Contribution of authors

Data compilation editors — Nadja Korotkova (main editor and compiler), Walter G. Berendsohn (name matching with contributed datasets, nomenclatural issues, data quality control, generation of formatted documents from output from the EDIT Platform, editorial guidelines)

Taxonomic information

David Aquino: *Epithelantha*, *Kadenicarpus*, *Rapicactus*, *Turbincarpus*

Salvador Arias: *Acanthocereus*, *Aporocactus*, *Astrophytum*, *Bergerocactus*, *Cephalocereus*, *Disocactus*, *Marshallocereus*, *Nyctocereus*, *Pachycereus*, *Peniocereus*, *Peresklopsis*, *Selenicereus*, *Stenocereus*, *Strophocactus*

Urs Egli: *Aylostera*, *Blossfeldia*, *Rebutia*, *Weingartia*, partial quality control of unresolved names

Alan R. Franck: *Cereus*, *Estevesia*, *Harrisia*, *Pilosocereus*, *Stenocereus*, *Xiquexique*

Pablo C. Guerrero: *Copiapoa*, *Eriogyne*, *Eulychnia*, *Rimacactus*

Héctor M. Hernández & Carlos Gómez-Hinostrosa: *Acanthocereus*, *Acharagma*, *Ariocarpus*, *Astrophytum*, *Aztekium*, *Bergerocactus*, *Cumarinia*, *Cylindropuntia*, *Echinocactus*, *Escontria*, *Grusonia*, *Lophophora*, *Mammillaria* p.p., *Melocactus* p.p., *Myrtillocactus*, *Neolloydia*, *Opuntia* p.p., *Peniocereus* p.p., *Sclerocactus*, *Thelocactus*, *Turbincarpus* p.p.

Matias Köhler: *Airampoa*, *Brasiliopuntia*, *Opuntia* p.p., *Salmonopuntia*, *Tacinga*

Nadja Korotkova: *Deamia*, *Disocactus*, *Epiphyllum*, *Hattoria*, *Kimnachia*, *Lepismium*, *Leuenbergeria*, *Lymanbensonia*, *Pereskia*, *Pfeiffera*, *Pseudorhipsalis*, *Rhipsalidopsis*, *Rhipsalis*, *Schlumbergera*, *Selenicereus*, *Strophocactus*, *Weberocereus*

Lucas C. Majure: *Cochemia*, *Consolea*, *Coryphantha*, *Cumarinia*, *Cylindropuntia*, *Grusonia*, *Kroenleinia*, *Leptocereus*, *Melocactus*, *Micropuntia*, *Opuntia* p.p.

Detlev Metzling: *Frailea*, *Gymnocalycium*, various other genera

Reto Nyffeler: *Parodia*

Daniel Sánchez: *Echinocereus*

Boris Schlumpberger: *Acanthocalycium*, *Echinopsis*, *Leucostele*, *Lobivia*, *Reicheocactus*, *Setiechinopsis*, *Soehrensia*, *Trichocereus*

Introduction

This *Cactaceae* checklist was compiled from literature and online sources using the tools of the EDIT Platform for Cybertaxonomy (<https://cybertaxonomy.eu>). The data also form a contribution for the World Flora Online (WFO) initiative (<http://www.worldfloraonline.org>). The general approach to compiling this checklist and the editorial guidelines are described in detail in the main article. This checklist represents the output from the database as of 16 August 2021. The online version at <http://caryophyllales.org/cactaceae/Checklist> represents the actual updated state of the database. The data are managed with the EDIT Platform for Cybertaxonomy software and the database is hosted at the Botanic Garden and Botanical Museum Berlin. Please refer to the above-cited article for background information.

The Checklist is divided into the Core checklist of accepted genera, species and infraspecies, including some definitely excluded names and taxa. Outside the Core checklist, we list names that are presently considered to belong to named hybrids that are probably not of natural occurrence, names of verified uncertain application, and unresolved names – i.e. names that could not be clarified with the sources used and need further investigation. Additional taxonomic data, such as morphological descriptions, identification keys, distribution data, as well as additional nomenclatural information, such as types and type image links for species and infraspecific taxa or names, and sources of the nomenclatural status, are so far only available for some taxa and are accessible in the online portal only.

Statistics — A total of 22,275 names are treated:

20,646 names are included in the Core checklist:

- 2835 taxa (1851 accepted species, 91 hybrid species, 458 heterotypic infraspecific taxa (including 2 hybrids), and 288 infraspecific taxa carrying autonyms.
- 17,932 synonyms and invalid designations that are clearly attributable to a taxon.
- 16 names were excluded.

Not treated in the Core checklist:

- 389 names are considered as of uncertain application.
- 672 names (including 151 synonyms) are unresolved.
- 454 names are found in the separate list of hybrid names.

Names of subfamilies, tribes and infrageneric groups (with few exceptions in the homotypic synonymy) are currently not included.

Secundum references — The backbone classification follows phylogeny-based taxonomic treatments as far as they are available; otherwise, appropriate classical or conventional taxonomic works are used as the basis. The classification with respect to the acceptance of taxa follows treatments that were published, in press or at least submitted during the compilation of the checklist. The taxonomic concept or circumscription of the accepted taxa is indicated by the secundum (“sec.”) reference. For synonyms, the “syn. sec.” reference indicates the assignment of the synonym to the concept of either the accepted name or one of its homotypic synonyms; this may or may not be the same reference as that of the secundum of the taxon. However, in the present state of our data, the sec. reference in some cases represents the source of a name (particularly when the taxonomic position of that name is not yet clear), or the reference for the placement (especially if the placement resulted in a changed name), or even the reference for the source of a name or taxon under one of the categories excluded from the Core checklist.

Systematic treatment

Cactaceae Juss., Gen. Pl.: 310. 1789. Sec. APG IV [Angiosperm Phylogeny Group] (2016)

Type: *Cactus* L.

Core checklist

Acanthocalycium thionanthum* subsp. *thionanthum

***Acanthocereus* (Engelm. ex A.Berger) Britton & Rose in Contr. U.S. Natl. Herb. 12: 432. 1909.** Sec. Korotkova & al. (2017)

Type: *Acanthocereus baxaniensis* (Karw. ex Pfeiff.) Borg

≡ *Cereus* subsect. *Acanthocereus* Engelm. ex A.Berger in Rep. (Annual) Missouri Bot. Gard. 16: 77. 1905 syn. sec. Korotkova & al. (2017)

= *Peniocereus* subg. *Pseudoacanthocereus* Sánchez-Mej. in Cact. Suc. Mex. 19: 38. 1974 syn. sec. Korotkova & al. (2017).

Type: *Peniocereus maculatus* (Weing.) Cutak; *Cereus maculatus* Weing.

Notes. – The sister relationship of *Peniocereus* subg. *Pseudoacanthocereus* and *Acanthocereus* has been shown several times with high statistical support from plastid data (Nyffeler 2002; Arias & al. 2005; Korotkova & al. 2017). Based on these results, *Acanthocereus* is only monophyletic if it also includes *Peniocereus* subg. *Pseudoacanthocereus*. Therefore, a new circumscription of *Acanthocereus* now including the nine erstwhile *Peniocereus* subgen. *Pseudoacanthocereus* species was provided by Korotkova & al. (2017). [Arias (2021)]

***Acanthocereus canoensis* (P.R.House, Gómez-Hin. & H.M.Hern.) S.Arias & N.Korotkova in Phytotaxa 327(1): 18. 2017.** Sec. Korotkova & al. (2017)

Notes. – Hummelinck (1938: 170) designated as lectotype of *Cereus tetragonus* two samples collected by him in Curaçao [Hummelinck 196 (flower), 170 (fruit) U], but Hunt (1991: 82, 1998: 16) and Egli (in Anderson 2005: 70) corrected its designation as neotype. However, this cannot be accepted according to the Art. 9.17. The designation of one of the specimens as neotype is currently in discussion (Hunt 2006).

Possible typification of *Cactus pentagonus* is not resolved (Hunt 1991: 83, Hunt 2006: 25). Eventual typification of *Cereus baxaniensis* is under discussion, since its identity and provenance is uncertain (Hunt 1998: 15, 2006: 25). [Korotkova & al. (2017)]; The name *Acanthocereus pitajaya* (Jacq.) Dugand was erroneously associated with *Acanthocereus*. According to Dugand (1966), in Jacquin's original description the fruit has white pulp, which suggests that it is a *Hylocereus* sp. [Hernández & Gómez-Hinostrosa (2021)]

***Airampoa* Frič, Akklim. Versuchs-Gart.: 1. 1933.** Sec. Doweld (2002)

Type: *Airampoa aurata* Frič

= *Tunilla* D.R.Hunt & Iliff in Cactaceae Syst. Init. 9: 10. 2000, nom. superfl. syn. sec. Doweld (2002). Type: *Tunilla soehrensii* (Britton & Rose) D.R.Hunt & Iliff

Notes. – **Phylogenetics:** The genus has not been adequately studied and only three species have been included in molecular phylogenetic analyses. Bárcenas & al. (2011) sampled *Tunilla erectoclada* and found it resolved outside the core *Opuntia* clade. Griffith & Porter (2009) sampled *T. corrugata* and *T. longispina* and found them well supported in a clade sister to accessions of *Maihueniopsis ovata* (Pfeiff.) F.Ritter that were misidentified - and are currently labeled as *T. corrugata* (see <https://livingcollections.org/dbg/Accession/593836>) – and *Miqueliopuntia miquelii* (Monv.) F.Ritter. Majure & al. (2012) sampled part of the same accessions of Griffith & Porter (2009) plus others of *T. corrugata*, and found it again supported out of *Opuntia* s.str. Köhler et al. (2020), using chloroplast genome sequences, resolved *T. corrugata* as sister to *Salmonopuntia* + *Miqueliopuntia*. Majure et al. (in prep. 2021), sampling four species of *Tunilla*, strongly supported them in a clade sister to *Miqueliopuntia*. Further molecular studies, including more *Airampoa* species, must be conducted to assert its monophyly and species delimitation. [Köhler (2021)]; **Nomenclature:** The generic name *Tunilla* has been used in the literature until recently. It was published by Hunt & Iliff (2000) to replace the untypified earlier name *Airampoa* Frič. That step has to be regarded as superfluous, because *Airampoa* Frič was validly published with a brief German description presented in two rare trade catalogues (Frič 1929; 1933). This satisfied all the rules of valid publication of a genus name; no Latin diagnosis was required prior to 1 Later, a Frič illustration and specimens in the Frič herbarium currently housed at PR (Guiggi 2007, cf. Figs 1, 2, 3) could further clarify the concept of Frič's genus *Airampoa*. Doweld (2002) provided a neotype for *Airampoa aurata* based on Frič's material in PR as well as the necessary combinations and typifications for 16 species he included in the genus. ***Aporocactus* Lem., Ill. Hort. Misc. 7: 67. 1860.** Sec. Korotkova & al. (2017)

Type: *Aporocactus flagelliformis* (L.) Lem.

Notes. – Used to be included in *Disocactus* Lindl. in recent treatments (Barthlott 1991; Barthlott & Hunt 1993; Kimmach 1993). Cruz & al. (2016), in their phylogenetic study of *Disocactus*, found the two *Aporocactus* species to be not closely related to *Disocactus* but to form a separate well-supported lineage within *Hylocereeae*. Therefore, *Aporocactus* was reinstated. Two species are recognized in recent taxonomic treatments, however there are doubts about the identity of some published names (see below). Consequently, an approximation is required in the delimitation of species. [Arias (2021)]

Type: *Astrophytum myriostigma* Lem.

= *Maierocactus* E.C.Rost in *Z. Sukkulentenk.* 2(8): 138-142. 1925 syn. sec. POWO. Plants of the World Online. Facilitated by the Royal Botanic Gardens, Kew. Type: *Maierocactus capricornis* (A.Dietr.) E.C.Rost

– *Digitostigma* Velazco & Nevárez in *Cact. Suc. Mex.* 47: 79. 2002, nom. inval. syn. sec. Vázquez-Lobo & al. (2015). Type: *Digitostigma caput-medusae* Velazco & Nevárez

Notes. – **Phylogenetics:** Confirmed as monophyletic, including *Digitostigma*, therefore transfer of *Digitostigma* to *Astrophytum*, as previously suggested by Hunt (2003) is justified (Vázquez-Sánchez & al. 2013, Vázquez-Lobo & al. 2015). Based on those two studies, *Astrophytum* includes six species grouped into two clades. *A. caput-medusae* D.R.Hunt is recognized as the sister of *A. coahuilense* (H.Moeller) K.Kayser, *A. capricorne* (A.Dietr.) Britton & Rose, and *A. asterias* (Zucc.) Lem., while *A. myriostigma* Lem. and *A. coahuilense* form another independent clade. It is supported that *A. coahuilense* is not conspecific with *A. myriostigma*. [Arias (2021)]

***Aylostera* Speg. in Anales Soc. Ci. Argent. 96: 75. 1923.** Sec. Ritz & al. (2016)

Type: *Aylostera pseudominuscula* (Speg.) Speg.

= *Mediolobivia* Backeb. in Blätt. Kakteenf. 1934(2): 3. 1934 syn. sec. Hunt (2006). Type: *Mediolobivia aureiflora* (Backeb.) Backeb.

= *Digitorebutia* Frič & Kreuz. ex Buining in Succulenta (Netherlands) 22. 1940 syn. sec. Hunt (2006). Type: *Digitorebutia haagei* (Frič & Schelle) Frič ex Buining

Notes. – The phylogenetic relationships in *Aylostera* were studied in detail by Ritz et al. (2016) based on the plastid DNA regions *atpB-rbcL* and *trnS-trnG* as well as AFLPs and morphological characters. *Aylostera* was confirmed as monophyletic and as distantly related to the clade that contains the type species of *Rebutia* K.Schum., thus justifying recognizing *Aylostera* as a separate genus. Based on their results, the authors suggested a new classification of *Aylostera* with nine species, this classification is followed here. [Korotkova (2021)]

Aztekium Boed. in Monatsschr. Deutsch. Kakteen-Ges. 1: 52. 1929. Sec. Vázquez-Sánchez & al. (2013)

Type: *Aztekium ritteri* (Boed.) Boed.

Notes. – The genus contains only three species; two of them (*A. ritteri* and *A. hintonii* Glass & W. A. Fitz Maur.) have been found well supported as sisters to each other (Vázquez-Sánchez & al. 2013). [Hernández-Ledesma & al. (2015)]

Bergerocactus Britton & Rose in Contr. U.S. Natl. Herb. 12: 435. 1909. Sec. Arias & al. (2005)

Type: *Bergerocactus emoryi* (Engelm.) Britton & Rose

Notes. – *Bergerocactus* is a monotypic genus within the *Pachycereinae* clade, and may be sister to *Nyctocereus* (Arias & al. 2005). *Bergerocactus emoryi* represents a unique tetraploid taxon, with the possibility of hybridizing with *Myrtillocactus* and *Pachycereus* in the floristic province of Baja California, where it is endemic. [Arias (2021)]

- = *Akersia* Buining in Succulenta (Netherlands) 1961: 25. 1961 syn. sec. Schlumpberger & Renner (2012). Type: *Akersia roseiflora* Buining
- = *Borzicactella* H.Johnson ex F.Ritter, Kakteen Südamerika 4: 1385. 1981 syn. sec. Hunt (2006). Type: *Borzicactella tenuispens* (Rauh & Backeb.) F.Ritter
- = *Maritimocereus* Akers & Buining in Succulenta (Netherlands) 1950: 49. 1950 syn. sec. Hunt (2016)

Notes. – *Borzicactus* is reinstated based on the results of Schlumpberger & Renner (2012). Its circumscription has been the subject of some debate, as summarized by Bregman (1992). The exact delimitation of *Borzicactus* and the genera currently included or considered related to it is still unclear. [Hernández-Ledesma & al. (2015)]

= *Pseudomitrocereus* Bravo & Buxb. in Bot. Stud. 12: 53. 1961 syn. sec. Tapia & al. (2017). Type: *Pseudomitrocereus fulviceps* (F.A.C.Weber ex K.Schum.) Bravo & Buxb.

Notes. – **Phylogenetics:** Tapia et al. (2017) have reconstructed the phylogeny of the *Cephalocereus* group using molecular data from seven plastid DNA regions (*petL-psbE*, *psbA-trnH*, *rpl16*, *rpl32-trnL*, *trnL-F*, *trnQ-rps16*, and *ycf1*), as well as morphological characters. The *Cephalocereus* group was recovered as monophyletic with high support values, whereas *Neobuxbaumia* appeared as paraphyletic. The *Cephalocereus* group was recovered as monophyletic with high support values, whereas *Neobuxbaumia* Backeb. appeared as paraphyletic. The authors have therefore proposed to unite all species of *Neobuxbaumia*, *Cephalocereus*, and *Pseudomitrocereus* Bravo & Buxb. in one single genus, for which *Cephalocereus* is the oldest name. [Arias (2021)].

***Cephalocereus fulviceps* (F.A.C.Weber ex K.Schum.) H.E.Moore in Bailey 19: 165. 1975. Sec. Tapia & al. (2017)**

- ≡ *Pilocereus fulviceps* F.A.C.Weber ex K.Schum., Gesamtbeschr. Kakt.: 176. 1897 syn. sec. Tapia & al. (2017) ≡ *Cereus fulviceps* (F.A.C.Weber) A.Berger in Rep. (Annual) Missouri Bot. Gard. 16: 64. 1905 syn. sec. Kew WCVP (2019) ≡ *Mitrocereus fulviceps* (F.A.C.Weber ex K.Schum.) Backeb. ex Bravo in Anales Inst. Biol. Univ. Nac. Mexico 24: 232. 1954 syn. sec. Tapia & al. (2017) ≡ *Pseudomitrocereus fulviceps* (F.A.C.Weber ex K.Schum.) Bravo & Buxb. in Bot. Stud. 12: 99. 1961 syn. sec. Tapia & al. (2017) ≡ *Pachycereus fulviceps* (F.A.C.Weber ex K.Schum.) D.R.Hunt in Bradleya 9: 89. 1991 syn. sec. Tapia & al. (2017) ≡ *Carnegiea fulviceps* (F.A.C.Weber ex K.Schum.) P.V.Heath in Calyx 2(3): 108. 1992 syn. sec. Tapia & al. (2017)

Notes. – *Pseudomitrocereus fulviceps* was previously included in *Pachycereus* or *Cephalocereus*, later elevated to generic rank as *Mitrocereus* (Backeberg 1942) and later *Pseudomitrocereus* (Bravo & Buxbaum, in Buxbaum 1961). Arias & al. (2003) found *P. fulviceps* to be unrelated to *Pachycereus* and instead as sister to a clade of *Cephalocereus* and *Neobuxbaumia*. Therefore, *Pseudomitrocereus* was previously reinstated by Arias & al. (2012). *Pseudomitrocereus* is characterized by having distinct fertile stem tips (on old primary and secondary branches), flowers completely covered with trichomes, and thick axial tissue (pericarpel and receptacle; Buxbaum 1961). Its inclusion in *Carnegiea* and *Pachycereus* was supported by non-informative attributes (e.g., growth form), shared by other members of *Pachycereinae* (or *Echinocereinae* sensu Nyffeler & Eggli 2010). However, it is part of the clade "Cephalocereus" according to Arias & al. (2003), composed by *Cephalocereus*, *Neobuxbaumia*, and *Pseudomitrocereus*. The species of this clade share the presence of prismatic crystals in epidermis, inner stamens and nectarial

chamber, while the fruit is dehiscent and the pulp is white (Arias & Terrazas 2006). *Mitrocereus* was based on the name *Pilocereus chrysomallus* Lem. as type species, but this name represents another species included in the synonymy of *Pachycereus militaris* (Audot) D. R. Hunt. Consequently, Buxbaum and Bravo (Buxbaum 1961) proposed the name *Pseudomitrocereus*, with *P. fulviceps* as the nomenclatural type. [Hernández-Ledesma & al. (2015)]

Notes. – Mottram & Hoxey (2020) questioned if the Schelle name was validly published. [Mottram & Hoxey (2020)]; *Cereus ayisyen* is a replacement name for *Cereus haitiensis* A.R.Franck & Peguero, an illegitimate homonym of *Cereus haitiensis* Schelle. Schelle's name was attributed to garden origin and published with the very brief description “hellgrün, gelbstachelig” without referencing the nearly verbatim description of *C. grandiflorus* var. *haitiensis* K.Schum., an apparently validly published, potential basionym. Although an explicit combination was not made by Schelle, Schelle was familiar with Schumann's works. [Franck (2021)]

– *Hildewintera* F.Ritter in *Kakteen And. Sukk.* 17: 11. 1966, nom. inval. syn. sec. Hunt (2016). Type: *Hildewintera aureispina* (F.Ritter) F.Ritter ex G.D.Rowley

Notes. – The broad circumscription of *Cleistocactus* as employed by Anderson (2001, 2005), and Hunt (2006) goes back to the *Cactaceae* consensus classification reported by Hunt & Taylor (1986), where the predominantly ornithophilous floral syndrome was used as diagnostic character. Schlumpberger & Renner (2012) found that *Cleistocactus* s.l. is polyphyletic - the monotypic *Cephalocleistocactus* was placed as sister to *Yungasocereus*, while *Cleistocactus* s.str. is sister to *Vatricania* next to *Weberbauerocereus*, and two terminals representing the former *Borzicactus* and *Loxanthocereus* are placed in the *Oreocereus* clade, the former next to *Matucana*, and the latter next to *Haageocereus*.

Deciding whether *Cleistocactus* s.l. should be retained or split up is difficult, since sampling of the group and its possible sister taxa is still inadequate. The affiliation of *Loxanthocereus* with *Haageocereus* was seen earlier and Nyffeler & Eggli (2010) listed it as synonym of *Haageocereus*. [Hernández-Ledesma & al. (2015)]

- Consolea* Lem. in *Rev. Hort. (Paris)* 1862: 174. 1862. Sec. Majure & al. (2021)**
- Type: *Consolea spinosissima* (Mill.) Lem.
- Notes. – **Phylogenetics:** Plastid and nuclear ITS data so far provided inconclusive results for the placement of *Consolea* and its separation from *Opuntia*. *Consolea* was found to be imbedded in *Opuntia* by Griffith & Porter (2009) based on combined nuclear and plastid data. The plastid and nuclear data of Majure & al. (2012) supported the monophyly but were incongruent regarding the placement of *Consolea*: while plastid data resolved *Consolea* outside of *Opuntia* (BS=53%), nuclear ITS data resolve *Consolea* within *Opuntia* (BS=75%), yet both these placements receive only weak support. Support for a placement outside of *Opuntia* increased to 81% BS when only diploids were included in a combined nuclear and plastid analysis. Majure & al. (2012) pointed out that evolution in *Opuntia* and allies involves hybridization and allopolyploidization and that *Consolea* might be of allopolyploid origin, as indicated by the incongruent plastid and nuclear trees. Nevertheless, Majure & al. (2012) and Majure & Puente (2014) argue for recognizing *Consolea* as a genus distinct from *Opuntia* because of good support for its monophyly, the placement by combined plastid and nuclear data outside of *Opuntia* and unique morphological characteristics. More recent topologies based on phylogenomic datasets and broader taxon sampling resolve *Consolea* as sister to the rest of Opuntieae (Köhler & al. 2020, Majure & al. in revision). Majure & al. (in revision) used plastome data to reveal species relationships in the clade. Barrios & al. (2019) and Majure & Clase (2018) provided updated distribution information for the species on Cuba and Hispaniola. [Majure (2021)]

Notes. – **Phylogenetics:** Larridon & al. (2015) have conducted the first molecular phylogenetic study of *Copiapoa*, using sequences from the three plastid DNA markers *rpl32-trnL*, *trnH-psbA*, and *ycf1*. They have additionally modeled the species distributions based on geo-referenced localities and climatic data and analysed the evolution of selected morphological characters. *Copiapoa* was maximally supported as monophyletic. The subclades that were resolved and received good statistical support did not fit to previously suggested subgeneric classifications, therefore the authors have provided a new subgeneric classification with four sections and two subsections based on their results. The data also allowed to define 32 species and 5 subspecies, though not all relations between the species could be resolved. The recovered relationships were often supported by morphological characters and distribution patterns. Larridon & al. (2018) conducted a population genetic study and modeled the species distributions. [Guerrero (2021)]

Notes. – **Phylogenetics:** Found as highly polyphyletic by Bárcenas & al. (2011), and as nested in *Mammillaria*. One core *Coryphantha* clade was resolved but only weakly supported as monophyletic (0.65 PP from Bayesian Inference). Vázquez-Sánchez & al. (2013) likewise find *Coryphantha* as polyphyletic, but not nested in *Mammillaria*, however much fewer species were sampled therein. One maximally supported group was found that also contains *Neolloydia matehualensis* Backeb., while other *Coryphantha* species were found close to *Echinomastus* and *Escobaria*.

Breslin et al. (2021) resolved three well-supported clades in the Mammilloid clade, these comprising *Mammillaria* s.s., *Cochemiea* and *Coryphantha*. *Escobaria* was nested within *Coryphantha*, although more taxon sampling is needed in the clade before completely understanding generic limits in the *Coryphantha* clade. Breslin et al. (2021) expanded *Cochemiea* to include *Neolloydia*, *Ortegocactus* and other species traditionally recognized as *Mammillaria* s.l. in that clade. See also notes under *Mammillaria* and *Neolloydia*. [Majure (2021)]

Cumulopuntia F.Ritter, Kakteen Südamerika 2: 399. 1980. Sec. Hunt (2016)

Type: *Cumulopuntia ignescens* (Vaupel) F.Ritter

= *Sphaeropuntia* Guiggi in Cactology 3 (Suppl. II): 1. 2012 syn. sec. Hunt (2016)

Notes. – **Phylogenetics:** Griffith & Porter (2009) found no support for a monophyletic *Cumulopuntia*, but it was also not contradicted. *Cumulopuntia* was then confirmed as monophyletic by Ritz & al. (2012). *Cumulopuntia* falls in two clades in the molecular phylogeny, one consisting of *C. sphaerica* (C. F. Först.) E. F. Anderson and related taxa from the W Andean slopes of Chile and Peru, characterized by forming dwarf shrubs with easily detachable stem segments, and another consisting of *Cumulopuntia* s.str., characterized by growth in often dense cushions, with firmly attached stem segments (Griffith & Porter 2009; Ritz & al. 2012). For the *C. sphaerica* clade, the generic name *Sphaeropuntia* was recently published, but its circumscription is not yet fully resolved, and it thus better treated as synonym for the time being. [Hernández-Ledesma & al. (2015)]

***Cylindropuntia* (Engelm.) F.M.Knuth, *Nye Kaktusbog*: 102. 1930. Sec. Majure & al. (2019)**

Type: *Cylindropuntia arborescens* (Engelm.) F.M.Knuth

≡ *Opuntia* subg. *Cylindropuntia* Engelm. in Proc. Amer. Acad. Arts 3: 302. 1856

Notes. – Griffith & Porter (2009) found no support for a monophyletic *Cylindropuntia* based on combined nuclear and plastid markers, while Bárcenas & al. (2011, 2015) found a monophyletic *Cylindropuntia* with high to maximal support based on plastid data only. Majure et al. (2019) showed that *Cylindropuntia* was indeed monophyletic and sister to *Grusonia* s.l., and *Micropuntia* was sister to the *Grusonia* + *Cylindropuntia* clade. See also under *Grusonia* and *Micropuntia*. [Majure (2021)]

***Echinocactus* Link & Otto in Verh. Vereins. Beförd. Gartenbaues Königl. Preuss. Staaten 3: 420. 1827. Sec. Vargas-Luna & al. (2018)**

Type: *Echinocactus platyacanthus* Link & Otto

- = *Echinofossulocactus* Lawr. in Gard. Mag. & Reg. Rural Domest. Improv. 17: 317. 1841 syn. sec. Vargas-Luna & al. (2018).

Type: *Echinofossulocactus helophorus* (Lem.) Lawr.

- = *Brittonrosea* Speg. in Anales Soc. Ci. Argent. 96: 69. 1923 syn. sec. Vargas-Luna & al. (2018)

- = *Emorycactus* Doweld in Succulenta (Netherlands) 75: 270. 1996 syn. sec. Vargas-Luna & al. (2018). Type: *Emorycactus polycephalus* (Engelm. & J.M.Bigelow) Doweld

- = *Meyerocactus* Doweld in Succulenta (Netherlands) 75: 271. 1996 syn. sec. Vargas-Luna & al. (2018). Type: *Meyerocactus horizontalonius* (Lem.) Doweld

Notes. – **Phylogenetics:** *Echinocactus* turns out to be paraphyletic in recent molecular studies (Bárcenas & al. 2011; Hernández-Hernández & al. 2011; Vázquez-Sánchez & al. 2013), with *E. grusonii* Hildm. resolved in a separate clade from the remaining four species. Vargas-Luna & al. (2018) showed that *Echinocactus* s.l. was paraphyletic with *Astrophytum* nested within, and *E. grusonii* resolved as sister to *Ferocactus*. They re-circumscribed *Echinocactus* to reflect this well-supported topology and also showed morphological characters to recognize two genera, *Echinocactus* s.s., and *Homalocephala*. It is clear that the monotypic *Kroenleinia grusonii* is not a member of *Echinocactus*, however, its distinction from *Ferocactus* is not entirely clear. See *Kroenleinia*. [Majure (2021)]

Type: *Echinocereus viridiflorus* Engelm.

= *Wilcoxia* Britton & Rose in Contr. U.S. Natl. Herb. 12: 434. 1909 syn. sec. Hunt (2006). Type: *Wilcoxia poselgeri* (Lem.) Britton & Rose

Notes. – **Phylogenetics:** Phylogenetic analyses using cpDNA (Sánchez & al. 2014) showed the monophyly of *Echinocereus* but excluding *E. pensilis* J.A.Purpus. *Echinocereus pensilis* was segregated as the monotypic genus *Morangaya* G.D.Rowley as sister to *Stenocereus* (A.Berger) Riccob., *Myrtillocactus* Console, *Escontria* Rose, and *Polaskia* Backeb. The monophyly of *Echinocereus* has been corroborated by the analysis of morphological characters (Sánchez & al. 2015, 2018). *Echinocereus* is

one of the most diverse lineages of the family and species delimitation is often challenging due to extreme morphological variation in some species complexes. [Sánchez (2021)]

Notes. – The type locality of *Cereus octacanthus* is said to be in Texas, USA (Coulter, 1896). The description and locality correspond to *E. coccineus*. Blum et al. (1998) mention *E. octacanthus* as synonym of *E. coccineus* subsp. *roemerii* (= *E. paucispinus*). [Sánchez (2021)]

***Echinocereus engelmannii* subsp. *llanuraensis* (Rutow) Felger in Proc. San Diego Soc. Nat. Hist. 35: 20. 1999.** Sec. Sánchez (2021)

≡ *Echinocereus nicholii* subsp. *llanuraensis* Rutow in Echinocereenfreund 8: 61. 1995 ≡ *Echinocereus llanuraensis* (Rutow) W.Blum & D.Felix in Echinocereenfreund 15: 16. 2002

Notes. – Chromosome counts of plants of *E. llanuraensis* from Guaymas, Sonora, Mexico show that those are tetraploid (Felger 1999), suggesting more affinity with *E. engelmannii* rather than with the diploid *E. nicholii*. Also, *E. llanuraensis* shows affinity with the tetraploid *E. engelmannii* complex by having dull grayish, often bicolored spines and large flowers with bright magenta inner tepals. In contrast, diploid *E. nicholii* has uniformly yellow spines and smaller flowers with pale pink inner tepals (Felger 1999). [Sánchez (2021)]

***Echinocereus neocapillus* (D.Weniger) W.Blum & Mich.Lange, *Echinocereus Prepr.*: 6. 1998. Sec. Blum & al. (2012)**

≡ *Echinocereus chloranthus* var. *neocapillus* D.Weniger in *Cact. Succ. J. (Los Angeles)* 41: 39. 1969 syn. sec. Blum & al. (2012)
 ≡ *Echinocereus viridiflorus* var. *neocapillus* (D.Weniger) A.D.Zimmerman, *Cacti Trans-Pecos*: 267. 2004 syn. sec. Blum & al. (2012)

Notes. – Blum & al. (1998) segregated *E. neocapillus* from *E. chloranthus* and *E. viridiflorus* due to the hairy spination in juvenile plants. Other taxa as *E. blumii*, *E. carmenensis*, and *E. milleri* also present this character. However, those taxa have discontinuous distribution and differ in spination in mature plants. For now, they are recognized as different species until more evidence is available. [Sánchez (2021)]

- Notes. – Taylor (1985) and Sánchez & al. (2013) suggest that *E. salm-dyckianus* and *E. scheeri* represent the same species. However, chromosome numbers suggest that *E. scheeri* is diploid, while *E. salm-dyckianus* is tetraploid (Rischer 2016). The morphology of the tetraploid *E. rischeri* overlaps to *E. salm-dyckianus* and both inhabit the same geographical region (at Sierra Madre Occidental, mainly Chihuahua and Sonora, Mexico). Although differences in flower opening are reported (night vs all day opening), they are not mutually exclusive. So, in the absence of phylogenetic or statistical data, *E. rischeri* and *E. salm-dyckianus* are treated here as belonging to the tetraploid lineage. [Sánchez (2021)]

Notes. – Molecular phylogenetic studies indicate that previous taxonomic concepts for the *Echinopsis* alliance fail to reflect natural relationships (e.g. Schlumpberger & Renner 2012). For a natural classification the following segregate genera are accepted here: *Acanthocalycium*, *Chamaecereus*, *Echinopsis*, *Leucostele*, *Lobivia*, *Reicheocactus*, *Setiechinopsis*, *Soehrensia* and *Trichocereus*. The new generic concept for the *Echinopsis* alliance, with all the segregate genera accepted, was also already used in the 3rd edition of the CITES Cactaceae Checklist (Hunt 2016). [Schlumpberger (2021)]

Notes. – This taxon was long seen as part of the *Echinopsis aurea* Britton & Rose complex, although it grows further north and isolated from the distribution area of *E. aurea*. It resembles *E. tubiflora* (Pfeiff.) Zucc. ex A.Dietr. with which it grows at least partly in sympatry, but differs from it in having yellow, diurnal and nectarless flowers. Molecular data suggest a close relationship to *E. tubiflora* (Schlumpberger & Renner 2012). [Schlumpberger (2021)]

***Echinopsis tubiflora* subsp. *tubiflora*.** Sec. Schlumpberger (2021)

***Epiphyllum* Haw., Syn. Pl. Succ.: 197. 1812.** Sec. Korotkova & al. (2017)

Type: *Epiphyllum phyllanthus* (L.) Haw.

 Type: *Epithelantha micromeris* (Engelm.) F.A.C.Weber ex Britton & Rose
 = *Cephalomamillaria* Frič in in Život v Přír. 29: 9. 1925 syn. sec. Aquino (2021). Type: *Cephalomamillaria micromeris* (Engelm.) Frič
- Notes. – The number of accepted species in *Epithelantha* has been constantly changing, while some authors, e.g. Donati & Zanovello (2011) recognized about half a dozen species, others, e.g. Hunt (2016) accepted only two (*E. bokei* and *E. micromeris*). Hitherto only *E. micromeris* had been sampled in phylogenetic studies (Vázquez-Sánchez & al. 2013, Bárcenas & al. 2011), and found in an isolated position within the tribe *Cactaeae*.
 Aquino & al. (2019) have performed a detailed phylogenetic study of the genus and reconstructed the phylogeny of *Epithelantha* using sequences from the four plastid regions *petL-psbE*, *psbA-trnH*, *trnL-F*, and *trnQ-rps16* and a set of morphological characters. *Epithelantha* was recovered as monophyletic with maximal support as sister to *Turbincarpus*. The tree was fully resolved at the species-level and all clades corresponding to species received high or maximal support, thus providing a reliable basis for accepting in total 10 species. [Aquino (2021)]

Notes. – The combination *Gymnocalycium froehlichianum* published by Osten (1941) is an auct. case. He uses the combination for plants from Zapato, Capilla del Monte (Argentina), which he describes in the text and depicts in two tables: "*Gymnocalycium Froehlichianum* (K. Sch.) o *Saglione* (Cels.)" So, he was obviously not sure whether the plants he found belonged to Schumann's

Echinocactus froehlichianus. Two species are illustrated in Osten (1941) under the name "*Gymnocalycium Froehlichianum* (K. Sch.) o *Saglione* (Cels.)": *Gymnocalycium valnicekianum* (*G. mostii* s. l) and *G. monvillei*. [Metzing (2021)]

***Escontria* Rose in Contr. U.S. Natl. Herb. 10: 125. 1906. Sec. Hernández & Gómez-Hinostrosa (2011)**

Type: *Escontria chiotilla* (F.A.C.Weber ex K.Schum.) Rose

Notes. – **Phylogenetics:** Monotypic, endemic to southern Mexico. Sampled by Arias & al. 2005, Bárcenas & al. 2011 and Hernández-Hernández & al. 2011. The latter two studies show *E. chiotilla* resolved together with *Stenocereus* species, while Arias & al. found *E. chiotilla* in a polytomy with *Polaskia chichipe*, *Myrtillocactus* and *Stenocereus*, but not nested in any other genus. So, maintaining *Escontria* as a separate genus may be justified, but generic limits within that clade need further evaluation. [Korotkova & al. (2021)]

***Espostopsis* Buxb. in Krainz, Kakteen: 38-39, C Va. 1968.** Sec. Taylor & Zappi (2004)

Type: *Espostopsis dybowskii* (Rol.-Goss.) Buxb.

= *Gerocephalus* F.Ritter in Kakteen And. Sukk. 19: 156. 1968 syn. sec. Taylor & Zappi (2004)

Notes. – Monotypic genus, endemic to the caatinga of Bahia, SE Brazil. Hernández-Hernández & al. 2011 found *E. dybowskii* within an unsupported *Trichocereae* clade, as sister to *Rauhocereus* (no support), while Schlumpberger & Renner 2012 found *E. dybowskii* as sister to *Micranthocereus densiflorus* with 78% MLBS support. *Espostopsis* is therefore not closely related to the Andean genus *Espostoa*, a relationship that had been suggested earlier based on the strong morphological similarities of the two genera. [Korotkova & al. (2021)]

***Espostoopsis dybowskii* (Rol.-Goss.) Buxb. in Krainz, Kakteen 39: CVa. 1968.** Sec. Taylor & Zappi (2004)

***Estevesia* P.J.Braun in Kakteen And. Sukk. 60(3): 64. 2009.** Sec. Franck (2021)

Type: *Estevesia alex-bragae* P.J.Braun & Esteves

Notes. – *Estevesia* P.J. Braun has not been included in any molecular study so far. It was provisionally placed in the synonymy of *Harrisia* by Nyffeler & Eggli (2010).

The status of *Estevesia* was revisited by Franck (2016), stating: "*Estevesia* P.J. Braun had been erroneously synonymized with *Harrisia* (Nyffeler & Eggli 2010; Hernández-Ledesma et al. 2015), but *Estevesia* is likely more related to *Cereus* s. str. and *Monvillea* Britton & Rose." However, this still needs to be confirmed by a phylogenetic study. [Franck (2021)]

***Estevesia alex-bragae* P.J.Braun & Esteves in Kakteen And. Sukk. 60: 64. 2009.** Sec. Franck (2021)

***Eulychnia* Phil., Fl. Atacam.: 23. 1860.** Sec. Larridon & al. (2018)

Type: *Eulychnia breviflora* Phil.

= *Philippicereus* Backeb. in Cactaceae (Berlin) 1941(2): 75. 1942 syn. sec. Larridon & al. (2018). Type: *Philippicereus castaneus* (Phil.) Backeb.

Notes. – **Phylogenetics:** Species boundaries and infrageneric relationships in *Eulychnia* have recently been comprehensively studied using six chloroplast markers (*rpl32-trnL*, *trnH-psbA*, *trnL-trnF*, *trnQ-rps16*, *trnS-trnG*, and *ycf1*) and a sampling covering the distribution range (Larridon et al. 2018). *Eulychnia* was confirmed as monophyletic and two major clades were retrieved in the molecular phylogenetic hypotheses, a northern clade and a southern clade, which both can also easily be distinguished morphologically. The results also supported accepting three further species *E. ritteri*, *E. chorosensis* and *E. taltalensis*, together with the recognition of the new species *E. vallenarensis*. [Guerrero (2021)]

Notes. – **Phylogenetics:** Vázquez-Sánchez & al. (2013) found *Ferocactus* in its current circumscription to be vastly polyphyletic, and the same is true for sect. *Bisnaga*. The *Ferocactus* clade found by Vázquez-Sánchez & al. (2013) also includes the genera *Leuchtenbergia*, *Glandulicactus*, *Stenocactus* and *Thelocactus*, corroborating the results of a much less dense sampling by Hernández-Hernández & al. (2011). The *Ferocactus* clade is morphologically characterized by pericarpels with scales and ribbed stems, and Vázquez-Sánchez & al. (2013) suggested expanding *Ferocactus* to embrace the genera just mentioned is the best taxonomic solution to make *Ferocactus* monophyletic, yet *Leuchtenbergia* is the oldest name of this assemblage and would have priority, unless the name *Ferocactus* is conserved. [Hernández-Ledesma & al. (2015)]

***Frailea* Britton & Rose, Cactaceae 3: 208. 1922. Sec. Hunt (2006)**

Type: *Frailea cataphracta* (Dams) Britton & Rose

Notes. – The combination of several *Frailea* names under *Astrophytum* by Halda & Malina (2005) reflects only a superficial similarity of seeds and flowers. This supposed close relationship had already been postulated by Buxbaum (1951) but has no

phylogenetic support up to now. *Frailea* is one of several genera that, according to molecular phylogenies, have an isolated position within the *Cactoideae*, but the relationship to other clades is still not finally resolved (Hernández-Hernández & al. 2011). [Metzing (2021)]

***Grusonia* F.Rchb. ex Britton & Rose, Cactaceae 1: 215. 1919. Sec. Majure (2021)**

Type: *Grusonia bradtiana* (J.M.Coult.) Britton & Rose

- = *Corynopuntia* F.M.Knuth, Kaktus-ABC: 114, 410. 1936 ["1935"] syn. sec. Hunt (2016). Type: *Corynopuntia clavata* (Engelm.) F.M.Knuth
- = *Marenopuntia* Backeb. in Desert Pl. Life 22: 27. 1950 syn. sec. Hunt (2016). Type: *Marenopuntia marenae* (S.H.Parsons) Backeb.

Notes. – **Phylogenetics:** *Corynopuntia* was included in *Grusonia* s.l. (Wallace & Dickie 2002; Anderson 2001, 2005; Nyffeler & Egli 2010), then accepted as separate genus by Hunt (2006). Griffith & Porter (2009) argue for recognizing *Corynopuntia* as a distinct genus, and *Grusonia* as monotypic, although support for the monophyly of *Corynopuntia* was only 67% BS in their study. Their data also suggest that *Micropuntia* could be recognised as a separate genus. Bárcenas & al. (2011) do not find support for treating *Corynopuntia* separate from *Grusonia*, and in addition find no support for a monophyletic *Corynopuntia*. Majure & al. (2019) showed that the characters used to separate *Corynopuntia* from *Grusonia* are either plesiomorphic or convergent, thus, there is no clear reason for separating these taxa into two genera. However, they did show that the genus *Micropuntia* (formerly *Grusonia pulchella*) was sister to a *Grusonia* and *Cylindropuntia* clade, and thus, should be recognized as a monotypic genus. See also notes under *Cylindropuntia* and *Micropuntia*. [Majure (2021)]

Type: *Gymnocalycium gibbosum* (Haw.) Pfeiff. ex Mittler

= *Brachycalycium* Backeb. in Cactaceae (Berlin) 1941(2): 76. 1942 syn. sec. Demaio & al. (2011). Type: *Brachycalycium tilcarensense* Backeb.

Notes. – **Phylogenetics:** Found as monophyletic at first by Ritz & al. (2007), then studied in more detail and confirmed as monophyletic by Meregalli & al. (2010). **Taxonomy:** Demaio & al. (2011) conducted the most detailed phylogenetic study by sampling almost the whole genus and again confirmed the monophyly of *Gymnocalycium* with maximal support.

Several infrageneric classifications have been proposed, based mainly on size, form and surface characters of the seeds, but corresponding with flowers and fruits characters, too (see Demaio & al. 2011 for an overview). Seven subgenera have been accepted by Demaio & al. (2011). The type bearing subgenus (*Gymnocalycium* subg. *Gymnocalycium*) represents the most recent clade within the genus. Many of the “new” taxa described in the last two decades belong to this subgenus. Distinction of the taxa belonging to it based on morphological or molecular data is often almost impossible, which may reflect a rapid and recent radiation (Demaio & al. 2011, Řepka & Mracek 2012). There is evidence for different ploidy levels and hybridization (Řepka 2015), but the taxonomy of this subgenus remains poorly understood. [Metzing (2021)]

Key literature: Illustrated synopsis by Charles (2009). **Nomenclature:** Published as "Gymnocalycium". A nomenclatural checklist of names prior to 1995 was provided by Metzing & al. (1995).

***Hattoria* Britton & Rose in L.H.Bailey, Standard Cycl. Hort.: 1432. 1915.** Sec. Korotkova & al. (2011)

Type: *Hattoria salicornioides* (Haw.) Britton & Rose

≡ *Hariota* DC., Mém. Cact.: 23. 1834, nom. illeg. syn. sec. Britton & Rose (1923)

Notes. – The circumscription of *Hatiota* has been clarified. *Hatiota* including *Rhipsalidopsis* as adopted by Barthlott (1987), Barthlott & Hunt (1993), Barthlott & Taylor (1995), Hunt (2006) and Nyffeler & Egli (2010) was found to be polyphyletic (Calvente & al. 2011a; Korotkova & al. 2011). *Hatiota* should therefore be restricted to species with cylindrical stems, terete pericarpels, and small yellow-orange or magenta flowers, corresponding to *Hatiota* in the traditional sense. Accordingly, *Rhipsalidopsis* in its traditional circumscription should again be accepted at generic rank. [Hernández-Ledesma & al. (2015)]

***Isolatocereus* Backeb. in Cactaceae (Berlin) 1941(2): 47, 76. 1942.** Sec. Arias & Aquino (2019)

Type: *Isolatocereus dumortieri* (Scheidw.) Backeb.

Notes. – *Isolatocereus* is recognized here as a monotypic genus. It belongs to Echinocereae, based on molecular evidence (Hernández-Hernández & al. 2011) and because it shares the three characters of the group (tannins in the funicles, seeds with striated microrelief, triterpenes in the stem). It shares with *Stenocereus* the presence of silica bodies in the stem, however, phylogenetic studies carried out with cpDNA markers reveal that it is closer to *Myrtillocactus* and *Escontria*. [Arias (2021)]

***Kadenicarpus* Doweld in Sukkulenty 1: 22. 1998.** Sec. Vázquez-Sánchez & al. (2019)

Type: *Kadenicarpus pseudomacrolele* (Backeb.) Doweld

- = *Bravocactus* Doweld in Sukkulenty 1: 22. 1998 syn. sec. Vázquez-Sánchez & al. (2019). Type: *Bravocactus horripilus* (Lem.) Doweld
= *Turbincarpus* subg. *Kadenicarpus* (Doweld) D.Donati, Revis. Tasson. Gen. Turbincarpus: 21. 2003 syn. sec. Vázquez-Sánchez & al. (2019)

Notes. – **Systematics:** *Kadenicarpus* is a monophyletic genus, strongly supported and is resolved as sister to the clade composed of *Ariocarpus* and *Turbincarpus* (Vázquez-Sánchez & al. 2019). Anatomically it shares with *Turbincarpus* the presence of prismatic crystals in the hypodermis and differs from it by the presence of xylem fibers in cortical bundles (De la Rosa-Tilapa & al. 2019). Three species and four subspecies are recognized, of which *Kadenicarpus pseudomacroechele* is the species with more morphological variation (See treatment).

Notes. – *Kadenicarpus pseudomacroechele* (Backeb.) Doweld is a species with wide morphological variation. The four subspecies

share the presence of numerous tortuous, thin, non-sharp spines and a napiform root (Lüthy & Moser, 2002). The floral variation

is the most diverse. Flowers are pale to dark pink in the subspecies *pseudomacroechele* and *lausseri* while flowers are yellow in

the subspecies *krainzianus* and *minimus*, which led authors to suggesting that these subspecies should be recognized as species

(Donati & Zanovello, 2004). A systematic study to elucidate the limits between taxa is therefore necessary. It is also worth

mentioning that these subspecies are distributed in restricted habitats and that they are sought-after for horticultural purposes

(Lüthy & Moser, 2002), so that a better understanding of species limits will also provide a rationale as to which taxa should have

priority for conservation. [Aquino (2021)]

Type: *Kroenleinia grusonii* (Hildm.) Lodé

Notes. – **Phylogenetics:** Vargas-Luna & al. (2018) showed that *Echinocactus grusonii* was most closely related to *Ferocactus* and not to *Echinocactus*. Thus, the species clearly does not belong in *Echinocactus*. Those authors state that perhaps the close relationship to *Ferocactus* should be further explored with morphological data, so it possible that *Kroenleinia grusonii* is best circumscribed within *Ferocactus* (Vargas-Luna & al. (2018). However, for now given the phylogenetic topology, the recognition of *Kroenleinia* seems to be warranted. See also notes under *Echinocactus*. [Majure (2021)]

Notes. – **Phylogenetics:** In the second half of the twentieth century, *Lemaireocereus* was referred to as synonym of *Pachycereus* (see there) by Buxbaum (1961), Bravo-Hollis (1978), and Gibson & Horak (1978), based on similar floral morphology.

Phylogenies based on molecular (Arias & al. 2003) and structural data (Arias & Terrazas 2006) consistently have revealed that *Lemaireocereus* is an early diversified lineage within *Pachycereinae*. *Lemaireocereus* should be restricted to species with rounded ribs, terminal flowers with long hairs and bristles, fruit with irregular dehiscence, and red pulp (Arias & Terrazas 2009; Arias & al. 2012). [Hernández-Ledesma & al. (2015)]

***Leocereus* Britton & Rose, Cactaceae 2: 108. 1920.** Sec. Taylor & Zappi (2004)

Type: *Leocereus bahiensis* Britton & Rose

Notes. – Monotypic genus from Eastern Brazil. Sampled by Schlumpberger & Renner 2012 and found highly supported as sister to *Facheiroa ulei*. Both genera used to be included in the *Trichocereae*, but their exact affinities were unclear (Taylor & Zappi 2004). Schlumpberger & Renner (2012) found *Leocereus* and *Facheiroa* outside the *Trichocereae* and within a clade containing *Stetsonia*, *Cereus*, *Praecereus*, *Micranthocereus*, and other genera. [Korotkova & al. (2021)]

***Lepismium* Pfeiff. in Allg. Gartenzeitung 3: 315. 1835. Sec. Korotkova & al. (2011)**

Type: *Lepismium commune* Pfeiff.

- = *Nothorhipsalis* Doweld in Sukkulenty 4(1-2): 29. 2002 ["2001"] syn. sec. Hunt (2006). Type: *Nothorhipsalis houlettiana* (Lem.) Doweld
- = *Ophiorhipsalis* (K.Schum.) Doweld in Sukkulenty 4(1-2): 39. 2002 ["2001"] syn. sec. Hunt (2006). Type: *Ophiorhipsalis lumbricoides* (Lem.) Doweld

Notes. – Several considerably different generic concepts have been suggested for *Lepismium* in the past 80 years. It was either recognized as monotypic for *L. cruciforme* (Vell.) Miq., e.g. by Britton & Rose (1923) or included into *Rhipsalis* (Schumann 1899; Vaupel 1925, 1926). Barthlott (1987) and Barthlott & Taylor (1995) redefined *Lepismium* based on the mesotonic branching as main diagnostic character, but this circumscription was found to be polyphyletic by Nyffeler (2002) and Korotkova & al. (2010). Consequently, some of its species were transferred to *Lymanbensonia* and *Pfeiffera* by Korotkova & al. (2010). [Hernández-Ledesma & al. (2015)]

(2014) ≡ *Echinopsis terscheckii* var. *montana* (Backeb.) H.Friedrich & G.D.Rowley in Repert. Pl. Succ. 25: 10. 1976 ["1974"] syn. sec. Kiesling & al. (2014) = *Trichocereus validus* (Monv. ex Salm-Dyck) Backeb. in Cactus (Paris) 46-47: 265. 1955 syn. sec. Schlumpberger (2021) = *Trichocereus terscheckioides* F.Ritter, Kakteen Südamerika 2: 446. 1980 syn. sec. Kiesling & al. (2014)

Notes. – *Echinopsis valida* was interpreted as related to or identical with what is now *Acanthocalycium rhodotrichum* or *A. leucanthum* (e.g. Schumann 1899, Britton & Rose 1922). As the protologue is not clearly assignable to any accepted taxon, we treat *E. valida* Monv. ex Salm-Dyck as a name of uncertain application (nomen dubium). But while Salm-Dyck (1850) described *E. valida* a rather low-growing plant ("caule subellipsoideo"), a second, different interpretation comes from Backeberg (1955), who assumed that Monvilles / Salm-Dyck's description was based on a juvenile plant of a columnar *Trichocereus*. Backeberg's *Trichocereus validus* (Monv. ex Salm-Dyck) Backeb. is clearly similar to *Leucosteles terscheckii*, based on his description and photos. The name is often used for such plants in living collections. In absence of more evidence, *T. validus* is here treated as synonym of *Leucosteles terscheckii*. [Schlumpberger (2021)]

Notes. – **Phylogenetics:** *Lophocereus* (including *L. gates* and *L. schottii*) was strongly recognized as a separate genus, restricted to the Sonoran Desert, by e.g. Lindsay (1963) and Bravo-Hollis (1978). Comparative studies carried out by Gibson & Horak (1978) showed that those species share morphological and anatomical characteristics with *Pachycereus marginatus*. However, other taxonomists preferred to include this genus and others (e.g. *Backebergia*, *Lemaireocereus*, *Marginatocereus*, *Mitrocereus*, *Pterocereus*) in a broader genus *Pachycereus* (Barthlott & Hunt 1993; Hunt 2006). Phylogenetic studies based on structural (anatomy + morphology) and molecular data confirm that *Lophocereus* is monophyletic including three species (*L. marginatus* as sister to the remaining species). The genus represents a lineage within the subtribe *Pachycereinae* but is not directly related to *Pachycereus* s.str. or *Backebergia* (Hartmann & al. 2001, 2002; Arias & al. 2003; Arias & Terrazas 2006). A proposal to recognize this genus newly circumscribed (now going also beyond the Sonoran Desert) was conducted by Arias & al. (2012).

Lophocereus now includes taxa characterized by cylindrical stems with basal branching, an apical fertile zone with areoles, and spines larger than those of the sterile zone, and two or more flowers per areole. The flowering zone is conspicuously modified in all three species, although in *L. gatesii* and *L. schottii* internodes are shorter and spines are longer (Arias & Terrazas 2009; Arias & al. 2012). Structural changes in the fertile zone exist between several genera of *Pachycereinae*, including cephalium (e.g. *Backebergia*, *Cephalocereus* spp.), pseudocephalium (e.g. *Lophocereus*, *Neobuxbaumia* spp.) and intermediate forms. However, those structures are highly homoplastic and occur within several genera. [Hernández-Ledesma & al. (2015)]

***Lophophora* J.M.Coult. in Contr. U.S. Natl. Herb. 3: 131. 1894.** Sec. Vázquez-Sánchez & al. (2013)

Type: *Lophophora williamsii* (Lem. ex Salm-Dyck) J.M.Coult.

= *Peyotl* F.Hern., Hist. Pl. Nov. Hisp. 3: 70. 1790 syn. sec. Vázquez-Sánchez & al. (2013)

Notes. – **Phylogenetics:** Butterworth & al. (2002) found *L. williamsii* as sister to *Obregonia* and *L. diffusa* (Croizat) Bravo as sister to *Acharagma*, yet both with only moderate support. In contrast, *Lophophora williamsii* and *L. diffusa* were resolved as sisters with moderate support in the study of Vázquez-Sánchez & al. (2013), who also found high support for the sister relationship of *Lophophora* and *Obregonia*, justifying generic rank for both. [Hernández-Ledesma & al. (2015)]; At present, about four species are known by combination of some characters such as papillae on the epidermis of the stem, the micromorphology of the seed, as well as the concentration of some alkaloids. A detailed population study (morphological, genomic) is required to circumscribe the species and their relationships. [Arias (2021)]

***Lymanbensonia* Kimmach in Cact. Succ. J. (Los Angeles) 56: 101. 1984.** Sec. Korotkova & al. (2010)

Type: *Lymanbensonia micrantha* (Vaupel) Kimmach

= *Acanthorhopsalis* Kimmach in Cact. Succ. J. (Los Angeles) 55: 177. 1983, nom. illeg. syn. sec. Korotkova & al. (2010)

Notes. – **Phylogenetics:** Segregated from *Acanthorhopsalis* (Kimmach 1984), but otherwise either assigned to *Lepismium* (Barthlott 1987; Barthlott & Taylor 1995; Anderson 2001, 2005) or to *Pfeiffera* (Hunt 2006). The molecular phylogenetic study

of Korotkova & al. (2010) unexpectedly found the three species now assigned to *Lymanbensonia* to represent a highly supported isolated clade distant from either *Lepismium* or *Pfeiffera*. As this new clade contained the nomenclatural type of *Lymanbensonia*, this generic name was reinstated. [Hernández-Ledesma & al. (2015)]

Notes. – **Phylogenetics:** Griffith & Porter (2009) found *Maihueniopsis* polyphyletic based on a combined analysis of nuclear ITS and plastid *trnL-F*, but Ritz & al. (2012) found a monophyletic *Maihueniopsis* to be strongly supported by nuclear *phyC* and plastid *trnK/matK*. The reasons for these deviating results are discussed in detail by Ritz & al. (2012) and appear to result from peculiarities in the evolution of the ITS sequences used by Griffith & Porter that seem unsuitable to adequately represent phylogenetic relationships. [Hernández-Ledesma & al. (2015)]

Notes. – **Phylogenetics:** *Mammillaria* is the largest genus within *Cactaceae*, and numerous suggestions for infrageneric entities have been proposed, often then segregated as different genera; the different taxonomic concepts were summarized by Butterworth & Wallace (2004). Although several phylogenetic studies dealing with the genus and allies have been published, there are still many uncertainties that result from insufficient phylogenetic resolution and support.

Mammillaria was studied in detail using data from the plastid *rpl16* intron and *psbA-trnH* intergenic spacer by Butterworth & Wallace (2004), who sampled about 4/5 of the accepted species, and Bárcenas & al. (2011) for *trnK/matK* compiled an even more extensive sampling.

Mammillaria was also included in the phylogenetic studies of the tribe *Cacteeae* by Butterworth & al. (2002) and Vázquez-Sánchez & al. (2013), though with much fewer species sampled.

The first sequence data already hinted to a non-monophyly of *Mammillaria* (Butterworth & al. 2002), yet without support. The results of Butterworth & Wallace (2004), based on a detailed sampling, again suggested polyphyly of *Mammillaria*. The genera *Peleciphora*, *Coryphantha*, *Escobaria*, *Ortegocactus*, *Mammilloidia* and *Neolloydia* were found nested in a maximally supported *Mammillaria* s.l. clade. Bárcenas & al. (2011) did not find sufficient support a monophyletic *Mammillaria*, and *Coryphantha* (likewise polyphyletic), *Ortegocactus* and *Escobaria* were nested in different *Mammillaria* clades. Vázquez-

Sánchez & al. (2013) found that *Mammillaria* and *Coryphantha* could be separate clades, yet *Mammillaria* was supported as monophyletic only in the parsimony tree (61% BS/78% JK) but not found as monophyletic by Bayesian Inference. A clade of *Coryphantha* incl. *Neolloydia* was maximally supported in the parsimony and Bayesian trees, but *C. macromeris* (Engelm.) Lem. fell outside that clade, suggesting that *Coryphantha* is likewise polyphyletic. *Escobaria* was found polyphyletic as well (Vázquez-Sánchez & al. 2013), but only few species have been sampled. The results of Vázquez-Sánchez & al. (2013) also did provide some insights on generic limits in the whole assemblage, as well as taxonomic changes by segregating *Cochemiea* from *Mammillaria*, and *Cumarinia* from *Coryphantha*.

Mammilloidya was found nested in *Mammillaria* (Butterworth & al. 2002; Butterworth & Wallace 2004; Bárcenas & al. 2011; Vázquez-Sánchez & al. 2013) and all authors argue *Mammilloidya* should therefore no longer be recognized at generic rank. The *Mammillaria* assemblage therefore remains one of the *Cactaceae* groups that need further detailed study. Some nodes were so far weakly supported, and final conclusions regarding the monophyly and generic limits of *Mammillaria* must await a more extensive sampling, especially for *Coryphantha* and *Escobaria*, until firm taxonomic and nomenclatural conclusions are possible. ***Marshallocereus* Backeb. in *Cact. Succ. J. (Los Angeles)* 22: 154. 1950.** Sec. Arias (2021)

Type: *Marshallocereus aragonii* (F.A.C.Weber) Backeb.

Notes. – **Phylogenetics:** Some phylogenetic analyses and taxonomic studies confirm that *Marshallocereus* belongs to the *Pachycereinae* subtribe, but its relationship with *Cephalocereus* and *Pachycereus* is still uncertain (Arias & al. 2003; Arias & Terrazas 2006, 2009). Its distribution is one of the southernmost of *Pachycereinae*, in the Mesoamerican region (Mexico to Costa Rica). The recognition of more than one species is not resolved. [Arias (2021)]

Notes. – **Phylogenetics:** *Opuntia* is the second-largest genus of the family *Cactaceae*. As in all species-rich *Cactaceae* groups, numerous different generic concepts with a varying number of segregate genera have been suggested for *Opuntia*. Both, extensive splitting (e.g. Backeberg 1966) or lumping into a broadly defined *Opuntia* were put forward (Rowley 1958; Benson 1982). The first phylogenetic study by Wallace & Dickie (2002) based on the *rpl16* intron found *Opuntia* in the broad sense to be polyphyletic. For the revised generic classification they presented based on their data, they argued for splitting *Opuntia*, because otherwise further genera (e.g. *Pereskiaopsis*, *Pterocactus*) were also nested within *Opuntia* and merging those would make *Opuntia* a highly heterogenous assemblage. Therefore Wallace & Dickie suggested reinstating the earlier-proposed *Opuntia* segregates *Austrocylindropuntia*, *Brasilopuntia*, *Consolea*, *Corynopuntia*, *Cumulopuntia*, *Cylindropuntia*, *Grusonia*, *Maihueiopsis*, *Miqueliopuntia*, *Nopalea*, *Tephrocactus*, and *Tunilla*. *Opuntia* s.str. was thus restricted to the taxa with flattened

stems and reticulate pollen. This concept was entirely adapted by Hunt (2006), and largely by Nyffeler & Egli (2010). Griffith & Porter (2009), using data from plastid *trnL-F* and nuclear ITS, found *Opuntia* in this restricted sense to additionally include *Consolea* and *Nopalea*, the clade including all three genera received 100% support, and both *Consolea* and *Nopalea* were also supported as monophyletic with 100%. The tree resolution, however, did not allow an immediate conclusion on the delimitation of these genera. *Nopalea* used to be separated from *Opuntia* s.str. because it differs primarily in its hummingbird-syndrome flowers. Nevertheless, it was repeatedly found to be nested in *Opuntia* (Wallace & Gibson 2002; Griffith & Porter 2009; Bárcenas & al. 2011; Hernández-Hernández & al. 2011). Majure & al. (2012) and Majure & Puente (2014) conclusively showed that *Nopalea* was deeply nested within *Opuntia* and merely resulted from a pollinator shift to birds within a more broadly, insect-pollinated clade. [Hernández-Ledesma & al. (2015)]; Although *Opuntia* s.s. is now well defined, species limits and taxonomy in the group are still problematic, and much systematic work is needed to refine our knowledge of species relationships and how species should be appropriately circumscribed. Majure & al. (2017) suggested that cryptic species exist in the clade, and detailed monographic work will be necessary to properly address this issue across the genus. [Majure (2021)]

***Pachycereus* (A.Berger) Britton & Rose in Contr. U.S. Natl. Herb. 12: 420. 1909. Sec. Arias & Terrazas (2009)**

Type: *Pachycereus pringlei* (S.Watson) Britton & Rose

- ≡ *Cereus* subg. *Pachycereus* A.Berger in Rep. (Annual) Missouri Bot. Gard. 16: 63. 1905 syn. sec. Arias & Terrazas (2009)
 = *Backebergia* Bravo in Anales Inst. Biol. Univ. Nac. Mexico 24: 230. 1954 syn. sec. Arias & Terrazas (2009)
 = *Pterocereus* T.MacDoug. & Miranda in Ceiba 4: 135. 1954 syn. sec. Arias & Terrazas (2009). Type: *Pterocereus foetidus* T.MacDoug. & Miranda

Notes. – **Phylogenetics:** Phylogenetic studies based on morphological and molecular data show consistently that *Pachycereus* s.str. is a monophyletic group with five species (Arias & al. 2003; Arias & Terrazas 2006, 2009; Arias & al. 2012). Other species previously considered in *Pachycereus* (Buxbaum 1961; Gibson & Horak 1978; Anderson 2001; Hunt 2006; Nyffeler & Egli 2010) have been transferred to *Lemaireocereus*, *Lophocereus*, and *Cephalocereus*. More inclusive and robust new evidence may corroborate or refute the current delimitation of these last genera. *Pachycereus* s.str. includes tree-like species, interareolar grooves on the stems, abundant trichomes on flower, and flexible spines on the fruit. The genera *Backebergia* and *Pterocereus* (both of them monospecific) remain inconclusive on molecular data available (Arias & al. 2003; Hernández-Hernández 2011), therefore their recognition as separate genera remains premature.

***Pelecyphora strobiliformis* (Werderm.) Frič & Schelle ex Kreuz., Verzeichnis Amer. Sukk. Rev. Syst. Kakteen: 9. 1935. Sec. Vázquez-Sánchez & al. (2013)**

- ≡ *Ariocarpus strobiliformis* Werderm. in Z. Sukkulentenk. 3(7): 126-128. 1927 syn. sec. Hunt (2006) ≡ *Encephalocarpus strobiliformis* (Werderm.) A.Berger, Kakteen: 332. 1929 syn. sec. Vázquez-Sánchez & al. (2013)

***Peniocereus* (A.Berger) Britton & Rose in Contr. U.S. Natl. Herb. 12: 428. 1909. Sec. Arias & al. (2005)**

Type: *Peniocereus greggii* (Engelm.) Britton & Rose

- ≡ *Cereus* subsect. *Peniocereus* A.Berger in Rep. (Annual) Missouri Bot. Gard. 16: 77. 1905 syn. sec. Hunt (2006)

= *Neoevansia* W.T.Marshall in Marshall & Bock, *Cactaceae*: 84. 1941 syn. sec. Hunt (2006). Type: *Neoevansia diguetii* (F.A.C.Weber) W.T.Marshall

= *Cullmannia* Distefano in *Kakteen And. Sukk.* 7: 8. 1956 syn. sec. Hunt (2006). Type: *Cullmannia viperina* (F.A.C.Weber) Distefano

Notes. – **Phylogenetics:** The generic circumscription of *Peniocereus* was revised based on the molecular phylogenetic study of Arias & al. (2005). Their study based on plastid *trnL-F* and *rpl16* found *Peniocereus* polyphyletic, its species resolved in three lineages. *Peniocereus* subg. *Pseudoacanthocereus* was found to be nested in *Acanthocereus*, yet both were also paraphyletic. For a classification reflecting these relationships, *Peniocereus* subg. *Pseudoacanthocereus* was transferred to *Acanthocereus* (Lodé 2013; Korotkova & al. 2017). The other major *Peniocereus* clade found by Arias & al. (2005) corresponds to *Peniocereus* subg. *Peniocereus*. *Peniocereus serpentinus* (Lag. & Rodr.) N. P. Taylor was resolved as a separate lineage. Since it is the type species of the earlier-proposed genus *Nyctocereus*, Arias & al. (2005) suggested reinstating it as monotypic. [Arias (2021)]

 – *Carpophyllus* Neck., *Elem. Bot.* 2: 84. 1790, nom. inval. syn. sec. Kew WCVP (2019)

Notes. – **Phylogenetics:** *Pereskia* has been repeatedly found to be paraphyletic by Nyffeler (2002), Edwards & al. (2005), and Butterworth & Edwards (2008). The genus forms a grade at the base of the *Cactaceae*, with a northern clade including Mesoamerican and Caribbean *Pereskias* as the first branching group followed by a southern clade, with mainly the Andean *Pereskias*, that also include the nomenclatural type of *Pereskia* (Butterworth & Wallace 2005; Edwards & al. 2005). No nomenclatural changes to reflect the paraphyly of *Pereskia* have been proposed by Edwards & al. (2005), who preferred their results to be tested with additional genes before suggesting a new classification for *Pereskia*. Also, no generic name was readily available for the northern *Pereskia* clade – the type of earlier-proposed segregate *Rhodocactus* was in the southern clade together with the type of *Pereskia* itself. An evolutionary instead of phylogenetic classification for *Pereskia* was favoured because both *Pereskia* clades have characters that are interpreted as ancestral within *Cactaceae*, such as a woody stem, the presence of true leaves, a flower morphology that differs from the rest of the *Cactaceae* and C₃ photosynthesis. Only recently, the northern *Pereskias* were segregated as *Leuenergeria* (Lodé 2013), yet this segregation also received criticism because the two clades are hard to distinguish morphologically (<http://www.mobot.org/MOBOT/research/Edge/apr13/apr13lit.shtml>; Hunt 2013). Seeking a compromise between molecular phylogenetic hypotheses and nomenclatural stability, Rowley (2013) suggested a subgenus *Leuenergera* (note the different spelling) for the northern *Pereskia* clade. [Hernández-Ledesma & al. (2015)]

= *Bolivianburya* Guiggi, Iconogr. Cat. Cact. Cult. Hanbury: 28. 2016 syn. sec. Korotkova (2021)

Notes. – **Phylogenetics:** The circumscription of *Pfeiffera* has undergone several radical changes in the past, and until the early 1980s, it was treated as monotypic genus with *P. ianthothele* (Monv.) F. A. C. Weber. Kimmach (1983) subsumed *Pfeiffera* under *Rhipsalis*, while Barthlott (1987), Barthlott & Taylor (1995) and Anderson (2001, 2005) synonymized it with *Lepismium*. In the molecular phylogeny of Nyffeler (2002), *P. ianthothele* unexpectedly grouped together with two traditional *Lepismium* species, and widely distant from either *Rhipsalis* or *Lepismium*. Hunt (2006) broadened the concept of *Pfeiffera* to include nine species. This circumscription of *Pfeiffera* was evaluated and clarified Korotkova & al. (2010) who rejected the circumscription of Hunt (2006) that also included the species now segregated as *Lymanbensonia* (see also note under *Lymanbensonia*). [Hernández-Ledesma & al. (2015)]

Notes. – The earliest available basionym for the *Pilosocereus* Byles & G.D.Rowley cacti of Puerto Rico and the Virgin Islands appears to be *Cereus armatus*. The protologue of *C. armatus* described the stems as “vix glaucescens”, which may pertain to cultivated young plants or stressed or older stems that are sometimes not as bluish glaucescent as are mature, vigorous stems. The use of *P. royenii* (L.) Byles & G.D.Rowley for these plants by Franck & al. (2019) cannot be followed because it overlooked the designation of neotype for *Cactus royenii* L. made by Mottram (2013). Both the neotype and the protologue of *C. royenii* (Linnaeus 1753) are ambiguous with regard to provenance and precise identity. [Franck (2021)]

Kew WCVP (2019) – *Monvillea parpaetiensis* F.Ritter, Kakteen Südamerika 2: 510. 1980 syn. sec. TPL (2013) [is misspelling for *Monvillea parapetiensis* F.Ritter]
- = *Cereus ritteri* P.J.Braun & Esteves in Succulenta (Netherlands) 74: 84. 1995 syn. sec. Kew WCVP (2019)
- = *Monvillea krapovickiana* R.Kiesling in Bonplandia (Corrientes) 19: 60. 2010 syn. sec. Kew WCVP (2019)
- = *Cereus saxicola* var. *anguiniformis* Riccob. in Boll. Reale Orto Bot. Palermo 8: 252. 1909 syn. sec. Kew WCVP (2019) – *Cereus anguiniformis* Hort. ex Riccob. in Boll. Reale Orto Bot. Palermo 8: 252. 1909, nom. inval. syn. sec. Hunt (2006)
- *Cereus cavendishii* Monv. ex Salm-Dyck, Cact. Hort. Dyck., ed. 1849: 210. 1850, nom. inval. syn. sec. Berendsohn

Notes. – Kiesling (2011 in Haseltonia 2011(16): 3–8) concluded that this is an earlier name for *Praecereus saxicola*, which is currently supported by the proposed neotype and epitype of *C. cavendishii*. Hunt (2016) maintained *C. cavendishii* referred to a species of *Acanthocereus*. The rib number and provenance of *C. cavendishii* in the protologue are somewhat conflicting with either usage. The use of *Monvillea* sensu Kiesling has so far not been widely adopted and *C. cavendishii* has not been proposed for rejection. [Franck (2021)]

***Pseudorhipsalis* Britton & Rose, Cactaceae 4: 213. 1923. Sec. Korotkova & al. (2017)**

Type: *Pseudorhipsalis alata* (Sw.) Britton & Rose

- = *Wittia* K.Schum. in Monatsschr. Kakteenk. 13: 117. 1903, nom. illeg. syn. sec. Korotkova & al. (2017). Type: *Wittia amazonica* K.Schum.
- = *Wittiocactus* Rauschert in Taxon 31: 558. 1982 syn. sec. Korotkova & al. (2017). Type: *Wittiocactus amazonicus* (K.Schum.) Rauschert
- = *Disisorhipsalis* Doweld in Sukkulenty 4(1-2): 40. 2002 ["2001"] syn. sec. Korotkova & al. (2017). Type: *Disisorhipsalis macrantha* (Alexander) Doweld

Notes. – *Pseudorhipsalis* was newly circumscribed by Korotkova & al. (2017) based on the results of their phylogenetic study. A *Pseudorhipsalis* clade including the nomenclatural type *P. alata* received maximum support from all analyses therein, but *P. ramulosa* was not part of that clade and a new genus *Kimmachia* was established for *P. ramulosa* (see also there). ***Rapicactus* Buxb. & Oehme in Cactaceae (Berlin) 1942(1): 24. 1942. Sec. Vázquez-Sánchez & al. (2019)**

Type: *Rapicactus subterraneus* (Backeb.) Buxb. & Oehme

- *Turbincarpus* subg. *Rapicactus* (Buxb. & Oehme) Zachar, Gen. Turbincarpus: 93 (10). 2004, nom. inval. syn. sec. Aquino (2021)
 = *Lodia* Mosco & Zanovello in Bradleya 18: 44. 2000 syn. sec. Aquino (2021). Type: *Lodia mandragora* (Frič ex A.Berger) Mosco & Zanov.

Notes. – **Phylogenetics:** Traditionally included in *Turbincarpus*, separated from it by Vázquez-Sánchez & al. (2013) after *Turbincarpus* was found to be polyphyletic by them and previously also by Bárcenas & al. (2011). Subsequent evidence indicated that *Rapicactus* was an independent lineage of *Turbincarpus* s.s. The presence of concentric druses in the hypodermis is a feature present in the members of *Rapicactus* (De la Rosa-Tilapa et al. 2018). Vázquez-Sánchez et al. (2019) performed a phylogenetic study that included five molecular markers (*matK*, *rbcl*, *psbA-trnH*, *rpl16* and *trnL-F*) and anatomical characters. *Rapicactus* was recovered as monophyletic with maximal support as sister to *Acharagma*, *Lophophora* and *Obregonia*. In conclusion, *Rapicactus* is a lineage independent from *Turbincarpus* s.s. Five species and four subspecies are recognized, of which *Rapicactus beguinii* is the species with the greatest morphological variation (See treatment). [Aquino (2021)].

***Rapicactus beguinii* (N.P.Taylor) Lüthy in Cactus & Co. 7(1): 38. 2003. Sec. Vázquez-Sánchez & al. (2013)**

 – *Rapicactus beguinii* subsp. *laurae* D.Donati & Zanov., Con. Cap. Colt. Turbincarpus - Rapicactus: 221. 2004, nom. inval. syn. sec. Aquino (2021)
 – *Rapicactus canescens* D.Donati & Zanov., Con. Cap. Colt. Turbincarpus - Rapicactus: 217. 2004, nom. inval. syn. sec. Aquino (2021)
 – *Rapicactus donatii* D.Donati & Zanov., Con. Cap. Colt. Turbincarpus - Rapicactus: 219. 2004, nom. inval. syn. sec. Aquino (2021)

Notes. – The morphological variation of *Rapicactus beguinii* is the widest in the genus, which is why multiple species and subspecies have been proposed (Donati & Zanovello 2004). A systematic study is required that includes a morphological analysis, DNA sequences and environmental variables that allows a better understanding of the variation and that allows to establish interspecific limits. [Aquino (2021)]
