## FOREWORD

---

Each year, the Center for Preventive Health Services provides detailed statistics on injury-related hospitalizations and injury-related deaths through a series of reports entitled ‘*Injuries in Maryland: A Statewide Perspective*’ and ‘*Injury-related Deaths in Maryland: A Statewide Perspective*’.

In an effort to better assist Maryland policy and decision makers, practitioners, epidemiologists, and other injury professionals design programs to reduce injuries to Maryland residents, the Center for Preventive Health Services has synthesized existing data sources on injuries into a single report. In addition to data on injury-related hospitalizations and injury-related deaths, this report also provides data on injury-related hospital emergency department visits.

While injuries are preventable, injuries continue to be a major public health problem resulting in death, disability and immense cost to individuals, their families, and society. We hope that this report provides injury professionals a better direction for designing future programs to reduce injuries to Maryland residents.

We would like to acknowledge the Health Services Cost Review Commission (HSCRC) for providing the hospital discharge and ambulatory care databases, and the Maryland Vital Statistics Administration for the mortality database upon which these analyses were based.

Additionally, we would like to thank Dr. Russell Moy, Director, and Joan Salim, Deputy Director, of the Family Health Administration for their continued support in injury prevention activities throughout the state.

Sincerely,

Lori A. Demeter, Ph.D.  
Director  
Center for Preventive Health Services

## EXECUTIVE SUMMARY

The *'Injuries in Maryland – 2002 Statistics on Injury-related Emergency Department Visits, Hospitalizations and Deaths'* report provides detailed statistics on all injuries which required medical attention or caused the deaths of over 3,300 Maryland residents during 2002. The information presented included injuries which occurred across Maryland and the 24 political subdivisions.

- ❖ During 2002, almost 535 thousand injuries were reported in Maryland, of which, 495,444 (92.7%) were injury-related hospital emergency department visits, 35,775 (6.7%) were injury-related hospitalizations and 3,363 (0.6%) were injury-related deaths.
- ❖ Injury-related hospital department visits accounted for 22% of all hospital emergency department visits during 2002, totaling \$120.5 million in hospital emergency department costs.
- ❖ Injury-related hospitalizations accounted for 5% of all hospital admissions during 2002, accumulating over \$330 million in hospital costs.
- ❖ There were 8,481 injury-related hospital emergency department visits per 100,000 Marylanders during 2002. The highest injury-related emergency rate occurred in Allegany County at 13,785 per 100,000, while Montgomery County had the lowest rate at 5,878 per 100,000 residents.
- ❖ In 2002, 655 per 100,000 Marylanders were admitted to a hospital for an injury. Baltimore City had the highest injury-related hospitalization rate at 1,347 hospital admissions per 100,000 residents. St Mary's county had the lowest injury-related hospitalization rate at 365 per 100,000.
- ❖ Maryland injury-related death rate was 62 per 100,000. The highest number of injury-related death rate occurred in Baltimore City at 132 deaths per 100,000 residents and the lowest rate was in Howard County at 30 deaths per 100,000 people.
- ❖ The outcome for an injured 15 to 24 year old was a visit to the emergency room, while the outcome for an injured senior aged 85 years and older tended to be hospitalization or death.
- ❖ Across all ages, the leading causes of injury-related emergency visit were: (1) struck by/against an object or person, (2) motor vehicle traffic incident and (3) fall. The leading causes of injury-related hospitalizations were: (1) fall and (2) motor vehicle traffic incident and (3) other unspecified causes. The leading causes of injury-related deaths were: (1) poisoning, (2) motor vehicle traffic incidents and (3) firearms.

# INTRODUCTION

Injuries are a major public health problem. Injuries were the sixth leading cause of death for Maryland residents and the leading cause of death for children under age 14 years<sup>1</sup> during 2002. Regardless of gender, race or economic status, the outcomes of injuries can have a profound impact on the lives of those affected, their families and society. Injuries may cause short-term pain that prevent individuals from temporarily undertaking normal daily activities to severe disability and chronic pain.

In Maryland, over half a million injuries (534,583) were reported during 2002. This resulted in 495,444 hospital emergency department visits (92.7%), about 35,775 (6.7%) hospital discharges and 3,363 (0.6%) deaths. The total number of injuries represented an average of 1,357 hospital emergency department visits, 98 hospital discharges and some 9 deaths each day. These incidences are not random events and generally preventable. Nonetheless, injuries continue to be a major public health problem resulting in death, disability, and immense cost to individuals, their families, and to society.

During 2002, injury-related hospitalizations accounted for over 5% of all hospitalizations in the State, with hospital charges of over \$330 million (HSCRC, 2002). In addition, the total number of injury-related emergency department visits accounted for 22% of all emergency room visits that totaled \$120.5 million in medical expenses. A significant proportion of the medical costs associated with injuries was borne by State and local governments. During 2002, Medicare, Medicaid and HMO schemes were the primary source of payment for more than half of all injury-related hospitalizations.

The *'Injuries in Maryland – Injury-related hospitalizations, emergency visits and deaths'* report aims to provide statistics on injuries which occurred in Maryland during 2002. Throughout this report, injury-related statistics, including injury-related emergency department visits, injury-related hospitalizations and injury-related deaths by various demographic characteristics, as well as the cause and manner of intent are provided for Maryland and the twenty-four political subdivisions. Additional information including the ranking of injury-related emergency department rates, injury-related hospital rates and injury-related death rates for each political subdivision relative to the State's average is provided.

The data presented in this report are based on the information collected by the Health Services Cost Review Commission (HSCRC), namely the HSCRC Ambulatory Care and HSCRC Inpatient Hospital Discharge Databases, and the Vital Statistics mortality database.

# DATA ISSUES AND METHODOLOGY

Throughout this report, information on injury-related emergency visits were derived from the Health Services Cost Review Commission (HSCRC) Ambulatory Care Database; information on injury-related hospitalizations were derived from the HSCRC Hospital Discharge Database; and data on injury-related deaths were extracted from the Vital Statistics Mortality Database.

## 1. HSCRC Databases

According to Maryland state law, the 64 non-federal acute care general hospitals are required to submit uniform abstract (UB-92) data on all hospital emergency room visits and all hospital discharges to the HSCRC. These data comprise demographic, clinic, diagnostic and procedures information which are used by the HSCRC to set hospital rates under the state's charge-per-case payment system.

Data on hospital emergency room visits are available from 1998 and data on hospital discharges are available from 1986.

Information on injury-related emergency visits and injury-related hospitalizations are based on the external-cause of injury codes (E-codes) as classified in the ninth revision of the International Classification of Diseases (ICD-9). The E-codes describe the mechanism or cause of injury by the manner or intent of the injury.

For the purpose of this report, instances whereby individuals who were taken to the emergency department or hospitalized on more than one occasion, either for the same or different injuries were considered as different individuals altogether.

## 2. Vital Statistics

Information on injury-related deaths was derived the death certificates collected by the Maryland Vital Statistics Administration.

Since 1999, the tenth revision of the ICD was used to code the causes of death reported on death certificates. ICD-10 differs from ICD-9 in that ICD-10 includes expanded detail for many conditions, transfers conditions between classifications.

The injury-related deaths reported in this publication refer to individuals whose underlying cause of death involved an external cause of injury containing codes V, W, X, Y as classified by the ICD-10.
