Notes. – **Phylogenetics:** The circumscription of *Rebutia* s.l. vs. a suite of proposed segregates (including *Aylosteria*, *Digitorebutia*, *Mediolobivia*, *Sulcorebutia* and *Weingartia*) has been the subject of continued debate in the past 30 years. The wide circumscription (including these taxa) was adopted by Anderson & al. (2001) and Hunt (2006), but not by Anderson (2005) who recognized *Sulcorebutia* and *Weingartia*. The broad concept goes back to the consensus *Cactaceae* classification as summarized by Hunt & Taylor (1986), and some participants of the discussions at that time even argued that *Rebutia* sensu latissimo should be placed in the synonymy of an even more expanded *Echinopsis*.

Recent molecular phylogenetic studies showed, however, that *Rebutia* does not belong into the *Echinopsis* clade (Ritz & al. 2007; Mosti & al. 2011; Schlumpberger & Renner 2012), and that the genus in this broad concept is an untenable polyphyletic assemblage. In the molecular phylogeny of Ritz & al. (2007), three independent clades with taxa of *Rebutia* s.l. are found, namely *Weingartia* (incl. *Sulcorebutia* and *Cintia*), "Rebutia I" (including the segregates *Aylosteria*, *Digitorebutia* and *Mediolobivia*), and "Rebutia II" (conforming to *Rebutia* s.str.). While *Rebutia* s.str. is placed as sister to *Browningia*, *Aylosteria* is placed in a clade with *Cereus* and *Stetsonia* (Ritz & al. 2007; Mosti & al. 2011). Therefore, it appears reasonable to abandon the concept of *Rebutia* s.l., to restrict *Rebutia* to the "true" rebutias, and to accept both *Aylosteria* as well as *Weingartia* as separate genera. Most of the necessary new combinations have been published for *Aylosteria* (Monti & al. 2011) and *Weingartia* (Hentzschel & Augustin 2008). [Hernández-Ledesma & al. (2015)]

= *Epiphyllopsis* A. Berger, Kakteen: 341. 1929 syn. sec. Korotkova (2021)

– *Epiphyllopsis* Backeb. & F.M.Knuth, Kaktus-ABC: 158. 1936 ["1935"], nom. inval. syn. sec. TPL (2013)

= ×*Rhipsaphyllopsis* Werderm. in Kakteenkunde 3: 11. 1939 syn. sec. Barthlott & Taylor (1995)

Notes. – **Phylogenetics:** As explained under *Hattoria*, the inclusion of *Rhipsalidopsis* in *Hattoria* is not supported by recent molecular phylogenies. Calvente & al. (2011) found the two traditional *Rhipsalidopsis* species (*R. gaertneri* (Regel) Moran, *R. rosea*) are sister to *Schlumbergera*, but with moderate support. Korotkova & al. (2011), however, found *Schlumbergera*, *Hattoria* s.str. and *Rhipsalidopsis* to form a grade, and even though support for this topology is also moderate, support for the monophyly of the three genera is maximal, therefore *Rhipsalidopsis* (Easter cacti) is best kept separate from *Schlumbergera* (Christmas cacti). [Hernández-Ledesma & al. (2015)]

– *Hariota* Adans., Fam. Pl. 2: 243, 520. 1763, nom. rej. syn. sec. Index Nominum Genericorum

Notes. – **Phylogenetics:** The circumscription of *Rhopsisalis* - one of the oldest genera of the family - has changed repeatedly over time, and often *Hatiota*, *Pseudorhopsisalis* and *Lepismium*, all now accepted at generic rank, were variously subsumed under *Rhopsisalis*. The morphology-based circumscription of *Rhopsisalis* by Barthlott & Taylor (1995) has been entirely confirmed as monophyletic with maximal support in the molecular phylogenetic study of Korotkova & al. (2011); the same result was shown by Calvente & al. (2011b), though with a less comprehensive sampling.

Rhopsisalis is notable since *R. baccifera* (Sol.) Stearn is the only species of the family that naturally occurs outside the New World. [Hernández-Ledesma & al. (2015)]

Notes. – Mottram & Hoxey (2020) have recently pointed out that *Rhopsisalis parasitica* (L.) Haw. (≡ *Cactus parasiticus* L.) has priority over *Rhopsisalis baccifera* (Sol. ex J.S.Muell.) Stearn. However, *Rhopsisalis parasitica* has hitherto never been in use, while *Rhopsisalis baccifera* is a well-established name that has been very frequently used throughout the literature. Therefore, *Rhopsisalis baccifera* / *Cassytha baccifera* Sol. ex J.S.Muell. is proposed for conservation against *Cactus parasiticus* (Taylor & Zappi 2020). [Korotkova (2021)]

Notes. – **Notes on *Selenicereus triangularis*:** The publication year of Plukenet's *Phytographia* containing the lectotype was incorrectly given by Doweld l.c as 1696.

Notes on *Cereus compressus*: Miller (1768) described *Cereus compressus* as different from *Cereus triangularis*. Yet in the protologue of *C. compressus*, he cited Plukenet's illustration from the "Phytographia" (Plukenet 1691). Miller apparently confused the figure of Plukenet, that was originally associated with the name *Cactus triangularis* by Linnaeus and associated it with his name *Cereus compressus*. Doweld (2002b) designated Plukenet's illustration as the lectotypes of both, *Cactus triangularis* Linnaeus and *Cereus compressus* Miller Therefore *Cereus compressus* Miller has to be a homotypic synonym of *Cactus triangularis* Linnaeus.

The name *Cereus triangularis* (Linnaeus) Miller is therefore not a combination of *Cactus triangularis* Linnaeus because it is based on a different type. However, it is unclear what exactly Miller based this name on. Therefore, Miller's name was probably not used or mentioned by later authors and should best be formally rejected. [Korotkova & al. (2017)]

Notes. – **Phylogenetics:** *Stenocereus* is a monophyletic genus if *S. aragonii* and *S. eichlamii* are excluded. The exclusion of *S. dumortieri* is still poorly supported, while retention of *S. yunckeri* is ambiguous; contains at least four clades (Alvarado-Sizzo et al. 2018; Alvarado-Sizzo et al. 2019; Arreola-Nava & Terrazas 2003). *Stenocereus* is one of the most diverse in Echinocereaceae, in stem and flower morphology. Its greatest taxonomic diversity is found in south-central Mexico. [Arias (2021)]

***Strophocactus Britton & Rose in Contr. U.S. Natl. Herb. 16: 262. 1913.* Sec. Korotkova & al. (2017)**

Type: *Strophocactus wittii* (K.Schum.) Britton & Rose

- = *Pseudoacanthocereus* F.Ritter, Kakteen Südamerika 1: 47. 1979 syn. sec. Korotkova & al. (2017). Type: *Pseudoacanthocereus brasiliensis* (Britton & Rose) F.Ritter
 – *Strophocereus* Frič & Kreuz. in Kreuzinger, Verzeichnis Amer. Sukk. Rev. Syst. Kakteen: 21. 1935, nom. illeg. syn. sec. Kew WCVP (2019)

Notes. – *Strophocactus* was originally established as a monotypic genus by Britton & Rose (1913) and remained in this circumscription until (Hunt 1989) transferred *Strophocactus* to *Selenicereus*. The reinstatement of *Strophocactus* with three species previously placed in *Selenicereus* was suggested by Bauer (2003) and adapted by Hunt (2006). Korotkova & al. (2017), based on plastid *trnK/matK*, *rpl16* intron and *trnL-F*, found *Strophocactus* sensu Bauer (2003) as polyphyletic; its nomenclatural type *S. wittii* was found nested within *Pseudoacanthocereus*, as sister to *P. sicariguensis* while *Strophocactus* (= *Deamia*) *testudo* and *S. chontalensis* formed a highly-supported sister to the subtribe *Pachycereinae*. Based on these results, Korotkova & al. (2017) newly circumscribed *Strophocactus* to include *Pseudoacanthocereus* and reinstated *Deamia*. [Korotkova (2021)]

Notes. – **Phylogenetics:** *Turbincarpus* was found to be polyphyletic in the molecular studies of Bárcenas & al. (2011) and Hernández-Hernández & al. (2011). The most comprehensively sampled dataset of Vázquez-Sánchez & al. (2013) showed *Turbincarpus* to fall into three separate clades. Recent studies have clarified the circumscription of *Turbincarpus*. Anatomically, *Turbincarpus* and *Kadenicarpus* clades share the presence of prismatic crystals in the hypodermis, while *Rapicactus* has prismatic druses, and *Turbincarpus* differs from *Kadenicarpus* by the absence of xylary fibers in the cortical bundles (De la Rosa-Tilapa & al 2019). The phylogenetic study performed by Vázquez-Sánchez et al. (2019) showed the *Turbincarpus* s.s. clade strongly supported as monophyletic, and sister to *Ariocarpus*. Three independent genera are thus accepted: *Kadenicarpus*, *Rapicactus* (see their respective treatments), and *Turbincarpus*. The number of species has been a matter of discussion. In this treatment, 23 species, 15 subspecies, two natural hybrids and 33 artificial hybrids are recognized. Furthermore, three taxonomic complexes are recognized: the *Turbincarpus saueri*, *T. schmiedickeanus* and *T. viereckii* complexes (see the respective treatments). The recognition of the species proposed here is based on general works focused on the genus, therefore, systematic work is required to solve this problem. [Aquino (2021)]

Turbincarpus dickisoniae (Glass & R.A.Foster) Glass & A.Hofer, *Guía Identific. Cactá. Amenazadas México: Tu/di*. 1997. Sec. Hunt (2006)

≡ *Turbincarpus schmiedickeanus* var. *dickisoniae* Glass & R.A.Foster in *Cact. Succ. J. (Los Angeles)* **54(2)**: 74. 1982 syn. sec. Hunt (2006) ≡ *Neolloydia schmiedickeana* var. *dickisoniae* (Glass & R.A.Foster) E.F.Anderson in *Bradleya* **4**: 20. 1986 syn. sec. Kew WCVP (2019) ≡ *Turbincarpus schmiedickeanus* subsp. *dickisoniae* (Glass & R.A.Foster) N.P.Taylor in *Cactaceae Consensus Init.* **5**: 14. 1998 syn. sec. Vázquez-Sánchez & al. (2013) ≡ *Pediocactus schmiedickeanus* var. *dickisoniae* (Glass & R.A.Foster) Halda in *Acta Mus. Richnov., Sect. Nat.*, **5(1)**: 20. 1998 syn. sec. IPNI ≡ *Turbincarpus gracilis* subsp. *dickisoniae* (Glass & R.A.Foster) Panar. in *Piante Grasse* **18(3)**: 120. 1999 syn. sec. Kew WCVP (2019)

Notes. – *Turbincarpus dickisoniae* has previously been classified as a subspecies of *T. schmiedickeanus* (Hunt 2006). The proposal of Lüthy & Moser (2002) to recognize this taxon as a distinct species is followed. Morphologically, the radial spines are persistent during the development of the individuals, while, in the other members of the *T. schmiedickeanus* complex, there are only present central spines. A micromorphological analysis of the spines shows that the walls of the spines of *T. dickisoniae* are entire, while the walls of the spines in *T. schmiedickeanus* are fissured (Mosco 2009). This is reflected in the appearance of the spines, rigid in *T. dickisoniae* and papiraceae in *T. schmiedickeanus*, which is consistent with the observations of Lüthy & Moser (2002). There are notable differences in terms of flower dimensions (ca. 20 mm long in *T. dickisoniae* and ca. 27 mm in *T. schmiedickeanus*), as well as in color (white with slight yellow tones in *T. dickisoniae*, while in *T. schmiedickeanus* they are white with a stripe in intense magenta tones). [Aquino (2021)]

Turbincarpus × *dubeniorum* Halda, Kracík & Malina in *Acta Mus. Richnov., Sect. Nat.*, **9**: 75. 2002. Sec. Aquino (2021)

Aquino (2021) ≡ *Turbincarpus macrochele* subsp. *flaviflorus* (Gerhart Frank & A.B.Lau) Doweld in *Sukkulenty* **3**: 69. 2000 syn. sec. Aquino (2021)

Notes. – *Turbincarpus flaviflorus*, previously a subspecies of *T. schmiedickeanus* is here raised to species rank since it was shown to be distant from *T. schmiedickeanus* and closely related to *T. alonsoi*. Unlike *T. schmiedickeanus*, which has depressed-globose stems, *T. flaviflorus* has short cylindrical stems with a slight broadening in the lower part (Donati & Zanolle, 2004). Mosco (2009) explains that under the epidermis of the spines there are fibers with open lumina and <2 µm thick walls, a characteristic that is not shared with *T. schmiedickeanus*. [Aquino (2021)]

Aquino (2021) ≡ *Turbinacarpus schmiedickeanus* subsp. *jauernigii* (Gerhart Frank) D.R.Hunt in Cactaceae Syst. Init. 20: 24. 2005 syn. sec. Aquino (2021)

Notes. – The proposal by Lüthy & Moser (2002) to recognize this taxon as an independent species of *Turbinacarpus schmiedickeanus* (Boed.) Buxb. & Backeb. is followed. The trees of Vázquez-Sánchez & al. (2019) show that *T. jauernigii* is not related to *T. schmiedickeanus*, in which it used to be included as a subspecies. The anatomy of the spines of *T. jauernigii* Gerhart Frank indicates that the spines have compact sclerenchyma, thick-walled fibers which make up spines that are hard, rigid to sub-rigid, mostly pungent (Mosco 2009). This character is shared with other species such as *T. gielsdorfianus* (Werderm.) John & Říha or *T. lophophoroides* (Werderm.) Buxb. & Backeb., but not with *T. schmiedickeanus*, which has non-pungent, papyraceous spines. [Aquino (2021)]

***Turbinacarpus ×pulcherrimus* Halda & Panar. in Acta Mus. Richnov., Sect. Nat., 10: 159. 2003.** Sec. Aquino (2021)

***Turbincarpus rioverdensis* Gerhart Frank in Succulenta (Netherlands) 71(2): 66. 1992.** Sec. Vázquez-Sánchez & al. (2019)

≡ *Pediocactus rioverdensis* (Gerhart Frank) Halda in Acta Mus. Richnov., Sect. Nat., 5: 22. 1998 syn. sec. Aquino (2021) ≡ *Turbincarpus schmiedickeanus* subsp. *rioverdensis* (Gerhart Frank) Zachar, Gen. Turbincarpus: 83. 2004 syn. sec. Aquino (2021)

= *Turbincarpus rioverdensis* subsp. *paoloi* Halda & Kupčák in Acta Mus. Richnov., Sect. Nat., 9: 77. 2002 syn. sec. Aquino (2021) ≡ *Turbincarpus paoloi* (Halda & Kupčák) Halda & Malina in Acta Mus. Richnov., Sect. Nat., 10: 159. 2003 syn. sec. Aquino (2021)

Notes. – According to the phylogenetic study of Vázquez-Sánchez & al. (2019), *Turbincarpus rioverdensis* Gerhart Frank is more closely related to *T. swoboda* Diers and *T. valdezianus* (H.Moeller) Glass & R.A.Foster, than to *T. schmiedickeanus* (Boed.) Buxb. & Backeb., in which it used to be included as subspecies (Hunt 2006). The spines of *T. rioverdensis* and *T. schmiedickeanus* are transversely cut by deep fissures that also involve the underneath layers. However, the stems of *T. rioverdensis* show periclinal epidermal wall type nipple and closed-type undulated-shape anticlinal epidermal walls, characters absent in *T. schmiedickeanus*. [Aquino (2021)]

***Turbincarpus ×roseiflorus* Backeb., Descr. Cact. Nov. 3: 15. 1963.** Sec. Vázquez-Sánchez & al. (2019)

≡ *Strombocactus ×roseiflorus* (Backeb.) T.Hewitt in Ashingtonia 2(1): cppo [3]. 1975 syn. sec. Aquino (2021)

≡ *Echinocactus saueri* Boed. in Z. Sukkulentenk. 3(16): 362–363. 1928 ["1927-1928"] syn. sec. Aquino (2021) ≡ *Neolloydia saueri* (Boed.) F.M.Knuth, Kaktus-ABC: 367. 1936 ["1935"] syn. sec. Aquino (2021) ≡ *Thelocactus saueri* (Boed.) Borg, Cacti, ed. 1: 281. 1937 syn. sec. Aquino (2021) ≡ *Gymnocactus saueri* (Boed.) Backeb. in Cactaceae (Berlin) 1941(2): 59. 1942 syn. sec. Aquino (2021) ≡ *Thelocactus saueri* (Boed.) H.P.Kelsey & Dayton, Standard. Pl. Names, ed. 2: 78. 1942 syn. sec. Aquino (2021) ≡ *Pediocactus saueri* (Boed.) Halda in Acta Mus. Richnov., Sect. Nat., 5: 18. 1998 syn. sec. Aquino (2021)

Notes. – *Turbincarpus saueri* comprises eight subspecies included in this taxonomic treatment. According to Lüthy & Moser (2002), these subspecies differ mainly by floral and stem morphology: large stems and flowers with white perianth (*T. saueri* subsp. *ysabelae*); small stems and flowers with pale pink perianth (*T. saueri* subsp. *nelissae*), stems with numerous spines (*T. saueri* subsp. *knuthianus*), and stems with few spines (*T. saueri* subsp. *nieblae*). Four of the eight subspecies were included in the phylogenetic analysis of *Turbincarpus*, but no close relationship was shown between the subspecies (Vázquez-Sánchez & al. 2019), they were intermixed with other *Turbincarpus* species, suggesting they might actually merit species rank. Still, the relevant nodes were unsupported or weakly supported. Therefore, a more comprehensive study phylogenetic / taxonomic study of all eight subspecies would be required to arrive at a better understanding of species-limits in this group. The four subspecies sampled by Vázquez-Sánchez & al. (2019) are here provisionally accepted at species rank. [Aquino (2021)]

≡ *Echinocactus schmiedickeanus* Boed. in Z. Sukkulentenk. 3(11): 229–230. 1928 ["1927-1928"] syn. sec. Aquino (2021) ≡ *Strombocactus schmiedickeanus* (Boed.) A.Berger, Kakteen: 250. 1929 syn. sec. Vázquez-Sánchez & al. (2019) ≡ *Toumeyia schmiedickeana* (Boed.) W.T.Marshall in Cactus (Paris) 4: 5. 1946 syn. sec. Aquino (2021) ≡ *Neolloydia schmiedickeana* (Boed.) E.F.Anderson in Bradleya 4: 19. 1986 syn. sec. Aquino (2021) ≡ *Pediocactus schmiedickeanus* (Boed.) Halda in Acta Mus. Richnov., Sect. Nat., 5(1): 20. 1998 syn. sec. Aquino (2021) – *Strombocactus schmiedickeanus* (Boed.) J.West in J. Cact. Succ. Soc. Amer. 2: 298. 1930, nom. inval. syn. sec. Aquino (2021) [non *Strombocactus schmiedickeanus* (Boed.) A.Berger] = *Turbincarpus schmiedickeanus* var. *alenae* Halda & Kupčák in Acta Mus. Richnov., Sect. Nat., 9: 79. 2002 syn. sec. Kew WCVP (2019)

Notes. – According to Hunt (2006), *Turbincarpus schmiedickeanus* comprises 13 subspecies whose main characteristic is the presence of curved to twisted, flexible and non-pungent spines (Mosco, 2009). Vázquez-Sánchez & al. (2019) included 11 of the 13 subspecies in their phylogenetic analysis but did not find them to form a clade; *T. schmiedickeanus* subsp. *schwarzii* was even resolved as the sister to the entire *Turbincarpus* clade.

For this reason, we propose the exclusion of five subspecies from *T. schmiedickeanus*: *T. bonatzi*, *T. dickinsoniae*, *T. flaviflorus*, *T. schwarzii* and *T. rioverdensis* (see their respective treatments). The remaining subspecies (*T. subsp. andersonii*, *T. subsp. gracilis*, *T. subsp. klinkerianus*, *T. subsp. macrochele*, *T. subsp. sanchezii-mejoradae* and *T. subsp. rubriflorus*), are retained as subspecies of *T. schmiedickeanus*. These taxa are either unresolved or are parts of subclades with low support in the trees of Vázquez-Sánchez & al. (2019). [Aquino (2021)]

- = *Turbincarpus macrochele* var. *polaskii* P.Lechner & Jantschgi in Turbi-Now 5: 14. 1998 syn. sec. Aquino (2021) ≡ *Turbincarpus macrochele* subsp. *polaskii* (P.Lechner & Jantschgi) D.Donati, Revis. Tasson. Gen. Turbincarpus: 17. 2003 syn. sec. Aquino (2021)

Notes. – *Turbincarpus schwarzii* is here recognized at species rank based on its phylogenetic position with respect to the other *Turbincarpus* species (Vázquez-Sánchez et al. 2019). Morphological differences can be found in the flowers: they are about 3.5 cm wide and with white perianth segments in *T. schwarzii*, and c. 2.5 cm wide and with perianth segments that are magenta in color with white tones at the edge of the tepals in *T. schmiedickeanus* (Donati & Zanovello 2004).

The recognition of *Turbincarpus polaskii* has been the subject of discussion. Taxonomic treatments such as Anderson (2006) and Hunt (2006) treat it as synonym of *T. schmiedickeanus* subsp. *schwarzii*. Donati & Zanovello (2004) propose the recognition of this taxon at the subspecific level. Based on the comparison of seedling development and seed characters, they conclude that there are greater morphological similarities with *T. schmiedickeanus* subsp. *macrochele*. A molecular analysis is still required in order to assess the recognition of this taxon, as it has not been sampled by Vázquez-Sánchez et al. (2019). [Aquino (2021)]

Notes. – Four subspecies have been recognized in *Turbincarpus viereckii*. Two of them (*T. viereckii* subsp. *viereckii* and *T. viereckii* subsp. *major*) were sampled in the phylogenetic study of *Turbincarpus* (Vázquez-Sánchez et al. 2019) and were resolved in different positions of the phylogenetic tree, suggesting they merit species rank, but node support was low. A more detailed study is therefore required to understand the morphological variation as basis to recognize species. All four subspecies are therefore left as such for this treatment. [Aquino (2021)]

Notes. – **Phylogenetics:** *Weberocereus* was newly circumscribed by Korotkova & al. (2017) based on the results of their phylogenetic study. Therein, *Weberocereus* was depicted as polyphyletic, a clade containing five species, including *W. tunilla* — the type species — was supported with 1 PP, 82% MLBS, 80% JK, but *W. glaber* and *W. tonduzii* were resolved at different positions within the *Selenicereus/Hylocereus* clade and are therefore excluded from *Weberocereus*. [Korotkova (2021)]

Notes. – **Phylogenetics:** *Weingartia* and *Sulcorebutia* used to be merged in *Rebutia*, e.g. by Barthlott & Hunt (1993), Anderson (2001), and Hunt (2006), but were recognized by Anderson (2005). The *Rebutia* s.l. assemblage was found highly polyphyletic by Ritz & al. (2007), and was shown to be separated into three well supported clades. One of these clades comprises species of *Weingartia*, *Sulcorebutia* and *Cintia* and includes the nomenclatural type of *Weingartia*. Ritz & al. (2007) suggested that all three could be merged into a single genus, for which *Weingartia* is the oldest name. [Hernández-Ledesma & al. (2015)]

Notes. – The true identity of *Cactus royerii* is nearly impossible to verify. From the 1753 protologue, *Cactus royerii* was based only on Royen's account and his citation of Boerhaave's description of a sterile, cultivated specimen of unknown provenance. Linnaeus might have seen this actual plant in cultivation during his visit to Leiden and Royen in 1737-1738. As neotype, Mottram (2013) selected a Burman (1758) version of a Plumier illustration with the vague provenance "insularum Antillanarum", presumably referring to the Lesser Antilles. This Burman illustration is not original material, since Linnaeus only studied Burman's illustrations in 1755 or afterwards (Moroni et al. 2018). Linnaeus may have studied a traced copy in the Codex Boerhaavianus during his stay in Leiden in 1737-1738, if such a version existed, but there still is no documented Linnaean connection between the Plumier illustration and *Cactus royerii*. The Plumier neotype (as well as his 1688 illustration) of *Cactus royerii* depicted rather short, subequal spines unlike plants of the Lesser Antilles which tend to have some conspicuously longer spines often overlapping those of adjacent areoles, especially around the flowering areoles. Plants of the Lesser Antilles with varying spine lengths, some typically exceeding the hairs, are not particularly congruent either with Linnaeus's description of the spines and hairs being equal in length, although this could be due to Linnaeus's description originating probably from a sterile specimen. Plumier's illustrations bear a better semblance to *P. polygonus* from Hispaniola than those of the Lesser Antilles, raising the possibility that the provenance given by Plumier was an error. It does not seem that Plumier's illustrations of the spines of this *Pilosocereus* would be inaccurate, as many of Plumier's illustrations of cacti depict spine lengths in accurate proportions true to the species. However, some flowers or fruits in his cacti illustrations may be untrue (e.g. Burman 1758, tab. 195, fig. 1). With the Plumier neotype of a vague provenance in the Lesser Antilles and it not being a great match for plants of the Lesser Antilles, it makes the application of *P. royerii* much less certain. Although rib number is variable in *Pilosocereus*, technically the Plumier neotype with eight ribs conflicts with the Linnaean description of ten ribs. The neotype proposed by Franck et al. (2019) is from St. John and has 10 ribs, but it is preceded by Mottram's (2013) selection. Mottram (2013) concluded that the specific epithet should be spelled as "*royenii*". [Franck (2021)]

 ≡ ?*Cactus leucodasys* (Salm-Dyck) Kuntze, *Revis. Gen. Pl.* 1: 260. 1891 syn. sec. Aquino (2021)
- Notes. – The description of *Mammillaria leucodasys* was made from a dead specimen, so the probability of errors in the application of the characters is greater. Sinking of the apex may eventually be due to stem rot. Characters that allow *Epithelantha micromeris* to be identified with certainty as the dimensions of the areole, and flowers are not described. (Aquino et al. 2019). Therefore, it is not possible to corroborate that it is a member of *Epithelantha*. [Aquino (2021)]
- Mammillaria leucodictia* Link in *Allg. Gartenzeitung* 16: 330. 1848. Sec. Aquino (2021)
 ≡ *Cactus leucodictyus* (Link) Kuntze, *Revis. Gen. Pl.* 1: 260. 1891 syn. sec. Aquino (2021)
- Notes. – The original description of *Mammillaria leucodictia* indicates that the taxon has bristles, and there is a clear distinction between radial and central spines. On the other hand, the author classifies his new taxon as a member of the serie *Leucocephalae*

or *Heteracanthae*, both taxonomic groups correspond to *Mammillaria*. The name *Mammillaria leucodictia* must be excluded from the synonymy of *Epithelantha micromeris*. [Aquino (2021)]

- Tephrocactus neopentlandii* Y.Itô, Cactaceae: 74. 1981. Sec. WFO 2019
- Trichocereus johnsonii* Hutchison. Sec. WFO 2019
- Trichocereus rondonianus* Kelsey & Dayton, Standard. Pl. Names, ed. 2: 78. 1942, nom. inval. Sec. WFO 2019
- Trichocereus serenanus* Y.Itô, Cactaceae: 166. 1981. Sec. WFO 2019
- Weberbauerocereus callanus* Hutchison. Sec. WFO 2019
- Weingartia frey-juckeri* Diers & K.Augustin in Gymnocalycium 20: 711. 2007. Sec. WFO 2019
- Weingartia sapi* F.H.Brandt in Kakteen Orch. Rundschau 1982(5): 72. 1982. Sec. WFO 2019

Excluded names

- Ariocarpus pulvilliger* K.Schum. in Bot. Jahrb. Syst. 24(5): 550. 1898. Sec. WFO 2019
 squalm. - *Ariocarpus pulvilligeris* (Lem.) K.Schum.
- Cereus mallentianus* J.F.Cels ex K.Schum. Sec. WFO 2019
 squalm. for *Cereus malletianus*
- Echinocactus barcelona* Walton in Cact. J. (London) 2: 79, 175, 191. 1899, nom. nud. Sec. TPL (2013)
 Name only f. Backeberg 1962.

***Echinocactus schlumbergeri* Cels in Schumann, Gesamtbeschr. Kakt.: 409. 1898.** Sec. Britton & Rose (1922)

Incorrect record

***Echinocactus sutterianus* Schick ex A.Berger, Kakteen: 220. 1929.** Sec. Kew WCVP (2019)

Duplicate record with incorrect author and nomenclatural reference.

***Echinocereus pectinatus* var. *armatus* Poselg.** Sec. TPL (2013)

An erroneous name from Tropicos, citation leads to *Cereus pectinatus* var. *armatus* Poselg.

***Echinocereus pulchellus* var. *amoenus* C.F.Först. in Allg. Gartenzeitung 12: 292. 1844.** Sec. TPL (2013)

Name is not found at cited page nor elsewhere. TPL name source was Tropicos.

***Eriocactus courantii* Lem.** Sec. WFO 2019

Echinocactus, nor *Eriocactus*

***Frailea altigibbera* P.J.Braun & Esteves in Succulenta (Netherlands) 74(3): 131. 1995.** Sec. Korotkova (2021)

Erroneous record, this combination was not published at the place cited.

***Gymnocalycium tilcarensense* (Backeb.) H.Till & W.Till, Monogr. Gattung Gymnocalycium: 134. 1992.** Sec. Metzinger (2021)

Incorrect record.

***Lobivia polypetala* Rausch.** Sec. TPL (2013)

Squalm. for *Lobivia pygmaea* var. *polypetala* Rausch

***Monvillea piedadensis* Backeb. & Voll.** Sec. TPL (2013)

A record from Tropicos that cannot be traced

***Nopalopuntia* Alexander**

Name does not exist, error from WFO (2019), likely derived from the erroneous "*Nopalopuntia macdougallii* (Alexander) Bravo".

***Notocactus nigrispinus* R.Kiesling.** Sec. TPL (2013)

Apparently a herbarium name that entered The Plant List from Tropicos.

***Pediocactella* Doweld.** Sec. TPL (2013)

Genus name probably derived from "*Pediocactella bradyi*" in Fl. N. Am. - no publication record for this generic name found.

***Pilosocereus leninghausii* F.Haage.** Sec. WFO 2019

Name could not be traced, probably squalm. *Pilocereus lenninghausii*
