASG,TJ oldmaster., U9V,ddddd

where 'ddddd' represents the number of the input data tape. This tape must have been created as the output tape *in a previous* run of one of the Great Lakes programs.

3.0 The output master data tape is assigned by:

@ASG,TJ newmaster., U9V

where 'newmaster' represents the tape-name which is to appear on the tape label and on the 'buff card'.

4.0 The print tape is assigned by:

@ASG,TJ printape., U9V

where 'printape' represents the tape-name to appear on the label and 'buff-card'.

5.0 The tape containing data for each run is assigned by:

@ASG,S datatape., U9S, ddddd

6.0 If for the required run, the data file is not at location 1 the tape must be moved with the @MOVE statement as described under the St. Marys program execution.

7.0 A temporary data file is assigned by:

@ASG,T stldata.

8.0 The data is copied by:

@Copy,G datatape., stldata.

9.0 The input master data tape is identified to the program as FORTRAN unit 8 by:

```
@USE 8.,oldmaster.
```

10.0 The output master data tape is identified as unit 9 by:

```
@USE 9.,newmaster.
```

11.0 If the program does not occupy file 1 of the program tape, then the tape must be positioned by:

```
@MOVE prog.,nn
```

where 'nn' represents the number of files to skip over on the program tape.

12.0 The temporary program file is assigned by:

```
@ASG,T stl.
```

13.0 The program modules are copied into the temporary program file 'stl' by:

```
@COPIN Pro.., stl.
```

14.0 The program tape is released by:

```
@FREE prog.
```

15.0 The printout from the program is directed to the printape by:

```
@BRKPT PRINT$/printape
```

This procedure allows multiple copies of the printout to be produced after completion of the run.

16.0 Execution of the program is started by:

```
@XQT stl. XQT
```

17.0 The data file is added by:

```
@ADD stldata.
```

18.0 After the program execution has been completed, the printout is directed back to the on-line printer by:

```
@BRKPT PRINT$
```

19.0 The print tape is released by:

@FREE printape.

20.0 The input data tape is released by:

@FREE oldmaster.

21.0 The output data tape is released by:

@FREE newmaster.

22.0 The printout output is printed by:

@PRINT printape.

23.0 The run is finished by:

@FIN

SECTION 2.4

SUMMARY PROGRAM - TOTAL OUTPUTS FROM ALL PLANTS: INPUTS

1.0 The input cards are of two types.

(a) Study Description

These cards contain the study name, the control code and the year range desired. There may be one or more Type A cards in a run. If there are two or more cards they should be arranged in alphabetical order of study name to save time in finding the studies on the master file tape. See Tables 14 and 15 for an example.

Cols. 1-16 Study name for which reports are required.

Cols. 17-20 Control code
'AVMW' for average monthly output for all three plants.
'PK3' for combined peak output of all three plants.
'PK2' for combined peak output of Saunders and St. Marys only.

Cols. 21-24 Earliest year required for study.

Cols. 25-28 Latest year required.

(b) Sentinel Card

One card is required, to be placed after the type A cards.

Cols. 1-4 '9999'

Examples of the input cards are shown on Table 14 and 15.

2.0 The Master File on tape as generated by the three programs. The format of the tape is described below:

1st record: 6 words
study identification (4 words)
plant code (1 word)
no. of years in study (N) (1 word)

2nd record to (N+1)th record - 37 words each year (1 word)
daytime monthly output (12 words)
nighttime monthly output (12 words)
peak monthly output (12 words)

The above pattern is repeated for each study, the studies being arranged on the tape in sequence according to the study and the plant code.

Last record - 6 words, each containing '999999'.

SUMMARY PROGRAM - TOTAL OUTPUTS FROM ALL PLANTS: OUTPUTS

1.0 If 'AVMW' option is used on the control card then duration listings are produced for each month of the totals for all three plants of the daytime power (MW), nighttime power (MW) and monthly average output (MW). Also a duration listing is produced of the total energy output (MWH) for each year.

2.0 If 'PK3' option is used on the control card, then duration listings are produced for each month of the peak output from all three plants.

3.0 If 'PK2' option is used on the control card, then duration listings are produced for each month of the peak output from the Saunders and St. Marys plants.

Samples of the outputs are attached. (See Section 5.0.)

SUMMARY PROGRAM - PROGRAM EXECUTION RUNSTREAM

The following cards are required in the runstream for the summary program. In general, lower case letters are used to indicate the items which change from run to run. See Table 16 for examples.

1.0 The program tape (or MIT) is assigned by:

```
@ASG,S prog.,U9S,ppppp
```

where 'ppppp' represents the number of the program tape (or MIT).

2.0 The input master data tape is assigned by:

```
@ASG,TJ oldmaster.,U9V,ddddd
```

where 'ddddd' represents the number of the input data tape. This tape must have been created as the output tape in a previous run of one of the Lake Erie Regulation.

3.0 The print tape is assigned by:

```
@ASG,TJ printape.,U9V
```

where 'printape' represents the tape-name to appear on the label and 'buff-card'.

4.0 The input data tape is identified to the program as FORTRAN unit 8 by:

```
@USE 8., oldmaster.
```

5.0 If the program does not occupy file 1 of the program tape, then the tape must be positioned by:

```
@MOVE PROG.,nn
```

where 'nn' represents the number of files to skip over on the program tape.

6.0 The temporary file is assigned to call the program elements from the program tape by:

```
@ASG,T summ.
```

7.0 The program modules are copied into the temporary program file 'summ' by:

```
@COPY,G prog., summ.
```

8.0 The program tape is released by:

```
@FREE prog.
```

9.0 The printout from the program is directed to the print tape by:

```
@BRKPT PRINT$/printape
```

This procedure allows multiple copies of the printout to be produced after completion of the run.

10.0 Execution of the program is started by:

```
@XQT summ.XQT
```

11.0 Data cards are supplied by their user (see Summary Input Section).

12.0 After the program execution has been completed, the printout is directed back to the on-line printer by:

```
@BRKPT PRINT$
```

13.0 The input data tape is released by:

```
@FREE oldmaster.
```

14.0 The summary output is printed by:

```
@PRINT printape.
```

15.0 The runstream is ended by:

```
@FIN
```

ANNEX D - COMPUTER PROGRAMS

PART 2 - QUEBEC SYSTEM

TABLE OF CONTENTS

ST. LAWRENCE RIVER REGULATION STUDIES

ST LAWRENCE RIVER REGULATION STUDIES

SECTION 1

General description

This program is used to calculate the power output at Beauharnois and Cedars generating station according to the inflow from Lake Ontario of differents plans.

The program is written in Fortran IV language and it is executed on a IBM/370 computer.

By comparaison with the base case, the program calculate the gains or the losses in kilowatts and dollars for eaxh plan.

Data file

The program use a temporary file on magnetic disk which is defined as follow: (170, 80, V.NR). The JCL associated to this file is: DSN = FILE NAME, DISP = (NEW, DELETE), SPACE = (TRK, (5,2)), DCB = (LRECL = 320, BLK SIZE = 1600, RECFM = FB), UNIT = TRAVAIL.

Subroutines

The main program use 5 subroutines and 3 function sudroutines which are listed in section 3. A deck of cards of every subroutines is supply with the main program.

The subroutines are written in Fortran IV Language and the function subroutines are written in Assembler Language.

- Subroutine HSCSU1 compute a function Y = F (X,Z)
- Subroutine RR100 compares output energy of Beauharnois G.S. and Cedars G.S. between the base case and other plans.
- Subroutine CADRE is used by the main program to centerize titles in an output vector
- Subroutine ANOMO return the number of days of a specify month.
- Function subroutines ISLA and ISRA are called by subroutine ANOMO and shift characters right or left.
- Function subroutine ICOMPL compares characters and it is called by subroutine CADRE.

ST LAWRENCE RIVER REGULATION STUDIES

SECTION 2

Input date definition

Card #1 (KAN, TIT)

KAN = Number of years simulated, in column 1 and 2

TIT = General title in column 3 to 80

Card #2 to 6 (C)

C = Regression coefficients to calculate head race elevation and energy output at Beauharnois G.S. and, energy output at Cedars G.S. Format: 5E15.7

Card #7 to 10 (XM1, XM2, XM3)

Maximum and minimum values associated to the regression coefficent C. Format: 4E15.7

Card #11 and 12 (CHE)

CHE = Non-power flow requirements at Beauharnois G.S. and Cedars G.S. Format: 12F6.0

Card #13 and 14 (QMX)

QMX = Maximum permissible discharge at Beauharnois G.S. in thousands of cfs. Format: 12F6.0

Card #15 and 16 (QMX)

QMX = Maximum permissible discharge at Cedars G.S. in thousands of cfs. Format 12F6.0

Card #17 and the following (STF)

STF = Monthly mean local inflow of Lake St-Francis

Each card contends 12 monthly value. Format: 12F6.0

The number of these cards depends on the number of years (KAN) to study. A listing of values from 1900 to 1978 is included at the end of this section.

Card #18 (KAS, IMP, PRIX)

KAS = Number of plan to be study with a maximum of 8 plans, in column 2.

IMP = This is a control parameter which allow the detail output to be printed or not (column 4)

if IMP = 1 the detail is printed

if IMP = 0 no detail output is printed

PRIX= Price associated to energy in dollars per mills. 5 different prices can be ask. Format 5F4.0 Column 5 to 24.

Card #19 and following (KTIT, COR)

KTIT= Title of the plan basis of comparaison, column 1 to 20.

COR = Monthly mean flow from Cornwall in thousands of cfs, column 5 to 40, (12 values) and on the same card the monthly mean outflow of Lake St-Louis in thousand of cfs, column 45 to 80 (12 values)

The column 1 to 4 contains the year which is overpass at reading time.

The number of cards depends on the number of years to be study.

The next decks of cards are all the other plans to be compare with the first plan (basis of comparaison) with the same format. (card #19)

The number of cases, including the base case, is defined by the variable KAS on card #18.

ST LAWRENCE RIVER REGULATION STUDIES

SECTION 4

Output

1- Listing of monthly mean values that have been fixed on input cards.

2- Detailled monthly caculation of energy available at Beauharnois G.S. and Cedars G.S. according to the inflow from Cornwall. The detail of every plans will be printed if the parameter IMP on input card #18 is equal on greather than 1.

3- Monthly mean power output of Beauharnois G.S. and Cedars G.S. together and the corresponding amont in dollars, at the price specified by PRIX on input card #18, for the base case and all the other plans.

4- Output power comparaison for each month and each plan in kilowatt and the mean yearly gain or lost in dollars.

ANNEX D - COMPUTER PROGRAMS

PART 3 - NEW YORK STATE SYSTEM

INTERNATIONAL LAKE ERIE REGULATION STUDY

ADDENDUM D - POWER

Determination of Power Output from New York State System

Niagara River Power Plants

Robert Moses Niagara Power Plant and
Lewiston Pumping Generating Station

Outline of Lake Erie Regulation Study
Computations for Niagara Power Evaluation

Energy

1. Lake Erie Outflow exceedence frequencies are received from Ontario Hydro for base case and for each run to be evaluated.

2. Adjust outflows to determine Niagara River Flow into Grass Island Pool (Table E-4 Pg 28).

3. Observe that for essentially all of the base case, Niagara entitlement can be diverted by US side; there are no residual losses in the base case.

4. Compare various plans with base case. Record exceedences at which high flows are higher and by how much. (Niagara diversion limit corresponds to a Niagara Flow of about 255 TCFS.)

5. Convert incremental flows - %'s to MW hrs (energy). Note here that only months of April, May, June, July and August were affected measurably by plans considered.

6. Convert MWH to economic value using the unit price of energy. (In this study, it is $110.6/MWH.)

Capacity

The capacity situation at Niagara is unique in that water can be stored in the Lewiston Reservoir and be available for generation during times of peak need. Normally peak output can be derived from Niagara anytime that diversion is about 55,000 cfs or more and sufficient water exists in the reservoir for the length of peak desired. Of course river flows must also be sufficient so that the reservoir can be pumped back in off-peak hours and on weekends so that the reservoir is full at the beginning of each week.

With the level at which production at Niagara is committed based on natural flows, the existing capacity at Niagara can be fully utilized any time the river is above about 185 TCFS during non-tourist periods and above about 210 TCFS during the tourist season.

With the above in mind, the computations* proceeded as follows:

1. The exceedence frequencies for each plan were compared with the base case for the aforementioned flows. These were taken at 10% intervals beginning with the 95% exceedence flow.

2. Any differences in flow were converted to an average monthly figure, divided by 2 to give the US share, and converted to megawatts at the rate of 22 MW/1000 cfs.

3. This yielded a change in capacity in units of megawatt-months, which was divided by 12 to give MW years.

4. This was then converted to economic value at the rate of 1 MW Yr. = $70,000.

*Note that no additional computer runs were made for US Niagara Calculations. The required information was extracted from the computer runs prepared by Ontario Hydro based on hydrologic information provided by the Hydrology Sub-Committee.

St. Lawrence River Power Plant

Robert Moses Power Dam

Peak and energy outputs were assumed to be the same as that of the Robert H. Saunders Generating Station and was computed by Ontario Hydro as described in Section 1.

I. PURPOSE AND INPUT

The Weinrub Power Program is designed to compute the total cost of power generation at both the Edison Sault Power Plant and at the U.S. Government Power Plant in Sault Ste. Marie, Mich.

The input data for the program are as listed below:

INPUT CARDS IN THE FOLLOWING ORDER

READ 200 - PARAMETER CARD - 1 CARD

COL	FMT	VAR	DESCRIPTION
01-05	I5	IYRS	NUMBER OF YEARS OF DATA
06-10	F5.0	CON	CONSTANT IN FEET TO CHANGE CONDITIONS ON MICHIGAN-HURON (1933 OR 1968).
11-15	I5	IFSQ	0 IF THE PROGRAM COMPUTES THE MINIMUM FLOW THRU THE STRUCTURES. 1 IF THE MINIMUM FLOW IS TO BE READ IN.
16-20	F5.0	DLLO	LONG LAKE OGOKI DIVERSION IN TCFS
21-25	F5.0	CMAX	MAXIMUM DIVERSION OF FLOW FOR CANADIAN POWER
26-30	F5.0	QMAX	MAXIMUM SUPERIOR FLOW
31-35	F5.0	QGI	DIVERSION OF FLOW FOR US GOVERNMENT POWER PLANT

36-40	I5	IFEPO	1 FOR PRINT OUT OF ALL VALUES COMPUTED
			0 OTHERWISE
41-45	I5	IFCSC	1 FOR CALCULATING CANADIAN DIVERSION
			0 OTHERWISE

READ 118 - PARAMETER CARD - 1 CARD

COL	FMT	VAR	DESCRIPTION
01-72	12F6.2	QM	MONTHLY FLOW LOSS FOR NAVIGATION

READ 100 - DATA CARDS - IN THE ORDER SUPERIOR MONTHLY MEAN LEVELS
MICHIGAN-HURON MONTHLY MEAN LEVELS,
SUPERIOR MONTHLY MEAN OUTFLOWS, AND
IF NECESSARY, THE FORCED MINIMUM FLOWS.

COL	FMT	VAR	DESCRIPTION
01-72	12F6.0	ELS	SUPERIOR MONTHLY MEAN LEVELS
01-72	12F6.0	ELH	MICHIGAN-HURON MONTHLY MEAN LEVELS
01-72	12F6.0	QO	SUPERIOR MONTHLY MEAN OUTFLOWS
01-72	12F6.0	QQS	FORCED MINIMUM FLOWS

Also included as input are the following:

```
DATA AMON / 744., 678.0, 744., 720., 744., 720., 2*744., 720., 744.,
720., 744./
```

(This data converts kilowatts to killowatt-hours)

ENERGY RATE

ER = 3.36

DEMAND RATE

DR = 28.33

This data is used to compute the distribution of flow and the head available at each power plant. The flow and head are employed in the computation of power output at each of the two plants, and then power costs are computed by use of the energy rate and the demand rate.

II. DEFINITION OF TERMS

HLAKES - H(1) - Head available between Lake Superior and Lake Michigan-Huron.

HSWP - H(2) - Head loss from Lake Superior to Southeast Pier gauge (SWP).

HPLANT - H(3) - Head loss from SWP to Edison Sault Power Plant.

HURON - H(4) - Head loss from U.S. Slip gauge (USS) to Lake Mich-Huron.

HEDS - H(5) - Head available for power at Edison Sault Power Plant.

HGOVT - H(6) - Head available for power at U.S. Government Plant.

ELS - Elevation of Lake Superior (monthly mean).

ELH - Elevation of Lake Michigan-Huron (monthly mean).

ELSWP - Elevation at Southwest Pier gauge.

ELUSS - Elevation at U.S. Slip gauge.

ELTRG - Elevation of tailrace of U.S. Government Power Plant.

ELTRES - Elevation of tailrace of Edison Sault Power Plant.

QT - Total outflow from Lake Superior.

QU - Flow available for U.S. power generation.

QC - Flow available for Canadian power generation.

QM - Flow required for navigation in U.S. Locks.

QG - Flow available for power generation at U.S. Govt. Power Plant.

QS - Flow available for power generation at Edison Sault Power Plant.

ELPLANT - Elevation of headrace at Edison Sault Power Plant.

ELO11 - Elevation at CHS gauge O11 upstream of Great Lakes Power Plant.

FH - Elevation of forebay of Great Lakes Power Plant.

ELO12 - Elevation at CHS gauge O12 downstream of Great Lakes Power Plant.

FT - Elevation of tailrace of Great Lakes Power Plant.

CHEAD - Head available at Great Lakes Power Plant.

CQMAX - Maximum possible flow through Great Lakes Power based on plant performance curve.

CQMIN - Minimum possible flow through Great Lakes Power based on plant performance curve.

PGLP - Power output (kw) at Great Lakes Power.

PSE - Power output (kw) at Edison Sault.

PGV - Power output (kw) at U.S. Government Plant.

TPSE - Power output (kw-hrs.) at Edison Sault.

TPGV - Power output (kw-hrs.) at U.S. Government Plant.

ENGCOS - Energy cost of power generation.

CAPCOS - Capacity cost of power generation.

TOTCOS - Energy plus capacity cost.

III. SAMPLE COMPUTATION

A. Basic Data

In order to describe the procedures employed in the Weinrub Power Program a sample computation has been performed using a random set of data from the Plan 1977 Base Case. The data used is for June, 1948:

Lake Superior outflow--75.74 tcfs

Lake Superior stage--600.46 ft.

Lakes Michigan-Huron--578.87 ft.

Several constants used in the computational procedures will change depending on the period that the data applies to.

For January to March period;

A = 1.93

B = 569.56

AN = .2

BN = 135.11

CN = 1142.14

DN .2926

For April to December period:

A = 1.605

B = 567.29

AN = .4

BN = 187.07

CN = 1138.2

DN = .2978

B. Head Losses

The computation begins by computing the forebay level of the Great Lakes Power Plant. This is obtained by computing the head loss from Lake Superior to CHS gauge 011 and subtracting this loss from the Lake Superior level.

$$ELO11\ (I,J) = ELS\ (I,J) - (Q/BN)^2$$

$$ELO11 = 600.46 - (75.74/187.07)^2$$

$$ELO11 = 600.30$$

The head loss from Lake Superior to Lakes Michigan-Huron,

$$H(1) = ELS\ (I,J) - ELH\ (I,J)$$

$$H(1) = 600.46 - 578.87$$

$$H(1) = 21.59 = HLAKES$$

The head loss from Lake Superior to Southwest Pier gauge, located near the entrance to the Edison Sault Power Canal,

$$H(2) = 37143E - 7 \times Q - .06572$$

$$H(2) = (.0037143 \times 75.74) - .06572$$

$$H(2) = .\underline{22} = HSWP$$

The elevation at the SWP gauge is the elevation of Lake Superior less the head loss from Lake Superior to SWP gauge,

$$ELSWP = ELS - H(2)$$

$$ELSWP = 600.46 - .22 = \underline{600.24}$$

At this point in the program, the Subroutine Head is called,

Call Head [ELH (I,J), H(4)]

This subroutine calculates H(4) by the method of successive approximation. It is set up to compute H(4) 19 successive times, or until accuracy to the nearest 0.0005 is obtained, each time substituting in the previously calculated value of H(4), so as to reduce the difference between two successive values of H(4) to an insignificant amount; thereby an accurate value of H(4) is arrived at.

Subroutine Head (Y, Y1) [Where Y = ELH and Y1 = H(4)]

Common A, B, AN, Y2, Q

$$Y2 = CM/(X - B)^{BM} + .09,$$

Where Y2 = Y1 = H(4)

X = Y1 + Y = U.S. Slip gauge elevation

B = 567.29

BM = 1.5/AN = 1.5/.4 = 3.75

and $CM = (Q/A)^{AM}$

Where Q = 75.74

A = 1.605

$$AM = 1./AN = 1./.4 = 2.5$$

Thus, $$CM = (75.74/1.605)^{2.5}$$

$$CM = 15297.68311$$

Next, a Do Loop is begun which will run through the following sequence of equations 19 times:

```
DO 5 I = 1,19
Y1 = Y2
X = Y1 + Y
```

In this example the initial value of Y1 is 1 and Y = 578.87

$$X = 1 + 578.87 = 579.87$$

These values are then substituted into the equation for head loss from U.S. Slip to Lake Mich-Huron:

(1) $$Y2 = CM/(X-B)^{BM} + .09$$

$$Y2 = 15297.68311/(579.87 - 567.29)^{3.75} + .09$$

$$Y2 = 1.24033$$

$$Y2 = (Y1 + Y2)/2$$

$$Y2 = (1 + 1.24033)/2$$

$$Y2 = 1.120165$$

If the difference between the absolute value of Y1 and the new Y2, and .0005, is negative, this is the actual value of Y2; if not, recalculate Y2.

IF [ABS (Y2 - Y1) - .0005] 10,5,5

1.120165 - 1 - .0005 = .119665 (positive)

5 Continue

10 Y1 = Y2

This new value of Y1 is then substituted in the equation X = Y1 + Y to attain a new value of X which is substituted in the equation for head loss.

(2) Y1 = Y2

X = Y1 + Y

X = 1.20165 + 578.87

X = 580.07165

$$Y2 = 15297.68311/(580.07165 - 567.29)^{3.75} + .09$$

Y2 = 1.173739

Y2 = (Y1 + Y2)/2

Y2 = (1.20165 + 1.173739)/2 = 1.187695

ABS (Y2 - Y1) - .0005 = (1.187695 - 1.120165) - .0005

= .000187 - .0005

= - .000313 (negitive)

Y1 = Y2 = H(4) = <u>1.180589</u>

RETURN TO MAIN PROGRAM

H(4) = <u>1.18</u>

Huron = H(4) = 1.18

The next step in the program is to compute the elevation at U.S. Slip gauge, which is,

$$ELUSS = ELH + H(4)$$

$$ELUSS = 578.87 + 1.18 = \underline{580.05}$$

The elevation of the tailrace of the U.S. Govt. plant is computed by adding the tailrace losses to the U.S. Slip gauge elevation. As referenced in "Appendix F - Power",[1] the river losses and head and tailrace losses were assumed constant at 0.6 ft. For this particular case, the assumption is made that the tailrace losses alone are 0.6 ft.

$$ELTRG = ELUSS + .6$$

$$ELTRG = 580.05 + .6 = \underline{580.65}$$

The elevation of the tailrace of the Edison Sault Plant is computed by adding the tailrace losses to the U.S. Slip gauge elevation. The tailrace losses for the Edison Sault Plant are assumed to be 0.2 ft.

$$ELTRES = ELUSS + .2$$

$$ELTRES = 580.05 + .2 = 580.25$$

[1] Report to the International Joint Commission by the International Great Lakes Levels Board, 7 December 1973.

C. Flow Distribution

The next step in the program involves the computation of the flow from Lake Superior which is available for U.S. power generation. The total Lake Superior flow for this example is 75.74 TCFS. The flow available for U.S. and Canadian power generation is computed by deducting from the total Lake Superior flow the flow required for navigation in the locks and the flow through the compensating works.

$$QT = Q - QM - 2.$$

The flow required for navigation (QM) varies for each month, and in this case is 1.35 TCFS. The flow through the compensating works is 2 TCFS; this value is based on 1/2 gate open at the average Lake Superior stage.

Thus,

$$QT = 75.74 - 1.35 - 2$$

$$QT = 72.39$$

1. Canadian Flow

The flow available for Canadian power generation is as follows:

$$QC = (Q - QM - 2)/2$$

$$QC = 72.39/2 = 36.2 \text{ TCFS}$$

In order to determine the actual Canadian Power diversion, it is first necessary to compute the head available at Great Lakes Power (Canadian Power Plant). The flow available (QC) at the computed head (H) is compared with the maximum and minimum flows, which are derived from the plant performance curves. If the limitations are exceeded, QC is increased/decreased incrementally and the head is recalculated using the new QC. (All equations used were developed by Ontario Hydro in co-operation with the Great Lakes Power Corporation). The head available is the difference between the forebay level and the tailrace level. The forebay level of Great Lakes Power is calculated by computing the head loss from Lake Superior to CHS gauge 011 (to obtain CHS011 level) and the head loss from CHS gauge 011 to the plant forebay (to obtain forebay level).

CHS011 Level:

for April to December,

(as previously calculated)

EL011 = 600.30

Forebay Level

$$FH(I,J) = EL011 - .0211QC^{2.2826} (EL011 - 574.147)^{-6.06}$$

$$FH = 600.30 - .0211 (36200)^{2.2826} (600.30 - 574.147)^{-6.06}$$

$$FH = 600.30 - 1.38$$

$$FH = 598.92$$

Tailrace Level

The tailrace level is calculated by computing the head loss from Lakes Michigan-Huron to CHS gauge 012 (to obtain CHS 012 level) and the head loss from CHS gauge 012 to the Great Lakes Power tailrace (to obtain tailrace level). At this point in the program, the Subroutine Tail is called,

Call Tail [ELH(I,J), QC(I,J), EL012(I,J)]

This subroutine calculates EL012 by the method of successive approximation. It is set up to compute EL012 19 successive times or until an accuracy to the nearest .00025 is obtained, each time substituting in the previously calculated value of EL012 so as to reduce the difference between two successive values of EL012 to insignificant amount; thereby an accurate value of EL012 is obtained. For this example, the equations used apply to the April to December period.

```
Subroutine Tail (Y, QC, EL)
Common A, B, AN, C, Q, CN, DN

EL = Y
CM = DN * QC
CM = CM * CM
```

For this example,

Y = 578.87 (Lakes Michigan-Huron stage)

QC = 36.2

Thus, CM = 10.78 and CM^2 = 116.22

These values are then substituted into the equation for EL012 level:

```
Do I = 1,19
  Y2 = Y + CM/(Y + EL - CN)**2
(1)  Y2 = 578.87 + 116.22/(578.87 + 578.87 - 1138.2)**2
  Y2 = 579.174391
```

The average of Lakes Michigan-Huron stage and the initial EL012 level is computed,

```
EL = (EL + Y2)/2
EL = (578.87 + 579.174391)/2
EL = 579.022196
```

If the difference between the absolute value of Y2 and EL, and .00025 is negative, that value of EL (EL012) is the actual value; if not, recalculate EL.

IF [ABS(Y2 - EL) - 0.00025] 10, 5, 5

Y2 - EL - .00025 = (579.174391 - 579.022196) - .00025

= .152195 - .00025 = .151945 (positive)

= .000232 - .00025 = - .000018

EL = EL012 = 579.165138

RETURN TO MAIN PROGRAM

Once the actual value of EL012 has been computed the tailrace level (FT) is computed.

$$FT(I,J) = EL012 + 1.2394 \times 10^{-11} \times QC^2 (590.551 - EL012)^{1.39}$$

$$FT = 579.165138 + 1.2394 \times 10^{-11} \times 36200^2 (590.551 - 579.165370)^{1.39}$$

FT = 579.165138 + .477491

FT = 579.642629

Head at Great Lakes Power

The head at the Great Lakes Power Plant is calculated as the forebay level minus the tailrace level,

CHEAD (I,J) = FH (I,J) - FT (I,J)

CHEAD = 598.92 - 579.642629

CHEAD = 19.28

The flow available (QC) for power at Great Lakes Power is 36.2 TCFS. The program now determines if this flow is within the maximum (CMAX) and minimum (CMIN) limitations of the plant performance curve.

CQMAX = CHEAD (I,J) + 17.6

CQMAX = 19.28 + 17.6

CQMAX = 36.88 TCFS

IF (CQMAX + 1 - QC (I,J)) 72, 71, 71

QC is within the maximum limitation.

Thus 36.2 TCFS is the Canadian Power diversion.

CQMIN = (.85 x CHEAD) + 13.9

CQMIN = (.85 x 19.28) + 13.9

CQMIN = 30.29 TCFS

IF(~~CQMIN~~ QC(I,J) + 1 - ~~QC (I,J)~~ CQMIN) 73, 74, 74

QC is within the minimum limitation.

Thus 36.2 TCFS is the Canadian Power diversion.

If QC had exceeded the limitations, a useable value of discharge would be determined by averaging QC with CQMAX/CQMIN and recalculating head until a value of QC within the limitations is obtained.

Once QC and CHEAD are determined, the power at Great Lakes Power is computed,

PGLP (I,J) = .072691 x QC (I,J) x CHEAD (I,J)

PGLP = .072691 x 36.2 x 19.28

PGLP = 50.52 MW

2. U.S. Flow

The flow available for U.S. power generation is the balance of the flow remaining after deducting the flow available for Canadian power from the total flow available for power.

QU = QT - QC (I,J)

QU = 72.39 - 36.2 = 36.19

From this total flow of 36.19, the U.S. Government Plant is allotted its present capacity of 12.7 TCFS and the Edison Sault Plant receives the balance of the flow available for U.S. power generation.

QS = QU - QGI

QS = 36.19 - 12.7 = 23.49

D. Edison Sault Head Losses

Next, the head loss in the Edison Sault Power Canal is computed with an equation from "Appendix F - Power".[1]

$$H(3) = 27800 \times QS^{2.6}/(ELSWP - 568.97)^{5.2}$$

$$H(3) = 27800 \times 23.49^{2.6}/(600.24 - 568.97)^{5.2}$$

$$H(3) = \underline{1.71} = HPLANT$$

NOTE: If H(3) is greater than 3.5 FPS, it is set equal to 3.5 and QS is recomputed.

The total head available at each power plant is the sum of all the losses deducted from the difference in head between Lake Superior and Lakes Michigan-Huron.

E. Head at U.S. Power Plants

Head at Edison Sault,

$$H(5) = H(1) - H(2) - H(3) - H(4) - .2$$

$$H(5) = 21.59 - .22 - 1.71 - 1.18 - .2 = 18.27 = HEDS$$

The elevation of the headrace at the Edison Sault Plant is the head loss deducted from the elevation at the SWP gauge.

$$ELPLANT = ELSWP - H(3)$$

[1] Ibid.

ELPLANT = 600.24 - 1.71 = 598.53

Head at U.S. Government Plant,

$$H(6) = H(1) - H(2) - .6 - H(4)$$

$$H(6) = 21.59 - .22 - .6 - 1.18$$

$$H(6) = 19.59 = HGOVT$$

F. Computation of Power Output

The equations used to compute the power output at each plant depends on the flow through the plant and the head,

1. Edison Sault

$$PSE_1 = .746[82H(5) - 220 + (89.5H(5) - 39)QS].94$$

IF $QS \leq 18.16 + .59\ H(5)$

$$PSE_2 = PSE_1 - (147)(.746)[QS - 18.16 - .59H(5)]^{1.6}(.94)$$

IF $H(5) \leq 17$ or $QS \leq 20.16 + .59H$

and $QS > 18.16 + .59H$

$$PSE_3 = PSE_2 - (100)(.746)[QS - 18.16 - .59H(5)]^{1.6}(.94)$$

IF $QS > 20.16 + .59H(5)$ and $H(5) > 17$

For this example.

$QS = 23.49$,

$18.16 + .59(18.27) = 28.9$

Thus the power output at Edison Sault is,

$$PSE = .746[82H(5) - 220 + (89.5 \times H(5) - 39)QS].94$$

$$PSE = .701[82 \times 18.27 - 220 + (89.5 \times 18.27 - 39)23.49]$$

$$PSE = 27179 \text{ KW}$$

2. U.S. Government Plant

$$PGV = 1055H(6) - 2890$$

IF $H(6) \leq 21.5$

$$PGV = 37,560 + H(6)\ [4280 - 75H(6)]$$

IF $H(6) > 21.5$

For this example, H(6) = 19.59

Thus the power output at the U.S. Government Plant is,

$$PGV = 1055H(6) - 2890$$

$$PGV = 1055(19.59) - 2890 = 17777 \text{ KW}$$

The program now adds PSE and PGV to obtain a total power output,

BOTH = PSE (I) + PGV (I)

PTOT = BOTH

BOTH = 27179 + 17777

BOTH = 44956

Determine the long-term monthly maximum and minimum power output during the period of record,

```
IF[BOTH .GT. PMAX(I)] PMAX(I) = BOTH        (Results in 12 values for
                                             the period of record)
IF[BOTH .LT. PMIN(I)] PMIN(I) = BOTH        (Results in 12 values for
                                             the period of record)
```

The monthly power output for each plant is multiplied by Amon (which is a factor in hrs./month) to convert from kw to kw-hrs; a cumulative total of power output in kw-hrs is then computed,

```
TPSE = TPSE + PSE(I) x AMON(I)     (One total for the period of record)
TPGV = TPGV + PGV(I) x AMON(I)     (One total for the period of record)
```

Compute the cumulative total of monthly power output in kilowatts for the period of record,

```
SUM(I) = SUM(I) + BOTH        (12 totals for the period of record)
```

Compute the total average monthly power output (in kw) for both power plants for the period of record,

```
AVG(I) = SUM(I)/FLOAT(I YRS)        (12 average outputs)
```

Compute the total power in kw-hrs,

TPOW = TPGV + TPSE (One total output)

Compute the cumulative total (in kw) of the long-term monthly minimum power outputs and then compute the average monthly minimum output,

SUMIN = SUMIN + PMIN(I)

AVEMIN = SUMAVG/12 (One average minimum output)

Compute the cumulative total (in kw) and the monthly average of the average monthly power outputs,

SUMAVG = SUMAVG + AVG(I)

AVGAVG = SUMAVG/12 (One average output)

Compute the energy costs, using an energy rate of 3.36,

ENGCOS = AVGAVG x 8.76 x ER

ENGCOS = AVGAVG x 8.76 x 3.36

G. Power Generation Costs

Compute the capacity cost using a demand rate of 28.33,

CAPCOS = AVEMIN x DR

CAPCOS = AVEMIN x 28.33

Compute the total cost of power generation,

Energy cost + capacity cost = total cost of power generation

B I L L B O A R D WRITEUPS SUBSET BKYNEWS WAS LAST CHANGED DEC 22
HANDBOOK SUBSET CHANGES WAS LAST CHANGED JAN 1 1981

DEC 22 PSS DISKS TO BE MOVED ON DEC 29
THE PSS DISKS ARE SCHEDULED TO BE PHYSICALLY MOVED ON MONDAY, DEC, 29. WE ANTICIPATE NO PROBLEMS. HOWEVER, CAUTIOUS USERS MAY WANT TO BACKUP THEIR PSS LIBRARIES. SEE HANDBOOK SUBSET STORAGE FOR THE RECOMMENDED METHOD.

DEC 12 NEW HOURS FOR TAPE SERVICES
BEGINNING IN JAN., 1981, TAPE SERVICES WILL ONLY BE OPEN ON WEEKDAYS, MONDAY TO FRIDAY, FROM 8 AM TO MIDNIGHT. THIS MEANS THAT TAPE TRANSACTIONS WHICH REQUIRE A TAPE LIBRARIAN CAN ONLY BE DONE DURING THOSE HOURS. TAPE TRANSACTIONS WHICH ARE DONE WITH CONTROL CARDS CAN OF COURSE BE DONE AT ANY TIME. BKYNEWS AND THE NEWSLETTER WILL HAVE MORE INFO. CALL TAPE SERVICES IF YOU HAVE QUESTIONS, x-6218.

NOV 18 ATTENTION DICOMED USERS
BECAUSE OF A NEWLY DISCOVERED BUG IN STAGE, YOUR STAGE CARD FOR ROUTING DICOMED OUTPUT SHOULD HAVE THE PARAMETER OFXF AND NOT OFXB. FOR EXAMPLE,
STAGE,FILM,LIBNO,OFXF,QT,W.

OCT 14 VARIAN PLOTTER AVAILABLE
A NEW VARIAN ELECTROSTATIC PLOTTER IS NOW AVAILABLE TO GRAPPAC AND IDDS USERS. FOR THE TIME BEING VARIAN PLOTS ARE FREE. DIRECTIONS FOR USING THE PLOTTER ARE GIVEN IN THE NOVEMBER ISSUE OF THE COMPUTER CENTER NEWSLETTER AND IN BKYNEWS.

TO CALL A CONSULTANT DIAL x5981, (415) 486-5981 OR 451-5981 (FTS)
