				Revised RPA. The RPA must reflect i) the "No-Build Alternative" outside of	
				Phase 1, and ii) include both TDM (Alternative 2) and Transit (Alternative 14) as	
				part of the RPA. We need affirmative assurance that future consideration of	
				improvements outside of Phase 1 will be through a new NEPA Study. Although	
				the area outside Phase 1 (essentially I-495 east of Old Georgetown Road), is	
				neither specifically included as part of the RDA in the SDEIS, nor to be included	
				in the 2022 update to Visualize 2045 being advanced by the TPB, the draft SDEIS	
				uses language that does not clearly remove I-495 east of Old Georgetown Road	
				from the NEPA Study.	
				a. The SDEIS states: "There is no action or no improvements on I-495 east of the	
				I-270 east spur to MD 5. While the Preferred Alternative does not include	
				improvements to the remaining parts of I-495 within the scope of this Study,	
				future improvements on the remainder of the system may still be needed in the	
Major 1	1		General-RPA	future."	
<del></del>				b. That portion of the Study area that is moving forward is still referred to as	
				Phase 1. And AMP, the P3 concessionaire has referred to future phases in some	
				of its own materials.	
Major_1	2		General-RPA	or its own materials.	
				c. Appendix C still addresses "future phases" in its discussion of offsite storm	
				water mitigation.	
Major 1	3		General-RPA		
iviajoi_1	3		General-NFA		
				d. Since all of the parkland outside of Phase 1 is now classified as "avoided,"	
				then there must also be affirmative language that describes the process to be	
				imposed in the event these natural resources are NOT avoided in the future.	
Major 1	4		General-RPA	imposed in the event these natural resources are not avoided in the ratio	
-,				e. If I-495 outside of Phase 1 is no longer part of this Study, then the transition	
				areas i) to I-495 on the east spur travelling south, and ii) north from the ALB to	
				Old Georgetown Road from the "split" are not necessary. In fact, creating the	
				transition in this manner encourages vehicular travel to unnecessarily continue	
Major_1	5		General-RPA	on I-495 as described in the TDM comment.	
				f. TDM such as dynamic signage is necessary to direct traffic to use the I-	
				270/MD 200 combination for travel along the I-95 corridor as stated by	
				Secretary Slater during the July 21, 2021 TBP discussion of the Project for	
				reinstatement to the 2022 update to Visualize 2045. Encouraging vehicle travel	
				on that route will open up additional capacity on the topside of I-495 for local	
				travel needs. Project-related mitigation can also include travel demand	
				management and transportation systems management measures, such as	
				improvements along impacted corridors outside the project limits, including I-	
				495 between the I-270 western spur and US 50. The addition of TSM	
				improvements, how being implemented along I-370 as part of the I-270	
				Innovative Congestion Management project should be considered, including	
Major_1	6		General-RPA	variable message signage and ramp metering.	

I-495 & I-2	-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 3

Comments fron	n MNC	PPC_1_SDEIS Ma	jor Issues_9.19.21 docum	ent	Revised comments where applicable
Major_2	9		General-EJ	b. The Morningstar Tabernacle No. 88 Moses Hall and Cemetery and the Poor Farm Cemetery are listed as sites that may be culturally significant in its Community and Environmental Justice Analysis. However, the Environmental Justice discussion concerns itself primarily with current minority population concentrations and does not address historical and ongoing injustice to small African American communities displaced by construction of the beltway and further threatened by the proposed expansion. This issue was explicitly acknowledged as related to social justice by the National Trust for Historic Preservation in their selection of the Moses Cemetery as one of the 11 most endangered historic sites in America in 2021. This listing and the environmental justice issues raised by it should be acknowledged and discussed in the SDEIS.	
				c. On August 10th, Congress passed a once-in-a-generation investment in infrastructure throughout the U.S. with bi-partisan support. Included in the measure is a commitment to "Reconnecting Communities," a concept not even mentioned in the SDEIS. "Too often, past transportation investments divided communities or it left out the people most in need of affordable transportation options. In particular, significant portions of the interstate highway system were built through Black neighborhoods. The Federal Infrastructure Bill creates a first-ever program to reconnect communities divided by transportation infrastructure. The program will fund planning, design, demolition, and reconstruction of street grids, parks, or other infrastructure through \$1 billion of dedicated funding. This concept should be included as part of this project.

			or Issues 9.19.21 docum	l ent	Revised comments where applicable
				d. Neither the DEIS nor the SDEIS reference any cumulative effects to specific cultural resources. Additional historical research conducted subsequent to the DEIS in Cabin John related to the Morningstar Tabernacle No. 88 Moses Hall and Cemetery and associated Gibson Grove community show that the construction of the beltway separated the fraternal hall and cemetery from the neighboring church, physically fragmented the community and contributed to the decline of these institutions. The community's decline in turn contributed to the closure and loss to fire of the Moses fraternal hall.	
Major_2	11		General-EJ		
Major_3	12		General-Bottleneck Issues	Shifting Bottleneck Issues Related to Project Design. A detailed technical transportation review of the SDEIS shows impacts of "relieving" congestion at the American Legion Bridge (ALB) does not eliminate congestion but shifts it from the ALB vicinity (McLean and Potomac) to other areas in Maryland. While some of these bottleneck shifts were expected, the degree of congestion resulting from the proposed project is severe on I-270 north of I-370, on the Inner Loop on the top side of the Beltway, and on the Inner Loop in Prince George's County. These bottleneck shifts are project-related impacts, and mitigation measures should be addressed in the SDEIS and included as part of project design to minimize these projected deficiencies.	
Major_3	13		General-Bottleneck Issues	a. Phase 1A and 1B should be constructed concurrently to reduce or eliminate bottlenecks on I-270.	

NCPPC Ref					
Doc_#	No.	Page	SDEIS Section	Comment	
nments fror	n MNCP	PC_1_SDEIS Ma	jor Issues_9.19.21 docu	ment	Revised comments where applicable
				b. For the other bottleneck issues, we recommend the following design changes	
				to the Preferred Alternative:	
				i. Eliminate the managed lanes from the I-270 Eastern Spur between I-270 and I-	
				495 because I-270 traffic headed south to the eastern spur would not use the	
				managed lane network. The managed lanes would provide minimal travel time	
				benefits for drivers from Gaithersburg and Rockville to most Montgomery	
				County destinations.	
				ii. Eliminate the managed lanes and exit/entrance ramps from I-495 between	
				the two spurs.	
				iii. Managed lane traffic destined to and from the Inner Loop should enter/exit	
				the managed lane network at the River Road crossover interchange.	
			General-Bottleneck		
Major_3	14		Issues		
				<u>Local Road Impact Analyses</u> . Without TTI results beyond the Study area, it is	
				more critical that the impact to the local road network be addressed sooner in	
				order to make appropriate considerations for design . The Interchange Access	
				Point Approval (IAPA) study now under development must be extended beyond	
				a single intersection since the increased congestion on I-270 and I-495 will	
				undoubtedly lead to both peak spreading effects and local traffic diversions that	
				have not been adequately considered to-date. When it can take over 30	
				minutes to travel 2 to 3 miles on some segments of the Beltway as presented in	
				this SDEIS, traffic will not subject themselves to this on a daily basis, and they	
				will find the shorter travel time route, regardless of local street impact. The	
				scope therefore agreed upon by FHWA for the IAPA (performing traffic	
				operational analyses at ramp terminal intersections and one adjacent	
				intersection (on both sides) beyond service interchanges that are modified by	
				the study) will be inadequate in areas where either I-270 or I-495 has very high	
				TTIs and extreme congestion. In those areas, the study area should follow all	
				significant diversionary traffic that switches to the local road network (defined	
Major 4	15		General	as all non-interstate roads). The study area can be determined by adding routes	
				on parallel routes with travel times equal to the GP lanes travel time.	
				<u>Bike/Ped Improvements</u> are inconsistent with master plans, particularly related	
				to design . The commitment made during meetings to construct per local master	1
				plans must be reflected in the SDEIS.	
Major 5	16		General		

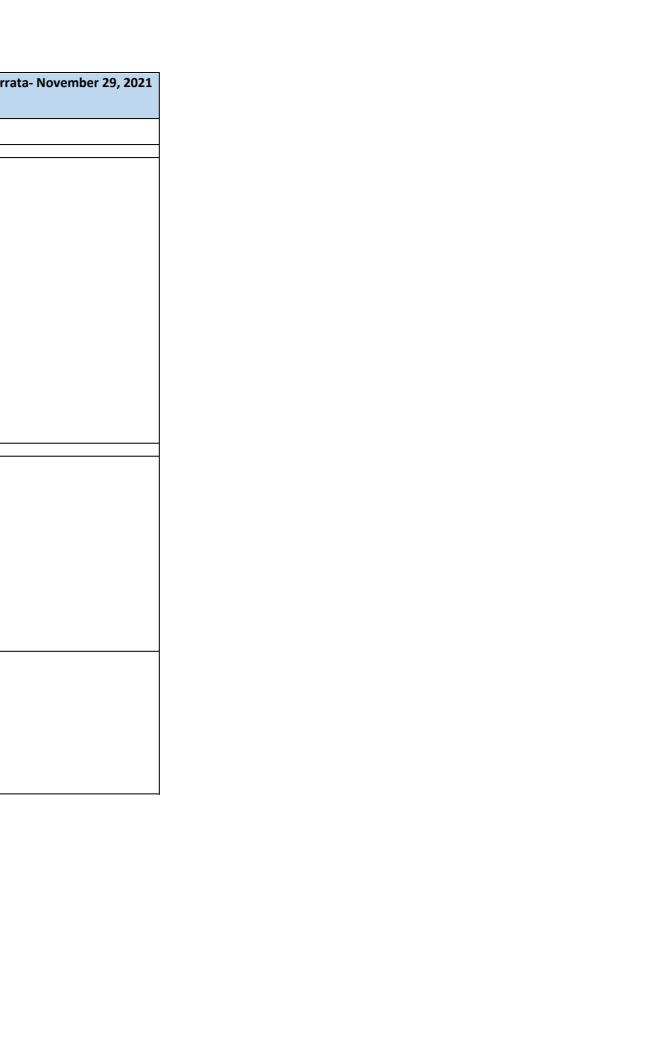

I-495 & I-	270 I	Managed La	nes Study- Draft	Supplemental Draft Environmental Impact Statement (S	SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021

Comments from	n MNC	PPC_1_SDEIS Ma	jor Issues_9.19.21 docur	nent	Revised comments where applicable
				Parkland LOD is not final for purposes of impact resolution. Before any work is	
				permitted to occur on Parkland the limits and nature of the work will need to be	
				reviewed and approved by M-NPPC and permission granted for construction to	
				commence. Because MDOT SHA does not plan to finalize the Project's design	
				until after it completes the NEPA review and awards a contract to a firm to	
				undertake the project, there is significant risk that the LOD will need to be much	
				larger than what is reflected in the SDEIS. An important aspect of avoidance	
				and minimization is minimizing the roadway footprint while still keeping a larger	
				LOD to address environmental issues and/or adequately restore disturbed areas	
				to ensure that they will appropriately handle the increased drainage pressures	
				that will result from advancing one of the Build Alternatives. Ongoing design of	
				the Project must ensure stable tie-ins for outfalls, protection and restoration of	
				stream banks, and improvements to resources based on Project impacts.	
				Although MDOT SHA has committed to the following: "All possible planning to	
				minimize harm will additionally involve an agreement document that outlines	
				the process to continue coordination with the OWJs over Section 4(f) properties	
				through the design phase of the project," the impacts to parkland are not	
Major 6	17	page 1 and 17	General	known and cannot be fully addressed until design of the project is created by

#### MNCPPC Ref Comment No. **SDEIS Section** Doc\_# Page Comments from MNCPPC\_1\_SDEIS Major Issues\_9.19.21 document Revised comments where applicable As stated in Parks DEIS comments, we feel that ignoring the existing untreated road pavement and requiring 50% treatment only if the roadway is fully reconstructed is insufficient to protect downstream waters. A higher goal closer to 50% of all existing untreated roadways would be more effective in protecting 35 Page 2-10 13 Section B downstream waters. The project needs to commit to significantly improving the Provided ESD surface area to a minimum of 80% of the Required ESD onsite (allowing for a maximum of 20% to be treated with the use of compensatory SWM mitigation offsite). These highways can be considered the worst water quality offenders in the County and the Project needs to take more responsibility for protecting the downstream water resources, which will never be improved if we don't take the Page 2-11, Table appropriate steps as part of this project. The Project should achieve better than 36 2-2 Section C this current projection. Parks requests more detail on the 20% banking fee. The statement that "use of innovative The statement that "use of innovative technologies may reduce the compensatory stormwater management requirements" is insufficient. technologies may reduce the compensatory stormwater management requirements" is MDOT/SHA needs to be specific in their committal to financially incentivize insufficient. MDOT/SHA needs to be specific in their committal to financially incentivize innovative technologies and techniques by the P3 to show their commitment to innovative technologies and techniques by the P3 to show their commitment to maximizing on-15 37 Page 2-11 Section C maximizing on-site water quality treatment. site water quality treatment. The MDE 6-digit watershed scale for offsite SWM water quality projects is meaningless to address the severe water quality impacts of the existing Page 2-12, highways and proposed expansion. All offsite compensatory mitigation should 38 16 paragraph 1 Section D.a take place within 1500' of the approved LOD. The credit potential of one-acre IAT credit per 100 linear foot stream restored is based on outdated crediting methodology. The project should be held to the most recent guidance at the time of permitting; at this time that is the 2020 Page 2-12, Wasteload Allocations Document. 17 39 paragraph 2 Section D.a Project needs to show a real commitment to treating additional onsite stormwater runoff (80% min) and existing offsite impervious within a meaningful distance to the project (within 1500') in order to follow through on the Study's Purpose and Need goal of Environmental Responsibility. This commitment needs to be made before a Developer is brought in and given free rein to identify projects that are prioritized by financial goals rather than environmental stewardship. For the maximum 20% water quality treatment achieved off-site, only a maximum of 25% of the IAT shall be achieved through stream restoration and outfall stabilization. The remaining 75% + shall be achieved through payement reduction/removal, Ch 3 and Ch5 SWM practices in 18 40 Page 2-12 Section D.b Need to explicitly show on plans areas designated for temporary construction 19 41 Page 2-17 Section 2.3.5 access, staging, and materials storage for further evaluation and review. Commitment to priority bicycle and pedestrian connections needs to include engthening the I-270 bridge over Tuckerman Ln to accommodate future pedestrian/bicycle facilities along Tuckerman Ln and widening the existing 20 42 Page 2-27 Section 2.4.1 variable-width side path along Seven Locks Rd under I-495 (Cabin John Trail). Need much more detail on the environmental enhancements that are mentioned in order to comment on them. Where are they, what are the limits, and how many of them are there? Parks needs specific locations and work plans 43 Page 2-27 Section 2.4.3

				enlarged to encompass an existing WSSC access road area if that is helpful to	
				site access, staging, storage. This would shift the LOD line approximately 30ft to	
35	57	Page Map 23	Section Appx D	the north.	
33	37	rage iviap 25	Зестоп Аррх D	3685+00 West Side 1270 – The LOD on the south side of Old Farm Creek is too	
				large for the proposed stream work. The stream can be access from the north.	
				The area between Old Farm Creek and Tuckerman Lane is riparian habitat	
				within the floodplain of Old Farm Creek. This area is important to protect due to	
36	5.0	Page Map 23	Section Appx D	the understory of native shrubs and the mature tree canopy.	
30	30	rage Iviap 23	Эессіон Аррх Б	3685+00 West Side 1270 – The new proposed culver under Tuckerman Lane has	
				significant impact to the existing riparian habitat. This new pipe should be	
				removed or use an alignment much closer to the highway since there will be a	
				new bridge designed for this location. If the new aerial structure dictates a pipe	
				replacement, the pipe should be as short as possible and outfall before the	
37	59	Page Map 23	Section Appx D	stream into a pool system.	
3,	33	r uge wup 25	эссион пррк в	3685+00 west side 1270 – The proposed aerial structure spanning Tuckerman	
				Lane and Old Farm creek will result in the removal of long culvert in Old Farm	
				Creek, Parks is supportive of this new bridge and looks forward to assisting in	
38	60	Page Map 23	Section Appx D	the design of the new stream channel underneath the bridge.	
- 55		r age map 20	осолот прри в	3685+00 west side 1270 – the note on the LOD size along Old Farm Creek states	
				the LOD is for culvert augmentation. The new aerial structure will negate the	
				need for culvert augmentation. The LOD in the stream should be noted as for	
39	61	Page Map 23	Section Appx D	stream restoration.	
40	_	Page Map 24	Section Appx D	3629+00 west side. The ownership of this parcel is under investigation.	
41	_	Page Map 24	Section Appx D	3625+00 daylight outfall, add step pools and stabilize overland flow.	
				3629+00 Describe what LOD shown around outfalls needed for. Parks does not	
				concur with the LOD needs. Eliminate LOD and temporary and permanent	
42	64	Page Map 24	Section Appx D	impacts.	
				3640+00 west side - ensure the drainage channel that flows downslope from	
				3645+00 has a stable tie in to the channel from the culvert under I270. There is	
				a new end wall proposed and the LOD does not seem to account for the other	
43	65	Page Map 24	Section Appx D	drainage channel.	
				3640+00 west side - A fiberglass bridge per Parks Specification should be	
				included to route the natural surface trail over the stream downstream of the	
				end wall.	
44	66	Page Map 24	Section Appx D		
				3640+00 west side - The stormwater design must accommodate the rerouted	
				natural surface trail. The trail needs to be located within well drained areas to	
45	67	Page Map 24	Section Appx D	prevent trail use issues.	
				3640+00 west side – the outfall from the stormwater management facility must	
				be addressed all the way to the confluence with the tributary. The limited LOD	
1				prevents this connection as it is currently shown. Enlarge the LOD or justify that	
				the flows can be discharged in the location shown without causing erosion and	
46	68	Page Map 24	Section Appx D	future degradation.	
				Page 12

Table 5-1 – Cabin John SVU6 – the impact can only be considered de minimis Table 5-1 – Cabin John SVU6 - There has not been a enough effort by SHA to present a sufficient once the required parkland mitigation requirements are met and approved by parkland mitigation package at this point. A complete Park Mitigation package must be M-NCPPC. There has not been a significant effort by SHA to present a sufficient approved by MNCPPC. 62 84 Page 5-5 Section 5.2.1 parkland mitigation package at this point. Therefore, the Preferred Alternative would avoid the use of 37 Section 4(f) properties that were previously reported as Section 4(f) uses in the DEIS and Draft Section 4(f) Evaluation, totaling approximately 105 acres." If SHA is going to consider the park properties on the rest of the alignment as avoided, then this implies that any proposed future "improvements" would require a 63 85 Page 5-5 Section 5.2.1 completely new NEPA process. 'No recreational facilities within Cabin John Stream Valley Park Unit 2 would be "No recreational facilities within Cabin John Stream Valley Park Unit 2 would be impacted by mpacted by the Preferred Alternative." This statement is false. Any further the Preferred Alternative." This statement is false. Any further development of the existing highway is detrimental to the park user experience on the natural surface trail even if the actua development of the existing highway is detrimental to the park user experience 86 Page 5-23 Section 5.2.8 on the natural surface trail. trail is not removed or relocated for the new highway alignment Until a robust, complete, and implementable mitigation plan detailing on site mitigation and restoration and parkland replacement is proposed and approved 87 Page 5-5 65 Section 5.2 by M-NCPPC no concurrence on the 4(f) status can be provided. LOD adjustments are required adjacent to Cabin John creek where the outfalls enter the stream LOD adjustments are required adjacent to Cabin John creek where the outfalls To ensure long-term stability in Cabin John creek, stream stabilization is required in the enter the stream. To ensure long-term stability in Cabin John creek, stream mainstem at the outfalls due to the increased flows from the new highway. SHA needs to define stabilization is required in the mainstem at the outfalls due to the increased flows from the new highway. the process for how opportunities for additional impact minimization and further adjustment of 66 88 Page 5-23 Section 5.2.8 the LOD during Final Design will occur. "No other recreational facilities would be impacted by the Preferred Alternative." It is Parks position that any widening will have an adverse impact on the public use campground, even if the actual campsites are not physically impacted. For example, noise and visual experience of the campground will be 89 Page 5-28 67 Section 5.2.11 diminished by any increase in the highway size. Parks has made numerous comments linked to App D that detail the numerous 90 Page 5-28 Section 5.2.11 LOD modifications that are still required. "Expansion of the LOD in certain areas was in response to M-NCPPC's comments to ensure stable outfall channels." We appreciate these changes and believe that providing stable outfalls is essential due to the large increases in 91 Page 5-28 Section 5.2.11 stormwater runoff that are not being fully treated. The relocation of the trail impacted by the proposed SWM facility should not be As SHA has stated to Parks, the relocation of the trail impacted by the proposed SWM facility considered mitigation. The project is directly affecting the trail and it must be hould not be considered mitigation. The project is directly affecting the trail and it must be rebuilt as part of the project. Mitigation for the trail disturbance will also be rebuilt as part of the project. Mitigation for the trail disturbance will also be required that will be required that will be above and beyond the relocation and rebuilding of the above and beyond the relocation and rebuilding of the impacted trail section. 92 Page 5-28 Section 5.2.11 70 impacted trail section. Noise/visual barrier should be pursued for all areas of parkland. Parks expectation that any areas shown with retaining wall adjacent to parkland within Phase 1 South, should also incorporate noise wall/visual barrier and

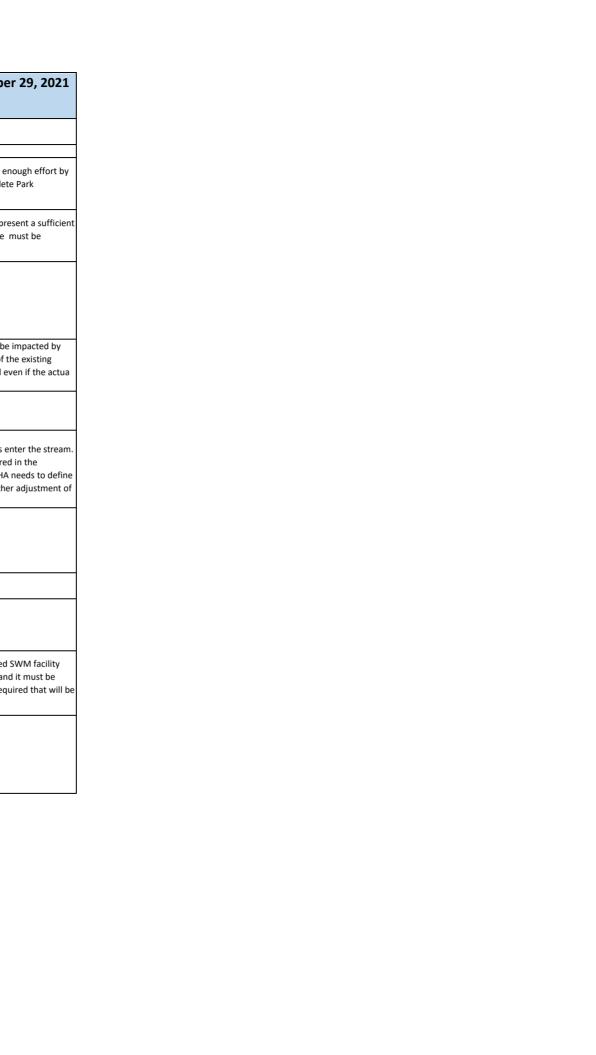

Page 14

vegetative barrier where appropriate.

MNCPPC Ref				Comment	
Doc_#	No.	Page	SDEIS Section		
omments from	MNC	PPC_1_SDEIS Ma	jor Issues_9.19.21 docur	ment	Revised comments where applicable
				I-270 should pass over Old Farm Creek via a roadway bridge and the existing	
				culvert should be removed allowing Old Farm Creek to have a natural channel	
				bottom. This would represent a significant improvement to the existing	
				condition and is reasonable considering the numerous aquatic resource impacts	
72	94	Page 5-30	Section 5.2.12	posed by this project.	
				The LOD on the east side I-270 in Tilden Woods SVP should more closely	
				resemble the LOD submitted with the DEIS. Parks does not support the larger	
				LOD. Is the larger LOD intended for the new aerial structure spanning Old Farm	
73	95	Page 5-30	Section 5.2.12	Creek? If so, Parks looks forward to discussing this in further detail.	
				Tree planting should be maximized at Old Farm NCA. NNI control is expected to	
				be park of the tree planting and be applied the entire parcel.	
				be park of the tree planting and be applied the entire pareer.	
74	96	Page 5-31	Section 5.2.13		
74	30	1 agc 3 31	Section 5.2.15	"The Preferred Alternative would not impact to Cabin John Trail, or any other	
				recreational facilities in Cabin John Stream Valley Park Unit 6." Remove this	
75	97	Page 5-33	Section 5.2.14	,	
/5	97	Page 5-33	Section 5.2.14	reference as there are no trails in CJ SVU 6.	
76	00	D 5 22	C1 5 2 4 4	The LOD on the west side of I-270 is too large. It needs to be tighter around the	
76	98	Page 5-33	Section 5.2.14	SWM facility and not go further than the confluence.	
				3620+00 west side. Remove LOD bump out at existing and recently restored	
77	99	Page Map 24	Section Appx D	outfall	
				Parks does not concur with the need for an augmentation culvert and the	
78	100	Page 5-33	Section 5.2.14	associated impacts	
				"The Preferred Alternative presented in this SDEIS would not avoid the use of all	
				Section 4(f) properties. It would, however, avoid the use of 37 Section 4(f)	
				properties for which impacts totaling roughly 105 acres as were reported in the	
				DEIS (Table 5-2). Those 105 acres of impact to 37 properties would be fully	
				avoided by the Preferred Alternative. " M-NCPPC takes this statement to mean	
				that any future improvements to the highway outside of the Phase 1 area would	
79	101	Page 5-50	Section 5.3	need a new and separate NEPA process.	
				"All possible planning to minimize harm will additionally involve an agreement	
				document that outlines the process to continue coordination with the OWJs	
				over Section 4(f) properties through the design phase of the project." M-NCPPC	
				Montgomery Parks will continue to require extensive review of all impacts to	
				Parkland with the goal to continue to minimize those impacts. Before any work	
80	102	Page 5-51	Section 5.4.1	is permitted to occur on Parkland a Park Construction Permit must be issued.	
				"Consideration of improvements to those remaining parts would have to	
				advance separately, and would be subject to additional environmental studies,	
				and analysis and collaboration with the public, stakeholders, and agencies."	
				and definition and definition and public, statementally, and agentics.

#### I-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021 MNCPPC Ref Comment Doc\_# No. **SDEIS Section** Page Comments from MNCPPC\_1\_SDEIS Major Issues\_9.19.21 document Revised comments where applicable Page 1 Paragraph Appendix C Compensatory SW Clarify Phase I south (There is also Phase I north). 91 113 Last sentence Mitigation Plan Part 1 Need to be more specific about how more environmental impacts won't result from this SWM effort and how they will be mitigated for. As the P3 can choose any sites (not just from this list) to move forward with, limitations on the Appendix C amount of environmental resources allowed to be impacted cumulatively for Page 1 Paragraph Compensatory SW this effort need to be set. Mitigation is not sufficient to compensate for impacts Mitigation Plan Part 1 resulting from compensatory offsite SWM. Instead of prioritizing existing MDOT SHA ROW for offsite compensatory mitigation in a large geographic area (that becomes meaningless on a 6-digit HUC scale it is so large), instead this effort should be to concentrate on all Appendix C untreated impervious areas within 1500' of the LOD. This would make the Page 1 Paragraph Compensatory SW benefits seen by the compensatory mitigation meaningful to the location of the Mitigation Plan Part 1 impacts and the surrounding waterways. "Future Phases" is inconsistent with the rest of the SDEIS document. "No Build" 116 Page 2 Figure 1-1 Appendix C 94 should be used instead. Stating that it is "desirable" for SWM to be met onsite is insufficient. The onsite SWM efforts shown are not enough; currently less than 45% of stormwater Appendix C water quality treatment is proposed onsite. The percentage of on-site SWM Page 3 Paragraph Compensatory SW reatment should be at least 80%, and then the remaining 20% that is offsite Mitigation Plan Part 1 hould occur within 1500' of the LOD corridor. The MDE 6-digit watershed is too large in this case and puts the compensatory Appendix C SWM sites too far away from the impacts. All off-site compensatory SWM Page 3 Paragraph Compensatory SW mitigation should occur within 1500' of the LOD to be proximate and Mitigation Plan Part 1 118 1 meaningful in its effect on the local water quality. roperty owners of proposed sites need to be notified sooner. Parks owns ome of the proposed sites and we were previously unaware of their inclusion Appendix C n this plan. We do not approve the use of any of these sites (or the LODs Page 3 Paragraph Compensatory SW shown) without separate, further coordination to understand the impacts these 97 119 4 Mitigation Plan Part 1 are mitigating for. The MDE 6-digit watershed, even overlaid with the Federal 8-digit HUC, is too large in this case and puts the compensatory SWM sites too far away from the Appendix C mpacts. All off-site compensatory SWM mitigation should occur within 1500' Page 3 Paragraph Compensatory SW of the LOD to be proximate and meaningful in its effect on the local water 120 4 98 Mitigation Plan Part 1 Appendix C Specify that this document only covers Phase I south. All other areas should be Page 4 Compensatory SW abeled "No Improvements" 121 Figure 2-1 Mitigation Plan Part 1 99 Page 5 Paragraph Appendix C The SDEIS only covers Phase I south Alternative 9. The rest of alternative 9 is no 1 and Paragraph | Compensatory SW nprovements and those impacts should not be included in this document. 100 122 2 Mitigation Plan Part 1 Be more specific about how the P3 will be incentivized to provide as much onsite SWM as possible. A minimum of 80% of water quality WM should be Appendix C required to be treated onsite, with strong incentives to treat the remaining 20% Page 5 Paragraph Compensatory SW on-site as well (or maybe through disincentivizing off-site compensatory SWM).

Page 17

All off-site SWM should be withing 1500' of the LOD.

Comments from	MNC		or Issues_9.19.21 docume	nt	Revised comments where applicable
				Montgomery Parks does not feel that good potential SWM opportunities should	
				be eliminated due to their location on Parkland. Conversely, we have spent	
				copious amounts of time working with the MDOT/SHA project team to identify	
				and review potential offsite compensatory SWM opportunities on Parkland.	
				Our priority remains to lessen the effects that this highway expansion will have	
				on downstream waterways and properties, many of which are Parkland.	
				Montgomery Parks is committed to being a partner in finding solutions to treat	
				stormwater runoff and hold the project accountable for its environmental	
			Appendix C Section 4.2.8	impacts. This includes the use of Parkland for compensatory stormwater	
116	138	Page 9	Part 1	mitigation when it can be effective.	
				See above. If sites fit all other criteria for compensatory SWM mitigation and	
			Appendix C Section 4.4	are on Parkland, they should be discussed with the landowner and considered	
117	139	Page 11	Part 1	(not just unduly removed from consideration).	
				Sites outside of the 1500' buffer surrounding the LOD should be removed from	
		Page 13 Table 4-		consideration. The majority of these 754 sites aren't even proximate to the	
118	140	3	Appendix C Part 1	impervious being installed.	
				The P3 should be held strictly accountable for treating a minimum of 80% of the	
			Appendix C Section 5	SWM water quality onsite, and the remaining maximum of 20% within 1500' of	
119	141	Page 13	Part 1	the corridor.	
			Appendix C Section 5.1.8		
120	142	Page 14	Part 1	This is inaccurate; section 4(f) land is included in this document.

#### I-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021 MNCPPC Ref Comment Doc\_# No. SDEIS Section Page Comments from MNCPPC\_1\_SDEIS Major Issues\_9.19.21 document Revised comments where applicable Noise/visual barrier should be pursued for all areas of parkland. Parks expectation that any areas shown with retaining wall adjacent to parkland within Phase 1 South, should also incorporate noise wall/visual barrier. In addition to the noise/visual barriers requires landscape plantings adjacent to all wall/barrier locations, include planting of specifically designed vegetative buffers. This would consist of plantings at least 5m wide with a diverse type of woody plants planted at a higher density. As far as the Visual Screening Options memo, Parks would like some discussion about the construction techniques and minimum footprints required to construct Timber Noise Barriers and Concrete Noise Barriers in conjunction with/on top of retaining walls. The LOD construction offset to the proposed retaining walls is shown in the most recent plans at approx. 15', Parks needs to understand any additional impacts being Chapter 4 incurred as a result of adding this element to the design. Parks could be open to 4.6.3 a combination of timber and concrete noise barriers along all parkland and Environmental would want to work with them to identify what is most appropriate in each area 166 188 Page 4-27 Consequences and look at heights that would be meaningful. Environmental Resource Add noise wall STA 192+50 to 197+00 on west side and 195+00 to 220+00 on 167 189 Map 8 Mapping Appx D **Environmental Resource** Add noise wall STA 203+00 to 220+00 and along River Road on east side. 190 Map 9 Mapping Appx D 168 Add noise wall STA 3683+00 to 3680+00 along east side and STA 3684+00 to 191 Map 23 Mapping Appx D Environmental Resource Add noise wall STA 3669+00 to 3619+00 on west side. 192 Map 23 Mapping Appx D 170 Parks does not recognize any NCPC authority over the Cabin John Regional Park or Cabin John SVU2. SHA and NCPC will have to provide clear documentation that those parks were purchased with Capper-Cramton funds. Section 4.4.3 B b 193 Page 4-10 171 M-NCPPC expects E&S measures beyond what is required to protect aquatic 194 Page 4-55 Chapter 4 Section 4.11.4 resources on park land 172 SHA is considering the impact area of the preferred alternative to have been significantly reduced, this implies that the rest of the alignment outside of Phase 1 should be clearly labeled as "no build" and any future improvements would require a new NEPA process. 195 Page 4-57 Chapter 4 Section 4.12.3 173 Indirect impacts to wetlands and waterways should be mitigated for by the onstruction of environmental stewardship projects design to enhance and 196 Page 4-57 Chapter 4 Section 4.12.3 protect the environment. 174 Parks requires further coordination for the impacts to wetlands and waterways on parkland as listed in table 4-24, 4-26 and 4-27. 197 Page 4-63 to 4-72 Chapter 4 Section 4.13

### I-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021 MNCPPC Ref Comment Doc\_# No. SDEIS Section Page Comments from MNCPPC\_1\_SDEIS Major Issues\_9.19.21 document Revised comments where applicable Parks requires further coordination for the impacts to forest impacts on parkland and potential mitigation. 198 Page 4-63 to 4-72 Chapter 4 Section 4.13 Parks requires further coordination for the increase in impervious areas, 98.2 acres of impervious added to Cabin John Creek watershed and other impacts listed in Table 4-28. Discuss BMPs being employed and long-term water quality impacts. SHA should commit to environmental stewardship projects in the watershed that are above and beyond required stormwater management and 404 mitigation. Chapter 4 Section 4.13.3 199 Page 4-71 Parks requires further coordination for avoidance and minimization through design and construction. Work to coordinate retention and addition of riparian buffers as well as aquatic passage through structures. Retain floodplain access and preserve existing stream buffers. Increase SWM techniques to improve water quality. 200 Page 4-71 Chapter 4 Section 4.13.4 178 The project needs to commit to significantly improving the Provided ESD surface area to a minimum of 80% of the Required ESD onsite (allowing for a maximum of 20% to be treated with the use of compensatory SWM mitigation offsite). These highways can be considered the worst water quality offenders in the County and the Project needs to take more responsibility for protecting the downstream water resources, which will never be improved if we don't take the 201 Page 4-73 Chapter 4 Section 4.14.4 appropriate steps as part of this project. 179 Parks requires further coordination for culvert augmentations and floodplain encroachments on Parkland to reduce impacts to hydrologic function and wildlife habitat. 202 Page 4-75 Chapter 4 Section 4.15.3 Further coordination on impacts to forested areas on Parkland, including impacts FIDS habitat species and NNI treatment. Coordinate reforestation on and offsite. SDEIS lists 9.5 acres of potential tree planting opportunities on M-Chapter 4 Section 4.16.2 NCPPC Parkland. 181 203 Page 4-76 Indirect impacts to wetlands and waterways should be mitigated for by the construction of environmental stewardship projects design to enhance and protect the environment. 204 Page 4-82 Chapter 4 Section 4.18.2 182 This table notes that there are 2 historic properties where the adverse effect cannot yet be determined. It should also note that there are a number of outstanding evaluations to determine if properties are eligible for the NR or not. The total number of Historic Properties is not yet determined, nor is the adverse 183 205 Page ES-11

				analyses been performed for the interchange ramps and ramp terminal	
				intersections on the interchange cross streets? Section 3.3.6 provides	
				information about overall network delay to the local roadway network, but	
				there is language about some increased delays around managed lane entrance	
				points on the cross streets. Were just the ramps and ramp terminal	
				intersections modeled, or did the model continue on either side of the	
				interchange to get a clearer representation of these cross street operations in	
				the vicinities of interchanges? We want to be sure that operational benefits to	
				the freeway system do not result in operational failures or safety concerns on	
				the ramps or cross streets, so it would be beneficial to have an idea of any	
6	6		Chapter 3	localized issues as well.	
				AADT Increases with Proposed Project: Table 3-3 shows 2045 Build Traffic. The	
				Build alternatives show ADTs that are higher than No-Build. It may be helpful to	
				discuss this growth in the context of induced demand and diverted trips: are	
				these additional trips new trips? Are they trips that were occurring at different	
				times, or that were using different routes? Are they trips that have shifted from	
				non-auto modes? All these trip types need to quantified to fairly understand	
7	7		Section 3.3	how the proposed project is changing mode choice and travel characteristics.	
				Travel Speeds: While this section alludes to more detailed travel speed	
				information in Appendix A, it may be helpful to provide a general note	
				highlighting any significant speed benefits or impedances experienced on a	
				segment level, which may be watered down by taking an average of a much	
8	8		Section 3.3	longer corridor.	
				System-Wide Delay: The Delay metric appears to combine both General	
9	9		Section 3.3.2	Purpose and Managed Lanes. As such, this is not a particularly useful metric.	
				Worsening of General Purpose Lanes: This project claims to improve traffic, but	t
				the project's analysis finds that in there are significant segments where the	
				General Purpose lanes worsen significantly as compared to No Build conditions.	
				Does MDOT accept degraded performance of the General Purpose lanes in the	
				interest of providing priced managed lanes? Penalizing current users of these	
				roads does not seem to be consistent with the stated policy objectives of this	
				program. If MDOT does accept this outcome, it is imperative that equity be	
10	10		Section 2.2.2	considered, and actions be incorporated into the project to address the needs of	
10	10		Section 3.3.3	users that are most adversely impacted.  Project Purpose and Need and Proposed Project: The project's Purpose & Need	4
				includes creating new options for users, but the Preferred Alternative instead	4
				appear to reduce options available to users unable to afford or otherwise access	
11	11		Section 3.3.3	the managed lanes	
			3333	Level of Service Metric: The Level of Service metric appears to combine both	
				General Purpose and Managed Lanes. As such, this is not a particularly useful	
				metric.	
				The aggregate nature of this metric may allow the effects of the managed lanes	
				or the general purpose lanes to be over representative, and we urge that this	
12	12		Section 3.3.5	metric account separately for managed lanes and general purpose lanes.	

I-495 & I	-270 I	/lanaged La	nes Study- Draft :	Supplemental Draft Environmental Impact Statement (	SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021
MNCPPC Ref				Comment	
Doc_#	No.	Page	SDEIS Section		
Comments fro	m MNC	PPC_1_SDEIS Maj	or Issues_9.19.21 docum		Revised comments where applicable
				I-270 ICMS Project: The ICMS document stated that there would be	
				transportation benefits from their proposed actions up to 2040 and beyond.	
				Given that this was a \$100M investment from the state, how much of those	
				improvements will actually contribute to alleviating the 2045 No Build	
				condition? How much of the Preferred Alternative actually removes or	
				significantly modifies the improvements spent on the ICMS project? Clearly,	
				given the abrupt decision of the MDOT SHA design team to re-design the build	
				alternatives on I-270 mid-stream to eliminate the express/local lane system,	
				why was this not considered in the ICMS project? In hindsight, this appears to	
				be a very shortsighted, short-term decision that will never achieve the cost-	
13	13		General	benefit ratios projected.	
14	14		Section 4.1	This section should include information on how this project will affect land use & zoning beyond the immediate impacts of the project. This includes a focus on how this may affect environmentally damaging development patterns and efforts toward Non-Auto Driver Mode Share (NADMS) goals.	
15	15		Section 4.8.1	This page includes the following statement: "Because the new Preferred Alternative, Alternative 9: Phase 1 South, includes no action for the majority of the study area, the affected network was updated to focus on just those segments near the project area" This does not appear to be an appropriate assumption, as the Transportation & Traffic chapter demonstrates that the Preferred Alternative will have increased vehicle volumes throughout the entire study area, and additional congestion in multiple segments within the study area. These impacts must be included for a complete analysis. It is also unclear whether local roadways have been included in this analysis, particularly noting the lack of Transportation & Traffic information on these same roadways.	

I-495 & I-	270 I	Managed Lar	nes Study- Draft S	Supplemental Draft Environmental Impact Statement (S	DEIS) M-NCPPC Comment/Response Errata- November 29, 2021

Doc_#	No.	Page	SDEIS Section	Comment	
Comments from	m MNC	PPC_1_SDEIS Majo	or Issues_9.19.21 docum	ent	Revised comments where applicable
				GHG Emissions: This page includes the following statement: "GHG emissions on	
				the affected transportation network for all modeled Build Alternatives in the	
				DEIS are projected to be lower in the opening (2025) and design (2040) years	
				compared to base year conditions. All Build Alternatives are projected to slightly	
				increase annual tailpipe GHG emissions by an average of 1.4 percent compared	
				to the No Build Alternative in 2040."	
				First, it sounds like the 1st sentence says this will have lower emissions, but the	
				2nd sentence says this will have higher emissions. How do these differ? Is it that	
				the 1st sentence appears to account for *all* GHG emissions, and the 2nd	
				sentence appears to focus only on tailpipe GHG emissions? More detail is	
				needed.	
				Second, if this is asserting that the project will reduce emissions: much more	
				detail is needed on methodology and assumptions, as this result seems	
				counterintuitive given that the project is increasing vehicle volumes and VMT.	
				Noting the State's interest in Electric Vehicles: if electric vehicles are a	
				substantive part of this reduction, it will be important to account for the	
				impacts of the electric vehicles themselves.	
				Electric vehicles have substantial impacts:	
				- Extracting the resources needed for their production (particularly their	
				batteries)	
				- Impacts of production	
				- Energy requirements, which at present is generated through unsustainable &	
				polluting sources	
				- Severely impactful waste issues (again largely due to the batteries)	
				- EVs are still vehicles: they demand pavements (concrete and asphalt; both	
16	16		Section 4.8.1	depend on highly impactful cement and petroleum production) and pose safety	
				Percent of Lane-Miles Operating at LOS F: Do these results include the	
				managed lane-miles or just the general-purpose lane-miles? If it includes the	
				managed lanes, we request that this section be modified to also provide a	
		Table 3-9, page 3-	-	comparison of percent lane-miles between the No Build and the Preferred	
17	17	12	Section 3.3.4	Alternative in the General-Purpose Lanes only.	

I-495 & I-2	270 ľ	Managed Lar	nes Study- Draft	Supplemental Draft Environmental Impact Statement (	SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021
MNCPPC Ref					
Doc_#	No.	Page	SDEIS Section	Comment	
Comments from	MNC	PPC_1_SDEIS Maj	or Issues_9.19.21 docum	nent	Revised comments where applicable
				I-495 east of I-270 LOS F conditions: It is stated that "29 percent of the lane	
				miles would continue to operate at LOS F in the design year of 2045 under the	
				Preferred Alternative, primarily in areas along I-495 east of the I-270 east spur	
				that would have no action." This statement does not seem accurate, as AM peak	
				hour conditions will grow considerably worse overall in certain sections of I-495	
				due to the proposed project. The localized summary of impacts has not been	
				presented in Table 3-9 or anywhere in the SDEIS.	
				Between MD 355 (I-270 East Spur) and I-95, there are 52 Inner Loop analysis	
				segments totaling 8.8 miles. During the 2045 AM Peak Hour, 20 of these	
				segments (3.4 miles or 39 percent of this section of I-495) operate at LOS F in	
				the No Build Condition, but 46 segments (8.28 miles or 94 percent of this	
				section of I-495) operate at LOS F with the Preferred Alternative in place.	
				Clearly, neither the Chapter 3 presentation nor Appendix A provides any of this	
				fine-grained analysis or conclusions. The data in Attachment F had to be	
				combed through to discover this significant impact. This evaluation should be enhanced to look at discrete sections of I-270 and I-495 where significant	
				congestion effects should be noted, acknowledged, and considered for	
				mitigation through modification of the proposed project by design element	
				changes or toll strategy modifications. This degradation seems to be a	
				significant impact of the proposed project, but it has been overlooked using a	
				simplistic and abbreviated summary of LOS F conditions. Frankly, an over-	
		Page 3-12 (Data		simplification of analysis results is not isolated to this one example. To often,	
		obtained from		EISs in the interest of brevity, shorten presentations so much to the point where	
		Appendix A,		any significant conclusions are not discernable to the average reader. The DEIS	
		Attachment F		chapters are intended to lay out the significant impacts with more detail	
		Link Evaluation		provided in Appendices. This document misses this on LOS F, and many of the	
18	18	Results)	Section 3.3.4	other transportation metrics studied	
				2045 Inner Loop PM Peak Hour VISSIM Travel Speed in the Managed Lanes:	
				During the PM peak hour, the route from the GW Parkway to the I-270 West	
				Spur is projected is projected to take only 4.2 minutes for a 4.3-mile section of	
				road (61 mph), not the 23 mph reported in Table 3-5. The 4.2-minute travel	
			C1: 2 2 / 0 -f	time was obtained from Appendix A - Attachment D – Travel Time Matrices for	
10	40	D 2 0	Section 3.3 (page 9 of	the ETL (PM Peak Hour). There must be an error in one of these travel	
19	19	Page 3-9	16)	time/speed measurements as they do not match.	
				Table 3-8 – TTI Results for General Purpose Lanes: The preferred alternative appears to cause a significant congestion effect on one area outside the project	
				limits, specifically during the 2045 AM peak hour on the Inner Loop between I-	
				270 and I-95 ("top side" of the Beltway) where the TTI increases from No Build	
				conditions of 1.3 to 2.7 in the General Purpose Lanes ( 208% increase). During	
				the 2045 PM peak hour, the Inner Loop from VA 193 to I-270 West Spur also	
				shows a decrease from No Build conditions of 6.6 to 6.9. What is causing the	
20	20	Page 3-11	Section 3.3.3	reduction in non-tolled TTI in each of these sections?	

I-495 & I-2	270 I	Managed Lar	nes Study- Draft S	upplemental Draft Environmental Impact Statement (S	SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021

Comments from	n MNC	PPC_1_SDEIS Majo	or Issues_9.19.21 docume	ent	Revised comments where applicable
				2045 Inner Loop PM Peak Hours TTIs: The TTIs for the Inner Loop PM peak hour	
				from VA 193 to I-270 do not seem to match with travel time data provided in	
				Appendix A, Attachment D. Is congested TTI defined based on the posted speed	
				limit of 55 mph or based on observations of existing off-peak speeds on that	
				stretch of road? The travel time for this 5.1-mile segment for the managed lanes	
		Appendix A, Page		is shown as 5.3 minutes in Appendix A, Attachment D (page 133 of 184). This	
		3-11 and		equates to an average speed of 58 mph. What is the TTI in the Managed Lanes	
		Appendix A,		through this same section? As an example, could you provide the TTI	
24		Attachment D		calculations for this segment for Alt 1, GP lanes and the Managed Lanes?	
21	21	and B	Section 3.3.3		
				2045 PM Peak Hour Travel Times from VA 193 to I-270 and Delay/Demand	
				Imbalance: Alternative 1 (No Build) has a 38.6-minute travel time and the	
				Preferred Alternative - GP lanes has a 40.1-minute travel time. The managed	
				lanes have a 5.3-minute travel time. The travel time differential through this	
				section seems totally unbalanced, as a managed lane toll strategy should seek to achieve a much lower speed than is forecast and still operate acceptably (by	
				reducing the toll) until a 45-mph average speed is achieved in the managed	
				lanes. 2,535 vph is the projected Inner Loop 6-7 PM toll volume at the ALB (page	
				101 of 184, Appendix A, Attachment B). Using MDOT SHA's vphpl lane max for a	
				managed lane of 1700 vphpl, it appears that there is excess room in the PM	
				Inner Loop managed lanes for an additional 865 vehicles during the highest 6-7	
				PM peak hour (more in the other 3 PM hours). This would represent a 13	
				percent reduction in volumes in the GP lanes if the toll was lowered to induce	
				more traffic to use the managed lanes to achieve this balance. This might help	
				to mitigate the poor GP lane conditions, so it is at least better than Alternative 1	
				(No Build). In general, it seems that this type of critical thinking and manual toll	
				adjustments should have been a standard step in the toll assignment process. It	
		Attachment D		is easy to diagnose, and likely can be fixed with a few iterative model runs with	
22	22	and B	Appendix A	reduced tolls when this occurs.	
				2045 AM Peak Hour SB I-270 Congestion: Per the I-270 SB Speed AM profile,	
				peak hour speeds will be disrupted significantly on the MD 121 to Middlebrook	
				Road segment of I-270 during the 2045 AM peak hour due to the addition of the	
				proposed project. This is likely to seriously increase travel delay for commuters	
				living in UpCounty Montgomery County and Frederick County. Please provide	
				more travel time summaries for more common travel patterns, including	
				Frederick to Rockville, Clarksburg to the GW Parkway, and Clarksburg to MD 97.	
				Please explain why increased congestion is projected to occur many miles	
				upstream from the project area. We anticipate that instead of this very long	
				delay, you would continue to see worsened peak spreading into the shoulder	
				hours during the AM commute period. This project seems to be setting up the	
				need for Phase 1B by design. In that sense, I think it is clear that the	
				segmentation of this project on I-270 into Phase 1A and Phase 1B was not fully	
				thought out, as widening on Phase 1A precipitates the need for Phase 1B. From	
			Evaluation Memo –	early on, the constraint at the Montgomery/Frederick County line has been	
23	23	Page 123	Attachment C	identified as a major bottleneck that is more of immediate action.

	<del></del>	. 080 120		Managed Lane versus General Purpose Lane Speeds: The General Purpose	
				lanes are projected to operate at nearly the same speed as the Managed Lanes	
				in the segments listed below, which may affect the usefulness of the Managed	
				Lanes. This could in-turn affect how much traffic chooses to instead remain in	
				the General Purpose lanes, and it is unclear how this evaluated such feedback	
				processes & whether an equilibrium was identified. This may also affect the	
				HOT lanes' financial viability. This, in general, highlights a serious concern with	
				how managed lane volumes were estimated.	
				- AM peak, 495 Outer Loop between 270 and GW Pkwy (8% faster)	
				- AM peak, 495 Inner Loop between GW Pkwy and 270 (13% faster)	
				- AM peak, NB 270 between 495 and 370 (3% faster)	
				- AM peak, SB 270 between 370 and 495 (16% faster)	
				- PM peak, 495 Outer Loop between 270 and GW Pkwy (13% faster)	
25	25		Section 3.3.1	- PM peak, SB 270 between 370 and 495 (equal speed)	
				Review of Travel Time Projections: A review was conducted of travel time	
				savings using travel time projections provided in Attachment D. Note that this	
				data is limited to the project study area, not the modeled area, so travel time	
				data on I-270 north of I-370 was not provided. See the AM and PM peak hour	
				tables below for typical Montgomery County O-D pairs. Expanding the	
				attachment D data to show the entire I-270 corridor studied would have been	
				useful. In addition, given that there appears to be some very large regional	
				traffic shifts on I-495 between the Maryland and Virginia sides, it would be	
				useful to see travel time data for larger segments of I-495 in Virginia (i.e., VA	
				193 to Tysons, Tysons to I-95, and I-95 to MD 414.	
			Evaluation Memo –	Please provide similar data for the I-495 Virginia segments and more O-D travel	
			Attachment D Travel	time summaries for UpCounty Montgomery County and Frederick County	
26	26		Time Matrix	commuters.	

### I-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021 MNCPPC Ref Comment Doc\_# No. **SDEIS Section** Page Comments from MNCPPC\_1\_SDEIS Major Issues\_9.19.21 document Revised comments where applicable Impact of Managed Lanes System on General Purpose Traffic: : Based on observation of the data reported in the tables above, here are some areas of 1) The 2045 AM peak hour trip from the GW Parkway to MD 97 (Inner Loop) increases from Alternative 1 - No Build to Preferred Alternative General Purpose Lanes by 8.3 minutes (63 percent increase). 2) The 2045 AM peak hour trip from MD 189 (Falls Road) to I-95 (I-270 and Inner Loop) increases by 14.3 minutes (62 percent increase). 3) the 2045 AM peak hour trip from MD 190 to MD 355 (Inner Loop) increases by 4.7 minutes (200% increase). 4) The 2045 PM peak hour trip from the GW Parkway to MD 189 (Falls Road) increases by 10 minutes (31% increase). Question 1: How does MDOT SHA justify making 2045 traffic conditions worse (Alternative 1 - No Build versus the Proposed Project - GP Lanes) for the benefit of toll paying drivers for these locations? These travel time losses are being incurred by the commuting population and essentially subsidizing the cost of the managed lanes as a result. Wherever possible, the toll strategy should be adjusted to ensure that GP Lane travel times are no worse than Alternative 1 -No Build conditions. This is basic traffic impact mitigation, and this evaluation should be conducted for all locations where this impact to GP traffic is Appendix D SDEIS Traffic projected. Question 2: Any worsening of the General Purpose lanes to benefit Evaluation Memo -Tolled Lanes presents a major equity issue that needs to be directly and Attachment D Travel substantively addressed. How will this be addressed from an 27 Time Matrix 27 equity/environmental justice lens? Travel Time Benefit of Managed Lanes for Montgomery County users: Using the data in the previous tables, here are some areas of concern: 1) During the 2045 AM peak hour, none of the typical O-D patterns in Montgomery County show any benefits of using the managed lanes at all with projected travel time savings ranging from 0.3 to 1.6 minutes. 2) During the 2045 PM peak hour, the GW Parkway to MD 97 route shows a 39minute travel time savings, although, this travel time savings is earned over a very short section of the Inner Loop between the GW Parkway and the I-270 west spur. 3) During the 2045 PM peak hour, the GW Parkway to MD 189 (Falls Road) route shows a 33-minute travel time savings; however, this is only a 23-minute net travel time savings over No Build conditions. 4) During the 2045 PM peak hour for all other Montgomery County patterns evaluated, the projected travel time benefits are negligible (ranging rom 0.4 to 1.1 minutes). Question 1 from this data: Why does this proposed project provide almost no travel time benefits for the vast majority of Montgomery County commuters? Question 2 from this data: The modeling assumptions seem suspect as a result, as most Montgomery County commuters will learn pretty quickly that the Managed Lanes have little benefit to their daily commute trip. Who are the actual projected users of these Managed Lanes? Who benefits and is that Appendix D SDEIS Traffic reflected in the modeling assumptions? Understanding the O-D patterns of ALB Evaluation Memo – users would help to understand who these managed lanes are designed for. We Attachment D Travel recommend that select link analyses be conducted using the travel demand

Page 37

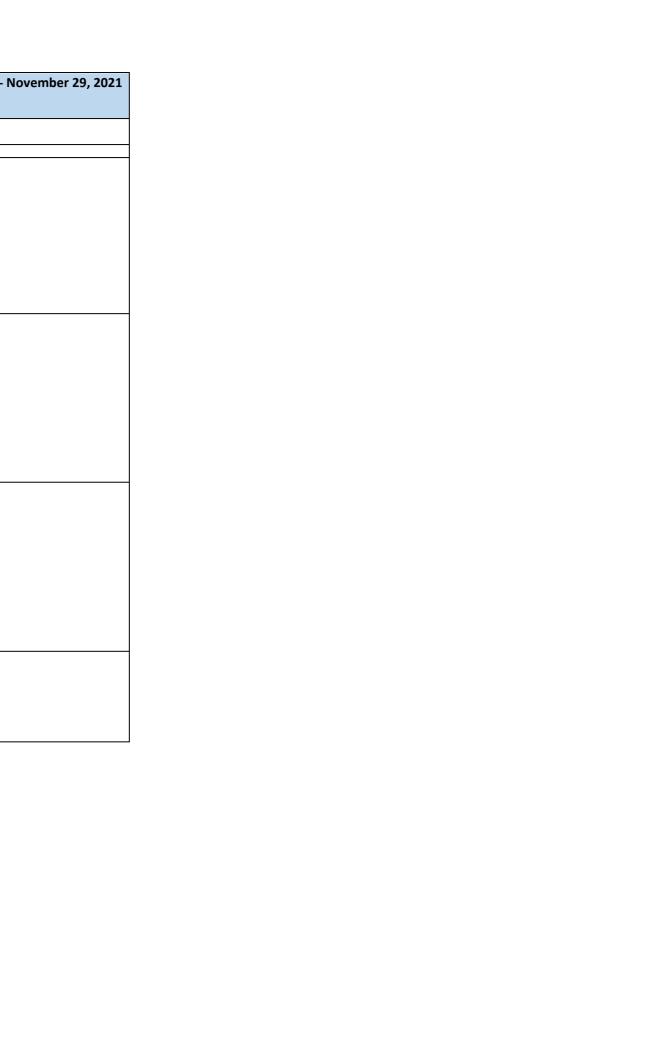

model in order to provide more detail and clarity.

28

I-495 & I-2	270	Managed La	nes Study- Draft S	upplemental Draft Environmental Impact Statement (S	SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021
MNCPPC Ref				Comment	
Doc_#	No.	Page	SDEIS Section		Desired comments where and leads
Comments from	n IVIIVC	PPC_1_SDEIS IVIAJ	jor Issues_9.19.21 docume	nt	Revised comments where applicable
				Travel Time Impacts on I-495 in Prince George's County: On observation of	
				data reported in the previous tables, the travel time on I-495 between MD 5 and	
				MD 97 was evaluated. During the 2045 PM peak hour, a very anomalous result	
				was found with the MD 5 to MD 97 route (Outer Loop) showing a 36-minute	
				travel time benefit between the No Build and the Preferred Alternative. Based	
				on 2045 PM peak hour Inner Loop results on the northeastern side of the	
				Beltway, it appears that a dramatic regional shift is projected from traffic with	
				an origin in Virginia and with a Maryland destination that now (and during the	
				2045 No Build condition) uses I-495 in Virginia crossing the Woodrow Wilson	
				bridge. Lacking travel time data for I-495 in most of Virginia, this is speculative.	
			Appendix D SDEIS Traffic	Question from this review: What is causing this significant travel time savings	
			Evaluation Memo –	from a regional perspective? To what extent is Prince George's County	
			Attachment D Travel	projected to benefit or projected to be impacted by a project so far away from	
29	29		Time Matrix	their jurisdiction?	
				AM Peak Hour Bottleneck Shift to Top Side of Beltway – Level of Service: A	
				comparison of the link evaluation results for the I-495 Inner Loop 2045 AM Peak	
				Hour shows how Inner Loop congestion will increase due to the addition of the	
				proposed project. Comparing graphics on page 144 and 155, you can see the	
				extent of congestion between the I-270 Western Spur to MD 193 caused by the	
				project increases significantly, jamming up the entire top side of the Beltway, as	
				more traffic is allowed to funnel into the top side of the Beltway than it can	
				handle. This will be devastating to AM peak hour traffic conditions on the top	
				side of the Inner Loop within most of Montgomery County during the 2045 AM	
				peak hour. In the 2045 No Build condition, only 4 of the total 48 road segments	
				evaluated were projected with Level of Service F conditions between the I-270	
				western spur and MD 193. With the preferred alternative, a total of 41 out of	
		Pages 144 and	Evaluation Memo –	the total 48 road segments are projected to operate at Level of Service F	
30	30	155	Attachment F	conditions during the 2045 AM peak hour.	
				Increased Southbound Congestion at Existing I-270 Bottleneck at	
				Montgomery/Frederick County Line: A comparison of the link evaluation	
				results for the I-270 SB 2045 AM Peak Hour shows how I-270 SB congestion will	
				increase due to the addition of the proposed project. Comparing graphics on	
				page 147 and 159, one can see the extent of congestion between four segments	
				north of MD 121 to Middlebrook Road caused by the project. In the 2045 No	
				Build condition, only 9 of the total 25 road segments evaluated were projected	
				with Level of Service F conditions within this area. With the preferred	
				alternative, a total of 24 out of the total 25 road segments are projected to	
				operate at Level of Service F conditions during the 2045 AM peak hour. The	
				projected worsening of traffic conditions in this section of I-270 seems to be	
			Annualis A CDEIC Tooff:	caused by the presence of additional capacity downstream, with more drivers	
		Dagga 147 as d		willing to suffer through this congestion in the Clarksburg area. Even if this	
24	24	Pages 147 and	Evaluation Memo –	results in a faster commute for some, it does increase the intensity of the	
31	31	159	Attachment F	existing bottleneck congestion.

				Increased Northbound Congestion at Existing I-270 Bottleneck at	
				Montgomery/Frederick County Line: A comparison of the link evaluation	
				results for the I-270 NB 2045 PM Peak Hour shows how I-270 NB congestion will	
				increase due to the addition of the proposed project. Comparing graphics on	
				page 152 and 164, one can see the extent of NB I-270 congestion between MD	
				121 to MD 85 caused by the project. In the 2045 PM peak hour No Build	
				condition, only 7 of the total 51 road segments evaluated were projected with	
				Level of Service F conditions within this area. With the preferred alternative, a	
				total of 43 out of the total 51 road segments are projected to operate at Level of	f
				Service F conditions during the 2045 AM peak hour. This is clearly an example	
		Pages 152 and	Evaluation Memo –	of the existing ALB bottleneck being shifted to north of the Managed Lane	
32	32	164	Attachment F	project terminus.	
				Regional Outer Loop Traffic Diversions Impact I-495 in Prince George's	
				County: A comparison of the link evaluation results for the I-495 Outer Loop	
				2045 PM Peak Hour shows how Outer Loop congestion is projected to increase	
				due to the addition of the proposed project. Comparing graphics on page 148	
				and 160, one can see the extent of Outer Loop congestion between MD 5 and	
				US 50 caused by the project, jamming up the entire southeastern side of the	
				Beltway. In the 2045 PM peak hour No Build condition, only 11 of the total 54	
				road segments evaluated were projected with Level of Service F conditions	
				between MD 5 and US 50. With the preferred alternative, a total of 41 out of	
				the total 54 road segments are projected to operate at Level of Service F	
			Appendix A SDEIS Traffic	conditions during the 2045 PM peak hour. Please explain why this level of traffic	
		Pages 148 and	Evaluation Memo –	congestion is projected along this segment of the Beltway, as this section of I-	
33	33	160	Attachment F	495 is far away from the project limits?	
				Regional Inner Loop Traffic Diversions Impact I-495 in Prince George's County:	
				A comparison of the link evaluation results for the I-495 Inner Loop 2045 PM	
				Peak Hour shows how Inner Loop congestion is projected to increase due to the	
				addition of the proposed project. Comparing graphics on page 150 and 162, one	
				can see the extent of Inner Loop congestion between US Route 1 and US Route	
				50 caused by the project, jamming up the entire northeastern side of the	
				Beltway. In the 2045 No Build condition, only 8 of the total 36 road segments	
				evaluated were projected with Level of Service F conditions between US 1 and	
				US 50. With the preferred alternative, a total of 34 out of the total 36 road	
				segments evaluated are projected to operate at Level of Service F conditions	
			Annendiy A SDEIS Traffic	during the 2045 PM peak hour. Please explain why this level of traffic	
		Pages 150 and	Evaluation Memo –	congestion is projected along this segment of the Beltway, as this section of I-	
34	34	-	Attachment F		
34	54	102	Accomment F	495 is far away from the project limits?	
				Delay increases on I-270: With the addition of the proposed project during the	
				2045 PM peak hour, almost all general-purpose travel lane segments on NB I-	
				270 between Middlebrook Road and MD 121 (21 out of 22 segments) are	
			Annondia A CDEIC Traffia	projected to experience increases in delay. How will the P3 contractor mitigate	
		Dagge 153		this project-related impact? Their profits are essentially exacerbating this	
25		Pages 152 and	Evaluation Memo –	congestion increase at the expense of UpCounty Montgomery County and	
35	35	164)	Attachment F	Frederick County taxpayers.

Comments fro	m MNCF	PC_1_SDEIS Maj	or Issues_9.19.21 docun		Revised comments where applicable
				Bottleneck Issues Related to Project Design: Most of the issues identified	
				above clearly show impacts of relieving the congestion at the American Legion	
				Bridge (ALB). In all cases, this does not eliminate congestion but shifts it from	
				the ALB vicinity (McLean and Potomac) to other areas in Maryland. While some	
				of these bottleneck shifts were expected, the degree of congestion resulting	
				from the proposed project is severe on I-270 north of I-370, on the Inner Loop	
				on the top side of the Beltway, and very surprisingly, on the Inner Loop in Prince	
				George's County. More attention needs to be spent on the project design to	
				mitigate these projected deficiencies. For I-270, a solution would be to more	
				closely link Phase 1A and 1B so that they are constructed concurrently. For the	
				other bottleneck issues, we are recommending the following design changes to	
				the Preferred Alternative:	
				1) Eliminate the managed lanes from the I-270 Eastern Spur between I-270 and	
				Old Georgetown Road,	
				2) Eliminate the managed lanes and exit/entrance ramps from I-495 between	
				the I-270 west spur and Old Georgetown Road,	
				3) Managed lane traffic destined to and from I-495 to the east of the I-270 west	
				spur ("top side of the Beltway")would enter/exit the managed lane network at	
				the River Road crossover interchange. It is uncertain that this crossover has	
				adequate capacity, but this limitation is likely to help reduce the "Top Side"	
				bottleneck discussed earlier.	
				4) I-270 Montgomery County drivers headed to the eastern spur would not use	
				the Managed Lane network at all. Clearly, for most Montgomery County	
				travelers, the managed lanes would provide minimal travel time benefits for	
				drivers from Gaithersburg and Rockville to most Montgomery County	
36	36		General	destinations.	
				Proportional highway/transit investment based on where bottleneck	
				congestion is created by the Project: Since this project is clearly shifting the	
				congestion almost as much as it is actually reducing the congestion, MDOT SHA	
				should actively plan to invest in the areas where bottleneck congestion will be	
37	37		General	created or worsened.

I-495 & I-2	I-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021					
MNCPPC Ref				Comment		
Doc_#	No.	Page	SDEIS Section			
Comments from	n MNC	PPC_1_SDEIS Maj	or Issues_9.19.21 docum	ent	Revised comments where applicable	
				Bottleneck Congestion leads to Local Street Diversions/Congestion: We have		
				never been satisfied with the extremely simplistic local street evaluation		
				presented in the DEIS and SDEIS. We are expecting to see more detail from		
				MDOT SHA (and be included in the review process) for the Interchange Access		
				Point Approval (IAPA) study now under development. The increased congestion		
				on I-270 and I-495 will undoubtedly lead to both peak spreading effects and		
				local traffic diversions that have not been adequately considered to-date. When		
				it can take over 30 minutes (TTIs greater than 6.0) to travel 2 to 3 miles on some		
				segments of the Beltway as presented in this SDEIS, drivers will not subject		
				themselves to this on a daily basis, and they will seek to find the shorter travel		
				time route, regardless of local street impact. The scope therefore agreed upon		
				by FHWA for the IAPA (performing traffic operational analyses at ramp terminal		
				intersections and one adjacent intersection (on both sides) beyond service		
				interchanges that are modified by the study, when within one mile) is likely to		
				be inadequate in areas where either I-270 or I-495 exhibits very high projected		
				TTIs and extreme congestion. In those areas, the study area should follow all		
				significant diversionary traffic that switches to the local road network (defined		
				as all non-interstate roads). In the Clarksburg area, this includes many parallel		
				roads, including MD 355, MD 28, Thurston Road, State Quarry Road, and Price's		
				Distillery Road. Along the Beltway, any parallel road or road that crosses I-495		
				may be the recipient of significant diversion traffic depending on location of		
				projected congestion. This includes Seven Locks Road, Burdette Road, and		
				Democracy Boulevard. The study area can be determined by adding routes on		
38	38		General	parallel routes with travel times equal to the GP lanes travel time.		
				Need for Improved Performance Data for I-270 north of I-370: All of the		
				evaluation material in Chapter 3 does not report comparable transportation		
				performance metrics (travel time, delay, Level of Service, TTI) within the I-270		
				modeled area to the north of I-370 where the proposed action may create		
				congestion. Without this information, it is difficult to determine travel time and		
				delay for commuters living north of I-370, including Germantown, Clarksburg,		
				and Frederick County residents. From a review of the link evaluation results		
				presented in Appendix A, Attachment F, it is clear that I-270 to the north of I-		
				370 will experience greater congestion with the proposed project. This was		
				demonstrated in Attachment F mentioned in Comments 14 and 15 above.		
				Please provide more detailed performance metrics for I-270 to the north of I-		
				370 so that the full transportation effects of this bottleneck condition can be		
39	39		General	assessed.

omments fron	n MNCP	PPC_1_SDEIS Ma	jor Issues_9.19.21 docume		Revised comments where applicable
				Lack of Feedback Loop in Modeling Process – Assumptions versus Results:	
				While we recognize that simplistic assumptions are often needed to evaluate	
				transportation projects, the tolling assumptions with Managed Lanes do not	
				mesh with the travel demand shown using the managed lanes versus the travel	
				time benefit provided. Unfortunately, there is no information provided to	
				validate the validity of the managed lane use assumptions. When large portions	
				of the managed lanes show little to no travel time benefit, who is using the	
				managed lanes and what percent of the driving population do they represent?	
				Are the estimates used reasonable? What are the origins and destinations of	
				these managed lane users? They can't be most local Montgomery County trips,	
				as preceding comments in this submission clearly show pretty clearly that most	
				typical O-D commuting pairs within the County have little use or benefit from	
40	40		General	the managed lanes.	
				Percent of Total Demand Using Managed Lanes: A review was conducted of	
				the peak hour travel demand presented in Appendix A - Attachments A (Peak	
				Period Volumes) and Attachment B (Travel Demand Tables). Link demand on	
				each segment of I-495 and I-270 within the project area was projected. Based	
				on this review, the percent of total demand using the managed lanes over the	
				four-hour commuting periods are shown in the following four tables: I-270 AM,	
				I-270 PM, I-495 AM, and I-495 PM. For each, managed lane demand varied by	
41	41		General	hour between 6 and 10 AM and between 3 and 7 PM. Questions related to	
41	41		General	these tables are provided in following comments  Percentage of total demand using managed lanes on I-270 Western Spur	
				During the AM Peak hours: Between 27 and 39 percent of total demand uses	
				the Managed Lanes on Southbound I-270 approaching I-495 during the AM peak	
				hours. This entire travel path only shows a 2.5-minute savings using the	
				Managed Lanes along its 14-mile tolled length. Between 42 and 52 percent of	
				total demand uses the Managed Lanes on Northbound I-270 just north of I-495	
				during the AM peak hours. This entire path only shows a 1.3-minute travel time	
			A	savings over its 14-mile tolled length. How are the percent demand achieved	
	40			using the managed lanes possible if the travel time benefit is so small (in other	
42	42		A and B	words, why pay when it is not worth the cost)?	
				Percentage of total demand using managed lanes on I-270 Western Spur	
				<b>During the PM Peak hours:</b> Between 42 and 45 percent of total demand uses	
				the Managed Lanes on Southbound I-270 approaching I-495 during the PM peak	
				hours. This entire travel path only shows a 1.3-minute savings using the	
				Managed Lanes along its 14-mile tolled length. Between 39 and 41 percent of	
				total demand uses the Managed Lanes on Northbound I-270 just north of I-495	
				during the PM peak hours. This entire path shows a 38-minute travel time	
				savings over its 14-mile tolled length. Again, the demand allocated to the	
			Appendix A Attachments	managed lanes and the methodology for this is questioned. There are just too	
43	43		A and B	many inconsistencies between demand and travel time benefits.

mments fron	n MNC	PPC_1_SDEIS Ma	jor Issues_9.19.21 docum	ent	Revised comments where applicable
				Modeling process detailed in DEIS Traffic Technical Report: Validation versus	
				travel time benefits: Recognizing that there was some iterative modeling	
				adjustments used to achieve a 45 mph average travel speed or higher and keep	
				the maximum lane volume in the 1600-1700 vehicles per hour range in the	
				Managed Lanes, shouldn't there have also been an iterative process to adjust	
				modeling adjustments based on some screenline O-D pair travel time	
				assessments? For example, for the demand volume estimated to travel between	
				I-370 and the ALB, does the actual travel time benefit and cost paid to achieve	
				that benefit mesh with measured managed lane toll rates and cost per mile or	
				cost per minute saved used across the country on similar managed lane facilities	
44	44		Modeling Process	now in operation?	
				2045 PM Peak Hour Inner Loop Volumes: The hourly volumes presented in	
				Attachments B and D do not match. The table below shows a summary for the	
				2045 PM Peak Hour Inner Loop GP Lane Volumes. Please explain this	
			Appendix A, Attachment	discrepancy. It appears that this discrepancy is not isolated to these three	
45	45	Page 99 of 84	В	sections.	
				Bike lane definition. Separated bike lanes do not have to be located "on-street"	
				as stated in the "Bike lane" definition. Per the Montgomery County Bicycle	
				Master Plan, separated bike lanes "are exclusive bikeways that combine the	
				user experience of a sidepath with the on-street infrastructure of a conventional	
				bike lane. They are physically separated from motor vehicle traffic and distinct	
46	46	Page 2-23		from the sidewalk. They operate one-way or two-way."	
				Redectrian and Riguela Facilities: The SDEIS is inconsistent with the "Design	
				Pedestrian and Bicycle Facilities: The SDEIS is inconsistent with the "Design Recommendation / Implication" identified in the "MLS Existing Bridge	
				Inventory_Montgomery Ped-Bike Facilities_12-11-2020_All.pdf" document.	
				Specifically, the SDEIS states: "The preliminary design approach for facilities	
				along crossroads where the crossroad bridge would be reconstructed is to	
				replace, upgrade or provide new pedestrian/bicycle facilities consistent with the	
				master plan, where adjacent connections on either side of the bridge currently	
				exist." However, the "Design Recommendation" included in the "MLS Existing	
				Bridge Inventory_Montgomery Ped-Bike Facilities_12-11-2020_All.pdf"	
				document recommended that the project add pedestrian and bicycle facility on	
				most crossroads regardless of whether adjacent connections on either side of	
				the bridge currently exist. Please remove: "The preliminary design approach for	
				facilities along crossroads where the crossroad bridge would be reconstructed is	
				to replace, upgrade or provide new pedestrian/bicycle facilities consistent with	
				the master plan, where adjacent connections on either side of the bridge	
				currently exist." as it conflicts with previous agreements.	
47	47	Page 2-23		, , ,	
				Add a statement to the last paragraph that expresses this sentiment: "Where	
				the I-495 and I-270 mainline or ramps cross under a roadway or	
				pedestrian/bicycle facility and the bridge would be replaced, the cross road	
48	48	Page 2-23		bridge would construct pedestrian and bicycle facilities over the structure."	
				Pedestrian and Bicycle Facilities: Identify the pedestrian and bicycle facilities to	
				be constructed by the project and the pedestrian and bicycle facilities to be	
				accommodated by the project based on the "MLS Existing Bridge	
49	49	Page 2-23		Inventory_Montgomery Ped-Bike Facilities_12-11-2020_All.pdf" document.

				Enhancements: "Lengthening the I-270 bridge over Tuckerman Lane to	
				accommodate future pedestrian/bicycle facilities along Tuckerman Lane" should	
				be identified as an enhancement, as it appears to meet the conditions at the	
51	51	Page 2-27		bottom of page 2-23.	
				Auchonological in continutions of the Door Forms Counction with account defended	
				Archaeological investigations at the Poor Farm Cemetery site remain deferred.	
				This has prevented adequate consideration of the effects to this site in the DEIS	
52	52	Page 4-33	Section 4.7.3	and SDEIS and under Section 4F.	
32	32	1 agc + 33	300001 4.7.3	The SDEIS environmental justice discussion should incorporate findings from the	
				May 2021 technical report about Morningstar Tabernacle No. 88 Moses Hall and	
				Cemetery (M:35-212). This report provides detailed historical background about	
				the cemetery and the historical African American community along Seven Locks	
				road that was displaced by the original construction of the beltway.	
				Construction was routed through the middle of the community leaving the	
				church and fraternal hall and cemetery on opposite sides of the highway.	
				Archaeological survey showed that the cemetery is larger in extent and closer to	
				the ROW and LOD than understood at the time of the DEIS. This new	
				information highlights the vulnerability of the church and cemetery to the	
				managed lanes project and should be discussed in the Environmental Justice	
				and Cumulative Impacts sections of the SDEIS.	
				The DEIS identifies the Morningstar Tabernacle No. 88 Moses Hall and Cemetery	
				and the Poor Farm Cemetery as sites that may be culturally significant in its	
				Community and Environmental Justice Analysis. However, the Environmental	
				Justice discussion concerns itself primarily with current minority population	
				concentrations and does not address historical and ongoing injustice to small	
				African American communities displaced by construction of the beltway and	
				further threatened by the proposed expansion. This issue was explicitly	
				acknowledged as related to social justice by the National Trust for Historic	
				Preservation in their selection of the Moses Cemetery as one of the 11 most	
				endangered historic sites in America in 2021. This listing and the environmental	
				justice issues raised by it should be acknowledged and discussed in the SDEIS.	
				Likewise, environmental justice issues are mentioned with respect to the Poor	
				Farm Cemetery site in the DEIS. This site contains the remains of an unknown	
				number of individuals, many of them African American. African American burial	
52	52	Dagge 1-70-82	Section 4.2.1		

sites have frequently suffered from inadequate consideration during

53 Pages 4-79-82 Section 4.2.1

MNCPPC Ref					
Doc_#	No.	Page	SDEIS Section	Comment	
		_	jor Issues 9.19.21 docu	ument	Revised comments where applicable
		1		Neither the DEIS nor the SDEIS reference any cumulative effects to specific	
				cultural resources. Additional historical research conducted subsequent to the	
				DEIS in Cabin John related to the Morningstar Tabernacle No. 88 Moses Hall and	
				Cemetery and associated Gibson Grove community show that the construction	
				of the beltway separated the fraternal hall and cemetery from the neighboring	
				church, physically fragmented the community and contributed to the decline of	
				these institutions. The community's decline in turn contributed to the closure	
				and loss to fire of the Moses fraternal hall.	
				Zoning limitations on the church parcel arising from the proximity of the	
				beltway have significantly delayed repair and rehabilitation of the church	
				following a fire in the mid-2000s. The initial construction of the Beltway resulted	
				in an oddly-shaped parcel and this has made it challenging for the property	
				owners to move new construction permitting through zoning reviews. These	
				cumulative delays to the rehabilitation, created in part from the Beltway's	
				construction, should be accounted as part of the DEIS review of cumulative	
				impacts.	
				The descendant community continues in the area, but the remaining cultural	
54	54	Pages 4-82-83	Section 4.22	institutions are threatened by the proposed expansion of the Beltway.	
				Archaeological investigations at the Poor Farm Cemetery site remain deferred,	
				thus it has not been evaluated for eligibility to the National Register of Historic	
				Places. This has prevented the site from being discussed as a historic site under	
55	55		4(f)	the Section 4(f) analysis in the DEIS and SDEIS.	
				The 4F evaluation does not take into account those portions of the Moses Hall	
				and Cemetery that already exist within the footprint and right of way of the	
				existing Beltway. Recent land records research and other information provided	
				demonstrates evidence for this and because there has not been a final	
				boundary determination, it cannot yet be ruled out of the analysis. Therefore	
				the Permanent Impact cannot be avoided under any scenario and should	
				account for acreage already within the footprint of the current Beltway.	
				Additionally, the construction of a noise barrier should not be taken as the de	
				facto solution for noise abatement at this property. Avoiding the use associated	
				with the retaining wall requires additional study of potential mitigation efforts	
				such as quiet pavement technology or additional roadway designs. Until those	
				solutions have been demonstrated as infeasible, they must be explored to avoid	
			l	the adverse effects and the required use of the property for the retaining walls	
56	56	1	4(f)	under 4F.	I .

I-495 & I-2	I-495 & I-270 Managed Lanes Study- Draft Supplemental Draft Environmental Impact Statement (SDEIS) M-NCPPC Comment/Response Errata- November 29, 2021						
MNCPPC Ref			<u> </u>				
Doc_#	No.	Page	SDEIS Section	Comment			
Comments from	n MNCI	PPC_1_SDEIS Maj	jor Issues_9.19.21 docum	nent	Revised comments where applicable		
				Additional use of the Gibson Grove Church site in order to minimize impacts to			
				the Moses Hall Cemetery must be avoided. As noted above, Section 4F requires			
				avoidance of these uses unless other alternatives are demonstrated to be			
				infeasible and contrary to the purpose and use of the undertaking. There have			
				been no design or schematic drawings shown to date that have demonstrated			
				that alternatives were considered. Further impacts to the Gibson Grove Church,			
				an historic resource that has already suffered cumulative adverse effects from			
				the first Beltway construction, should not be accepted as a 4F alternative to avoid impacts to Moses Hall. Other design solutions must be evaluated.			
				avoid impacts to ivioses hall. Other design solutions must be evaluated.			
57	57		4(f)				
				As noted above, 4F uses and impacts to the Carderock Springs Historic District			
				from retaining walls and design changes meant to protect Gibson Grove and the			
				Moses Hall Cemetery do not include any evaluation of design alternatives for			
				review. This all calls into question			
				what exactly they are doing. If all 3 of these resources are suffering from 4F			
				uses and encroachments to protect each other, but they are all having adverse			
				effects, what is being achieved here? We are all in the dark without a chance to			
				sit at the table and design this all out as a group. It is unacceptable under 4F. 4F			
				requires avoidance, different from Section 106. Only if the 'use' of the property			
				is DEMONSTRATED that it cannot be avoided, then it can be done, but there			
58	58		4(f)	must be discussion and consideration of the options.			
				Provide an O-D Matrix of travel times for the No-Build, Managed and General			
				Purpose lanes for each access point along I-270 and I-495 (with accompanying			
				narrative, as needed). This will help better understand flows, identify			
				specifically failing pairings, and better tailor responses to these needs. This is			
				especially important considering it is our understanding that many/most trips			
				along these facilities are relatively short in nature, using the interstate for only a			
				few interchanges. Therefore longer & larger systemic effects may be of less			
59	59		Chapter 3	utility to actual users.
