FIGURE 2.- MAP SHOWING HIGHLIGHTS OF 1959 OIL AND GAS DEVELOPMENT.

SUMMARY OF OIL AND GAS WELL DRILLING ACTIVITIES IN OHIO DURING 1959

For more than a century Ohio has been producing commercial quantities of oil and gas. Although production has been moderate, over 650 million barrels of crude and 3 trillion cubic feet of gas have been produced. It is estimated that 150 thousand wells have been drilled.

The discovery of oil and gas in Ohio, purely by accident in 1814, predates the Drake well in Pennsylvania by 45 years. In Noble County a well was being drilled for brine for the purpose of extracting salt when oil was struck at 350 feet. The well flowed periodically, and the oil reportedly was used for lighting and for lubricating purposes. This early discovery was considered a nuisance since the presence of oil rendered the brine useless for salt extraction.

Since the first discovery of oil in the State, in 1814, the shallow formations have been well explored and in many areas overdrilled. However, the deeper rocks of the Cambrian and Lower Ordovician systems and the Middle Ordovician in Ohio have not been tested adequately. Approximately 300 wells have penetrated rocks of the Lower Ordovician and Cambrian systems. These older rocks may possibly hold vast quantities of oil and gas that exceed the total production thus far yielded by the shallow formations.

At the present time the entire area of the Appalachian basin, including Ohio on the western rim, is being studied and re-evaluated by the major oil companies. Interest has been aroused by the discovery of oil and gas from the older formations in Ohio and neighboring states.

Two of the thirteen tests drilled this year to the Lower Ordovician and Cambrian were successful. The No. 1-A Frank L. Smith, located in Medina County and drilled by the Wiser Oil, East Ohio, and Ohio Fuel Gas Companies, was completed at 1,200,000 cubic feet of gas and 5 barrels of distillate daily after acidizing. The bottom hole pressure was 2435 pounds per square inch. The production is from a zone at the erosional surface in the Trempealeau. The producing zone was reported at a depth of 5775 to 5790 feet. Besides the 192,000 cubic feet of gas produced natural at this depth, salt water and oil-cut mud were recovered from 5856 to 5865 feet and 5875 to 5884 feet. This well had a total depth of 7040 feet and bottomed in Precambrian metamorphic rocks of Grenville age.

The second and most recent well in the Cambrian is the No. 2 N. J. Monk, located in Morrow County and drilled by N. J. Monk, et al. The well showed 4 barrels of oil and 2 barrels of water natural and was reported to have produced 85 barrels the first 11 hours after acidizing. After flowing intermittently for 45 days the well was pumped for 24 hours and produced 95 barrels of oil and 22 barrels of water. Five pay zones were recorded-- 3594 to 3602 feet, 3621 to 3630 feet, 3685 to 3689 feet, 3710 to 3714 feet, and 3718 to 3720 feet. Only the top two zones were perforated. Again the erosional surface on the Trempealeau is the producing zone. The total depth of the well is 3731 feet.

Of the thirteen stratigraphic deep tests, four penetrated Precambrian metamorphic rocks. Two of these were the previously mentioned No. 1-A Frank L. Smith well in Medina

County, and the No. 1 Margaretha E. Warner, also located in Medina County, drilled by Ohio Fuel Gas Company et al, to a depth of 6731 feet. The Warner was a dry hole. The Kewanee Oil Company drilled the other two unsuccessful basement tests. The No. 1-A Harry Long, located in Pickaway County, bottomed at 3257 feet, and the No. 1 Van Pelt, located in Clinton County, had a total depth of 3259 feet.

The other nine tests penetrated the Lower Ordovician or Cambrian, the previously mentioned No. 2 N. J. Monk being the only one of this group successfully completed in the older rocks. Two wells in Ashtabula County, Russel McConnell's No. 1 C. M. Brydle, total depth 5710 feet, and Devonian Gas and Oil Company's No. 1 Conrad Mueller, total depth 6238 feet, were drilled to the Trempealeau. Both of these were plugged back and completed as gas wells in the Clinton sand. The Kewanee Oil Company drilled two holes to the Mt. Simon sandstone. Of these the No. 1 Harold and Faye Pavey, located in Highland County, had a total depth of 3512 feet, and the No. 1 Newton and Ledia Igo, located in Clinton County, bottomed at 3351 feet. In Medina County, the No. 3-A Hayden H. Hier of the Wiser Oil Co. et al. was drilled to 6031 feet testing the Trempealeau. The No. 1 Harry Johnson of Glenn R. Nye et al., located in Coshocton County, bottomed at 5845 feet in the Trempealeau. The No. 1 H. and A. Gecowets of S. E. Brown et al., located in Defiance County, bottomed at 2300 feet in the Trempealeau. The Continental Oil Company, a new-comer to Ohio, drilled the No. 1 Walter C. Brisbin to 2715 feet in Hamilton County, stopping in the Eau Claire dolomite.

The Trenton tests numbered 20, of which 11 were wildcat wells. Six of the Trenton wells were completed as small oil or gas wells. Three wells in Defiance County were completed at 2 to 10 barrels daily. The others were small gas wells which were sold to the land owners.

McClure Oil Company drilled two wells in Fulton County and one in Williams County into the Trenton-Black River section in hopes of extending the significant fields in the Trenton of southeastern Michigan. Small shows of oil were noted in the Trenton in one of the Fulton County wells and in the Williams County well. All three wells were abandoned.

Another interesting wildcat well was the No. 1 Warren F. Shank drilled by Ohio Drillers in Crawford County. The total depth was 2160 feet, and no shows were noted in the Trenton.

The Clinton sands of the Medina group again account for over half of the wells drilled. A total of 672 wells were drilled, of which 162 were gas, 88 were oil and 296 were combination oil and gas producers. The 126 dry holes represent 18.8 percent failures of the total number of wells drilled. The 81.2 percent successful completions looks favorable at first; however, in light of the poor marketing situation and the ever increasing prices of material and labor, it is questionable whether half of these wells will pay out. Year after year large initial production figures are reported for many wells, yet many of these wells fail to make money.

The most active drilling activity was in Wayne County, where 127 wells were drilled to the Clinton. Of the 95 producers, 22 were gas, 8 were oil, and 65 were combination wells. Holmes, Coshocton, and Perry Counties each had over 70 wells drilled to the Clinton. More than 45 wells were drilled to the Clinton in each of the following counties: Knox, Licking, and Muskingum.

The largest gas well reported was Felmont Oil Corporation's No. 1 Walter Hall, located in Monroe Township in Ashtabula County. The natural open flow was 1,500,000 cubic feet of gas from interbedded shales and sands of the Clinton, at a depth of 3034 to 3133 feet. The production after fracture was reported at 20,000,000 cubic feet of gas, and the 16-hour rock pressure was 1020 pounds per square inch.

In Vinton County a completion in the Clinton was reported at 16,030,000 cubic feet of gas after fracture. This was Darrell Blanton's No. 1 Pearl Bray, located in Swan Township. The sands ranged in depth from 2814 to 2851 feet. The natural production was

1, 280, 000 cubic feet of gas. The 48-hour pressure was 832 pounds per square inch.

In Perry County, one of the more active areas of drilling for several years, a sizable gas well was reported. The Hoosier Drilling Company's No. 1 William McClond, in Madison Township, was completed after fracture at 10, 450, 000 cubic feet of gas. The Clinton sand ranged in depth from 3214 to 3246 feet, which was the total depth. The well was gaged at 340, 000 cubic feet of gas natural.

Three Clinton oil wells were reported completed at 500 barrels or more after fracture. The No. 2 Parker Rine, drilled by Alkire, Floto, et al. and located in Knox County, Jackson Township, made 18 barrels natural and was reported completed after fracture at 600 barrels of oil. The Clinton sand and shales ranged in depth from 2932 to 2984 feet. R. B. Weed and Associates' No. 7 Muskingum Watershed Conservancy District, located in Coshocton County, New Castle Township, was completed after fracture at 500 barrels of oil and 750, 000 cubic feet of gas. The interbedded Clinton sands and shales ranged in depth from 2873 to 2933 feet. R. S. King's No. 1 Snyder, located in Wayne County, Canaan Township, was completed after fracture at 500 barrels of oil and 500, 000 cubic feet of gas. The interbedded Clinton sands and shales ranged in depth from 2965 to 3100 feet.

The "Newburg" zone received some attention this year as a result of deeper drilling in the Clinton in Wayne County. This dolomite pay zone is an erosional one; in some places reefs have been found at the base of the Cayuga group and in the top of the Niagara group. Of the 16 wells drilled in Wayne County, 13 were completed as gas wells. Production ranged from a few hundred thousand to 11 million cubic feet of gas. The largest of these wells was Preston Oil Company's No. 7 R. J. Dial, located in Franklin Township. The dolomite pay zone was recorded from 2988 to 3056 feet. The production after acidizing was 11, 400, 000 cubic feet of gas. The 24-hour rock pressure was 1140 pounds per square inch.

The only significant well in the Oriskany sand was the Ohio Fuel Gas Company's No. 1 Harrold W. Gerber, located in Wayne County, Sugar Creek Township. The Oriskany sand was found at 2579 feet, and the total depth was 2580 feet. The well was completed natural at 40 barrels per day. An offset to the west of this well proved to be dry.

The First Berea and Second Berea again hold the second and third position in the number of completions this year. The First Berea had a total of 251 wells, of which 58 were gas, 90 were oil, and 21 were combination oil and gas wells. The Second Berea had a total of 49 wells, of which 27 were gas, 4 were oil, and 8 were combination wells. The initial production from these zones is seldom greater than 20 barrels of oil and 500, 000 cubic feet of gas.

The shallow sands of the upper Mississippian and Pennsylvanian in eastern Ohio account for about 10 percent of the total number of wells drilled annually. A total of 118 wells were drilled, of which 56 were producers. Production from these shallow wells is small and of little significance to the total production.

A total of 1158 wells were drilled in the State this year. Of the total, 843 were producing wells -- 305 were gas, 203 were oil, and 335 were combination oil and gas wells. The percentage of dry holes was 27.2 percent. The first 24-hour daily initial production was reported to be 30, 504 barrels of oil and 434, 337, 000 cubic feet of gas. The total footage drilled was 2, 845, 373 feet, for an average of 2457 feet per well.

The actual production of oil for the year was 5, 978, 280 barrels, down approximately 500, 000 barrels from the 1958 production. Gas production increased approximately $2\frac{1}{2}$ billion cubic feet. The total gas produced was 36, 311, 000, 000 cubic feet. The estimated value of the production at the well head is \$25, 534, 470. The value of the oil produced was \$17, 074, 007 and of the gas \$8, 460, 463.

1959 OIL AND GAS DEVELOPMENTS

1 - Modified from Ohio Oil & Gas Assoc.

2 - Abbreviation: P/L, pipeline; avg., average; B/D, barrels per day.

3 - Estimated.

The estimated number of producing wells, including wells drilled this year and those still producing from prior years, is 24,054. Of these, 7,120 are gas and 16,934 are oil.

FUTURE EXPECTATIONS

Two discoveries in the upper Cambrian have aroused increased interest in the deeper zones. It is anticipated that an increasing number of wells will be drilled to test the lower Ordovician and Cambrian rocks. A re-evaluation of the Appalachian basin by the major oil companies is now in progress. It is hoped that a study of the limited data available will disclose some information as to what may be expected in these older rocks. The high-arch area of western Ohio, in which exploration has been more or less dormant for 50 years, will again be subjected to testing. From this area the testing will probably spread eastward into the Appalachian basin.

Drilling to the Clinton will continue to be active. However, this picture could be much brighter if spacing, completion, and production practices were improved. East-central and northeastern Ohio will be the more active areas.

It is hoped that more and better geological and engineering methods will be applied to the petroleum industry in Ohio. All available data should be preserved and utilized by the operators as a means to reduce expenses. Cooperation among the operators, owners, and State research and regulatory agencies could lead to greater ultimate production at lower cost to the producers.

Note: The writers wish to acknowledge and thank the many contributors who made the 1959 report possible. The following organizations and individuals have been especially helpful; Mr. Ira M. Korst, Ohio Oil and Gas Association; Mr. Allen Johnson, Ohio Fuel Gas Company; and Mr. J. C. Wilson, Ohio Division of Mines.

Totals for all types of wells completed for 1959

| Type of well | Number of wells | Production | | Footage drilled |
