1979 BUREAU OF MINES SAMPLING SITES AND ANALYTICAL
RESULTS FOR SAMPLES COLLECTED IN THE CHUGACH
NATIONAL FOREST, ALASKA

by

Uldis Jansons ¹

INTRODUCTION

The Bureau of Mines and U.S. Geological Survey are conducting a mineral resource/reserve evaluation of the Chugach National Forest as part of an interagency resource evaluation under Roadless Area Review and Evaluation (RARE II) aegis mandated by the National Forest Management Act of 1976 (P. L. 94-588). The evaluation is due to be completed in 1983.

The study area consisted of about 2.9 million acres located principally on the Kenai Peninsula and Prince William Sound. This area is underlain by two geologic terranes which contain characteristic mineralization. Cretaceous, principally metasedimentary, rocks contain gold-bearing quartz veins and derivative placer gold deposits. Small scale placer gold mining is being actively pursued in the area at the present time. Tertiary meta-sedimentary rocks and associated mafic volcanic rocks have a history of base metal, specifically copper, production since the early 1900's. Two of Alaska's biggest copper producers, the Beatson and the Ellamar mines, as well as several other areas of copper mineralization such as at Copper Mountain, Port Fidalgo, Knight Island, and the Cordova area, are within the sampled area.

The area was sampled extensively by the Bureau of Mines in 1979, and sample site locations and analytical results are made available to the

¹ Supervisory Physical Scientist, Alaska Field Operations Center, Anchorage Alaska

public by this open-file report. The report consists of a computer listing of analytical results (table 2) and five maps (figures 2-6) showing sample sites in the Chugach National Forest, Alaska. The location of the Chugach N.F. and the quadrangles covered by the sample site maps are shown on figure 1.

The samples were analyzed in Anchorage, Alaska, and Wheat Ridge, Colorado, by commercial laboratories using standard techniques. Detection limits of the emission spectrographic analyses are shown on table 1.

Detailed evaluations of the data, currently in progress, may show the nature and abundance of elements contained in and between areas of known mineralization, identify extensions of zones of known mineralization, and locate previously unsuspected zones of mineralization.

Cursory data examination shows that samples from some drainages on the Kenai Peninsula contain anomalous gold in stream sediments and several areas of anomalous base metal content in stream sediments in Prince William Sound.

DATA PRESENTATION

The data listing on table 2 shows all samples taken in 1979 by the Bureau of Mines for chemical analysis, rock and mineral specimens and material taken for slabbing, thin-section and/or polished section preparation, etc.

Samples may have been analyzed by one or more techniques, i.e., atomic absorption, multi-element emission spectrography, etc. The same elements were not necessarily determined in all samples. An "IS" in the tabulation indicates insufficient material to perform a requested analysis.

Figures 2-6 show sampling sites and sample station numbers. When several samples were taken at a site, a circle is used instead of a sample dot and the beginning and ending numbers of the sample series represented by that circle are indicated. In the case of a series of closely spaced samples only the beginning and ending number of a series of samples may be indicated. For example, the samples at the head and mouth of a creek are numbered but the intervening sample sites are shown but not numbered.

The data listing presents three separate groups of information. Lines 1 through 9 describe the sample type, underlying geology, and sample location. Lines 11 through 18 list element contents determined by methods other than emission spectrography. Lines 20 through 27 list element contents determined by emission spectrography.

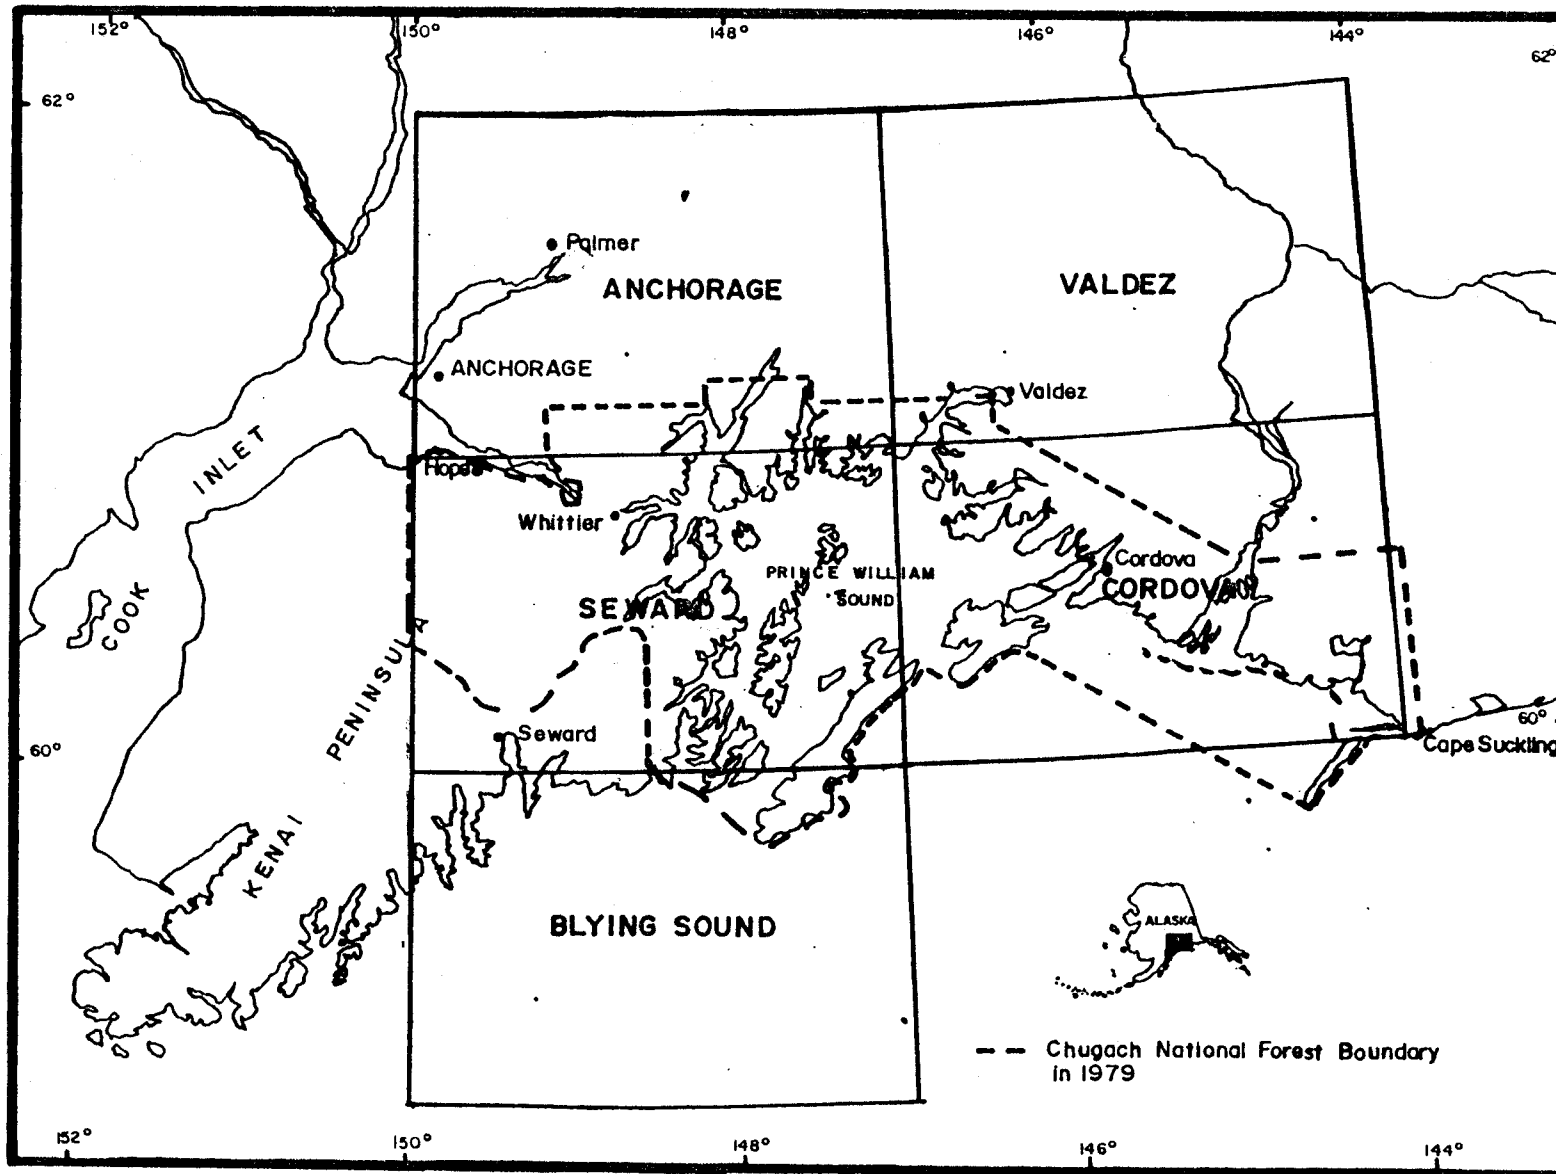

FIGURE 1. Outline of Chugach National Forest and 1:250,000 Map Quadrangle Covering Areas Sampled in the 1979 Bureau of Mines RARE II Minerals Resource/Reserve Evaluation

The following notes should be useful in using the print-out.

Line 1 - SAMPLE NUMBER - note that the listing is in numerical order with gaps in the numbering sequence.

Line 2 - ROCK AGE - refers to the geologic age of the underlying rock groups as shown on geological maps.

Line 3 - ROCK TYPE - refers to rock types in the area of sampling as shown on 1:250,000 scale geological maps. Three rock types mapped as being present are:

Metased - refers to metasedimentary rocks, which include essentially all non-igneous rocks in the region.

Felint - refers to felsic intrusives.

Mafvol - refers to mafic volcanics.

Line 4 - MAT. TYPE - refers to the type of material collected at the sampling site, is predominant at the sample site, or was of interest when sampling was done. The following material types were collected, most are self-explanatory.

Stream Sed - Stream sediment

Sulfides

Phyllite

Quartz

SP/SS/CG - Shale, sandstone, conglomerate

Schist

Sed Rk/Q - Sedimentary rock with quartz veins

Fel Plut - Felsic plutonic rock

Maf Volc - Mafic volcanic rock

Maf Plut - Mafic plutonic rock

Calc - Calcite vein

Sed/Volc - Sedimentary and volcanic rocks in area
Mill Pr - Mill product, such as from a ball or stamp mill
Pan Con - Pan concentrate

Line 5 - 1 MI. QUAD - refers to the 1:63,360 scale quadrangle map which covers the sample area. For full name of map refer to name on Line 6 of printout. For example, for sample 1, the reference map at the 1:63,360 scale is Cordova D7.

Line 6 - 4 MI. QUAD - refers to the 1:250,000 scale map name as outlined on the Standard Topographic Series covering Alaska.

Lines 7, 8, 9 - SECTION, TOWNSHIP, RANGE - refers to land subdivision in which sample was collected. The Seward Base Line and Meridian pertain to areas in most of the western part of the study area; the Copper River Base Line and Meridian pertain to the western part of the study area.
