FOREWORD

Among the responsibilities assigned to the Office of the Manager, National Communications System, is the management of the Federal Telecommunication Standards Program. Under this program, the NCS, with the assistance of the Federal Telecommunication Standards Committee identifies, develops, and coordinates proposed Federal Standards which either contribute to the interoperability of functionally similar Federal telecommunication systems or to the achievement of a compatible and efficient interface between computer and telecommunication systems. In developing and coordinating these standards a considerable amount of effort is expended in initiating and pursuing joint standards development efforts with appropriate technical committees of the Electronic Industries Association, the American National Standards Institute, the International Organization for Standardization, and the International Telegraph and Telephone Consultative Committee of the International Telecommunication Union. This Technical Information Bulletin presents an overview of an effort which is contributing to the development of compatible Federal, national, and international standards in the area of digital facsimile standards. It has been prepared to inform interested Federal activities of the progress of these efforts. Any comments, inputs or statements of requirements which could assist in the advancement of this work are welcome and should be addressed to:

## 1.0 INTRODUCTION

This document summarizes work performed by Delta Information Systems, Inc. for the Office of Technology and Standards of the National Communications System, an organization of the U.S. Government, under contract number DCA100-81-C-0042. The Office of Technology and Standards, headed by National Communications System Assistant Manager Marshall L. Cain, is responsible for the management of the Federal Telecommunications Standards Program, which develops telecommunication standards whose use is mandatory by all Federal agencies.

Work is now actively underway by the EIA and CCITT to develop standards for Group 4 facsimile equipment. One of the most fundamental parameters for any facsimile system is the resolution since this issue has a major impact on many other system parameters such as image quality, transmission time, cost, complexity, and compatibility with other systems such as TELETEX. The purpose of this study is to analyze alternative resolution standards for Group 4 facsimile as a contribution to the overall standardization process.

Four test documents were scanned at five candidate resolutions and the results of all twenty scans were printed. One of the test charts (the Legibility Test Chart) was developed on this project and is designed to measure the

legibility of a visual communication system. The legibility of various character fonts at alternative resolutions was measured. In addition the compression ratio for the Modified Read Code for each of the 20 scans was measured.

Work on the Group 4 Resolution study was divided into the six tasks listed below. The work accomplished on each task is described in the section noted. Conclusions are drawn in Section 8.

<u>Section</u>	<u>Task</u>
2.0	Selection of Candidate Scanning Resolution
3.0	Selection of Test Documents
4.0	Image Scanning
5.0	Image Processing
6.0	Image Printing
7.0	Image Analysis
8.0	Conclusion

## 2.0 SELECTION OF CANDIDATE SCANNING RESOLUTIONS

The scanning resolutions which were selected are listed below along with a brief rationale for the selection of each. These candidate resolutions were reviewed with the TR-29 Facsimile committee of the EIA to insure they were in agreement with the selection.

No.	Pels/Inch	
	Vertical	Horizontal
1	200	200
2	240	240
3	300	300
4	400	400
5	480	480
6	200	400

### 200 x 200

This resolution was chosen because it is the high resolution option for Group 3 facsimile systems. Since most Group 3 equipments provide this optional capability this resolution in Group 4 equipment would contribute to the compatibility between Group 3 and Group 4 systems.

### 240 x 240

This resolution was chosen because it is more compatible with proposed TELETEX standards and because there is some digital printing equipment in the field operating at this resolution. TELETEX standards call for textual characters to be printed at a nominal pitch of 10 characters/inch horizontally and

6 rows/inch. If an integral number of pels are to be positioned within the character space of 1/10 in x 1/6 in the resolution must be divisible by 60. This candidate resolution conforms to that requirement.

#### 300 x 300

This resolution was chosen for the three reasons listed below.

- o It provides a significantly higher quality output image than 200 x 200. Some studies have shown that images which are scanned/printed at 300 x 300 lines/inch will usually pass as "originals".
- o It meets the TELETEX compatibility requirement—divisible by 60.
- o There are several digital printing systems in the field using this resolution

#### 400 x 400

Some believe that Group 4 must provide a very high quality output image relative to Group 3 if it is to be successful as a new and distinctive service. Some also believe that it is important to be downward compatible with Group 3. This resolution satisfies these two requirements.

#### 480 x 480

Some argue that the 240 x 240 resolution should be the low resolution mode for Group 3 rather than 200 x 200 since it is compatible with TELETEX. These people would also advocate

a high resolution mode and it is natural that this higher resolution be double the low resolution.

200 x 400

This resolution is selected to provide an intermediate mode between 200 x 200 and 400 x 400.

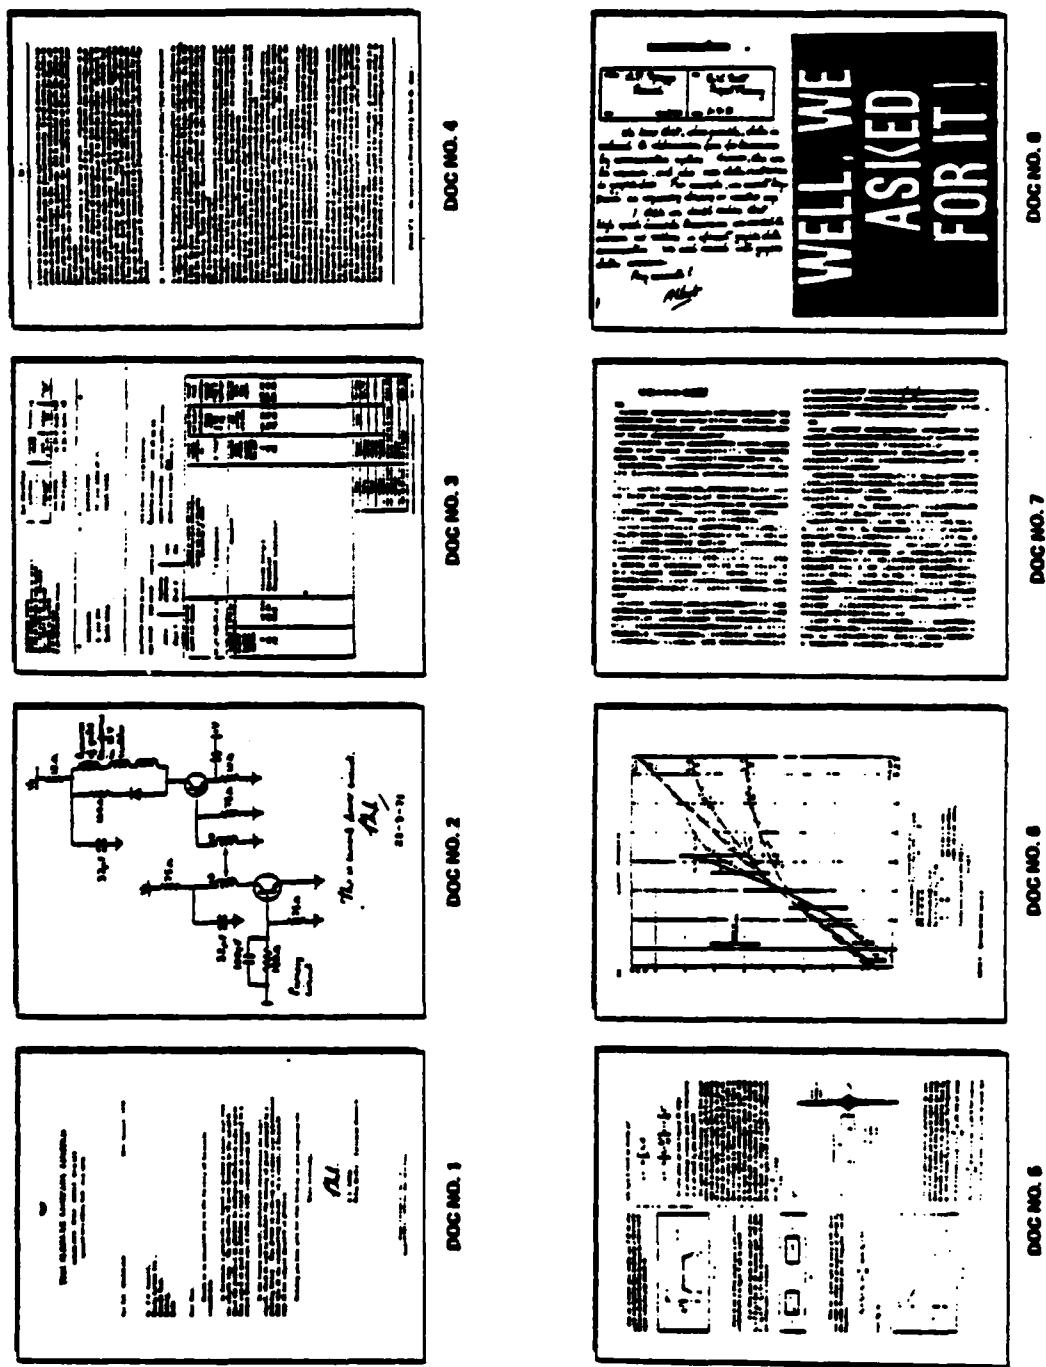

### 3.0 SELECTION OF TEST DOCUMENTS

Four images were selected to be used as test documents in the subject program. Three of the pages were chosen from the 8 standard CCITT test documents shown in Figure 3-1. It is advantageous to use CCITT test documents because the test results may be readily compared with other data developed by facsimile investigators. The three CCITT documents selected are listed below. The selections of these test documents were reviewed with the TR-29 Facsimile committee of the EIA to insure they agreed with the choice.

<u>CCITT NO.</u>	<u>Name</u>	<u>Figure NO.</u>
1	English letter	3-2
5	French Text Figures	3-3
7	Kanji	3-4

Documents 1,5, and 7 are representative of a wide range of detail which is likely to be encountered in facsimile systems. Pages 1 and 7 are representative of documents which contain relatively small and large amounts of information respectively. Image 5 contains an intermediate amount of detail. Document 4 is also commonly used in studies of this type. The test results for documents 4 and 7 are usually very similar.

A new test chart was developed on this project to permit the quantitative measurement of image legibility. The test chart was first prepared as an offset plate. This plate was used to print a number of high quality test images. One of these offset prints was scanned as part of this resolution project. Another one of

Dr. P.N. Cundall,  
Mining Surveys Ltd.,  
Holroyd Road,  
Reading,  
Berks.

Dear Pete,

Permit me to introduce you to the facility of facsimile transmission.

In facsimile a photocell is caused to perform a raster scan over the subject copy. The variations of print density on the document cause the photocell to generate an analogous electrical video signal. This signal is used to modulate a carrier, which is transmitted to a remote destination over a radio or cable communications link.

At the remote terminal, demodulation reconstructs the video signal, which is used to modulate the density of print produced by a printing device. This device is scanning in a raster scan synchronised with that at the transmitting terminal. As a result, a facsimile copy of the subject document is produced.

Probably you have uses for this facility in your organisation.

Yours sincerely,

*Phil.*

Figure 3-2  
CCITT IMAGE NO. 1

Cela est d'autant plus valable que  $T\Delta f$  est plus grand. A cet égard la figure 2 représente la vraie courbe donnant  $|\phi(f)|$  en fonction de  $f$  pour les valeurs numériques indiquées page précédente.

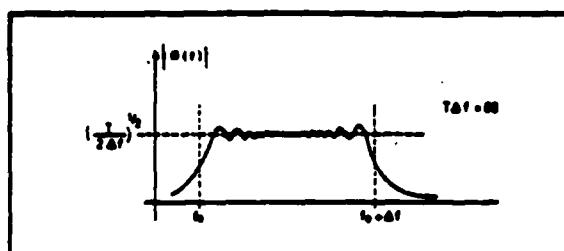

FIG. 2

Dans ce cas, le filtre adapté pourra être constitué, conformément à la figure 3, par la cascade :

- d'un filtre passe-bande de transfert unité pour  $f_0 \leq f \leq f_0 + \Delta f$  et de transfert quasi nul pour  $f < f_0$  et  $f > f_0 + \Delta f$ , filtre ne modifiant pas la phase des composants le traversant ;

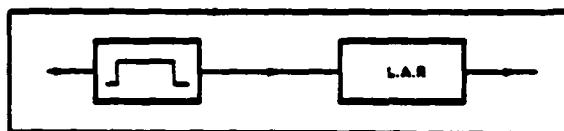

FIG. 3

- filtre suivi d'une ligne à retard (LAR) disperseuse ayant un temps de propagation de groupe  $T_R$  décroissant linéairement avec la fréquence  $f$  suivant l'expression :

$$T_R = T_0 + (f_0 - f) \frac{T}{\Delta f} \quad (\text{avec } T_0 > T)$$

(voir fig. 4).

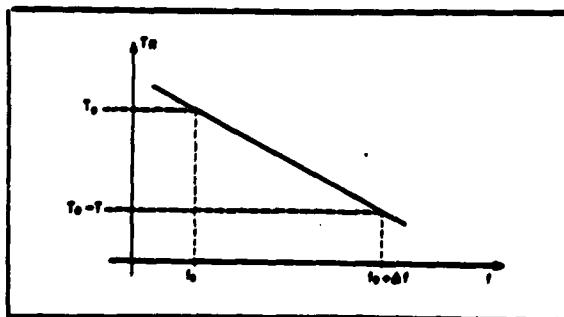

FIG. 4

telle ligne à retard est donnée par :

$$\varphi = -2\pi \int_0^f T_R df$$

$$\varphi = -2\pi \left[ T_0 + \frac{f_0 T}{\Delta f} \right] f + \pi \frac{T}{\Delta f} f^2$$

Et cette phase est bien l'opposé de  $|\phi(f)|$ , à un déphasage constant près (sans importance) et à un retard  $T_0$  près (inévitable).

Un signal utile  $S(t)$  traversant un tel filtre adapté donne à la sortie (à un retard  $T_0$  près et à un déphasage près de la porteuse) un signal dont la transformée de Fourier est réelle, constante entre  $f_0$  et  $f_0 + \Delta f$ , et nulle de part et d'autre de  $f_0$  et de  $f_0 + \Delta f$ , c'est-à-dire un signal de fréquence porteuse  $f_0 + \Delta f/2$  et dont l'enveloppe a la forme indiquée à la figure 5, où l'on a représenté simultanément le signal  $S(t)$  et le signal  $S_1(t)$  correspondant obtenu à la sortie du filtre adapté. On comprend le nom de récepteur à compression d'impulsion donné à ce genre de filtre adapté : la « largeur » (à 3 dB) du signal comprimé étant égale à  $1/\Delta f$ , le rapport de compression

$$\text{est de } \frac{T}{1/\Delta f} = T\Delta f$$

FIG. 5

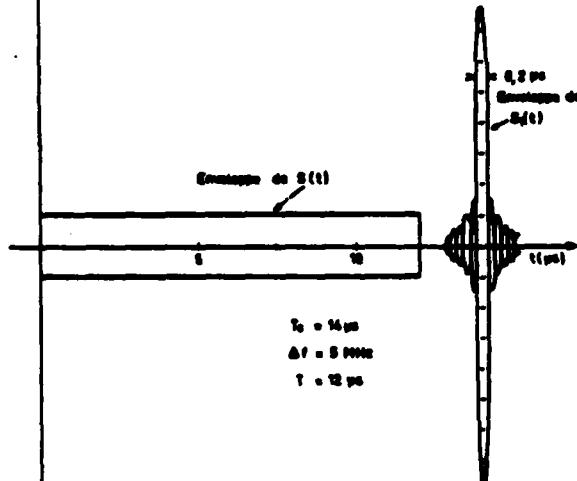

FIG. 5

On saisit physiquement le phénomène de compression en réalisant que lorsque le signal  $S(t)$  entre dans la ligne à retard (LAR) la fréquence qui entre la première à l'instant 0 est la fréquence basse  $f_0$ , qui met un temps  $T_0$  pour traverser. La fréquence  $f$  entre à l'instant  $t = (f - f_0) \frac{T}{\Delta f}$  et elle met un temps  $T_0 - (f - f_0) \frac{T}{\Delta f}$  pour traverser, ce qui la fait ressortir à l'instant  $T_0$  également. Ainsi donc, le signal  $S_1(t)$

Figure 3-3  
CCITT Document No. 5

## CCITTの概要

CCITTは、国際電気通信連合（ITU）の四つの常設機関（事務局、国際電話電信規約委員会、CCIR、CCITT）の一つとして、ITUの中でも、世界

の国際規制上の諸問題を真先に取上げ、その解決方法を見出していく重要な機関である。日本名は、国際電信電話諮問委員会と称する。

CCITTの前身は、CCIF（国際電話諮問委員会）とCCIT（国際電信諮問委員会）である。CCIFは、1924年にヨーロッパに「国際长途電話連絡規則委員会」が設置され、これが1935年のパリ電信電話会議のとき、正式に、「国際電話諮問委員会」として万国電信連合の公式機関となりたのである。CCITは、同じく1925年の会議のとき、CCIFと併立するものとして設置された。

そして、CCIFは、1956年の12月に第18回総会が開催されたのが、CCITでは、同年同月に第8回総会が開催されたのが、併合されて現在のCCITTとなつた。1956年には、CCIFとCCITが解散した直後、第1回総会を開催し、第2回総会は、1960年にトーナリーで、第3回総会は、1964年、シンシナティで、第4回総会は、1968年、アルゼンチンで開催された。

CCIFとCCITが合併したのは、有線電気通信の分野、とくに衛星通信について、電信回線と電話回線などを技術的に分ける意味がなくなってきたこと、各國とも大体において、衛星部門と電信部門は同一組織内にあること、CCIFの事務局とCCITTの事務局の合併による能率増進等がおもな理由であった。

CCITTは、上述のヨーロッパ内の国々によって、ヨーロッパ内の電信・電話の技術・規則・資金の基準を定め、あるいは統一をはかってきたので、現在では、その影響を受け、全会員国は、ヨーロッパの国が多く、ヨーロッパで生じる問題の研究が多い。たとえば、1960年のCCITT勧告の中で、技術上記述する問題は約2,500題であったが、これはヨーロッパ内領域を想定したものである。

しかしながら、1956年9月に敷設された大西洋横断電話ケーブルは、大陸間電話通信の自動化および半自動化への技術的可行性を与え、CCITTがこの問題を取り上げるに及び、CCITTの性格は漸次、汎世界的色彩を実質的に帯びるに至った。この汎世界的性格は第2次世界大戦後目まぐしくなったアジア・アフリカ・南米等の独立に伴つてITUの構成員の中にこれらの国が加わり、ITUの中に新しい意見が導入されたことなどが起因して、技術面・政治面の双方から導入されてき

た。CCITTの汎世界化は、1960年の第2回総会がニューヨークで開催されたことにあらわされている。この総会では、CCITT・CCIFの「やがては、アメリカやアジアで総会が開催されることなく、CCITTが販賣会・ニューヨーク総会の準備文書で、この点には注目すべきであるとのべている。

出版

ITUは、各種委員会議、主旨会議を始めとして、セミナーの開催を中心、それぞれ機関の権限と任務は国際電気通信条約に明記されている。そこで条約を参照してみるとわかるが、CCITTの任務は、つまるとおりとなっている。

「国際電信電話諮問委員会(CCITT)は、電信および電話に関する技術、運用および料金の問題について研究し、および意見を表明することを任務とする。」(1965年モントルー条約第187号)

「各国際諮問委員会は、その任務の遂行に当たつて、新しい国または発展途上にある国における地域的および国際的分野にわたる電気通信の創設、発達および改善に直接関連のある問題について研究し、および意見を作成するよう妥当な注意を払わなければならない。」(同第188号)

「各国際諮問委員会は、また、開発途上国に着目し、その国内電気通信の問題について研究し、かつ、勧告を行なうことができる。」(同第189号)

「記第187号と第188号にいわれる「勧告」とは、フランス語の Avis かふ証したもので、英語では、「勧告(Recommendation)」と云つてゐる。CCITTの表明する意見は、国際法的には強制力をもたないものであつて、この点が、条約・電信規則・電話規則等各國を拘束する力をもつてゐること異なる。さうとも意見とは称しても、技術的分野では、電信規則のこと、各國政府が承認してその内容を実施する強制規則をもたないので、実際にある機器の仕様を定める場合には、多くの国の意見が統一されたこの「意見」に従わなければ、国際的な国際通信を行なうことができない場合が多い。この意見(または勧告)は、国際通信を行なう場合各国が直面する問題について、具体的な意見を表明するもので、たとえば、大陸間ケーブルで大陸間電話を半自動化しようとする場合、その信号方式や取り扱う電話の種類および料金は、どのようにするかを研究して意見を表明する。したがつて、CCITTの活動は、つねに時代の最先端を行くもので、CCITTの活動方向は、そのまま世界の国際通信の活動方向であるといえる。

この意見は、また、電信規則以下のその他の規則のことと、数年以上の問題をもつて開催される主旨会議というような大会議の決定をまたなくとも表明することができます。また、その改正も容易であるので、現在のように進歩の早い国際通信では、開発途上の意見を統一した国際的見解としては非常に便利である。

Figure 3-4  
CCITT Image No. 7

these same offset prints is included as Figure 3-5. The legibility chart consists of two parts. The top half of the test chart is divided into five parts each assigned a different size or point of text. Four lines of text are included for each point. Each line contains random text including numbers, upper case, and lower case characters. The text is organized in groups of five characters with a single space between the five character groups. Each of the four lines is a different type font. The four fonts are Helvetica, Times Roman, American Type-writer, and Bodoni Bold.

The bottom half of the test chart is devoted to half-tone imagery. Five different half-tone screen densities are included - 65, 85, 120, 133, and 150 lines/inch. Each of the five half-tone test areas is divided into two parts. The right side is a half-tone of a typical scene. The left side is a uniform half-tone designed to illustrate beat patterns which may appear when the image is scanned. The five different half-tone screen densities are included to represent different input material ranging from newspapers to high quality magazines.

#### 4.0 IMAGE SCANNING

The four images described in section 3.0 were each scanned with five different resolutions to provide a total of twenty separate files of scanned images on magnetic tape. The scanning process was performed by the Applied Physics Laboratory of Johns Hopkins University. The scanning equipment, described in detail in Appendix A, was manufactured by Optronics International, Inc. and is designated as Model P-1700.

The P-1700 scanning equipment is a highly precise device which employs a square aperture and samples the images in a rectilinear fashion; i.e. the sampling density in the horizontal and vertical directions is identical. The scanner has two limitations which constrained the scanning procedure. First, the maximum size of the input copy to be scanned is 10 inches by 10 inches. Second, the number of spot sizes which are available is limited.

Due to these limitations, all input images were photographically reduced prior to being scanned. Table 4-1 shows the reduced image size and spot size for each scan.

Table 4-1  
Scanning Parameters

Resolution <u>lines/inches</u>	Optical Reduction <u>Ratio</u>	Size of Scanned Image <u>In. by In.</u>	Scanned Spot Size <u>μm</u>
200	1.274	6.67 x 8.63	100
240	2.117	4.02 x 5.20	50
300	1.693	5.02 x 6.50	50
400	1.274	6.67 x 8.63	50
480	2.117	4.02 x 5.20	25

The output of the scanner was fed to an 8 bit analog-to-digital converter and each pixel was stored on magnetic tape.

## 5.0 IMAGE PROCESSING

The Image Processing Task was divided into the three subtasks listed below each of which is discussed in a separate subsection.

- o Reformat the Scanned Data
- o Measurement of Compression - Modified READ Code
- o Alternate Line Interpolation

### 5.1 Reformat the Scanned Data

The scanned data was reformatted in three different ways as listed below.

1. Each pel was converted from the 8 bit gray scale form to the 1 bit black-white form by merely selecting the most significant bit.
2. A specific number of pels per scan line was selected for each resolution, and the scanned data was truncated at that point. See table 5-1.
3. A specific number of scan lines per image was selected for each resolution, and the scanned data, was truncated accordingly. See Table 5-1.

The binary data after having been reformatted was stored on magnetic tape in the format shown in Table 5-1.

Table 5-1  
BINARY IMAGE FORMAT

## 5-2 Measurement of Compression - Modified READ Code

It is likely that the basic coding technique which will be chosen for the Group 4 facsimile standard will be a version of the Modified READ code (MRC). For that reason it was decided to measure the compression ratio for the three CCITT images when coded by the MRC. Since Group 4 facsimile equipment will operate over data circuits having error control the K-factor in the simulation was made infinite. It is also anticipated that Group 4 equipment will transmit from memory to memory. Therefore the minimum scan line time was set at zero.

The basic description of the standard Modified READ code is contained in CCITT Recommendation T.4 (EIA Standard RS-465; Fed. Std. 1062). The coding portion of this standard is included in Appendix B for reference purposes. Page 6 of this document shows that the maximum run length defined by the standard is 2,560 pels. Since the high resolution images have line lengths longer than this it was necessary to use a coding procedure for run lengths beyond 2,560. The coding procedure which was used in this simulation is included in Appendix C. A computer program was written to implement this procedure, and the code listing for this program is included in Appendix D.

### Measurement of MRC Compression

The formatted scan data for the three CCITT documents (Number 1, 5, 7) was entered into the DCA computer system in Reston, VA. The computer program, previously written to measure

MRC compression, as modified for long run lengths, was used to measure the number of MRC code bits. To repeat, the K-factor was set at infinity, and the minimum scan line time was set at zero. The test results for the simulation process are summarized in Table 5-2 and Figure 5-1. Note that the bits-per-page is essentially a linear function of the resolution. To a very close approximation, if the resolution doubles the number of bits/page is doubled. This occurs in spite of the fact that, if the resolution doubles, the number of pels/page increases by four to one. The reduced bits/page occurs because the compression ratio increases as a function of the resolution. This in turn is due to the increased correlation between pels as the resolution increases.

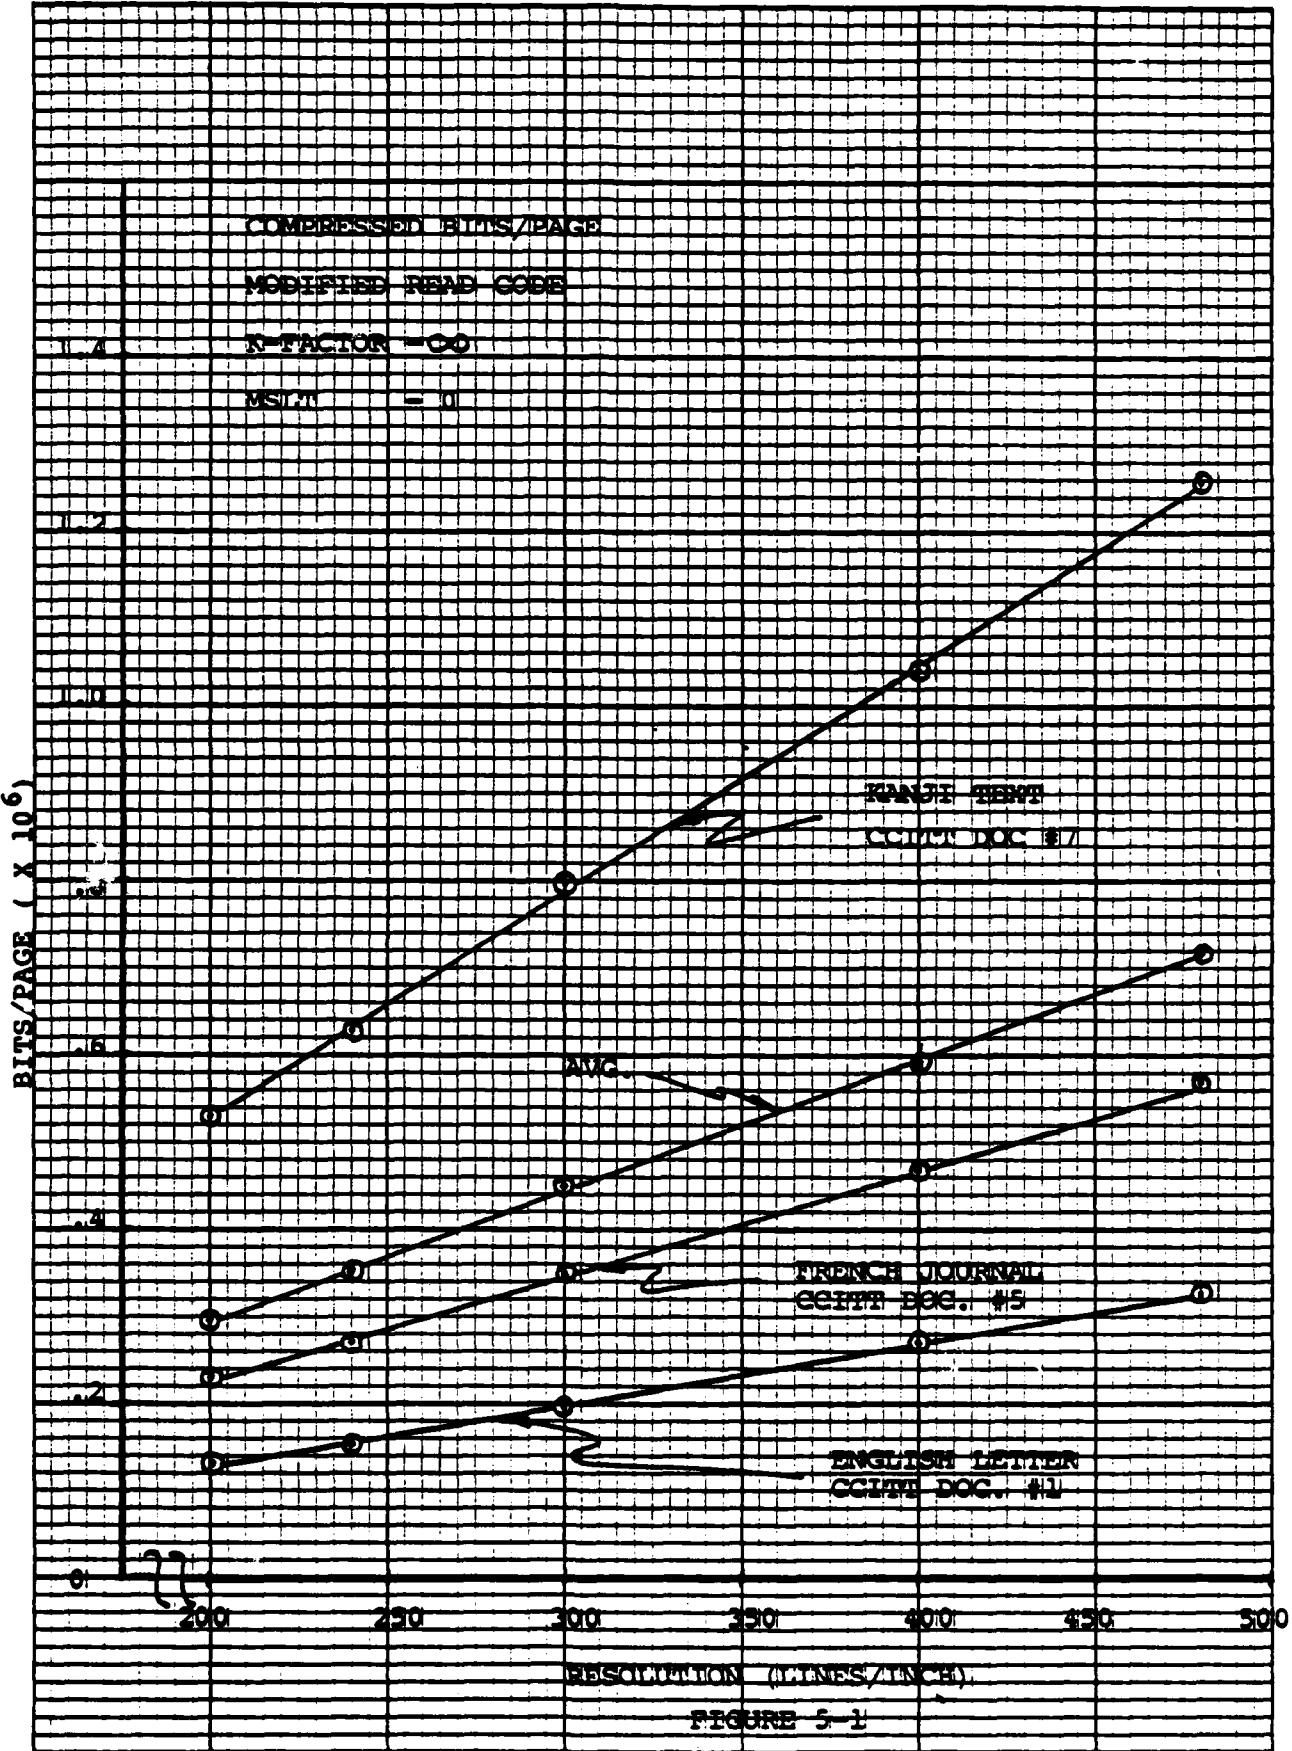

Statistical measures describing the Modified READ code data for the twenty scanned images is contained in Appendix E. The statistical data applies to the number of coded bits per scan line. The following statistical data is provided in the Appendix.

- o Minimum bits/line
- o Maximum
- o Median
- o Mean
- o Standard Deviation

### 5.3 Alternate Line Interpolation

Compression techniques are used in digital facsimile systems to minimize the time required for document transmission. Source coding -- a technique which reduces redundancy inherent in the input document -- is the most common compression technique which is used. The Modified Huffman Code and Modified READ code are examples of source coding techniques. One fundamental characteristic of source coding is that, assuming no transmission errors, the output document is identical to the input digital image. No approximations or degradation occurs relative to the original digitized image. Another characteristic of source coding is that the compression ratio is highly dependent upon the complexity of the input document. Complex documents require more transmission time than documents containing little information. Alternate Line Interpolation is a compression technique which achieves a fixed compression ratio of 2 to 1 by deleting alternate scan lines from transmission. At the receiver the missing scan lines are interpolated from the transmitted data.

Consider a typical digital facsimile system which scans, and prints, with the same resolution in both the horizontal and vertical direction. For example, the one resolution being considered for Group 4 facsimile equipment employs a resolution of 400 lines/in.in both directions. Figure 5-2 illustrates the general concept of line interpolation where each square represents one pixel in the input and output images (e.g. 1/400 inch x 1/400 inch). As shown in the diagram every

ALTERNATE LINE INTERPOLATION

The pel to be interpolated is designated as "x". The first step in the interpolation process is to consider the pair of transmitted pels ( $P_0$ ) which are adjacent to "x" in the line above and below. If the  $P_0$  pels are both black interpolate "x" to be black. If the  $P_0$  pels are both white interpolate "x" to be white. If the two  $P_0$  pels are of different color, adjacent pairs ( $P_{\pm 1}$ ,  $P_{\pm 2}$ , etc.) are examined to determine the color of the nearest pair where both pels are black or white. Pel "x" is interpolated to be the color of the nearest pair which is all black or all white. For example, if pairs  $P_{-2}$ ,  $P_{-1}$ ,  $P_0$ , and  $P_1$  all have differing colored pels in each pair, but the pels in  $P_2$  are both white then "x" is interpolated to be white. If opposite colors are found equidistant from "x" then "x" is interpolated to be white. For example, under the following conditions "x" is interpolated to be white.

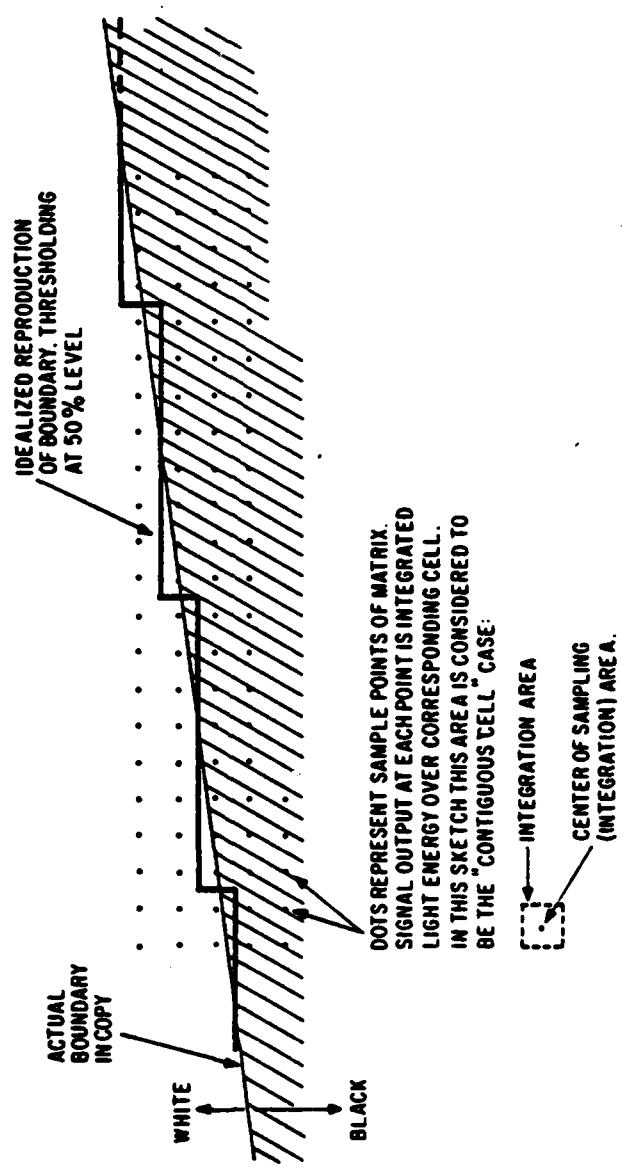

- $P_{-2}$  - both black
- $P_{-1}$
- $P_0$  } - pairs have different colored pels
- $P_1$
- $P_2$  - both white

Figure 5-2

other line of pixels is transmitted, and those lines which were not transmitted are interpolated at the receiver. It is anticipated that the pixels would be interpolated sequentially by a hardware and/or software processor. In Figure 5-2 the pixel which is labelled "x" is being interpolated using the transmitted information from the lines above and below.

It should be noted that the proposed system will occasionally interpolate pixels incorrectly. Therefore the interpolation scheme differs from source coding in two respects. First, the compression ratio is fixed at 2 to 1 regardless of the redundancy of the input image. Second, the interpolation technique does not reproduce the input digital image exactly; errors will occasionally be made.

The above discussion views the proposed system from a data compression perspective. It is also possible to consider the interpolation proposal from an "image enhancement" viewpoint. Consider Figure 5-3 which illustrates the typical "stairstep" distortion in a conventional digital facsimile system when scanning a black-white edge which is nearly parallel with the scanning track. This ragged edge distortion is very visible to the naked eye and significantly reduces the acceptability of digital facsimile. It is possible to enhance the appearance of the output image by artificially creating, or interpolating twice as many scan lines on the output copy as were scanned and transmitted. If this were done the size of the ragged stairstep distortion would be reduced 2 to 1 and the image would be more pleasing to the eye. The proposed interpolation algorithm

Stairstep Generation in Sampled Two-Level System

Figure 5-3

would automatically position the stairstep transitions on the interpolated lines in the optimum position -- halfway between the steps on the above and below transmitted lines.

A computer program was written to simulate the Alternate Line Interpolation algorithm. The code listing for the program is included in Appendix F. The algorithm was run on all four test images at 400 x 400 line resolution. Every other scan line of the 400 x 400 line image was deleted. The missing lines were then replaced by interpolated lines. A CONVERT program was then written to permit the interpolated image to be printed on the Johns Hopkins printer. A code listing for the CONVERT program is included in Appendix G.

## 6.0 IMAGE PRINTING

A total of 20 images were printed consisting of all combinations of the four test images (CCITT Nos 1, 5, 7 and Legibility Chart) and five resolutions (200, 240, 300, 400, 480 lpi). Four additional images were also printed for the Alternate Line Interpolation algorithm; all four test pages at 400 x 400 lpi. A print of each of the 24 images is included in this report. Table 6-1 lists the figure numbers and the parameters for each. Of course the quality of the images in this report is not representative of the original images which were photographically printed. Dennis Bodson, the COTR on this project, has a complete set of the original photographic prints.

The images were first printed on the Johns Hopkins system described in Appendix A. A reduced size photographic transparency was produced by the printer. In general the size of the output transparency and the aperture size corresponded to the parameters listed in Table 4-1. The Johns Hopkins transparencies were then photographically enlarged to the full 8½ in. x 11 in. size.

SAPORS LANE · BOOLE · DORSET · BH25 8ER

TELEPHONE BOOLE (94513) 51617 · TELEX 123456

Our Ref. 350/PJC/EAC

18th January, 1972.

Dr. P.N. Cundall,  
Mining Surveys Ltd.,  
Holroyd Road,  
Reading,  
Berks.

Dear Pete,

Permit me to introduce you to the facility of facsimile transmission.

In facsimile a photocell is caused to perform a raster scan over the subject copy. The variations of print density on the document cause the photocell to generate an analogous electrical video signal. This signal is used to modulate a carrier, which is transmitted to a remote destination over a radio or cable communications link.

At the remote terminal, demodulation reconstructs the video signal, which is used to modulate the density of print produced by a printing device. This device is scanning in a raster scan synchronised with that at the transmitting terminal. As a result, a facsimile copy of the subject document is produced.

Probably you have uses for this facility in your organisation.

Yours sincerely,

*Phil.*

Figure 6-10  
480 lpi

6-12

Cela est d'autant plus valable que  $T\Delta f$  est plus grand. A cet égard la figure 2 représente la vraie courbe donnant  $|\phi(f)|$  en fonction de  $f$  pour les valeurs numériques indiquées page précédente.

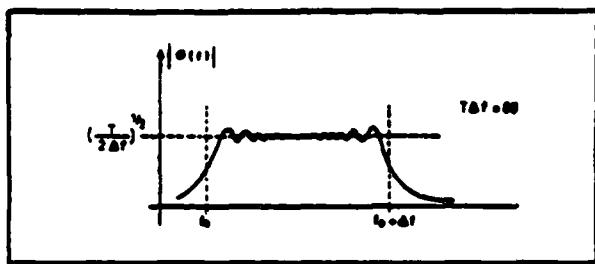

FIG. 2

Dans ce cas, le filtre adapté pourra être constitué, conformément à la figure 3, par la cascade :

- d'un filtre passe-bande de transfert unité pour  $f_0 \leq f \leq f_0 + \Delta f$  et de transfert quasi nul pour  $f < f_0$  et  $f > f_0 + \Delta f$ , filtre ne modifiant pas la phase des composants le traversant ;

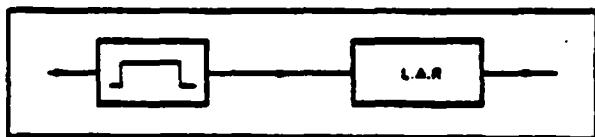

FIG. 3

- filtre suivi d'une ligne à retard (LAR) disper- sive ayant un temps de propagation de groupe  $T_R$  décroissant linéairement avec la fréquence  $f$  suivant l'expression :

$$T_R = T_0 + (f_0 - f) \frac{T}{\Delta f} \quad (\text{avec } T_0 > T)$$

(voir fig. 4).

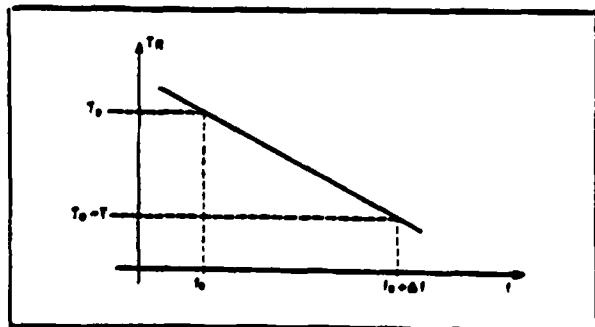

FIG. 4

telle ligne à retard est donnée par :

$$\varphi = -2\pi \int_0^f T_R df$$

$$\varphi = -2\pi \left[ T_0 + \frac{f_0 T}{\Delta f} \right] f + \pi \frac{T}{\Delta f} f^2$$

Et cette phase est bien l'opposé de  $|\phi(f)|$ , à un déphasage constant près (sans importance) et à un retard  $T_0$  près (inévitable).

Un signal utile  $S(t)$  traversant un tel filtre adapté donne à la sortie (à un retard  $T_0$  près et à un déphasage près de la porteuse) un signal dont la transformée de Fourier est réelle, constante entre  $f_0$  et  $f_0 + \Delta f$ , et nulle de part et d'autre de  $f_0$  et de  $f_0 + \Delta f$ , c'est-à-dire un signal de fréquence porteuse  $f_0 + \Delta f/2$  et dont l'enveloppe a la forme indiquée à la figure 5, où l'on a représenté simultanément le signal  $S(t)$  et le signal  $S_1(t)$  correspondant obtenu à la sortie du filtre adapté. On comprend le nom de récepteur à compression d'impulsion donné à ce genre de filtre adapté : la « largeur » (à 3 dB) du signal comprimé étant égale à  $1/\Delta f$ , le rapport de compression

est de  $\frac{T}{1/\Delta f} = T\Delta f$

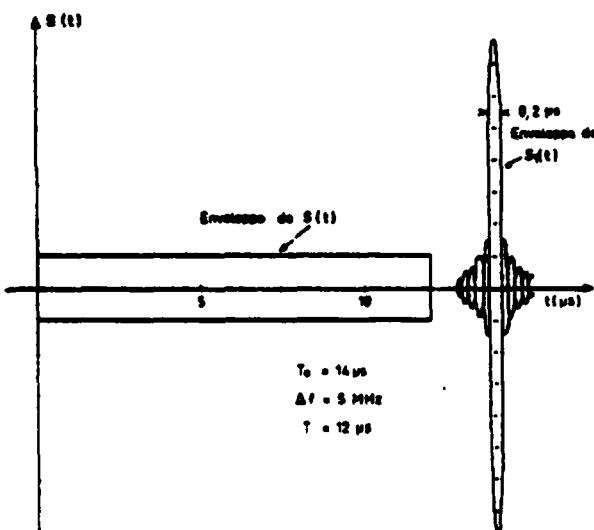

FIG. 5

On saisit physiquement le phénomène de compression en réalisant que lorsque le signal  $S(t)$  entre dans la ligne à retard (LAR) la fréquence qui entre la première à l'instant 0 est la fréquence basse  $f_0$ , qui met un temps  $T_0$  pour traverser. La fréquence  $f$  entre à l'instant  $t = (f - f_0) \frac{T}{\Delta f}$  et elle met un temps  $T_0 - (f - f_0) \frac{T}{\Delta f}$  pour traverser, ce qui la fait ressortir à l'instant  $T_0$  également. Ainsi donc, le signal  $S(t)$

Figure 6-11  
200 lpi  
6-13

Cela est d'autant plus valable que  $T\Delta f$  est plus grand. A cet égard la figure 2 représente la vraie courbe donnant  $|\phi(f)|$  en fonction de  $f$  pour les valeurs numériques indiquées page précédente.

CCITTは、国際電気通信連合（ITU）の団体の常設機関（事務局）、国際電信規範委員会、CCIR、CCITT、CIEとして、ITUの中でも、世界

の国際通信用上の諸問題を真先に取上げ、その解決方法を取扱う行く重要な機関である。日本名は、国際電信電話規範委員会と称する。

CCITTの前身は、CCIE（国際電話規範委員会）とCCITE（国際電信路間委員会）である。CCIEは、1924年にヨーロッパにて「国際長距離電話通信規範委員会」が設置され、これが1925年のパリ電信電話会議のとき、正式に「国際電話路間委員会」として万国電信連合の公式機関となつたものである。CCIEは、同じく1925年の会議のとき、CCIEと併立するものとして設置された。

そして、CCIEは、1956年の12月に第1回総会が開催されたのち、CCIEとは、四年毎に第3回総会が開催されたらしく、併合されて現在のCCITTとなつた。このCCIEとCCITTは、CCIEとCCITTが解散した直後、第1回総会を開催し、第2回総会は、1960年にリーナリーで、第3回総会は、1964年、シエネードで、第4回総会は、1968年、アルゼンチンで開催された。

CCIEとCCITTが合併したのは、有線電気通信の分野、とくに伝送路について電信回線と電話回線とを技術的に分ける意味がなくなってきたこと、各國とも大体において、電信部門と電話部門は同一組織内にあること、CCIEの事務局とCCITTの事務局の合併による能率増進等がおもな理由であった。

CCITTは、上述のよう、ヨーロッパ内の国々に加えて、ヨーロッパ内の電信・電話の技術・運用・料金の基準を定め、あるいは統一をはからでめたので、現在でも、その影響を受け、会員参加国は、ヨーロッパの国が多く、ヨーロッパで生じる問題の研究が多い。たとえば、1960年のCCITT勧告の中で、技術上記述する距離は約2,500kmであったが、これはヨーロッパ内領域を想定したものである。

しかしながら、1956年9月に敷設された大西洋横断電話ケーブルは、大陸間電話通信の自動化および半自動化への技術的可能性を示す、CCITT子がこの問題を取り上げるに及び、CCITTの性格は漸次、汎世界的の色彩を実質的に帯びるに至つた。この汎世界的性格は第2次世界大戦後さしかなったアジア・アフリカ植民地の独立に伴つてCCITTの構成員の中にこれらの国が加わり、ITUの中に新しい意見が導入されたことに起因して、技術面・政治面の双方から導入されてき

た。CCITTの汎世界化は、1960年の第2回総会がニューヨークで開催されたいとからかれていた。この総会までは、CCIT・CCIEの「すれどしき、アメリカやアジアで資金が開催されたことがなく、CCITT・CCIE委員会は、ニューヨーク総会の準備文書で、この点には注目すべきであるとのべて」いる。

### 任務

ITUは、全権委員会議、主席会議を始めとして、七つの機関をもち、それぞれの機関の権限と任務は国際電気通信条約に明記されている。そこで条約を参照してみるとならば、CCITTの任務は、(1)のとおりとなる。

「国際電信電話路間委員会(CCITT)は、電信および電話に関する技術、運用および料金の問題について研究し、および意見を表明することを任務とする。」(1965年モントル一条約第187号)

「各国路間委員会は、その任務の遂行に当たって、新しい国または発展の途上にある国における地域的および国際的分野にわたる電気通信の創設、発達および改善に直接関連のある問題について研究し、および意見を作成するように妥当な注意を払わなければならぬ。」(同第188号)

「各国路間委員会は、まだ、開拓中の重要な問題について、その国内電気通信の問題について研究し、かつ、勧告を行なうことができる。」(同第189号)

上記第187号と第188号に「わざる「勧告」とは、「テレックス」や「テレハブ」(Avia)から証したので、英語では、「Recommendation」となる。CCITTの

表明する意見は、国際法的には強制力をもたないことをおつて、「の意が、条約、電信規則、電話規則等各國を拘束する力をもつて」いるものと異なる。むしろ意見とは称しても、技術的分野では、電信規則のこと、各國政府が承認してその内容を実施する強制規則をもつたないので、実際にある機器の仕様を定める場合には、多くの国が意見が第一されたの「意見」に従わなければ、日本が国際通信を行なうことができない場合が多い。この意見(または勧告)は、国際通信を行なう場合各國が直面する問題について、具体的意見を表明するもので、たとえば、大陸間ケーブルで大陸間電話を半自動化しようとする場合、その信号方式や取り扱う電話の種類および料金は、どのようにするかを研究して意見を表明する。したがって、CCITTの活動は、つねに時代の最先端を行くもので、CCITTの活動方向は、そのまま世界の国際通信の活動方向であるともいえる。

この意見は、また、電信規則以下のその他の規則のことく、数年以上の問題をもて開催される主要会議というような大會議の決定をまたなくとも表明することができる。また、その改正も容易であるので、現在のように過歩の早い国際通信界では、開催国の意見を統一した国際的見解としては非常に便利である。

## CCITTの概要

沿革

CCITTは、国際電気通信連合（IITU）の四つの常設機関（事務局、国際電話電信委員会、CCIR、CCITT）として、一団の中でも、世界の国際通信上の諸問題を真先に取上げ、その解決方法を見出して行く重要な機関である。日本名は、国際電信電話諮問委員会と称する。

CCITTの前身は、CCIF（国際電話諮問委員会）とCCIT（国際電信電話諮問委員会）である。CCIFは、1924年にヨーロッパに「国際長距離電話通信規則」が設置され、これが1925年のパリ電信電話会議のとき、正式に、「国際電話諮問委員会」として万国電信連合の公式機關となつたものである。CCITは、同じく1925年の会議のとき、CCIFと併立するものとして設置された。

そして、CCIFは、1956年の12月に第18回総会が開催されたら、CCITは、同年同月に第8回総会が開催されたら、併合されて現在のCCITTとなる。CCITTは、CCIFとCCITが解散した直後、第1回総会を開催し、第2回総会は、1960年にニューヨークで、第3回総会は、1964年、シエーブで、第4回総会は、1968年、アルゼンチンで開催された。

CCIFとCCITが合併したのは、有線電気通信の分野、とくに伝送路について電信回線と電話回線とを技術的に分ける意味がなくないやうだ、他国とも大体において、電信部門と電話部門は同一組織内にあること、CCIFの事務局とCCITの事務局の合併による能率増進等がおもな理由であった。

CCITTは、上述のようにヨーロッパ内の国々など、ヨーロッパ内の電信・電話の技術・運用・料金の基準を定め、あるいは統一をはかってきたので、現在でも、その影響を受け、会員参加国は、ヨーロッパの国が多く、ヨーロッパで生じる問題の研究が多い。たとえば、1960年のCCITT勧告の中、技術上配慮する距離は約2,500kmであるが、これはヨーロッパ内領域を想定したものである。

しかしながら、1956年9月に敷設された大西洋横断電話ケーブルは、大陸間電話通信の自動化および半自動化への技術的可能性を与え、CCITTがこの問題を取り上げるに及ぶ。CCITTの性格は漸次、汎世界的色彩を実質的に帯びるに至った。この汎世界的性格は第2次世界大戦後目まじくなつたアジア・アフリカ植民地の独立に伴つてIITUの構成員の中にこれらの国が加わり、IITUの中に新しい意見が導入されたことに起因して、技術面、政治面の双方から導入されたり。

た。CCITTの現世界化は、1960年の第2回総会がニューヨークで開催されたことにもあらわれてゐる。この総会では、CCITT、CCIRのいずれか、アメリカやアジアで総会が開催されたことがなく、CCITT委員長も、ユーネチー総会の準備文書で、この点には注目すべきであるとのべている。

任務

IITUは、全権委員会議、主管序会議を始めとして、七つの機関をもつ、それぞれの機関の権限と任務は、つどとのおりとないでいる。

「国際電信電話諮問委員会（CCITT）は、電信および電話に関する技術、運用および料金の問題について研究し、および意見を表明することを任務とする。」(1965年モントル一条約第187号)

「各國における地域的および国際的分野にわたる電気通信の創設、発達および改善に直接関連のある問題について研究し、および意見を作成するように妥当な注意を払わなければならぬ。」(同第188号)

「各國電話諮問委員会は、また、関係国の要請に基づき、その国内電話通信の問題

について研究し、かつ、勧告を行なうことができる。」(同第189号)

「記第187号と第188号とにわたり「意見」とは、フランス語のavisから訳したもので、英語では、「recommandation」となっていて。CCITTの

この意見は、また、電信規則以下のその他の規則のことと、数年以上の間隔をもつて開催される主管序会議というような大会議の決定をまたなくとも表明することができ、また、その改正も容易であるので、現在のように進歩の早い国際通信界では、関係国の中の意見を統一した国際的見解としては非常に便利である。

## CCITT の概要

沿革

CCITT は、国際電気通信連合（ITU）に因つた本部機関（事務局）、国際電話電報委員会、CCIR、CCITT（シーティー）の3つとし、ITUの中でも、世界の国際通信上の諸問題を真先に取上げ、その解決方法を見出していく重要な機関である。

日本名は、国際電信電話諮詢委員会と称する。CCITT の前身は、CCIR（国際電話電報委員会）と CCITT（国際電信電話連絡委員会）である。CCIR は、1924年にヨーロッパにて「国際長距離電話連絡諮詢委員会」が設立され、これが1925年のパリ電信電話会議のとき、正式に「国際電話電報委員会」として万国電信連合の公式機關となつたものである。CCITT は、同じく1925年の会議のとき、CCIR と併立するものとして諮詢され

た。

CCITT は、1956年の12月に第18回総会が開催されたのが、CCIT では、同年同月に第8回総会が開催されたのが、併合されて現在のCCITTとなつた。いわゆる CCIR は、CCIR と CCITT が解散した直後、第1回総会を開催し、第2回総会は、1960年にリーナリーで、第3回総会は、1964年、シネード、第4回総会は、1968年、アルゼンチンで開催された。

CCIF と CCITT が合併したのは、有線電気通信の分野、とくに长途路線について電信回線と電話回線などを技術的に区別する意味がなくなりましたが、各団とも大体において、電信部門と電話部門は同一組織内にあること、CCITT の事務局と CCITT の事務局の合併による能率増進等がおもな理由であった。

CCITT は、上述のようにヨーロッパ内の国々に加えて、ヨーロッパ内の电信・電話の技術・運用・料金の基準を定め、あるいは統一をはかり始めたので、現在でも、その影響を受け、会員参加国は、ヨーロッパの国が多く、ヨーロッパで生じる問題の研究が多い。たとえば、1960年のCCITT 総会の中で、技術上記述する問題は約2,500の題目であったが、これはヨーロッパ内領域を規定したものである。

しかしながら、1956年9月に解散された大西洋横断電話ケーブルは、大陸間電話連絡の自動化および半自動化への技術的可能 性を示す、CCITT がこの問題を取り上げるに及び、CCITT の性格は漸次、汎世界的色彩を実質的に帯びるに至った。この汎世界的性格は第2次世界大戦後最もしくなったアジア・アフリカ植民地の独立に伴つてヨーロッパの構成員の中にこれらの國が加わり、ITUの中には新しい意見が導入されたことに起因して、技術面、政治面の双方から導入されてき

た。CCITT の現世界化は、1960年の第2回総会がリューリーで開催されたりとばかりでない。この総会では、CCIT、CCIR の「やがて」アヘリカやアジアで総会が開催されたことがなく、CCITT 総会が、リューリー総会の準備文書で、「今には注目すべきである」としている。

任務

CCITT は、全種委員会議、主種子会議を始めとして、廿つの種類をもつ、それぞれの機関の権限と任務は国際電気通信条約に明記されている。そこで条約を参照してみると、CCITT の任務は、いかのとおりとなる。

「国際電信電話諮詢委員会(CCITT)は、電信および電話に関する技術、適用および料金の問題について研究し、および意見を表明することを任務とする。」(1965年モントル一条約第187号)

「中国電話諮詢委員会は、その任務の遂行に当たつて、新しい開拓たる发展の途上にある国における地域的および国际的分野にわたる電気通信の創設、発達および改善に直接関連のある問題について研究し、および意見を作成するよう妥当な注意を払わなければならない。」(同第188号)

「各国電話諮詢委員会は、また、開拓国の政策に協力し、その国内電気通信の問題について研究し、かつ、勧告を行なうことができる。」(同第189号)

上記第187号と第188号に記載される「意見」とは、フランス語 C Avis から訳したもので、英語では、「勧告(Recommendation)」としない。CCITT の表明する意見は、国際法的には強制力をもたないものである。この点が、条約、電信規則、電話規則等各國を拘束する力をもつてゐること異なる。ひととも意見とは共して、技術的分野では、電信規則のことと、各國政府が承認してその内容を実施する強制規則をもたないので、実際にある機器の仕様を定める場合には、多くの國の意見が統一された時の「意見」に従わなければ、円滑な国際通信を行なうことができない場合が多い。この意見(または勧告)は、国際通信を行なう場合各國が直面する問題について、具体的意見を表明するもので、たとえば、大陸間ケーブルで大陸間電話を半自動化しようとする場合、その信号方式や取り扱う通話の種類および料金は、どのようにするかを研究して意見を表明する。したがって、CCITT の活動は、つなに時代の最先端を行くもので、CCITT の活動方向は、そのまま世界の国際通信の活動方向であるともいえる。

## CCITTの概要

### 沿革

CCITTは、国際電気通信連合（ITU）に因る常設機関（事務局）、国際周波数登録委員会、CCIR、CCITT（ITU）のうち、ITUの中である。世界の国際通信上の諸問題を真先に取上げ、その解決方法を見出していく重要な機関である。日本名は、国際電信電話諮問委員会と称する。

CCITTの前身は、CCIFE（国際電話諮問委員会）とCCITT（国際電信電話諮問委員会）である。CCIFEは、1924年にヨーロッパに「国際長距離電話通信諮問委員会」が設置され、これが1925年のパリ電信電話会議のとき、正式に「国際電話諮問委員会」として万国電信連合の公式機関となつたものである。CCITTは、同じく1925年の会議のとき、CCIFEと併立するものとして設置された。

そして、CCIFEは、1956年の12月に第18回総会が開催されたのち、CCITTは、同年同月に第8回総会が開催されたのち、併合されて現在のCCITTとなつた。こうCCITTは、CCIFEとCCITTが解散した直後、第1回総会を開催し、第2回総会は、1960年にニューヨークで、第3回総会は、1964年、シカゴで、第4回総会は、1968年、アルゼンチンで開催された。

CCIFEとCCITTが併合したのは、有線電気通信の分野、とくに伝送路について、電信回線と電話回線とを技術的に区別する意味がなくなってきたこと、各國とも大体において、電信部門と電話部門は同一組織内にあること、CCIFEの事務局とCCITTの事務局の合併による能率増進等がおもな理由であった。

CCITTは、上述のように、ヨーロッパ内の国々によって、ヨーロッパ内の電信・電話の技術・運用・料金の基準を定め、あるいは統一をはかってきたのだが、現在でも、その影響を受け、会員参加国は、ヨーロッパの国が多く、ヨーロッパで生じる問題の研究が多い。たとえば、1960年のCCITT勧告の中で、技術上配慮する距離は約2,500kmであったが、これはヨーロッパ内領域を想定したものである。

しかしながら、1956年9月に敷設された大西洋横断電話ケーブルは、大陸間電話通信の自動化および半自動化への技術的可能性を与え、CCITTがこの問題を取り上げるに及び、CCITTの性格は漸次、汎世界的の色彩を実質的に帯びるに至った。この汎世界的性格は第2次世界大戦後目ざましくなったアジア・アフリカ植民地の独立に伴つてITUの構成員の中にこれらの国が加わり、ITUの中に新しい意見が導入されたことに起因して、技術面、政治面の双方から導入でき

た。CCITTの汎世界化は、1960年の第2回総会がニューヨークで開催されたことにあらわされている。この総会までは、CCIT、CCIFEの二重存在、アメリカやアジアで総会が開催されたことがなく、CCITT委員長も、ニューヨーク総会の準備文書で、この点には注目すべきであるといつてある。

### 任務

ITUは、全権委員会議、主管会議を始めとして、七つの機関を中心とする。それぞれの機関の権限と任務は国際電気通信条約に明記されている。そこで条約を参照してみるとなるべく、CCITTの任務は、つぎのとおりとなる。

「国際電信電話諮問委員会(CCITT)」は、電信および電話に関する技術、運用および料金の問題について研究し、および意見を表明することを任務とする。(1965年モントルイ条約第187号)

「各國際諮問委員會は、その任務の遂行に当たつて、新しい國または發展の途上にある國における地域的および國際的分野にわたる電氣通信の創設、發達および改善に直接關係のある問題について研究し、および意見を作成するように妥當な注意を払わなければならない。」(同第188号)

「各國際諮問委員會は、また、關係國の要請に基づき、その國內電氣通信の問題について研究し、かつ、勧告を行なうことができる。」(同第189号)

上記第187号と第188号にいわれる「意見」とは、フランス語の Avis から訳したもので、英語では、「勧告(Recommendation)」となつてゐる。CCITTの表明する意見は、国際法的には強制力をもたないものであつて、この点が、条約、電信規則、電話規則等各國を拘束する力をもつてゐること異なる。もっとも意見とは称しても、技術的分野では、電信規則のことと、各國政府が承認してその内容を実施する強制規則をもたないので、実際にある機器の仕様を定める場合には、多くの国の意見が統一されたこの「意見」に従わなければ、円滑な国際通信を行なうことができない場合が多い。この意見(または勧告)は、国際通信を行なう場合各國が直面する問題について、具体的意見を表明するもので、たとえば、大陸間ケーブルで大陸間電話を半自動化しようとする場合、その信号方式や取り扱う通話の種類および料金は、どのようにするかを研究して意見を表明する。したがつて、CCITTの活動は、つねに時代の最先端を行くもので、CCITTの活動方向は、そのまま世界の国際通信の活動方向であるともいえる。

Dr. P.N. Cundall,  
Mining Surveys Ltd.,  
Holroyd Road,  
Reading,  
Berks.

Dear Pete,

Permit me to introduce you to the facility of facsimile transmission.

In facsimile a photocell is caused to perform a raster scan over the subject copy. The variations of print density on the document cause the photocell to generate an analogous electrical video signal. This signal is used to modulate a carrier, which is transmitted to a remote destination over a radio or cable communications link.

At the remote terminal, demodulation reconstructs the video signal, which is used to modulate the density of print produced by a printing device. This device is scanning in a raster scan synchronised with that at the transmitting terminal. As a result, a facsimile copy of the subject document is produced.

Probably you have uses for this facility in your organisation.

Yours sincerely,

*Phil.*

Figure 6-22  
400 lpi

6-24

Cela est d'autant plus valable que  $T\Delta f$  est plus grand. A cet égard la figure 2 représente la vraie courbe donnant  $|\phi(f)|$  en fonction de  $f$  pour les valeurs numériques indiquées page précédente.

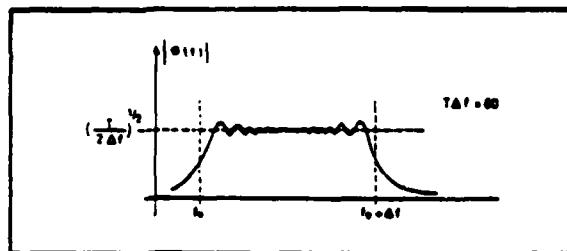

FIG. 2

Dans ce cas, le filtre adapté pourra être constitué, conformément à la figure 3, par la cascade :

- d'un filtre passe-bande de transfert unité pour  $f_0 \leq f \leq f_0 + \Delta f$  et de transfert quasi nul pour  $f < f_0$  et  $f > f_0 + \Delta f$ , filtre ne modifiant pas la phase des composants le traversant ;

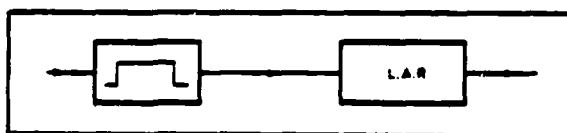

FIG. 3

— filtre suivi d'une ligne à retard (LAR) disper- sive ayant un temps de propagation de groupe  $T_R$  décroissant linéairement avec la fréquence  $f$  suivant l'expression :

$$T_R = T_0 + (f_0 - f) \frac{T}{\Delta f} \quad (\text{avec } T_0 > T)$$

(voir fig. 4).

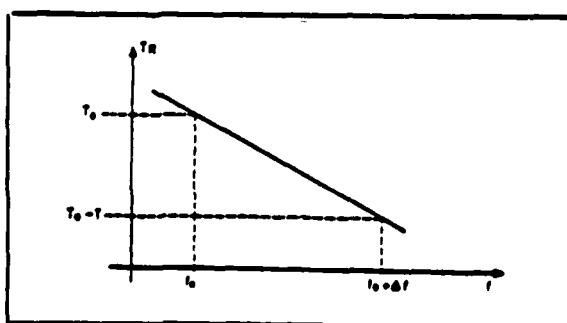

FIG. 4

telle ligne à retard est donnée par :

$$\varphi = -2\pi \int_0^f T_R df$$

$$\varphi = -2\pi \left[ T_0 + \frac{f_0 T}{\Delta f} \right] f + \pi \frac{T}{\Delta f} f^2$$

Et cette phase est bien l'opposé de  $\underline{\phi(f)}$ , à un déphasage constant près (sans importance) et à un retard  $T_0$  près (inévitable).

Un signal utile  $S(t)$  traversant un tel filtre adapté donne à la sortie (à un retard  $T_0$  près et à un déphasage près de la porteuse) un signal dont la transformée de Fourier est réelle, constante entre  $f_0$  et  $f_0 + \Delta f$ , et nulle de part et d'autre de  $f_0$  et de  $f_0 + \Delta f$ , c'est-à-dire un signal de fréquence porteuse  $f_0 + \Delta f/2$  et dont l'enveloppe a la forme indiquée à la figure 5, où l'on a représenté simultanément le signal  $S(t)$  et le signal  $S_1(t)$  correspondant obtenu à la sortie du filtre adapté. On comprend le nom de récepteur à compression d'impulsion donné à ce genre de filtre adapté : la « largeur » (à 3 dB) du signal comprimé étant égale à  $1/\Delta f$ , le rapport de compression

est de  $\frac{T}{1/\Delta f} = T\Delta f$

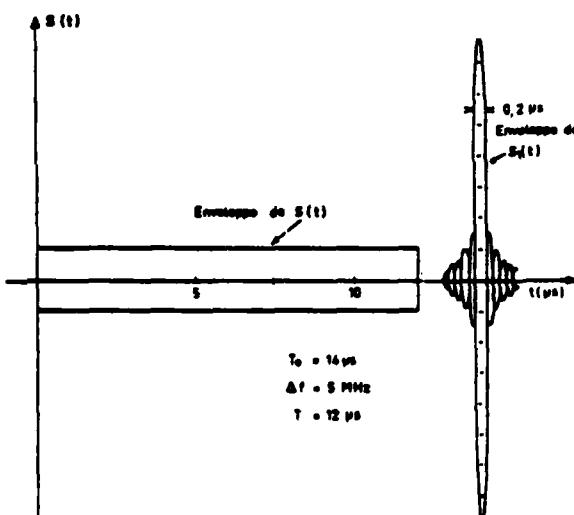

FIG. 5

On saisit physiquement le phénomène de compres-sion en réalisant que lorsque le signal  $S(t)$  entre dans la ligne à retard (LAR) la fréquence qui entre la première à l'instant 0 est la fréquence basse  $f_0$ , qui met un temps  $T_0$  pour traverser. La fréquence  $f$  entre à l'instant  $t = (f - f_0) \frac{T}{\Delta f}$  et elle met un temps

$T_0 - (f - f_0) \frac{T}{\Delta f}$  pour traverser, ce qui la fait ressortir à l'instant  $T_0$  également. Ainsi donc, le signal  $S(t)$

CCITTの概要

卷五

CCITTは、国際電気通信連合（ITU）の四つの常設機関（事務局、国際電波放送委員会、CCIR、CCITT）の一つとして、ITUの中でも、世界の国際通信上の諸問題を率先取り上げ、その解決方法を見出して行く重要な機関である。日本名は、国際電信電話諮問委員会と称する。

CCITTの前身は、CCIF（国際電話諮問委員会）とCCOI（国際電信諮問委員会）である。CCIFは、1924年にヨーロッパに「国際長距離電話連絡諮問委員会」が設置され、これが1925年のパリ電信電話会議のとき、正式に、「国際電話諮問委員会」として万国電信連合の公式機関となりたのである。CCOIは、同じく1925年の会議のとき、CCIFと併立するものとして設置された

そして、CCIEは、1956年の12月に第18回総会が開催されたが、CCITは、同年同月に第8回総会が開催されたため、併合されて現在のCCITTとなつた。このCCITTは、CCIEとCCITが解散した直後、第1回総会を開催し、第2回総会は、1960年にニューヨークで、第3回総会は、1964年、シネープで、第4回総会は、1968年、アルゼンチンで開催された。

しかしながら、1956年9月に敷設された大西洋横断電話ケーブルは、大陸間電話通信の自動化および半自動化への技術的可能性を与え、C C I T T がこの問題を取り上げるに及び、C C I T T の性格は漸次、汎世界的色彩を実質的に帯びるに至った。この汎世界的性格は第2次世界大戦後目さましくなったアジア・アフリカ植民地の独立に伴ってI T U の構成員の中にこれらの国が加わり、I T U の中に新しい意見が導入されたことにも起因して、技術面、政治面の双方から導入されきて

た。CCITTの汎世界化は、1960年の第2回総会がニューヨークで開催されたことにあらわれている。この総会までは、CCIT、CCIFのいずれかが、アメリカやアジアで基金が開催されたことがなく、CCITT委員長は、ニューヨーク

通志

ITIは、全種委員会並主催會を始めとして、十七の機関をもつてゐる。これらの機関の権限と任務は、國際電気通信条約に明記されている。そこで条約を参照してみると、CCITTの任務は、つぎのとおりとなつてゐる。  
「國際電信電話諮詢委員会(CCITT)は、電信および電話に関する技術、運用および料金の問題について研究し、および意見を表明することを任務とする。」(一九六五年モントル一議約第187号)

「各國際諮問委員会は、その任務の遂行に当たつて、新しい国または发展の途上にある国における地域的および国际的分野にわたる電気通信の制限、免送および改善に直接関連のある問題について研究し、および意見を作成するよう妥当な注意を払わなければならない。」(同第188号)

「各國際諮問委員会は、まだ、開保因の要請に基づき、その因電電氣通信の問題について研究」、かゝる勧告を行なうことができる。」(同第180号)

上記第187号と第186号に、「たゞ、アランセス語の Avis から証したままで、英語では、「勧告(Recommendation)」などといふ。C.U.I.T.T.の表明する意見は、国際法的には強制力をもたないものである。」の点が、条約、憲

信規則、電気規則等各國を拘束する力をもつてゐるものと見なされる。これが実現すれば、技術的分野では、電信規則のことき、各國政府が承認してその内容を実施する強制規則をもたないので、實際にある機器の仕様を定める場合には、多くの國の意見が統一されたこの「意見」に従わなければ、円滑な国際通信を行なうことができない場合が多い。この意見（または勧告）は、国際通信を行なう場合各國が直面する問題について、具体的意見を表明するもので、たとえば、大陸間ケーブルで大陸間電話を半自動化しようとする場合、その信号方式や取り扱う通話の種類および料金は、どのようにするかを研究して意見を表明する。したがつて、CCITTの活動は、つねに時代の最先端を行くもので、CCITTの活動方向は、その

この意見は、また、電信規則以下のその他の規則のことへ、数年以上の間隔をもつて開催される主管庁会議というような大会議の決定をまたなくして表明することができ、また、その改正も容易であるので、現在のように進歩の早い国際通信界では、関係国の意見を統一した國際的見解としては非常に便利である。

## 7.0 IMAGE ANALYSIS

Four different types of image analysis were performed. The procedures and results of each analysis are summarized in the following subsections.

- o Measurement of legibility using the Legibility Test Document
- o Evaluation of Half-tone performance using the Legibility Test Document
- o Evaluation of the relative quality of the 3 CCITT images as a function of resolution
- o Subjective evaluation of effectiveness of the Alternate Line Interpolation algorithm

### 7.1 Measurement of Legibility

The objective of this test was to obtain a quantitative measure of the legibility or intelligibility of a hypothetical Group 4 facsimile system as a function of resolution. The textual portions of the Legibility Test Chart was used for this purpose.

#### Test Procedure

A number of subjects were used to read the random characters in the Legibility Test Chart. This, of course, is necessary to insure the test results are not dependent upon a particular subject. The subjects were required to illuminate the characters with a special lamp, but special viewing optics are not used. If the subject normally wears reading glasses they were worn in the test. If he does not use glasses no optical aids were used.

Before a subject took the test he was given a set of instructions to read. The instructions are reproduced in the following two pages.

The instructions refer to a yellow sheet with a number of rectangular holes to expose the 5-character nonsense words. There are four different masks and a copy of Mask #1 is included in Figure 7-1. The instructions also refer to a score sheet. Figure 7-2 is a copy of the score sheet which was used in the test.

#### Test Schedule

Table 7-1 is a summary of the tests which were performed. A "trial" is defined as the set of readings taken when a subject reads one test page. In a trial the subject reads 48 sets of 5 characters using a particular combination of resolution and mask. The maximum number of trials performed by one subject is 8. A total of nine subjects were involved in the test to varying degrees.

#### Test Results

The raw test data has been accumulated and tabulated in Appendix H. The final test results are plotted in Figure 7-3. On the ordinate is plotted the percentage of characters which were correctly read for any particular resolution and font size. The following conclusions are drawn from the data.

- o The legibility of 6, 8, and 10 point type is near 100% for all resolutions down to 200 x 200.
- o For 4 point type there is a greater variation in legibility but even at 200 x 200 the legibility is 90%.

## INSTRUCTIONS

The U. S. Defense Communications Agency has awarded a contract to Delta Information Systems to measure the legibility of a series of test documents. Although all the test documents may look alike to the casual observer they are different, and it is these differences which we are measuring. The results of these tests will be used to help set international standards for future facsimile equipment. These facsimile equipments will be designed to transmit documents over digital communication networks.

You will be given a page with varying sizes and styles of printing, and asked to read the characters to the best of your ability. This is not a test of your visual acuity, but rather a test of various methods of processing graphic data.

The yellow sheet has holes in it that expose 5-character nonsense words. Attempt to read the characters in each word, starting at the bottom with the smallest print. Beside each hole is a number, usually to the left. Record the characters you read on the score sheet opposite the same number.

Keep in mind the following rules and information:

1. If you are not sure about a character, guess.
2. With a sheet of paper, cover all the words above the one you are working on.
3. After you have completed a word do not go back and make any changes.

4. Use your normal reading glasses, but not a magnifier.
5. Use the high-intensity lamp to provide as much light as you need.
6. You may get as close as you wish to the page to try to identify the characters.
7. You may take as much time as you feel is needed to identify the characters. It should not take more than 15 minutes to complete the test.
8. The character set is upper and lower case letters, and numerals.
9. Do not be concerned with distinguishing between "zero" and upper case "O", or between "one" and lower case "L".
10. Your entries on the score sheet may be upper or lower case, and do not have to correspond with the case of the character you have read.

Table 7-1  
LEGIBILITY TEST SCHEDULE

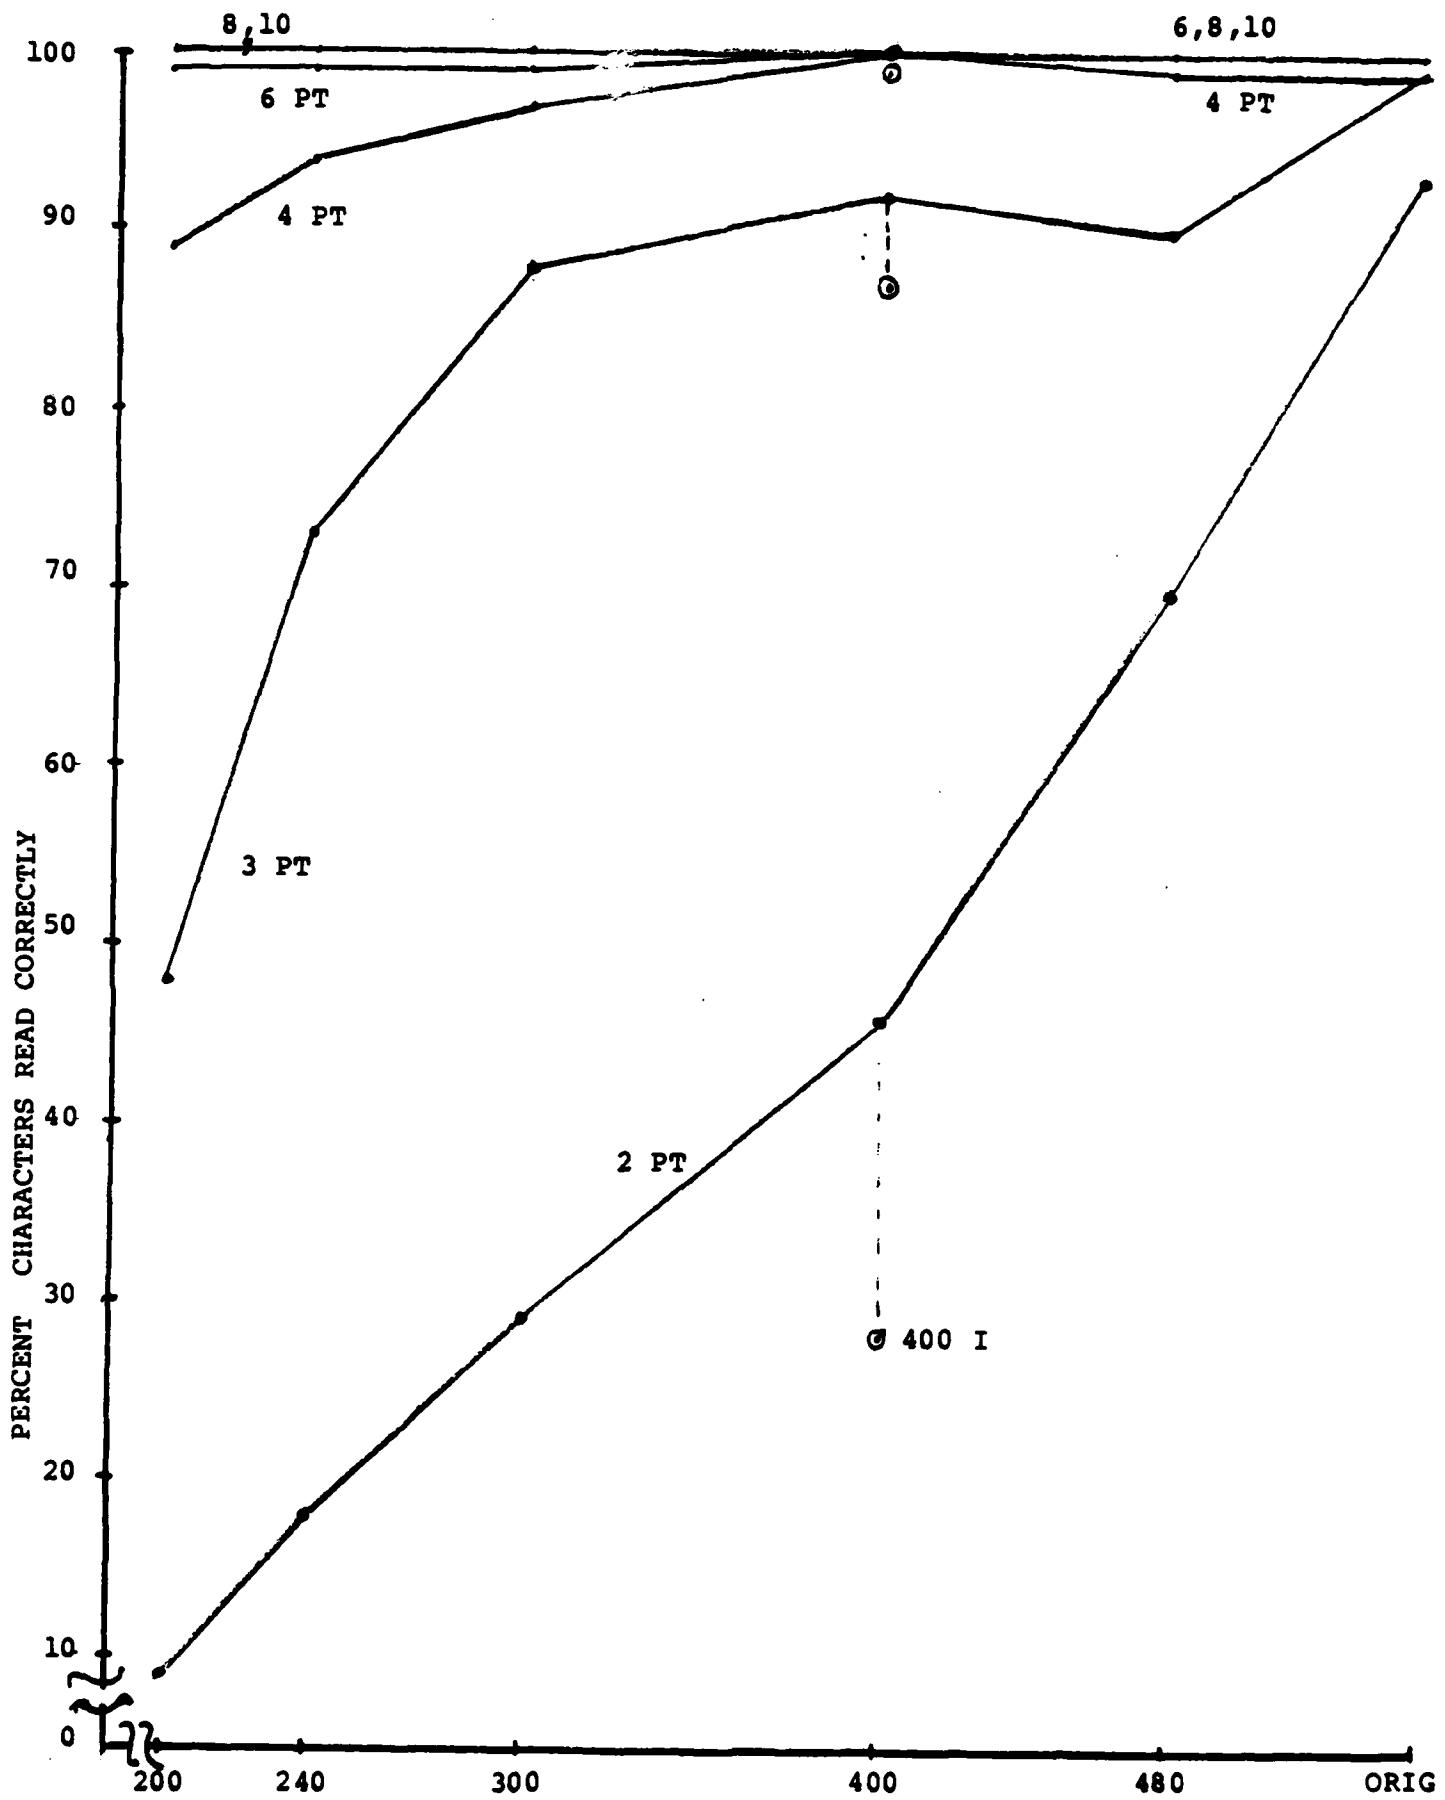

Figure 7-3

7-8

- o The legibility curve for 3 point type is most interesting. There is a large increase in intelligibility from 200 x 200 to 300 x 300 - 40%. On the other hand the increase from 300 x 300 to 400 x 400 is only 4%.
- o The intelligibility of the interpolated image for 3 point text drops only 5% relative to the original 400 x 400 image. It would seem highly advantageous to reduce the transmitted bits in half while impacting the intelligibility so little.

### 7.2 Evaluation of Half Tone in Legibility Test Chart

- o 200 x 200 - The distortions in the 133 and 150 line screen image of the girl is quite severe.
- o 240 x 240 - The distortion in the 85 line screen of the girl is quite severe.
- o 300 x 300 - The beat distortions in the girl pictures are greatly reduced relative to the lower resolutions.
- o 400 x 400 - Good quality for 65, 85, 120 line screens - almost free of beats.
- o 480 x 480 - More distortion than 400 x 400

### 7.3 Quality of CCITT Images

#### CCITT No. 1 (Figures 6-6 through 6-10)

The most noticeable variation in quality as a function of resolution appears in the logo and signature. The raggedness of the logo and signature is quite perceptible at 200 x 200 and 240 x 240 line resolutions. It is marginally

perceptible at 300 x 300 and virtually imperceptible at 400 x 400 and 480 x 480.

CCITT No. 5 (Figure 6-11 through 6-15)

This image is most useful for evaluation of quality due to the large number of vertical and horizontal lines. The eye is most sensitive to raggedness on these lines. The improvement of 300 x 300 over 200 x 200 is very significant. However, the raggedness on the 300 x 300 image is still perceptible. It is unlikely that the raggedness on the 400 x 400 image would be noticed by the casual user.

CCITT No. 7 (Figures 6-16 through 6-20)

Several of the delicate Kanji characters are seriously distorted by the 200 x 200 and 240 x 240 resolutions. Most of the significant distortion is eliminated at 300 x 300 lines but the clarity at 400 x 400 and 480 x 480 is visibly superior to 300 x 300.

#### 7.4 Subjective Evaluation of Interpolation (Figure 6-21 through 6-24)

Legibility Test Chart

The half-tone scenes are significantly distorted by the interpolation process when the interpolated image is compared with the 400 x 400 original.

CCITT No. 1

The interpolated image appears quite comparable to the 400 x 400 original. The interpolation on the logo and signature appears to perform very well.

CCITT No. 5

The interpolated image compares quite favorably with the 400 x 400 original.

CCITT No. 7

The interpolated image distorts many of the Kanji characters quite seriously. In many cases the quality is comparable to the 200 x 200 lpi images.

## 8.0 CONCLUSIONS

It is inappropriate for this report to draw any firm conclusions or recommendations regarding resolution for Group 4 facsimile systems. This is due to the fact that technical factors such as intelligibility and quality are merely one issue to be considered in selecting a standard. Other issues such as compatibility with other facsimile groups and word processing standards could have a great impact on the standard selected.

The purpose of this study is merely to provide a base of technical data to those groups deliberating upon the Group 4 standard. The technical data which has been generated by this study and which should be useful for these deliberations are listed below.

- o Perhaps the most important output of the study is the set of 24 images which are included in Figures 6-1 through 6-24. The copies in this report are of limited value since the quality at the high resolution has been reduced by the printing process. Dennis Bodson, the COTR on the project, has a high quality set of prints.
- o Compression Analysis - Section 5.0 provides data on the compression ratios for the modified READ Code at varying resolutions.
- o Legibility - Section 7.1 provides data on the legibility/intelligibility of a facsimile system as a function of resolution.

- o Quality - Sections 7.2, 7.3, and 7.4 provide general subjective comments on image quality for a facsimile system as a function of resolution.

**APPENDIX A**

**IMAGE SCANNING AND WRITING SYSTEM**

### Image Scanning and Writing System

The image scanning and writing system provides a unique capability within IPL for the computer processing of color and black and white photographic data. A photographic image on either film or opaque paper can be scanned and digitized, and the resultant data then written on a computer storage medium such as magnetic tape or disk. Conversely, properly formatted computer data can be written on film (either ordinary silver halide film or Polaroid film) to construct a photographic image. Computer processing of the data provides a powerful means for image analysis, manipulation, and enhancement. The computer processing can be performed by either the PDP-11/70 or the central computing system. The choice depends on the characteristics of the processing to be performed. Standard image processing programs are available now, and special application programs can be prepared on request.

The system uses two units of equipment purchased from Optronics International, Inc. One unit (a P-1700) scans both black and white (B/W) and color images and also writes B/W images; the other unit (a C-4300) writes both B/W and color images, but is used ordinarily for writing only color images. The P-1700 is shown in Figure 3. The C-4300 (not shown) is similar to the P-1700 but does not include scanning components.

Data are transmitted between the PDP-11/70 and the scanning or writing device as eight-bit bytes at a rate of 28 kilobytes per second. Each byte represents the density of one square picture element, a "pixel." Pixel sizes are selectable in six geometrically increasing steps from 12.5 micrometers to 400 micrometers. With eight-bit bytes, 256 density levels can be represented. For scanning operations, one may confidently expect a density resolution approaching that number. For writing operations, 64 repeatable density levels for B/W and 32 for each primary color can be achieved.

Both the P-1700 and the C-4300 employ electro-mechanical rotating drums for scanning and writing. Color scan and color write operations are performed using filters for the three (additive) primary colors, red, green, and blue. Color operations, therefore, require three passes for scanning or writing.

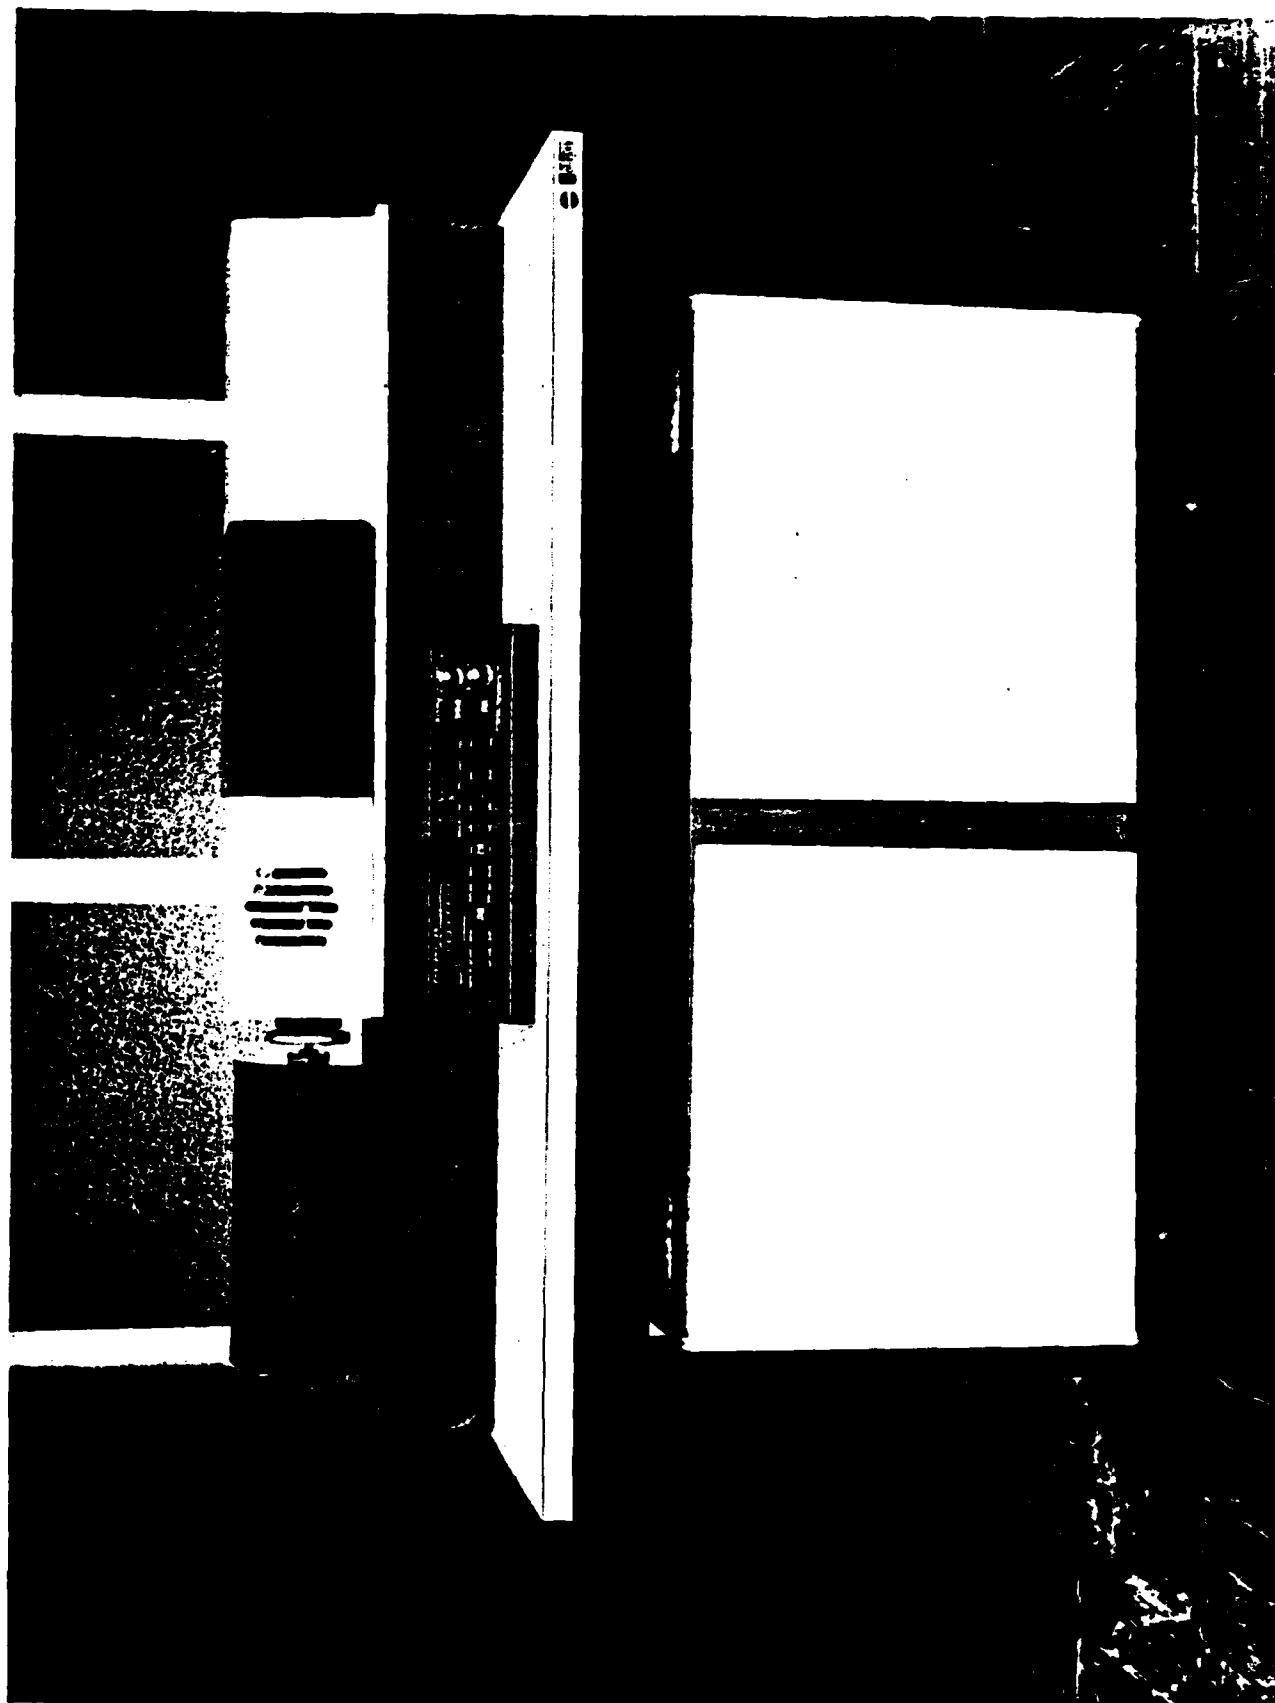

Both units accommodate media in sizes up to 10-in. by 10-in., but the maximum usable image area is 9-in. by 9-in. in the P-1700 and 9-in. by 10-in. in the C-4300. Film types stocked for the image writer are as follows: Linagraph Shellburst 2474 (B/W, 10-in. by 10-in.); Ektachrome SO-278, emulsion equivalent to ET-160 amateur film, process E-6 (color transparency, 10-in. by 10-in.); and Polacolor 2, type 808 (fast color prints, 8-in. by 10-in.).

Figure 3. P-1700 Image Scanning and Writing System

### Scanning Operations

The scanning portion of the P-1700 (used for both B/W and color) consists of a rotating, horizontally aligned drum and a movable "C" carriage. One arm of the carriage moves into and out of the open-ended drum along a line parallel to the drum's axis. The other arm of the carriage, rigid with respect to the first arm, is located outside the drum. The medium to be scanned is attached to the periphery of the drum where a section of the wall has been removed. Drum rotation and carriage movement provide the Y and X scanning motions, respectively.

The light source is a halogen-filled incandescent lamp located away from the carriage area; light is transmitted from the source to the carriage area by means of fiber optics bundles. For scanning transparencies, the light is emitted from the end of the arm within the carriage and transmitted through the transparency to a photodetector mounted on the carriage arm outside the drum. For scanning opaque media, the light is emitted from the carriage arm outside the drum and reflected from the medium to the detector.

Before it is emitted, the light is transmitted through an optical system that ensures uniform illumination, focusing, and spot size selection. Before its intensity is measured by the densitometer photodetector, the light passes through an imaging aperture. Each measurement defines the density of one pixel. The output from the photodetector is amplified logarithmically (giving a selectable density range of 0-2D or 0-3D) or linearly (giving a transmittance range of 0 to 100 percent).

Around the circumference of the drum (Y direction), the optical density is measured at the selected pixel interval. After each drum revolution, a precision lead screw and stepping motor move the "C" carriage axially (in the X direction) by the raster width (pixel dimension) until the entire area of interest has been scanned. Pixel positional accuracy in both X and Y is  $\pm 2$  micrometers rms/cm. Once per revolution, the densitometer photodetector is reset to an optical density of 0 as defined by the air path through an opening in the drum, or from a reflector on the drum if an opaque medium is being scanned.

### Writing Operations

For write operations, eight-bit bytes from the computer are converted to analog signals, which modulate a light source to expose the photosensitive medium. The P-1700 is used for writing B/W images, and the C-4300 is used for writing color images. The writing portion of each device includes a rotating drum to which the unexposed medium is attached in a darkroom. The drum is enclosed in a light-tight cassette, which can be easily attached to and removed from the device proper. (A slide opening on the cassette permits exposure of the medium when the cassette is

attached.) The optical system that writes on the film is located on a carriage under the cassette, and it is moved by the same precision lead screw and stepping motor as the scanning carriage.

For the C-4300 (color writing), the optical system consists of a white-light glow crater tube, a color-filter select assembly, a selectable aperture, and a lens system to focus the beam onto the film plane. The film is exposed at every selected raster point along the circumference of the drum (Y direction) by pulse modulation of the light beam, and the optical carriage is stepped in the axial (X) direction by the raster width after each revolution of the drum. The C-4300 is capable of writing up to 32 repeatable density levels for each primary color and has a dynamic range of 0-2D.

The writing portion of the P-1700 (B/W writing) differs from the C-4300 principally in that a red light-emitting diode is used as the source, rather than a white-light glow crater tube. This difference in light source allows B/W imagery to be written with greater or lesser resolution (smaller or larger pixel sizes) than color imagery. The P-1700 is capable of writing up to 64 repeatable density levels and has a dynamic range of 0-2.5D.

Functional characteristics and specifications of the image processing system are summarized in Figure 4. A chart of the scan and write times as a function of specimen size (at different resolutions) is given in Figure 5.

Figure 4 Image Processing System <u>Functional Characteristics and Specifications</u>			
Operation	Pixel/Raster Size	Resolvable Range*	Levels
SCANNING Black & White and Color (P-1700)	12.5, 25, 50, 100, 200 & 400	0-2D or 0-3D or 0-100%T	256
WRITING Black & White (P-1700)	12.5, 25, 50, 100, 200 & 400	0-2.5D	64
WRITING Color (C-4300)	25, 50, 100 & 200	0-2D	32/Color

\* D (density) =  $\log_{10} [I(i)/I(t)]$ ,  
 $I$  (transmittance) =  $[I(t)/I(i)]$ ,  
where  $I(i)$  = incident light and  
 $I(t)$  = transmitted light

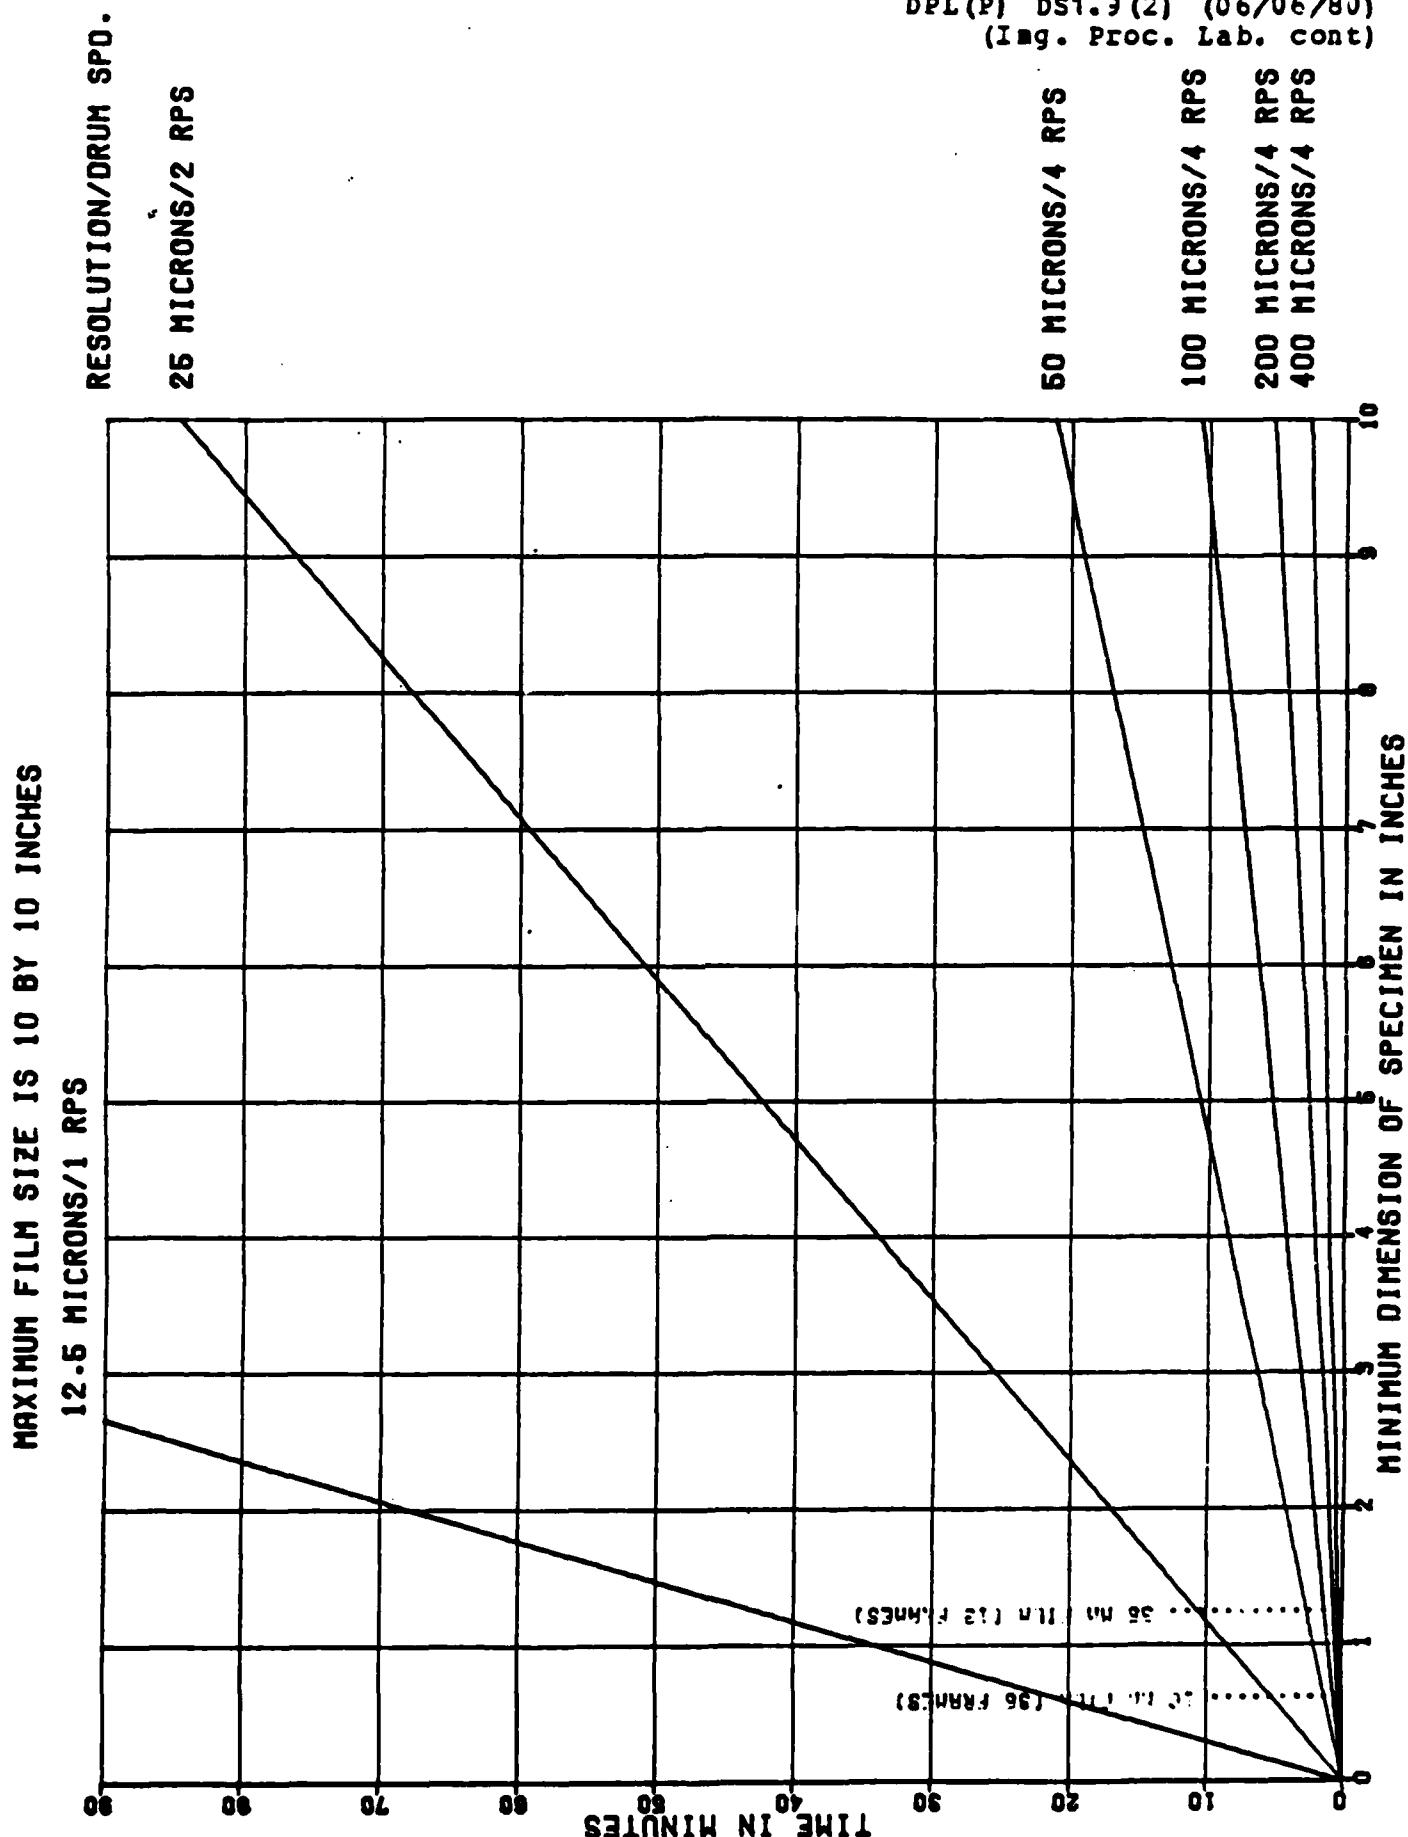

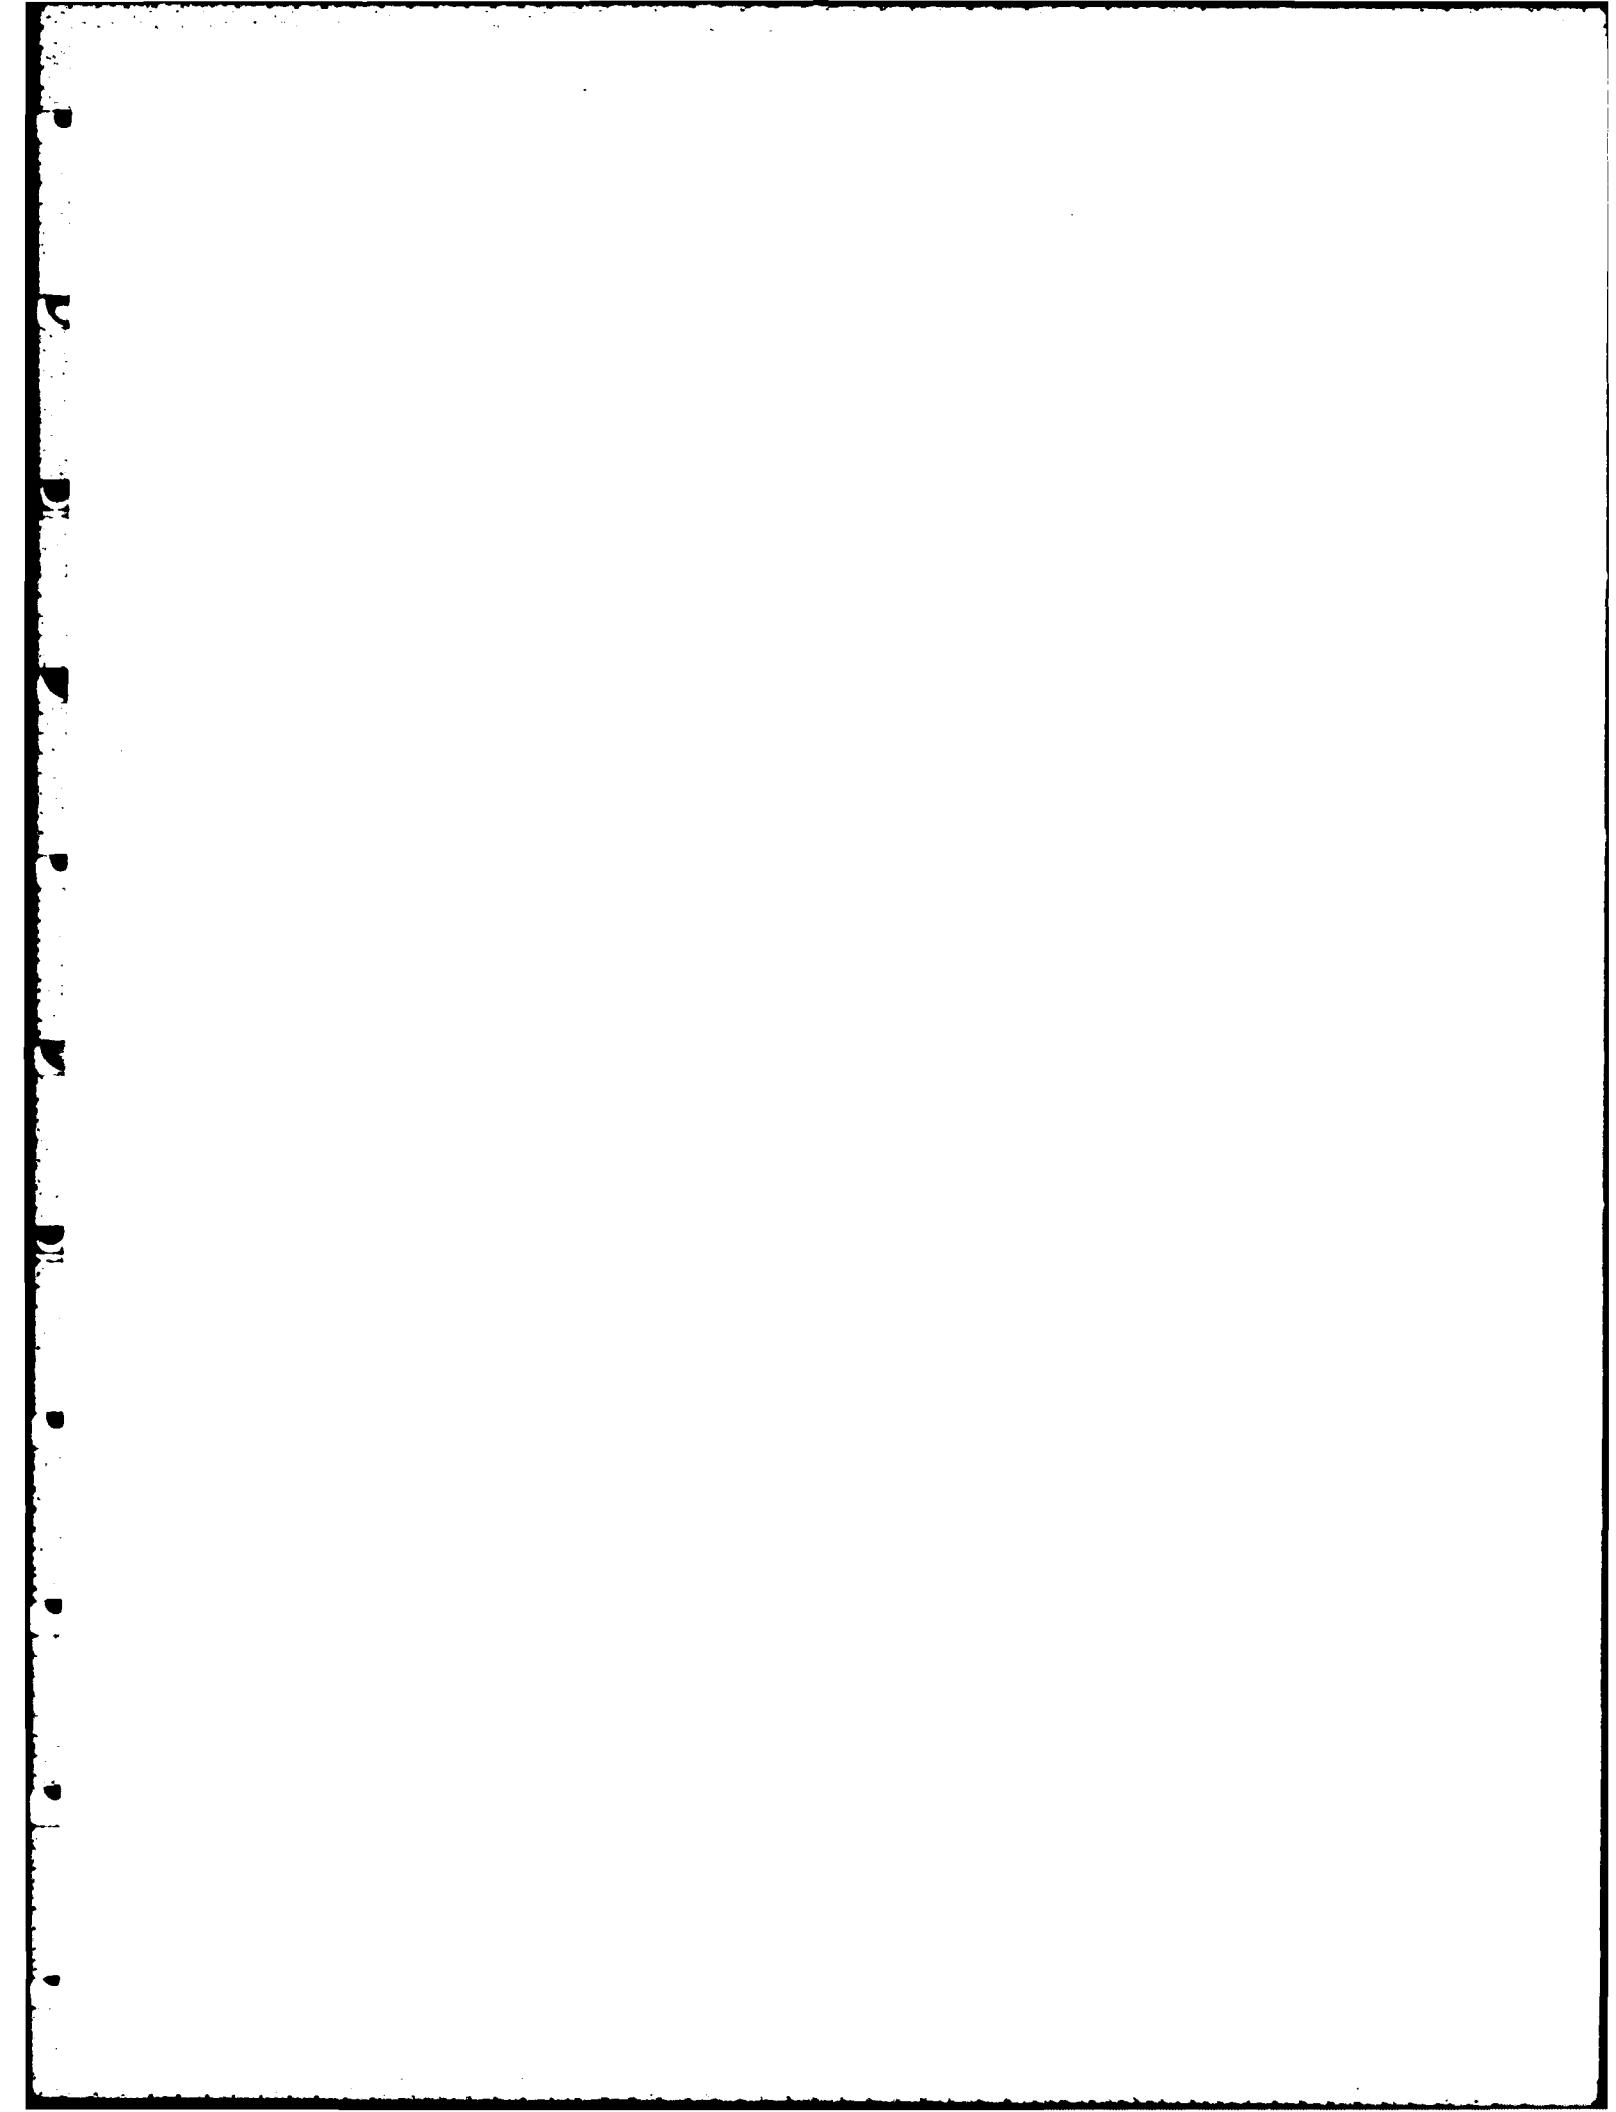

Figure 5. Scan and Write Times

**APPENDIX B**

**EIA RS 465**

**Group 3 Facsimile Apparatus for  
Document Transmission**

## GROUP 3 FACSIMILE APPARATUS FOR DOCUMENT TRANSMISSION

(From EIA Standards Proposal No. 1301-A, formulated under the cognizance of EIA TR-29 Committee on Facsimile Systems and Equipment.)

### INTRODUCTION

This standard is based upon the International Telegraph and Telephone Consultative Committee (CCITT) Recommendation T.4 approved by CCITT Study Group XIV. It conforms in all essential aspects with this CCITT Recommendation.

### SCOPE

This standard is concerned with the characteristics of inter-operability affecting Group 3 facsimile equipment operating on voice band analog circuits. This equipment incorporates means for reducing the redundancy in its message information prior to the modulation process and thus achieves a nominal transmission time of one minute for a typical full-page typescript document. Where options are indicated, the identification and choice of these options is to be made in the pre-message portion of the control procedures as standardized in EIA Standard RS-466.

#### 1. Scanning Track

The message area shall be scanned in the same direction in the transmitter and receiver. Viewing the message area in a vertical plane, the picture elements shall be processed as if the scanning direction were from left to right with subsequent scans adjacent and below the previous scan.

#### 2. Dimensions of Apparatus

The following dimensions shall be used :

2.1 A standard resolution and an optional higher resolution of 3.85 line/mm  $\pm 1\%$  and 7.7 line/mm  $\pm 1\%$  respectively in vertical direction;

2.2 1728 black and white picture elements along the standard scan line length of 215 mm  $\pm 1\%$ ;

2.3 Optionally, 2048 black and white picture elements along a scan line length of 255 mm  $\pm 1\%$ ;

2.4 Optionally, 2432 black and white picture elements along a scan line length of 303 mm  $\pm 1\%$ .

Input documents up to a minimum of 216 x 297 mm size shall be accepted.

#### 3. Transmission Time Per Total Coded Scan Line

For the standard one-dimensional coding scheme as described in paragraph 4.1, the total coded scan line is defined as the sum of DATA bits plus any required FILL bits plus the EOL bits.

For the optional two-dimensional coding scheme as described in paragraph 4.2, the total coded scan line is defined as the sum of DATA bits plus any required FILL bits plus the EOL bits plus a tag bit.

3.1 To handle various printing methods, several minimum total coded scan line times are possible. The minimum transmission times of the total coded scan line shall conform to the following:

3.1.1 Alternative 1, where the minimum transmission time of the total coded scan line is same both for the standard resolution and for the optional higher resolution,

3.1.1.1 20 milliseconds standard,

3.1.1.2 10 milliseconds option with a mandatory fall-back to the 20 milliseconds standard,

3.1.1.3 5 milliseconds option with a mandatory fall-back to the 10 milliseconds option and the 20 milliseconds standard,

3.1.1.4 0 millisecond option with a mandatory fall-back to the 5 milliseconds option, and the 10 milliseconds option and the 20 milliseconds standard and an optional fall-back to the 40 milliseconds option,

3.1.1.5 40 milliseconds option,

3.1.2 Alternative 2, where the minimum transmission time of the total coded scan line for the optional higher resolution is half of that for the standard resolution (see note). These figures refer to the standard resolution.

3.1.2.1 10 milliseconds option with a mandatory fall-back to the 20 milliseconds standard,

3.1.2.2 20 milliseconds standard,

3.1.2.3 40 milliseconds option.

The identification and choice of this minimum transmission time shall be made in the pre-message (Phase B) portion of the EIA Standard RS-466 control procedure.

Note: Alternative 2 applies to equipment with printing mechanisms which achieve the standard vertical resolution by printing two consecutive, identical higher resolution lines. In this case, the minimum transmission time of the total coded scan line for the standard resolution is double the minimum transmission time of the total coded scan line for the higher resolution.

3.2 The maximum transmission time of any total coded scanning line shall be less than 5 seconds. When this transmission time exceeds 5 seconds, the receiver shall proceed to disconnect the line.

#### 4. Coding Scheme

##### 4.1 One-dimensional Coding Scheme

The standard one-dimensional run length coding scheme for Group 3 apparatus is as follows :

#### 4.1.1 DATA

A line of DATA is composed of a series of variable length code words. Each code word represents a run length of either all white or all black. White runs and black runs alternate. A total of 1728 picture elements represent one horizontal scan line of 215 mm length. In order to insure that the receiver maintains colour synchronization, all DATA lines will begin with a white run length code word. If the actual scan line begins with a black run, a white run length of zero will be sent. Black or white run lengths, up to a maximum length of one scan line (1728 picture elements or pels) are defined by the code words in Tables 1 and 2. The code words are of two types : Terminating Code words and Make Up Code words. Each run length is represented by either one Terminating Code word or one Make Up Code word followed by a Terminating Code word.

Run lengths in the range of 0 to 63 pels are encoded with their appropriate Terminating Code word. Note that there is a different list of code words for black and white run lengths.

Run lengths in the range of 64 to 1728 pels are encoded first by the Make Up Code word representing the run length which is equal to or shorter than that required. This is then followed by the Terminating Code word representing the difference between the required run length and the run length represented by the Make Up Code.

#### 4.1.2 End of Line (EOL)

This code word follows each line of DATA. It is a unique code word that can never be found within a valid line of DATA; therefore, resynchronization after an error burst is possible.

In addition, this signal will occur prior to the first DATA line of a page.

Format: 000000000001

#### 4.1.3 FILL

A pause may be placed in the message flow by transmitting FILL. FILL may be inserted between a line of DATA and an EOL, but never within a line of DATA. FILL must be added to insure that the transmission time of DATA, FILL and EOL is not less than the minimum transmission time of the total coded scan line established in the pre-message control procedure.

Format: variable length string of 0's.

#### 4.1.4 Return to Control (RTC)

The end of a document transmission is indicated by sending six consecutive EOL's. Following this RTC signal, the transmitter will send the post message commands in the framed format and the data rate of the control signals defined in EIA Standard RS-466.

Format: 000000000001-----000000000001  
(total of 6 times)

Figures 1 and 2 clarify the relationship of the signals defined herein. Figure 1 shows several scan lines of data starting at the beginning of a transmitted page. Figure 2 shows the last coded scan line of a page.

2304	000000010111
2368	000000011100
2432	000000011101
2496	000000011110
2560	000000011111

The identification and choice of either the standard code table or the extended code table is to be made in the pre-message (Phase B) portion of the control procedures defined in EIA Standard RS-466.

#### 4.2 Two-dimensional Coding Scheme

The two-dimensional coding scheme is an optional extension of the one-dimensional coding scheme specified in Paragraph 4.1 and is as follows:

##### 4.2.1 DATA

###### 4.2.1.1 Parameter K

In order to limit the disturbed area in the event of transmission errors, after each line coded one-dimensionally at most  $K-1$  successive lines shall be coded two-dimensionally. A one-dimensionally coded line may be transmitted more frequently than every  $K$  line. After a one-dimensional line is transmitted, the next series of  $K-1$  two-dimensional lines is initiated. The maximum value of  $K$  shall be set as follows:

Standard vertical resolution:  $K = 2$

Optional higher vertical resolution:  $K = 4$

###### 4.2.1.2 One-dimensional Coding

This conforms with the description of DATA, Paragraph 4.1.1.

###### 4.2.1.3 Two-dimensional Coding

This is a line-by-line coding method in which the position of each changing picture element on the current or coding line is coded with respect to the position of a corresponding reference element situated on either the coding line or the reference line which lies immediately above the coding line. After the coding line has been coded it becomes the reference line for the next coding line.

###### a) Definition of changing picture elements (see Figure 3)

A changing element is defined as an element whose color (i.e. black or white) is different from that of the previous element along the same scan line.

$a_0$  The reference or starting changing element on the coding line. At the start of the coding line  $a_0$  is set on an imaginary white changing element situated just before the first element on the line. During the coding of the coding line, the position of  $a_0$  is defined by the previous coding mode. (See Paragraph 4.2.1.3,b)

$a_1$  The next changing element to the right of  $a_0$  on the coding line.

$a_2$  The next changing element to the right of  $a_1$  on the coding line.

$b_1$  The first changing element on the reference line to the right of  $a_0$  and of opposite color to  $a_0$ .

$b_2$  The next changing element to the right of  $b_1$  on the reference line.

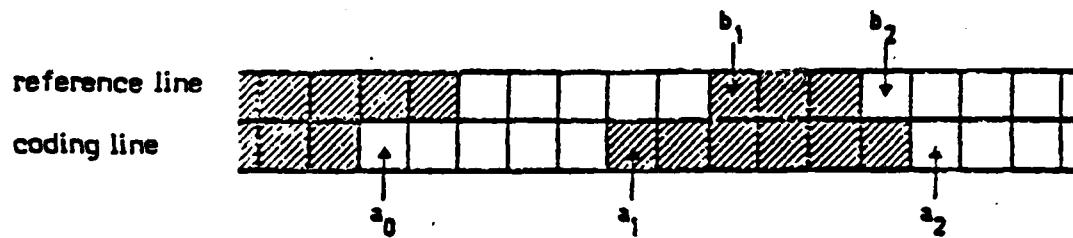

FIGURE 3 - Changing Picture Elements

b) Coding Modes

One of three coding modes are chosen according to the coding procedure described in Paragraph 4.2.1.3,c to code the position of each changing element along the coding line. Examples of the three coding modes are given in Figures 4, 5 and 6.

(i) Pass mode

This mode is identified when the position of  $b_2$  lies to the left of  $a_1$ .

When this mode has been coded,  $a'_0$  is set on the element of the coding line below  $b_2$  in preparation for the next coding. (i.e. on  $a'_0$ )

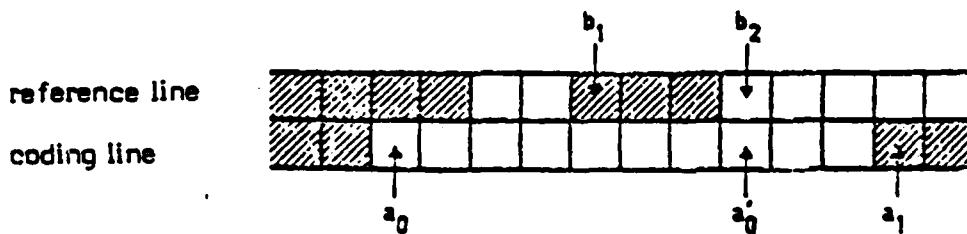

FIGURE 4 - Pass mode

However, the state where  $b_2$  occurs just above  $a_1$ , as shown in Figure 5, is not considered as a Pass mode.

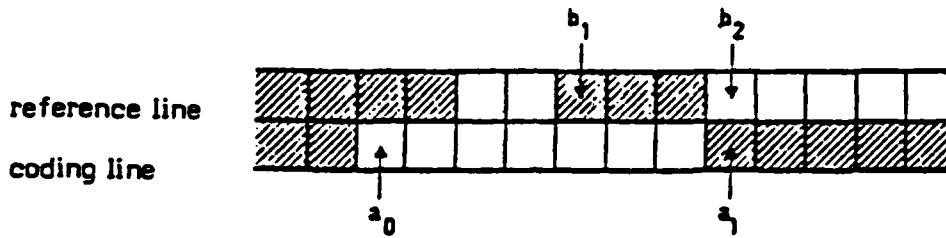

FIGURE 5 - An example not corresponding to a Pass mode

(ii) Vertical mode

When this mode is identified, the position of  $a_1$  is coded relative to the position of  $b_1$ . The relative distance  $a_1 b_1$  can take on one of seven values  $V(0)$ ;  $V_R(1)$ ,  $V_R(2)$ ,  $V_R(3)$ ,  $V_L(1)$ ,  $V_L(2)$  and  $V_L(3)$ , each of which is represented by a separate code word. The subscripts R and L indicate that  $a_1$  is to the right or left respectively of  $b_1$  and the number in brackets indicates the value of the distance  $a_1 b_1$ . After vertical mode coding has occurred, the position of  $a_0$  is set on  $a_1$ . (see Figure 6)

(iii) Horizontal mode

When this mode is identified, both the run-lengths  $a_0 a_1$  and  $a_1 a_2$  are coded using the code words  $H + M(a_0 a_1) + M(a_1 a_2)$ . H is the flag code word '001' taken from the two-dimensional code table (Table 3).  $M(a_0 a_1)$  and  $M(a_1 a_2)$  are code words which represent the length and color of the runs  $a_0 a_1$  and  $a_1 a_2$  respectively and are taken from the appropriate white or black one-dimensional code tables (Tables 1 and 2). After a horizontal mode coding, the position of  $a_0$  is set on  $a_2$ . (see Figure 6)

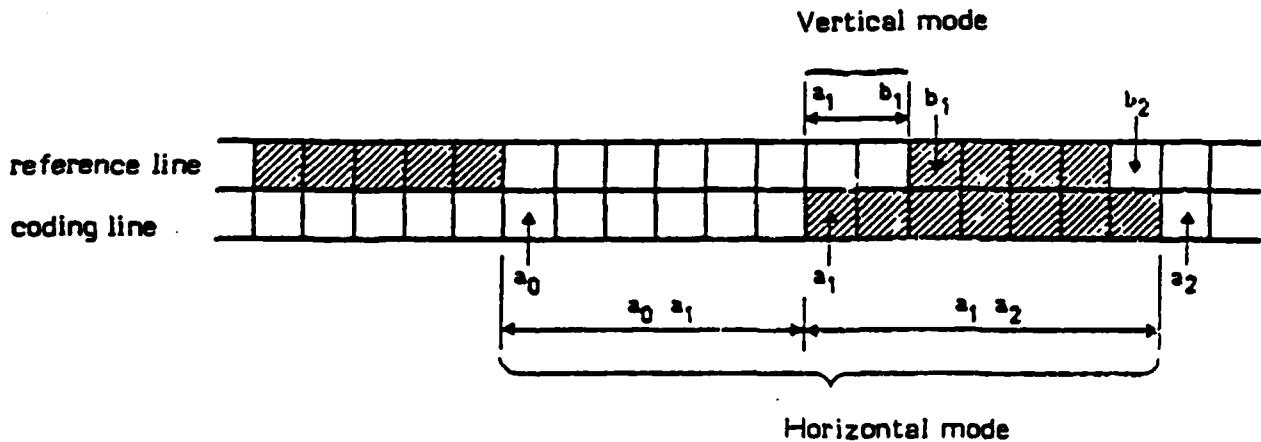

FIGURE 6 - Vertical mode and Horizontal mode

c) Coding Procedure

The coding procedure identifies the coding mode that is to be used to code each changing element along the coding line. When one of the three coding modes has been identified according to Step 1 or Step 2 mentioned below, an appropriate code word is selected from the code table given in Table 3. The coding procedure is as shown in the flow diagram of Figure 9.

Note: It does not affect compatibility to restrict the use of Pass mode in the encoder to a single Pass mode.

Step 1

- i) If a pass mode is identified this is coded using the code word '0001' (Table 3). After this processing, picture element  $a'_0$  just under  $b_2$  is regarded as the new starting picture element  $a_0$  for the next coding. (see Figure 4)
- ii) If a pass mode is not detected then proceed to Step 2.

Step 2

- i) Determine the absolute value of the relative distance  $a_1 b_1$ .
- ii) If  $|a_1 b_1| \leq 3$ , as shown in Table 3,  $a_1 b_1$  is coded by Vertical mode, after which position  $a_1$  is regarded as the new starting picture element  $a_0$  for the next coding.
- iii) If  $|a_1 b_1| > 3$ , as shown in Table 3, following Horizontal mode code '001',  $a_0 a_1$  and  $a_1 a_2$  are respectively coded by one-dimensional coding. After this processing position  $a_2$  is regarded as the new starting picture element  $a_0$  for the next coding.

TABLE 3  
Two-dimensional code table

MODE	ELEMENTS TO BE CODED		NOTATION	CODE WORD
PASS	$b_1, b_2$		P	0001 "
HORIZONTAL	$a_0 a_1, a_1 a_2$		H	$001 + M(a_0 a_1) + M(a_1 a_2)$ Note 1
VERTICAL	$a_1$ just under $b_1$	$a_1 b_1 = 0$	$V(0)$	1
	$a_1$ to the right of $b_1$	$a_1 b_1 = 1$	$V_R(1)$	011
		$a_1 b_1 = 2$	$V_R(2)$	000011
		$a_1 b_1 = 3$	$V_R(3)$	0000011
	$a_1$ to the left of $b_1$	$a_1 b_1 = 1$	$V_L(1)$	010
		$a_1 b_1 = 2$	$V_L(2)$	000010
		$a_1 b_1 = 3$	$V_L(3)$	0000010
EXTENSION		2-D (extensions) 1-D (extensions)		Note 2 0000001xxx 000000001xxx

Note 1 Code  $M(\ )$  of Horizontal mode represents the code words in Tables 1 and 2, Paragraph 4.1.1.

Note 2 The Uncompressed mode is an optional extension of the two-dimensional coding scheme for Group 3 apparatus. The bit assignment for the xxx bits is 111 for the Uncompressed mode of operation whose code table is given in Table 4.

Note 3 If the suggested uncompressed mode is used on a line designated to be one-dimensionally coded, the coder must not switch into the uncompressed mode following any codeword ending in the sequence "000". This is because any codeword ending in "000" followed by a switching code "000000001" will be mistaken for an end-of-line code."

TABLE 4  
Uncompressed mode code table

<u>Image Pattern</u>	<u>Code Word</u>
1	1
01	01
001	001
0001	0001
00001	00001
00000	000001

<u>Exit</u>	<u>Image Pattern</u>	<u>Code Word</u>
	0	00000001T
	00	00000001T
	000	000000001T
	0000	0000000001T
		00000000001T

T denotes a tag bit which indicates the color of the next run. (black = 1, white = 0)

d) Processing the first and last picture elements in a line

(i) Processing the first picture element

The first  $a_0$  element on each coding line is imaginarily set at a position just before the first actual picture element, and is regarded as a white picture element. (4.2.1.3,a)

The first run length on a line  $a_0 a_1$  is replaced by  $a_0 a_1 - 1$ . Therefore, if the first run is black and is deemed to be coded by horizontal mode coding, then the first code word  $M(a_0 a_1)$  corresponds to a white run of zero length. (see Figure 10, Example 5)

(ii) Processing the last picture element

The coding of the coding line continues until the position of the imaginary changing element situated just after the last actual element has been coded. This may be coded as  $a_1$  or  $a_2$ . Also, if  $b_1$  and/or  $b_2$  are not detected at any time during the coding of the line, they are positioned on the imaginary changing element situated just after the last actual picture element on the reference line.

#### 4.2.2 Line Synchronization Code Word

To the end of every coded line the end-of-line (EOL) code word '0000000000001' is added. The EOL codeword is followed by a single tag bit which indicates whether one- or two-dimensional coding is used for the next line. In addition, EOL plus the tag bit "1" signal will occur prior to the first DATA line of a page.

Format:

EOL + 1 : one-dimensional coding of next line  
EOL + 0 : two-dimensional coding of next line

#### 4.2.3 FILL

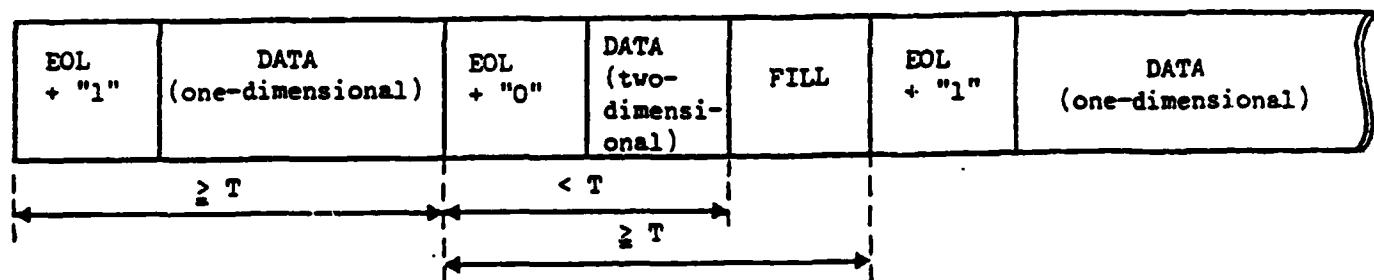

FILL is inserted between a line of DATA and the line synchronization signal, EOL + tag bit, but is not inserted in DATA. FILL must be added to insure that the transmission time of DATA, FILL and EOL plus tag bit is not less than the minimum transmission time of the total coded scan line.

Format : variable length string of 0's.

#### 4.2.4 Return To Control (RTC)

The format used is six consecutive Line Synchronization Code Words, i.e.,  $6 \times (EOL+1)$ .

To further clarify the relationship of the signals defined herein, Figures 7 and 8 are offered in the case of  $K = 2$ . Figure 7 shows several scan lines of data starting at the beginning of a transmitted page. Figure 8 shows the last several lines of a page.

T: minimum transmit time of a total coded scan line

FIGURE 7 - Message transmission (first part of page)

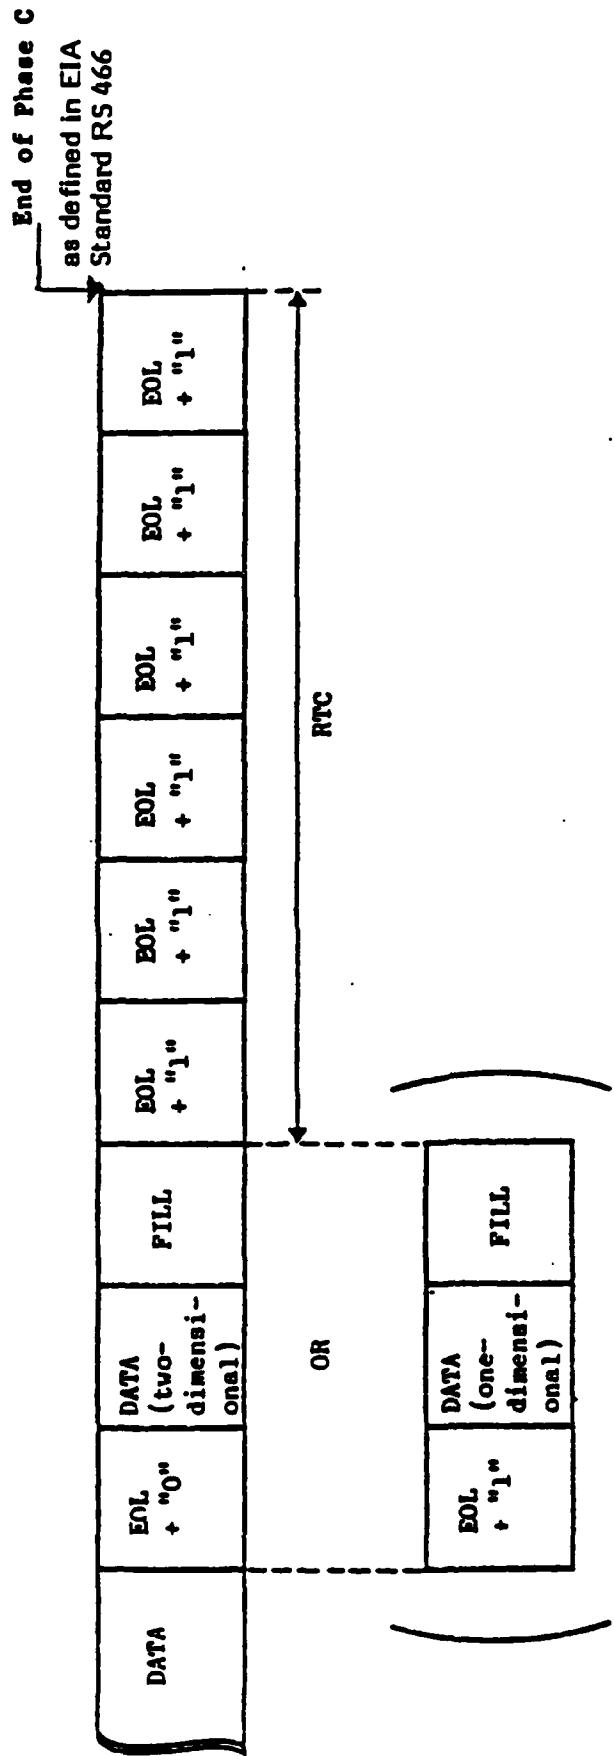

FIGURE 8 - Message transmission (last part of page)

Two Dimensional  
Coding Flow  
Diagram

#### 4.2.5 Coding Examples

Figure 10 shows coding examples of the first part of scanning lines and Figure 11 coding examples of the last part, while Figure 12 shows other coding examples. The notations P, H and V in the figures are, as shown in Table 3, the symbols for Pass mode, Horizontal mode and Vertical mode respectively. The picture elements marked with black spots indicate the changing picture elements to be coded.

### C. PROCEDURE FOR EXTENDED RUN LENGTHS

Run Lengths up to and including 2560 pels are coded as described in EIA RS-465. If the run length is greater than 2560, the Make Up Code for 2560 is output followed by one or more Make Up Codes of the same color if the remaining part of the run is greater than 63 followed by the appropriate Terminating Code in the same color for the remaining part of the run (0-63). Thus, a very long run will have a number of Make Up codes for 2560 followed by a Make Up Code in the range 64 to 2496 if required followed by a Terminating Code in the range 0-63, all in the same color.
