NASA Technical Note D-7181

THERMODYNAMIC AND TRANSPORT PROPERTIES OF GASEOUS TETRAFLUOROMETHANE IN CHEMICAL EQUILIBRIUM

By James L. Hunt and Lillian R. Boney
August 1973

The reference enthalpy ($4.6489 \times 10^5 \text{ Jkg}^{-1}$) and the reference entropy ($3.548 \times 10^3 \text{ Jkg}^{-1}\text{K}^{-1}$) used in the subject report are in error. The correct reference enthalpy is $4.6571 \times 10^5 \text{ Jkg}^{-1}$ and the correct reference entropy is $3.542 \text{ Jkg}^{-1}\text{K}^{-1}$.

The enthalpy equation for CF_4 (eq. (8), p. 9) contains erroneous terms. For values of specific volume V above $0.030 \text{ m}^3\text{kg}^{-1}$, the error in enthalpy is negligible. Between $V = 0.030$ and $0.0055 \text{ m}^3\text{kg}^{-1}$, the error in enthalpy is of the order of 0.5 percent. For the range of V from 0.0055 to $0.0026 \text{ m}^3\text{kg}^{-1}$, the error increases up to a maximum of 4.5 percent at $V = 0.0026 \text{ m}^3\text{kg}^{-1}$. All errors are positive (that is, too large).

In equation (8) beginning with line 6, replace the following terms within braces

$$+ \left\{ \frac{V^2}{2} \left[\frac{-4B_4 T}{(V - b)^5} + A_6 \alpha e^{\alpha V} + B_6 T \alpha e^{\alpha V} \right] + V \left[\frac{B_4 T}{(V - b)^4} + A_6 e^{\alpha V} + B_6 T e^{\alpha V} \right] \right.$$
$$\left. - \frac{V_r^2}{2} \left[\frac{-4B_4 T}{(V_r - b)^5} + A_6 \alpha e^{\alpha V_r} + B_6 T \alpha e^{\alpha V_r} \right] - V_r \left[\frac{B_4 T}{(V_r - b)^4} + A_6 e^{\alpha V_r} + B_6 T e^{\alpha V_r} \right] \right\}$$

with

$$-4B_4 T \left[\frac{1}{3(V_r - b)^3} + \frac{b}{4(V_r - b)^4} - \frac{1}{3(V - b)^3} - \frac{b}{4(V - b)^4} \right]$$
$$+ (A_6 + B_6 T) \left[\frac{e^{\alpha V} (\alpha V - 1) - e^{\alpha V_r} (\alpha V_r - 1)}{\alpha} \right]$$

THERMODYNAMIC AND TRANSPORT PROPERTIES OF GASEOUS TETRAFLUOROMETHANE IN CHEMICAL EQUILIBRIUM

By James L. Hunt and Lillian R. Boney
Langley Research Center

SUMMARY

Equations and computer code are presented for the thermodynamic and transport properties of gaseous, undissociated tetrafluoromethane (CF_4) in chemical equilibrium. The computer code calculates the thermodynamic and transport properties of CF_4 when given any two of five thermodynamic variables (entropy, temperature, volume, pressure, and enthalpy).

Equilibrium thermodynamic and transport property data are tabulated for gaseous CF_4 from a dimensionless entropy S/R of 24.0 to 46.0 and from a temperature of 89.45 K to 845 K. These data are listed at constant entropy in increments of 0.25 with temperature increments of 10 K. Pressure-enthalpy diagrams generated with data from the computer code which contain lines of constant entropy, temperature, volume, speed of sound, isentropic expansion exponent, and compressibility factor are presented. Transport property and specific heat data are also tabulated over a specific volume range from $0.002 \text{ m}^3\text{kg}^{-1}$ to $80 \text{ m}^3\text{kg}^{-1}$ for five values of temperature from 100 K to 800 K.

INTRODUCTION

Tetrafluoromethane is currently being used in hypersonic tunnels at enthalpy levels below that at which dissociation occurs to simulate the inviscid flow field on blunt or lifting bodies in hypersonic flight where dissociation of the gas in the shock layer does occur. (See ref. 1.) This use of gaseous CF_4 has generated interest in the thermodynamic and transport properties of CF_4 in a higher enthalpy range and different form than that presently available (ref. 2) which covers the range of conditions where tetrafluoromethane is normally expected to be used as a refrigerant. Also, more recent and extensive pressure-volume-temperature measurements (information received from E. I. du Pont de Nemours & Co. as generated by Dr. J. J. Martin of the University of Michigan) resulted in an equation of state somewhat different from that used in reference 2.

Equations and computer code are presented for the thermodynamic and transport properties of gaseous, undissociated tetrafluoromethane (CF_4) in chemical equilibrium.

The computer code calculates the thermodynamic and transport properties of CF₄ when given any two of five thermodynamic variables (entropy, temperature, volume, pressure, and enthalpy).

Equilibrium thermodynamic and transport property data are tabulated for gaseous CF₄ from a dimensionless entropy (S/R) of 24.0 to 46.0 and from a temperature of 89.45 K to 845 K. These data are listed at constant entropy in increments of 0.25 with temperature increments of 10 K. Pressure-enthalpy diagrams generated with data from the computer codes are presented which contain lines of constant entropy, temperature, volume, speed of sound, isentropic expansion exponent, and compressibility factor. Transport property and specific heat data are also tabulated over a specific volume range from 0.002 m³kg⁻¹ to 80 m³kg⁻¹ for five values of temperature from 100 K to 800 K.

r	reference conditions (eq. (5))
s	saturation

CHARACTERISTICS

Tetrafluoromethane (CF_4) is a nonlinear polyatomic molecule (ref. 3). Its nine vibrational energy modes (ref. 3) display anharmonic oscillator characteristics having four fundamental frequencies; two are threefold degenerate, one is twofold degenerate,

and one is onefold degenerate. The acute temperature dependence of the vibrational energy of this molecule reveals itself in the specific heats at constant pressure and volume and their ratio γ along with the isentropic expansion exponent.

In the gaseous state, tetrafluoromethane is colorless, odorless, and nontoxic. It has a low ratio of specific heats, low boiling point, and short vibrational relaxation time. (See ref. 4.) Some of the physical properties of CF_4 (obtained from E. I. du Pont de Nemours & Co.) are given in the following table. (Note that 1 atmosphere = 101 kN m^{-2} .)

Molecular weight	88.01
Boiling point at 1 atm, K	145
Freezing point, K	89.4
Critical temperature, K	227.48
Critical pressure, atm	36.96
Critical volume, $\text{cm}^3 \text{mole}^{-1}$	141
Critical density, kg m^{-3}	0.626×10^3
Density, liquid at 193 K, kg m^{-3}	1.317×10^3
Density, saturated vapors at boiling point, kg m^{-3}	7.62
Specific heat, liquid at 193 K, $\text{J kg}^{-1} \text{K}^{-1}$	1.23×10^3
Specific heat, vapor at 1 atm and 298 K, $\text{J kg}^{-1} \text{K}^{-1}$	0.707×10^3
Specific-heat ratio at 1 atm and 298 K	1.159
Heat of vaporization at boiling point, J kg^{-1}	136.0×10^3
Vibrational relaxation time at 298 K and 1 atm, sec	8.2×10^{-7}

The method of reference 5 was used to compute the equilibrium composition of CF_4 as a function of temperature for several pressures covering the range that would normally be used in a wind tunnel, and it was found that no dissociation occurred for temperatures lower than 1600 K.

GENERAL EQUATIONS

Thermodynamic Properties of Gaseous CF_4

The equation of state of tetrafluoromethane was obtained from E. I. du Pont de Nemours & Co. and is

$$p = \frac{RT}{V - b} + \frac{A_2 + B_2 T + C_2 e^{-KT}}{(V - b)^2} + \frac{A_3 + B_3 T + C_3 e^{-KT}}{(V - b)^3} + \frac{A_4 + B_4 T}{(V - b)^4} + \frac{A_5 + B_5 T + C_5 e^{-KT}}{(V - b)^5} + (A_6 + B_6 T)e^{\alpha V} \quad (1)$$

where p is given in N m^{-2} , V in m^3kg^{-1} , and T in K, and where the virial coefficients are

$$A_2 = -5.811999 \times 10^1$$

$$B_2 = 1.032692 \times 10^{-1}$$

$$C_2 = -5.089595 \times 10^2$$

$$A_3 = 7.387702 \times 10^{-3}$$

$$B_3 = 3.873415 \times 10^{-5}$$

$$C_3 = 9.054616 \times 10^{-1}$$

$$A_4 = 2.01177417 \times 10^{-5}$$

$$B_4 = -7.385870 \times 10^{-8}$$

$$A_5 = -2.929506 \times 10^{-8}$$

$$B_5 = 1.066416 \times 10^{-10}$$

$$C_5 = -3.162000 \times 10^{-7}$$

$$A_6 = 4.0257244 \times 10^{11}$$

$$B_6 = -1.149705 \times 10^9$$

and

$$R = 9.447002 \times 10^1 \text{ J kg}^{-1}\text{K}^{-1}$$

$$b = 9.364194 \times 10^{-5}$$

$$K = 1.758236 \times 10^{-2}$$

$$\alpha = -1.059139 \times 10^4$$

This equation was developed through an empirical approach (ref. 6) in which the 13 virial coefficients and α and b were evaluated along the experimentally determined critical isotherm by Dr. J. J. Martin of the University of Michigan. This equation probably gives an accurate representation of the pressure-volume-temperature behavior of CF_4 at densities as high as 1.5 times the critical value. Dr. Martin (ref. 7) has since developed

an equation of state which gives an accurate representation of the pressure-volume-temperature behavior of CF_4 at densities as high as 2.5 times the critical value. The specific heat at constant volume is

$$c_v = c_{v'} + J \int_{\infty}^V T \left(\frac{\partial^2 p}{\partial T^2} \right)_V dV \quad (2)$$

Two third-degree expressions in temperature were obtained from P. E. Liley of Thermophysical Properties Research Center, Purdue University, for the ideal-gas specific heat c_p' . These expressions were curve fits of spectroscopic and molecular structural data derived from statistical mechanics which were compiled from six sources. These two expressions for the ideal-gas specific heat at constant pressure were converted to specific heat at constant volume by the ideal-gas relationship $c_v' = c_p' - R$. The equation for specific heat at constant volume at zero pressure is

$$c_v' = a_4 + b_4 T + c_4 T^2 + d_4 T^3 \quad (3)$$

where c_v' is in $\text{J kg}^{-1}\text{K}^{-1}$. When equation (3) is fitted over the temperature interval 100 K to 615 K:

$$a_4 = 1.43308 \times 10^2$$

$$b_4 = 1.51168 \times 10^0$$

$$c_4 = 5.15767 \times 10^{-4}$$

$$d_4 = -1.59381 \times 10^{-6}$$

When equation (3) is fitted over the temperature interval 615 K to 1500 K:

$$a_4 = 2.95790 \times 10^2$$

$$b_4 = 1.53754 \times 10^0$$

$$c_4 = -1.0727 \times 10^{-3}$$

$$d_4 = 2.64172 \times 10^{-7}$$

These curve fits are stated to fit the enumerated values with mean deviations of 0.66 and 0.09 percent and maximum deviations of 3.6 and 0.27 percent, respectively.

Evaluating the integral term of equation (2) with the equation of state (1) gives

$$c_V = c_V' - TK^2 e^{-KT} \left[\frac{C_2}{V - b} + \frac{C_3}{2(V - b)^2} + \frac{C_5}{4(V - b)^4} \right] \quad (4)$$

The entropy S expressed as a function of T and V is

$$S - S_r = \int_{T_r}^T \frac{c_V}{T} dT + \int_{V_r}^V \left(\frac{\partial p}{\partial T} \right)_V dV \quad (5)$$

where the subscript r represents reference conditions taken herein as

$$S_r = 3.548 \times 10^3 \text{ J kg}^{-1}\text{K}^{-1}$$

$$T_r = 4.556 \times 10^2 \text{ K}$$

$$p_r = 6.8948 \times 10^3 \text{ N m}^{-2}$$

$$V_r = 6.2428 \text{ m}^3\text{kg}^{-1}$$

From the integration of equation (5), the expression for entropy becomes

$$\begin{aligned} S - S_r = & a_4 \log_e \frac{T}{T_r} + b_4(T - T_r) + \frac{c_4}{2}(T^2 - T_r^2) + \frac{d_4}{3}(T^3 - T_r^3) \\ & + K(e^{-KT} - e^{-KTr}) \left[\frac{C_2}{V_r - b} + \frac{C_3}{2(V_r - b)^2} + \frac{C_5}{4(V_r - b)^4} \right] + R \log_e \left(\frac{V - b}{V_r - b} \right) \\ & - (B_2 - KC_2 e^{-KT}) \left(\frac{1}{V - b} - \frac{1}{V_r - b} \right) - \frac{B_3 - KC_3 e^{-KT}}{2} \left[\frac{1}{(V - b)^2} - \frac{1}{(V_r - b)^2} \right] \\ & - \frac{B_5 - KC_5 e^{-KT}}{4} \left[\frac{1}{(V - b)^4} - \frac{1}{(V_r - b)^4} \right] - B_4 \left[\frac{1}{3(V - b)^3} - \frac{1}{3(V_r - b)^3} \right] \\ & + B_6 \left(\frac{e^{\alpha V}}{\alpha} - \frac{e^{\alpha V_r}}{\alpha} \right) \end{aligned} \quad (6)$$

The enthalpy H expressed as a function of T and V is

$$H - H_r = \int_{T_r}^T \left[c_V + V \left(\frac{\partial p}{\partial T} \right)_V \right] dT + \int_{V_r}^V \left[V \left(\frac{\partial p}{\partial V} \right)_T + T \left(\frac{\partial p}{\partial T} \right)_V \right] dV \quad (7)$$

and becomes in integrated form

$$\begin{aligned} H - H_r = & a_4(T - T_r) + b_4 \frac{T^2 - T_r^2}{2} + c_4 \frac{T^3 - T_r^3}{3} + d_4 \frac{T^4 - T_r^4}{4} + \left[e^{-KT} (KT + 1) - e^{-KTr} (KTr + 1) \right] \left[\frac{C_2}{V_r - b} + \frac{C_3}{2(V_r - b)^2} + \frac{C_5}{4(V_r - b)^4} \right] \\ & + V_r \left[\frac{R}{V_r - b} (T - T_r) + \frac{B_2(T - T_r) + C_2(e^{-KT} - e^{-KTr})}{(V_r - b)^2} + \frac{B_3(T - T_r) + C_3(e^{-KT} - e^{-KTr})}{(V_r - b)^3} + \frac{B_4(T - T_r)}{(V_r - b)^4} \right. \\ & \left. + \frac{B_5(T - T_r) + C_5(e^{-KT} - e^{-KTr})}{(V_r - b)^5} + B_6 e^{\alpha V_r} (T - T_r) \right] - \left\{ R T \left[\log_e \left(\frac{V - b}{V_r - b} \right) + \frac{b}{V_r - b} - \frac{b}{V - b} \right] \right. \\ & + 2 \left(A_2 + B_2 T + C_2 e^{-KT} \right) \left[\frac{1}{V_r - b} + \frac{b}{2(V_r - b)^2} - \frac{1}{V - b} - \frac{b}{2(V - b)^2} \right] + 3 \left(A_3 + B_3 T + C_3 e^{-KT} \right) \left[\frac{1}{2(V_r - b)^2} + \frac{b}{3(V_r - b)^3} - \frac{1}{2(V - b)^2} - \frac{b}{3(V - b)^3} \right] \\ & + 4 A_4 \left[\frac{1}{3(V_r - b)^3} + \frac{b}{4(V_r - b)^4} - \frac{1}{3(V - b)^3} - \frac{b}{4(V - b)^4} \right] + 5 \left(A_5 + B_5 T + C_5 e^{-KT} \right) \left[\frac{1}{4(V_r - b)^4} + \frac{b}{5(V_r - b)^5} - \frac{1}{4(V - b)^4} - \frac{b}{5(V - b)^5} \right] \\ & + \left\{ \frac{V^2}{2} \left[\frac{-4B_4 T}{(V - b)^5} + A_6 \alpha e^{\alpha V} + B_6 T \alpha e^{\alpha V} \right] + V \left[\frac{B_4 T}{(V - b)^4} + A_6 \alpha e^{\alpha V} + B_6 T \alpha e^{\alpha V} \right] - \frac{V_r^2}{2} \left[\frac{-4B_4 T}{(V_r - b)^5} + A_6 \alpha e^{\alpha V_r} + B_6 T \alpha e^{\alpha V_r} \right] \right. \\ & \left. - V_r \left[\frac{B_4 T}{(V_r - b)^4} + A_6 \alpha e^{\alpha V_r} + B_6 T \alpha e^{\alpha V_r} \right] \right\} + T \left\{ R \log_e \left(\frac{V - b}{V_r - b} \right) - (B_2 - K C_2 e^{-KT}) \left(\frac{1}{V - b} - \frac{1}{V_r - b} \right) \right. \\ & \left. - \frac{B_3 - K C_3 e^{-KT}}{2} \left[\frac{1}{(V - b)^2} - \frac{1}{(V_r - b)^2} \right] - B_4 \left[\frac{1}{3(V - b)^3} - \frac{1}{3(V_r - b)^3} \right] - \frac{B_5 - K C_5 e^{-KT}}{4} \left[\frac{1}{(V - b)^4} - \frac{1}{(V_r - b)^4} \right] + \frac{B_6}{\alpha} (e^{\alpha V} - e^{\alpha V_r}) \right\} \quad (8) \end{aligned}$$

where $H_r = 4.6489 \times 10^5 \text{ J kg}^{-1}$ at reference conditions. (See ref. 2.)

The pressure, entropy, and enthalpy are now expressed as a function of temperature and volume. A computer code (see appendix) was developed which computes all these thermodynamic variables when any two are known. The computer code also calculates specific heat at constant pressure c_p , ratio of specific heats γ , isentropic exponent γ_e , speed of sound a , and compressibility factor Z at the same thermodynamic point as the first five variables. The equations for these thermodynamic properties are

Specific heat at constant pressure:

$$c_p = c_V - T \frac{\left[\left(\frac{\partial p}{\partial T} \right)_V \right]^2}{\left(\frac{\partial p}{\partial V} \right)_T} \quad (9)$$

Specific heat ratio:

$$\gamma = \frac{c_p}{c_v} = 1 - \frac{T \left[\left(\frac{\partial p}{\partial T} \right)_V \right]^2}{c_v \left(\frac{\partial p}{\partial V} \right)_T} \quad (10)$$

Speed of sound:

$$a = \left[\left(\frac{\partial p}{\partial \rho} \right)_S \right]^{1/2} = \left[\gamma \left(\frac{\partial p}{\partial \rho} \right)_T \right]^{1/2} = \left[-\gamma V^2 \left(\frac{\partial p}{\partial V} \right)_T \right]^{1/2} = \left\{ \frac{V^2 T}{c_v} \left[\left(\frac{\partial p}{\partial T} \right)_V \right]^2 - V^2 \left(\frac{\partial p}{\partial V} \right)_T \right\}^{1/2} \quad (11)$$

Isentropic exponent:

$$\gamma_e = \left(\frac{dp}{d \log \rho} \right)_S = \frac{\rho}{p} \left(\frac{dp}{d \rho} \right)_S = \frac{a^2}{pV} \quad (12)$$

Compressibility factor:

$$Z = \frac{pV}{RT} \quad (13)$$

where the partial derivatives in c_p , γ , and a are

$$\begin{aligned} \left(\frac{\partial p}{\partial T} \right)_V &= \frac{R}{V - b} + \frac{(B_2 - KC_2 e^{-KT})}{(V - b)^2} + \frac{(B_3 - KC_3 e^{-KT})}{(V - b)^3} + \frac{B_4}{(V - b)^4} \\ &\quad + \frac{(B_5 - KC_5 e^{-KT})}{(V - b)^5} + B_6 e^{\alpha V} \end{aligned} \quad (14)$$

$$\begin{aligned} \left(\frac{\partial p}{\partial V} \right)_T &= -\frac{RT}{(V - b)^2} - 2 \frac{(A_2 + B_2 T + C_2 e^{-KT})}{(V - b)^3} - \frac{3(A_3 + B_3 T + C_3 e^{-KT})}{(V - b)^4} \\ &\quad - \frac{4(A_4 + B_4 T)}{(V - b)^5} - \frac{5(A_5 + B_5 T + C_5 e^{-KT})}{(V - b)^6} + \alpha(A_6 + B_6 T)e^{\alpha V} \end{aligned} \quad (15)$$

These equations are limited to temperatures above the saturated vapor line. The saturation pressure in N m⁻² as a function of saturation temperature in kelvins is (ref. 2):

$$\log p = A + \frac{B}{T} + C \log T + DT + E \left(\frac{F - T}{T} \right) \log(F - T) + G \quad (16)$$

where

$$A = 20.71545389$$

$$B = -2467.505285$$

$$C = -4.69017025$$

$$D = 6.4798076 \times 10^{-4}$$

$$E = 0.770707795$$

$$F = 424$$

$$G = 3.83852$$

The critical temperature T_c is 227.48 K. Equations (1) to (15) are also limited to temperatures below those at which dissociation occurs ($T < 1600$ K).

Transport Properties of Gaseous CF₄

Viscosity. - Five sources of experimental data for the viscosity of CF₄ at a pressure of 1 atmosphere were fitted to a quadratic equation in 1/T by P. E. Liley of Purdue University. The data covered a temperature range from 230 K to 460 K. The agreement of the data of the various sets was stated to be generally good and the accuracy was thought to be ± 2 percent over the aforementioned temperature range. The empirical equation is

$$\mu^* = \frac{\sqrt{T}}{0.64625 + \frac{103.00}{T} - \frac{3.42714}{T^2}} \times 10^{-6} \quad (17)$$

where μ^* is in N s m⁻². The viscosity of CF₄ at a pressure of 1 atmosphere determined from this equation is plotted over a temperature range of 150 K to 800 K in figure 1. Even though the curve fit was only made for a temperature interval of 230 K to 460 K, equation (1) behaves well over the extended range. To obtain the viscosity of CF₄ at pressures other than 1 atmosphere, the residual viscosity is expressed as a function of the density, molecular weight, and critical constants of the substance (ref. 8) through a dimensional

analysis treatment, and the correct dependencies are established by the use of experimental data. The dimensional analysis treatment (ref. 8) resulted in the following expression:

$$(\mu - \mu^*)\xi = \frac{\beta}{R^{1/6}} Z_c^m \rho_R^n \quad (18)$$

Experimental high-pressure viscosities for the gaseous and liquid phases available in the literature for 14 polar substances including 5 Freons (CCl_3F , CCl_2F_2 , $CHCl_2F$, $CHClF_2$, and $C_2Cl_3F_3$) were used (ref. 9) in conjunction with pressure-volume-temperature data to establish the constant β and the exponents m and n of equation (18). Plots of $(\mu - \mu^*)\xi$ against ρ_R (ref. 9) were found to be essentially the same for all 14 substances; therefore, it was concluded that the exponent m of Z_c in equation (18) was zero. The analytical representation of the residual viscosity correlation for the 14 polar substances (ref. 9) which should apply to CF_4 as well are

$$\left. \begin{aligned} (\mu - \mu^*)\xi &= 16.56 \times 10^{-8} \rho_R^{1.111} && (\rho_R \leq 0.10) \\ (\mu - \mu^*)\xi &= 0.607 \times 10^{-8} (9.045\rho_R + 0.63)^{1.739} && (0.10 < \rho_R \leq 0.90) \\ -\log[(\mu - \mu^*)\xi] &= 10^{0.6439 - 0.1005\rho_R - \Delta} + 3 && (0.9 < \rho_R < 2.6) \end{aligned} \right\} \quad (19)$$

where $\Delta = 0$ for $0.9 < \rho_R < 2.2$ and $\Delta = 4.75 \times 10^{-4}(\rho_R^3 - 10.65)^2$ for $2.2 < \rho_R < 2.6$ and $\xi = T^{1/6}/M^{1/2} p_c^{2/3} = 0.023735$ for CF_4 with μ in $N s m^{-2}$.

Thermal conductivity.- The thermal conductivity of CF_4 gas at a pressure of 1 atmosphere was obtained from P. E. Liley of Purdue University as

$$k^* = 1.73073 \left[7.2910 \times 10^{-3} + (2.377 \times 10^{-5}) \left(\frac{9}{5}T - 459.67 \right) \right] \quad (20)$$

where k^* is in $W m^{-1} K^{-1}$. This is a curve fit of experimental data over a temperature range from 230 K to 460 K. An uncertainty of 5 percent in value obtained from this equation appears to be a reasonable estimate. The thermal conductivity at 1 atmosphere of pressure is plotted over a temperature range of 100 K to 800 K in figure 2. Again, equation (20) is well behaved over the extended temperature range. The thermal conductivity relationship is extended to pressures other than 1 atmosphere in the same manner as was the viscosity. Residual thermal conductivities $k - k^*$ for CF_4 were obtained from experimental data and correlated with the corresponding reduced densities

(ref. 10) to produce the following expression:

$$k - k^* = 7.18 \times 10^{-3} [\exp(\rho_R) - 1] \quad (21)$$

where $k - k^*$ is in $\text{W m}^{-1}\text{K}^{-1}$. Equation (21) represents the thermal conductivity of CF_4 in the dense gaseous region. Deviations have been observed (ref. 10) at lower densities; these deviations may be attributed to difficulties encountered in obtaining precise thermal conductivity values in the less dense region.

CALCULATION PROCEDURE

In generating the thermodynamic and transport properties of CF_4 by using the computer code given in the appendix, the boundaries of the thermodynamic regime of interest were first designated in terms of temperature and volume. These boundaries were taken as

- (a) The saturation pressure line (eq. (16)) $p_S = f(T_S)$. The saturation volume was determined from the equation of state (eq. (1)) $p_S = f(T_S, V_S)$.
- (b) The critical volume line $V_C = 0.0016 \text{ m}^3\text{kg}^{-1}$, $T = T_C$ to 844.7 K.
- (c) The constant temperature line $T = 844.7 \text{ K}$, $V_C = 0.0016$ to $V = 81.16 \text{ m}^3\text{kg}^{-1}$.
- (d) The constant volume line $V = 81.16 \text{ m}^3\text{kg}^{-1}$, $T = 844.7 \text{ K}$ to saturation temperature (procured from the simultaneous solution of the saturation pressure equation (eq. (16)) and the equation of state (eq. (1)), that is, $p_S = f(T_S)$ and $p_S = f(T_S, V)$ where $V = 81.16 \text{ m}^3\text{kg}^{-1}$).

Other thermodynamic and the transport properties along the boundary are now easily calculated since they are expressed as a function of T and V .

To present the thermodynamic and transport property data in a convenient form, it is advantageous to calculate the properties at specified values of a given variable. A good example is the entropy which remains constant during a frequently occurring class of expansions in gas dynamic analysis. (Equations and computer codes for isentropic expansions and flow across normal and oblique shocks in CF_4 are given in the appendixes of ref. 1.) First, S is determined at the critical point which gives a lower limit for the thermodynamic regime specified herein. The upper limit on S is determined by inserting the highest temperature and volume occurring on the boundaries of the specified regime ($T = 844.7 \text{ K}$ and $V = 81.16 \text{ m}^3\text{kg}^{-1}$) into equation (6) ($S = f(T, V)$). The entropy is then divided into equal intervals between the upper and lower limits and set at the partition nearest the lower limit, $S = \text{Constant} = f(T, V)$. The volume is set slightly above the critical value at $V = 0.0026 \text{ m}^3\text{kg}^{-1}$ in order to avoid the large gradients and consequent convergence difficulties that occur along the critical volume line and the

corresponding temperature calculated. This procedure gives an upper limit on the temperature for the specified value of the entropy. With the entropy held constant, the temperature is reduced at even intervals and the volume calculated at each temperature point until the saturated volume or the upper limit ($V = 81.16 \text{ m}^3\text{kg}^{-1}$) is exceeded. The transport properties and remaining thermodynamic variables which are given herein as a function of T and V are then calculated for the specified value of the entropy. This procedure is repeated at each entropy interval until the limits have been spanned. A similar procedure is used in calculating the thermodynamic and transport properties at constant values of any of the other thermodynamic variables.

RESULTS

Pressure-enthalpy diagrams are presented in figures 3 to 6. Each of these diagrams contain lines of constant entropy and volume. In addition to these lines in common, figure 3 contains lines of constant temperature, figure 4 contains lines of constant speed of sound, figure 5 contains lines of constant isentropic expansion exponent, and figure 6 contains lines of constant compressibility factor. These diagrams were generated from the computer code of the appendix with subroutines added to calculate the constant speed of sound, isentropic expansion exponent, and compressibility factor.

Equilibrium thermodynamic data and transport property data (calculated from the computer code presented in the appendix) are presented in table I for CF_4 from a dimensionless entropy S/R of approximately 24.0 to 46.0 and from a temperature of 89.45 K to 845 K. These data are listed at constant entropy in increments of 0.25 with temperature increments of 10 K.

Transport property data along with the specific heats are tabulated in table II for CF_4 over a specific volume range from 0.002 to $80 \text{ m}^3\text{kg}^{-1}$ for five values of temperature from 100 K to 800 K. These properties show little effect of the specific volume except near the critical value $0.0016 \text{ m}^3\text{kg}^{-1}$.

CONCLUDING REMARKS

Equations for the thermodynamic properties of gaseous, undissociated tetrafluoromethane (CF_4) in chemical equilibrium have been generated by using as accurate an equation of state and the curve fits of specific heat available. These equations along with those for the transport properties of CF_4 have been incorporated into a computer code. Thermodynamic and transport property data generated by the computer code are presented in a form which lends itself to a convenient gas dynamic analysis over a thermodynamic regime heretofore not penetrated.

DIGITAL COMPUTER CODE FOR CALCULATING THERMODYNAMIC PROPERTIES OF CF₄

A FORTRAN IV Control Data Series 6000 computer code was developed for evaluating the thermodynamic properties of gaseous, dissociated tetrafluoromethane (CF₄) in chemical equilibrium. The computer code calculates the thermodynamic properties of CF₄ when given any two of five thermodynamic variables (entropy, temperature, volume, pressure, and enthalpy). Besides the five aforementioned variables, the computer code also calculates specific heat at constant pressure, specific heat ratio, speed of sound, isentropic expansion exponent, compressibility factor, viscosity, and thermal conductivity.

Subroutine CF4

Language: FORTRAN IV

Purpose: Evaluates the thermodynamic and transport properties of gaseous, undissociated tetrafluoromethane (CF₄) in chemical equilibrium when given any two of five thermodynamic variables (entropy, temperature, volume, pressure, and enthalpy). Besides the five aforementioned variables, the subroutine calculates specific heat at constant pressure, specific heat ratio gamma, speed of sound, isentropic expansion exponent, compressibility factor, viscosity, and thermal conductivity.

Use: CALL CF4 (N, UNIN, UNI0, ERR, TG, VG, SD, HD, PD, TI, VI, P, H, A, CP, GAM, G, Z, S, EMU, EK1)

Code inputs:

N	Option indicating thermodynamic variables required on input
N = 1	Input SD, VI, and TG (estimate), Set HD, PD, TI, and VG at zero
N = 2	Input HD, VI, and TG (estimate), Set SD, PD, TI, and VG at zero
N = 3	Input PD, VI, and TG (estimate), Set SD, HD, TI, and VG at zero
N = 4	Input SD, TI, and VG (estimate), Set HD, PD, VI, and TG at zero
N = 5	Input HD, TI, and VG (estimate), Set SD, PD, VI, and TG at zero
N = 6	Input PD, TI, and VG (estimate), Set SD, HD, VI, and TG at zero
N = 7	Input VI and TI, Set HD, PD, SD, VG, and TG at zero
N = 8	Input SD, HD, TG (estimate), and VG (estimate), Set PD, VI, and TI at zero

APPENDIX – Continued

Flow Chart for Subroutine CF4

Computes thermodynamic properties of CF_4 when given any two of five thermodynamic variables

APPENDIX - Continued

Other Subroutines

SUBROUTINE ITT (XVAR, XI, YVAR, YGG, YI, ZVAR, ZI, ZD, ERR, K)

(Iterative procedure to calculate $ZI = f(XI, YI)$)

Given XI, YGG, and ZD

Compute XI terms

Estimate $YI = YGG$

(1) Compute YI terms, compute $ZI = f(XI, YI)$

If ZI is not the desired ZD , second estimate of $YI = 0.95 * \text{first estimate}$.

Other estimates after first two are by linear interpolation or extrapolation.

Repeat from (1).

If ZI is not ZD after 1000 iterations, stop.

SUBROUTINE POTV (P, VI, TI)

$P = f(T, V)$

SUBROUTINE SOTV (S, VI, TI)

$S = f(T, V)$

SUBROUTINE HOTV (H, VI, TI)

$H = f(T, V)$

SUBROUTINE TVAR (TI)

Computes T terms

SUBROUTINE VVAR (VI)

Computes V terms

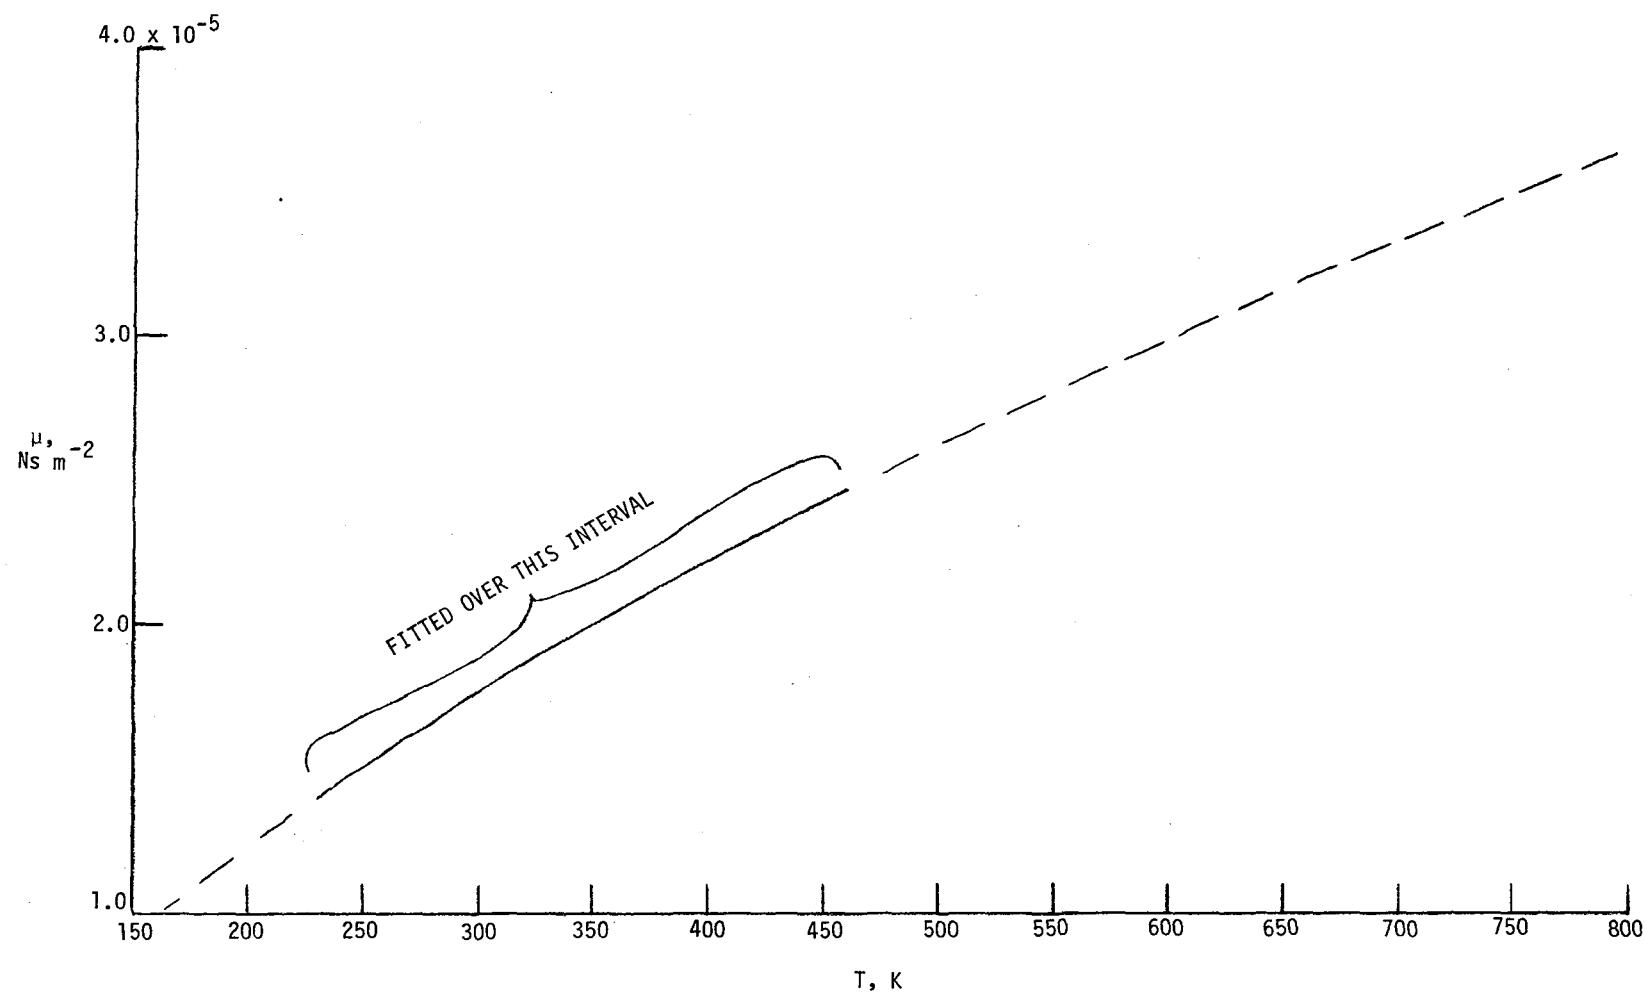

Figure 1.- Viscosity of CF_4 at a pressure of 1 atmosphere.

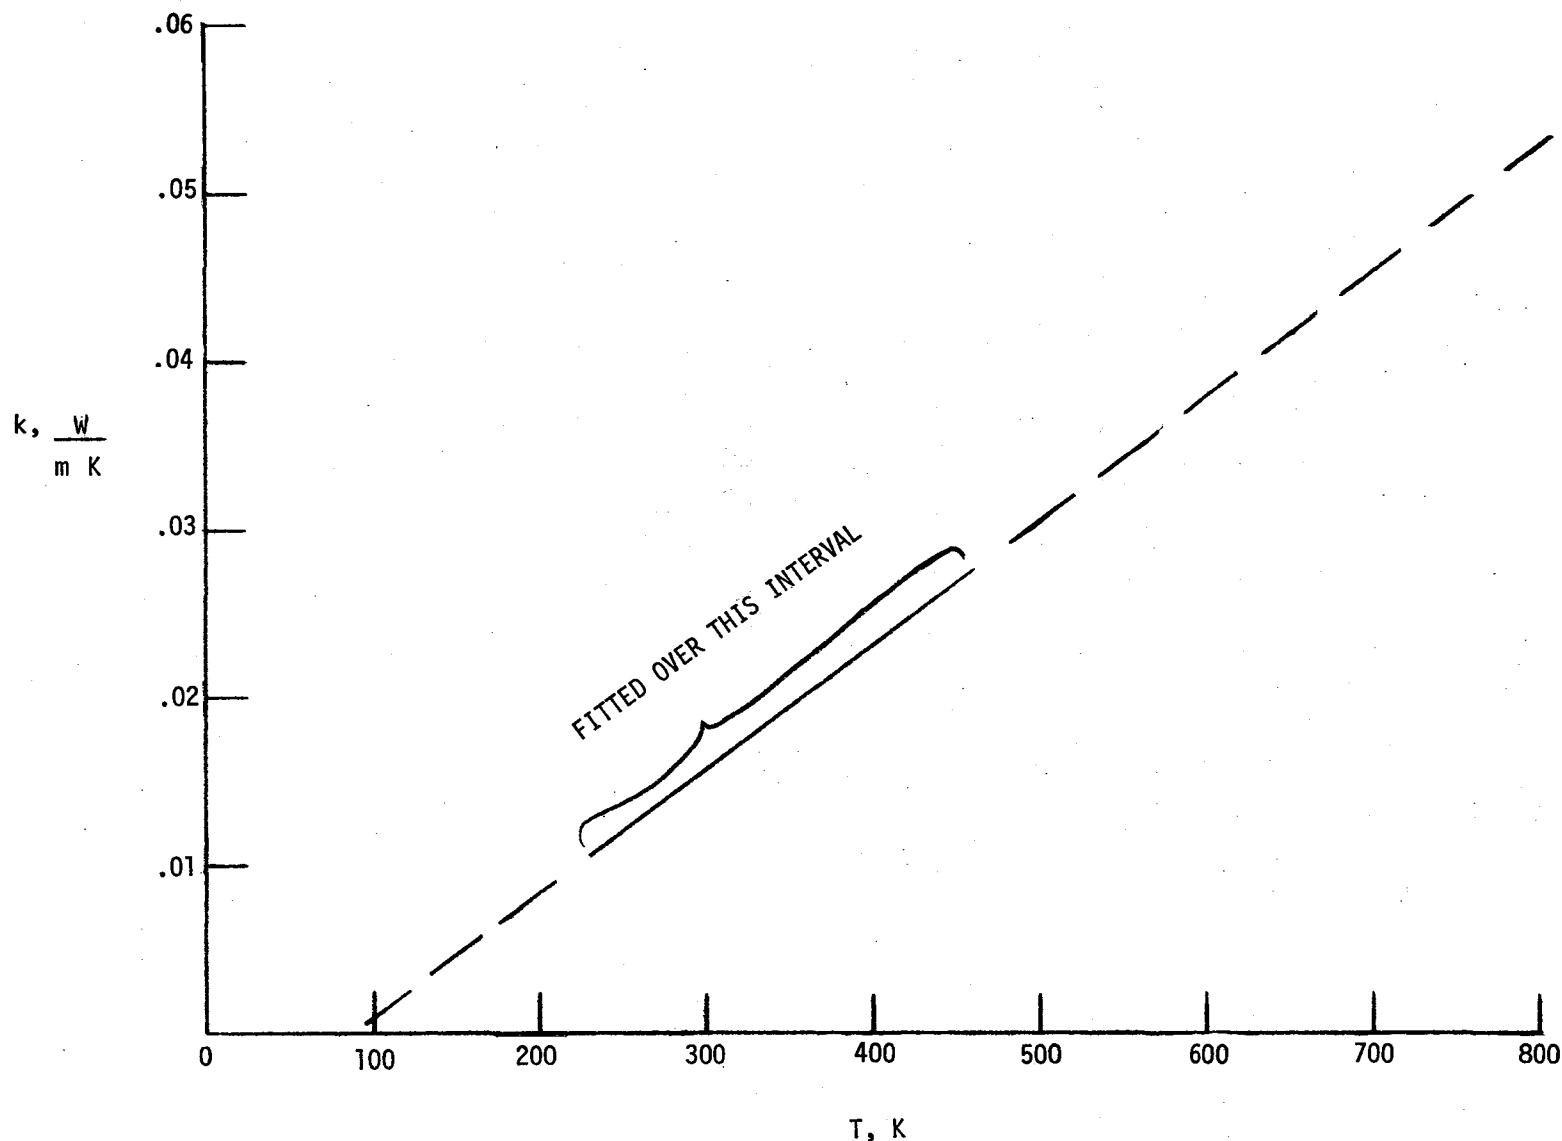

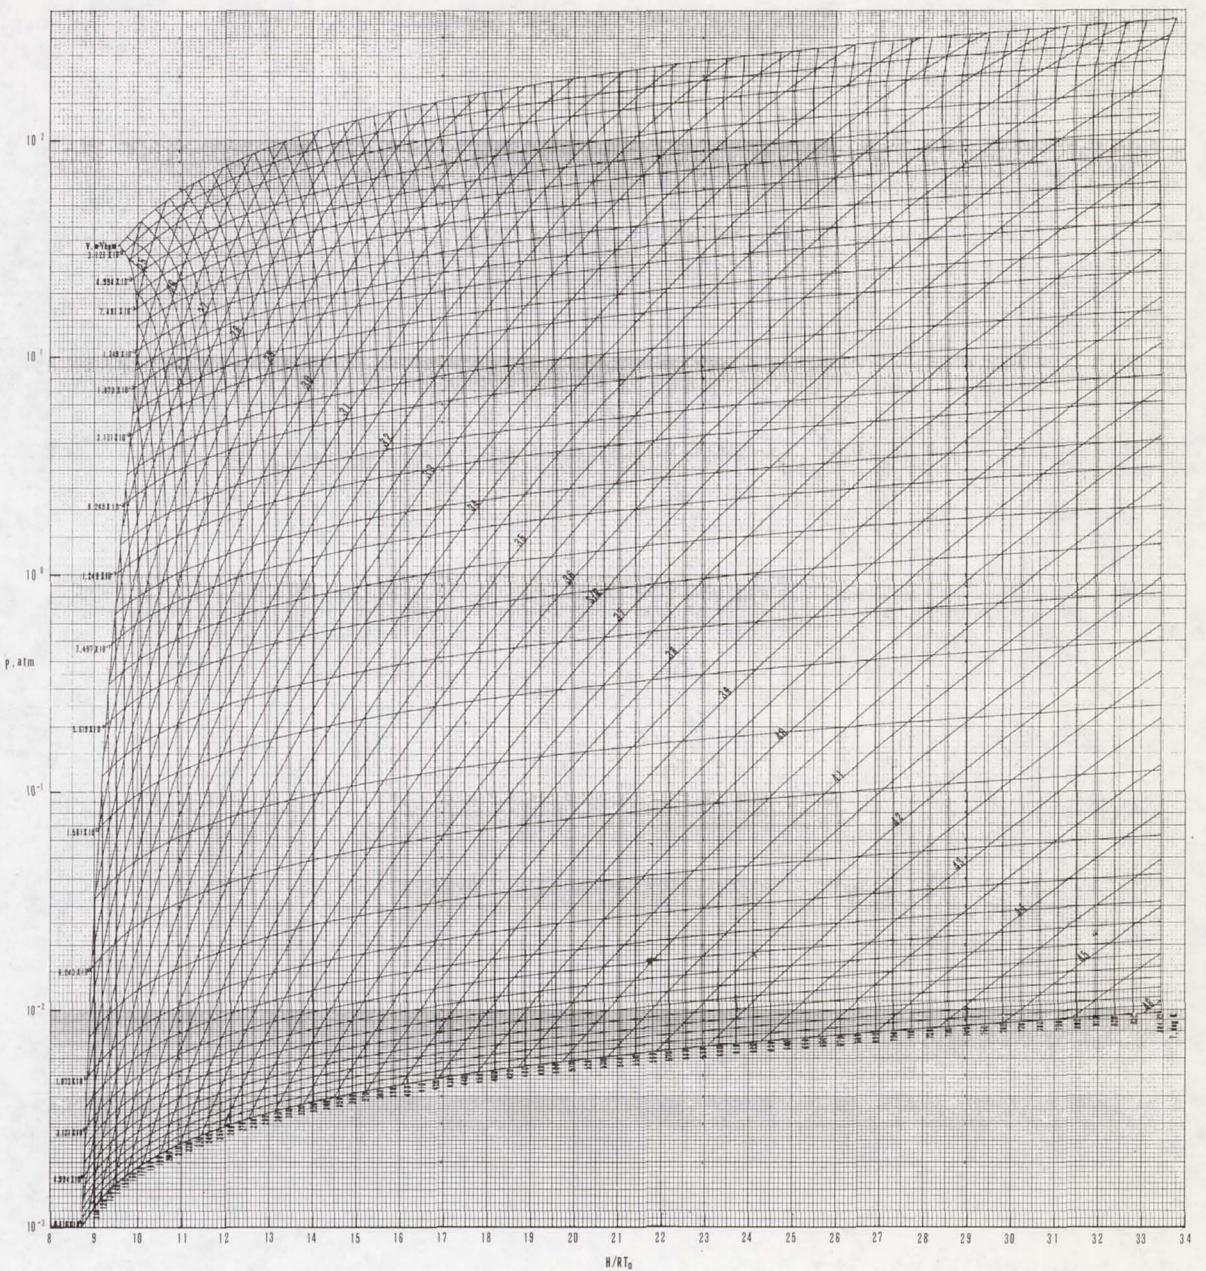

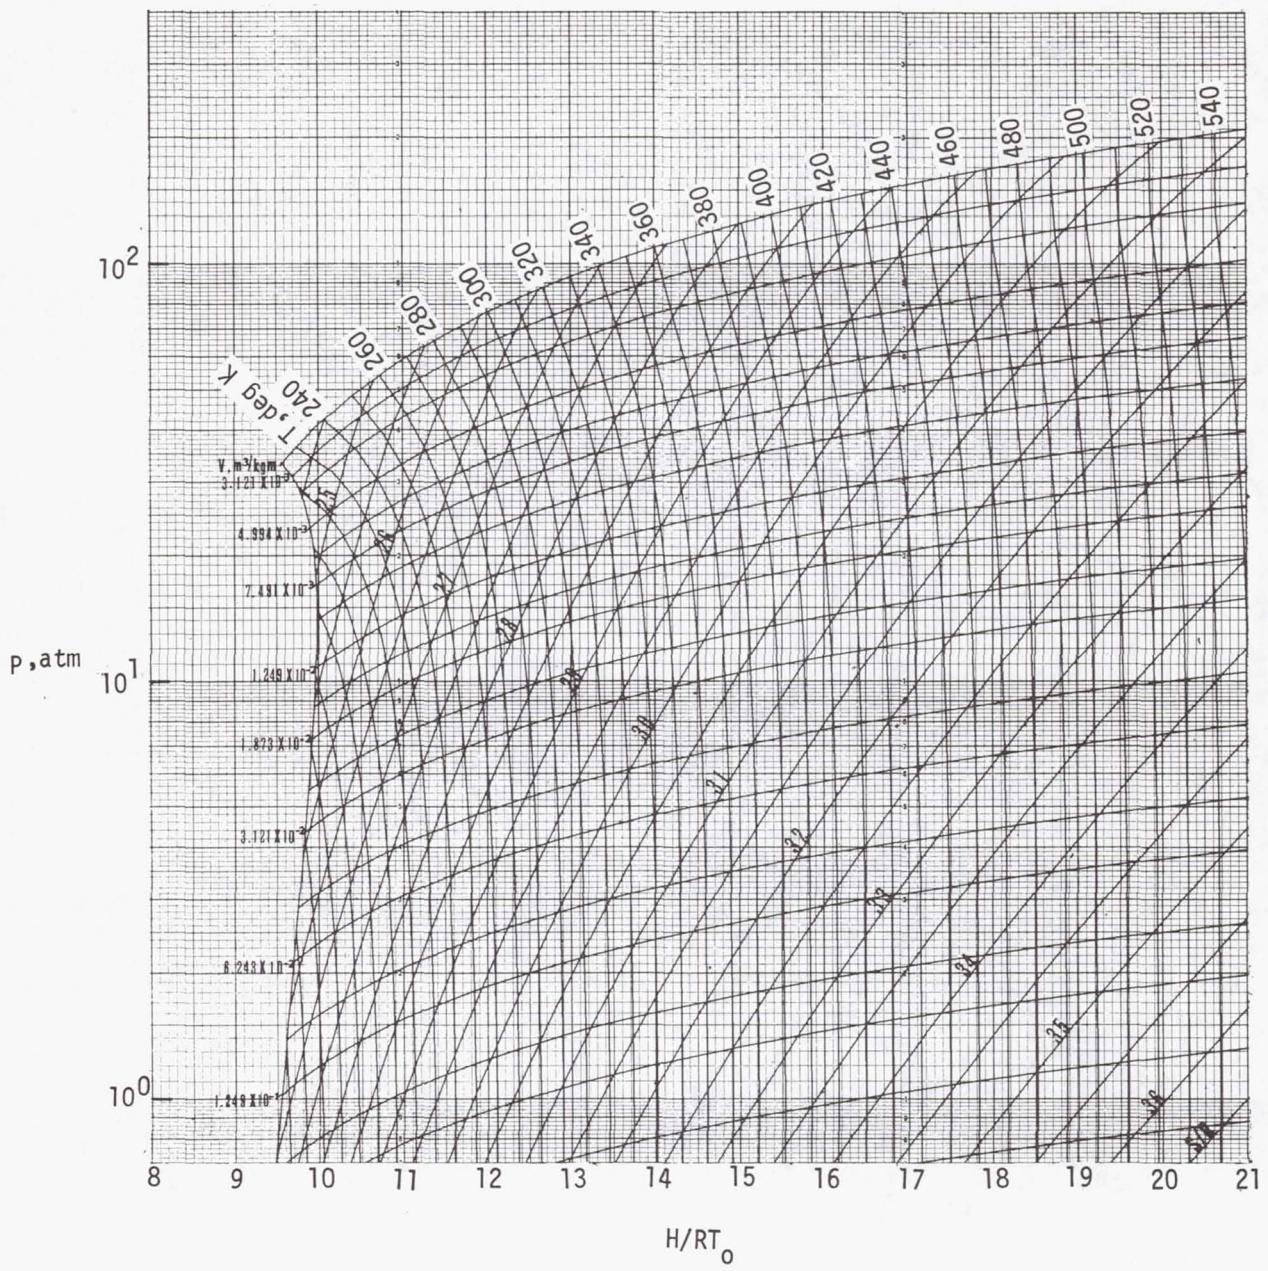

Figure 2.- Thermal conductivity of CF_4 at a pressure of 1 atmosphere.

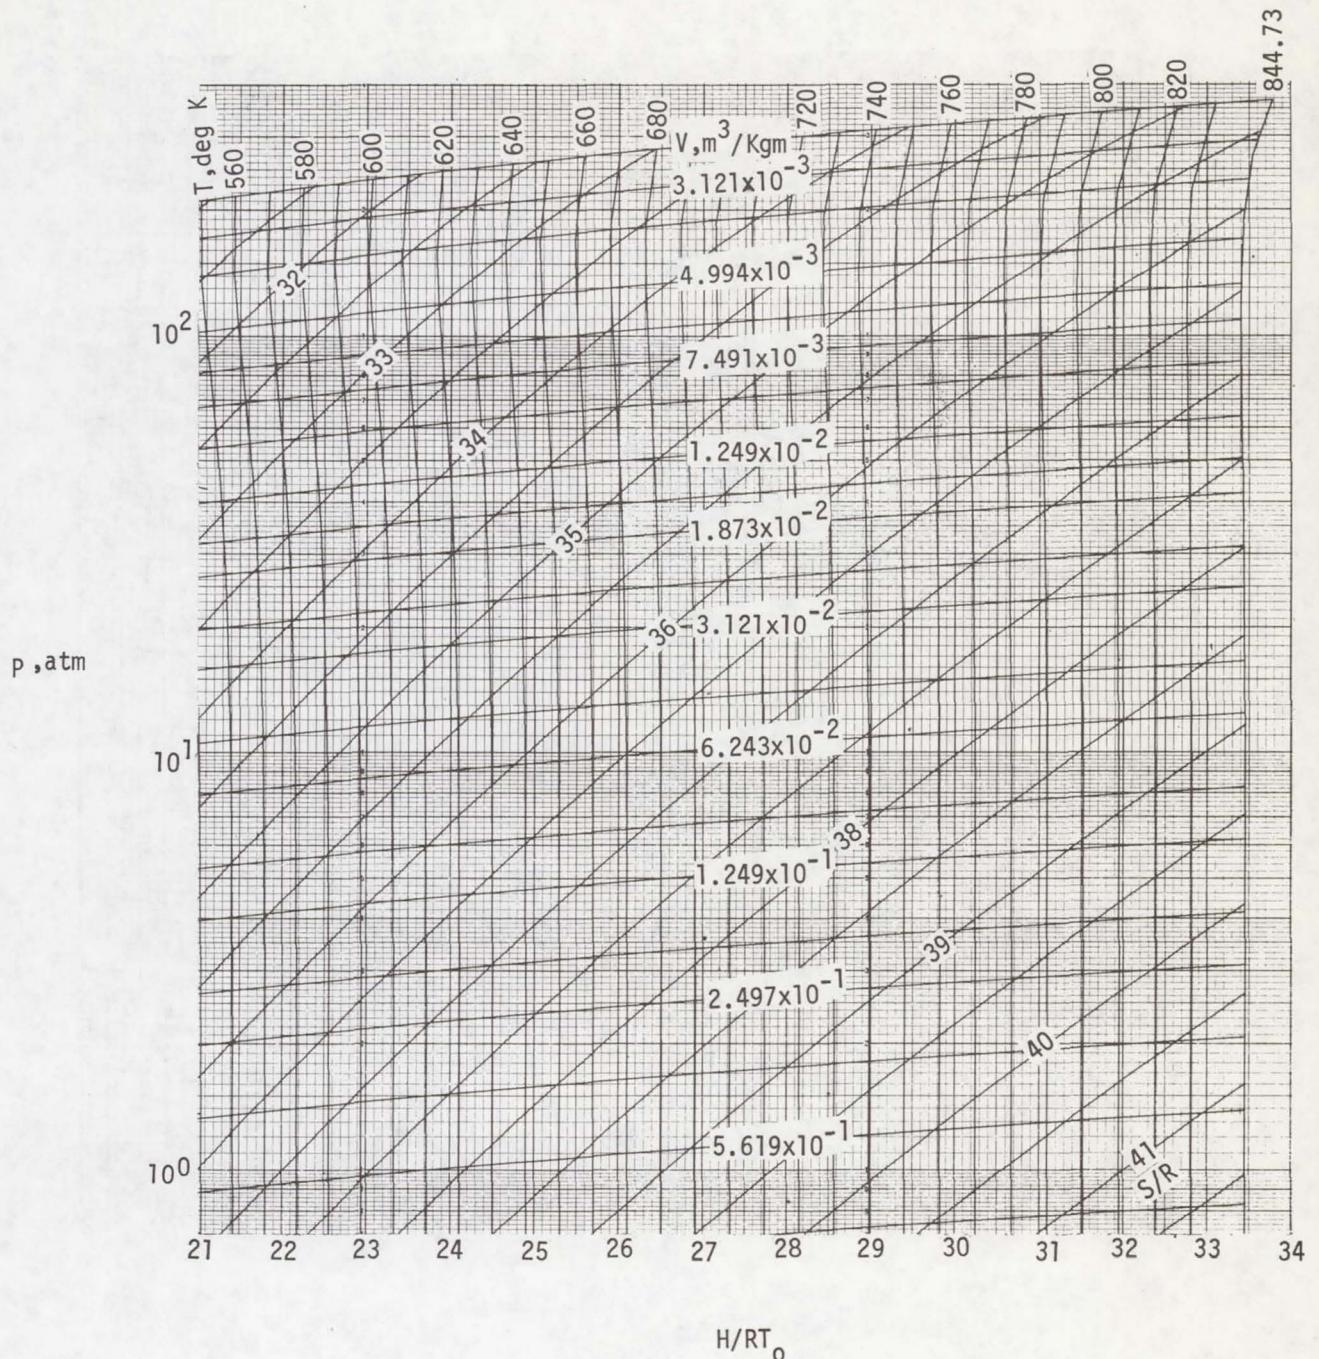

(a) Overall plot.

Figure 3.- Pressure enthalpy diagram for CF_4 with lines of constant entropy, volume, and temperature.

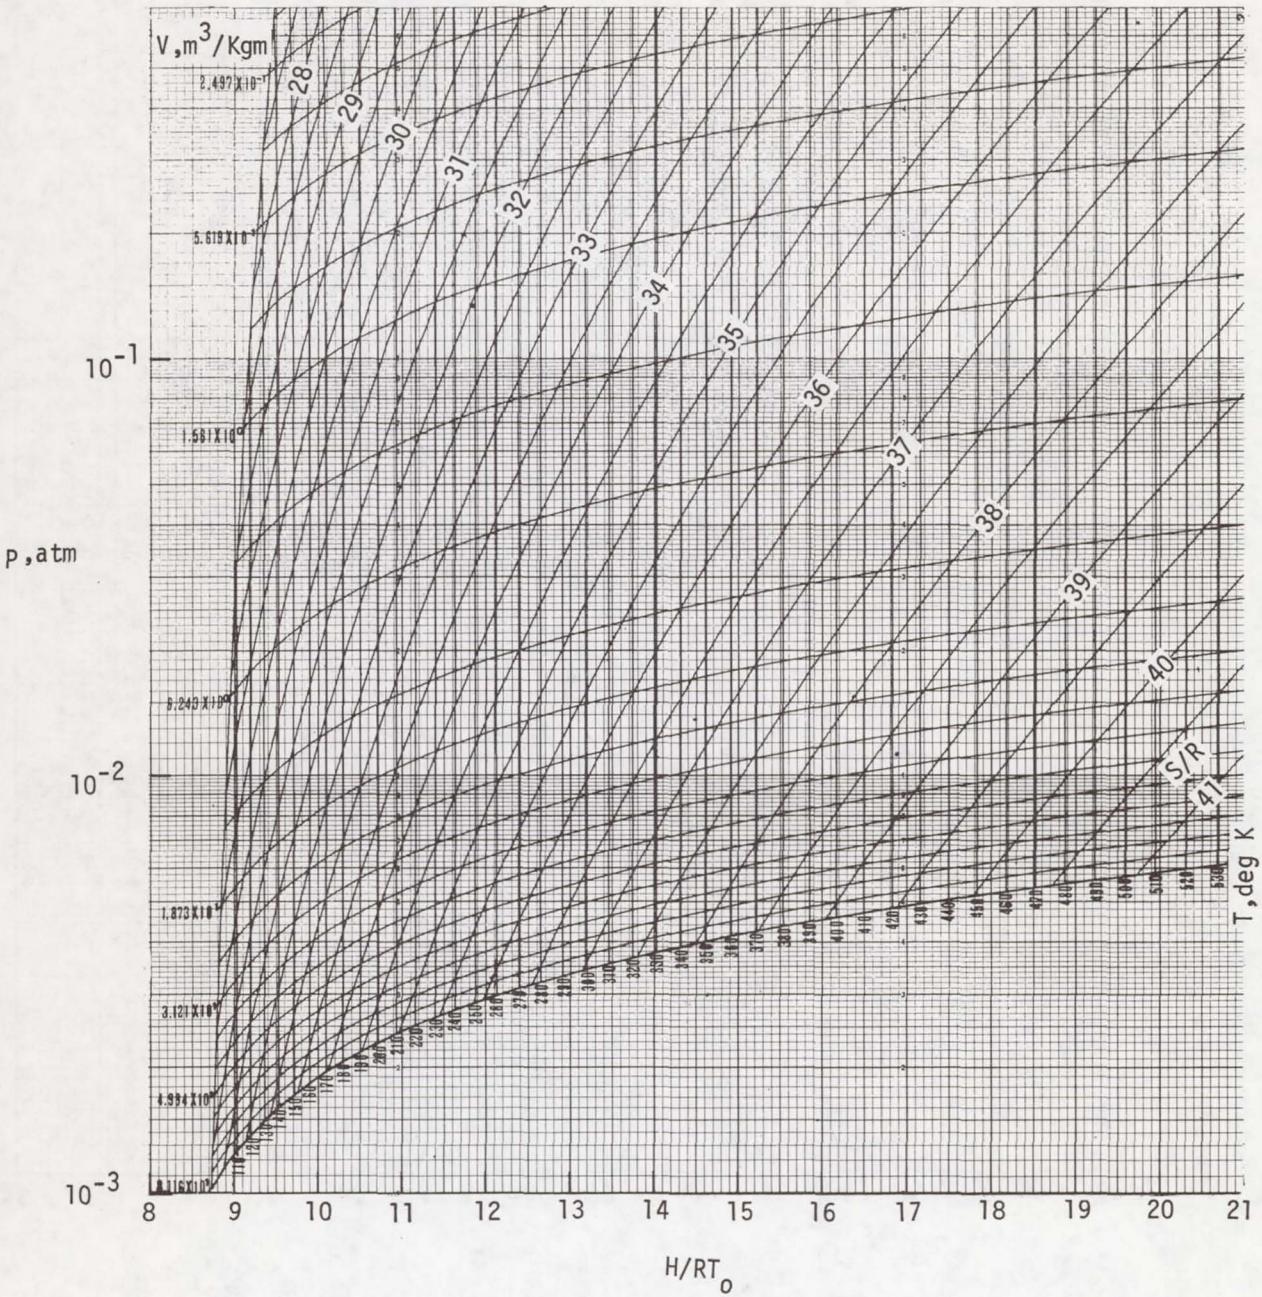

(b) Upper left quadrant.

Figure 3.- Continued.

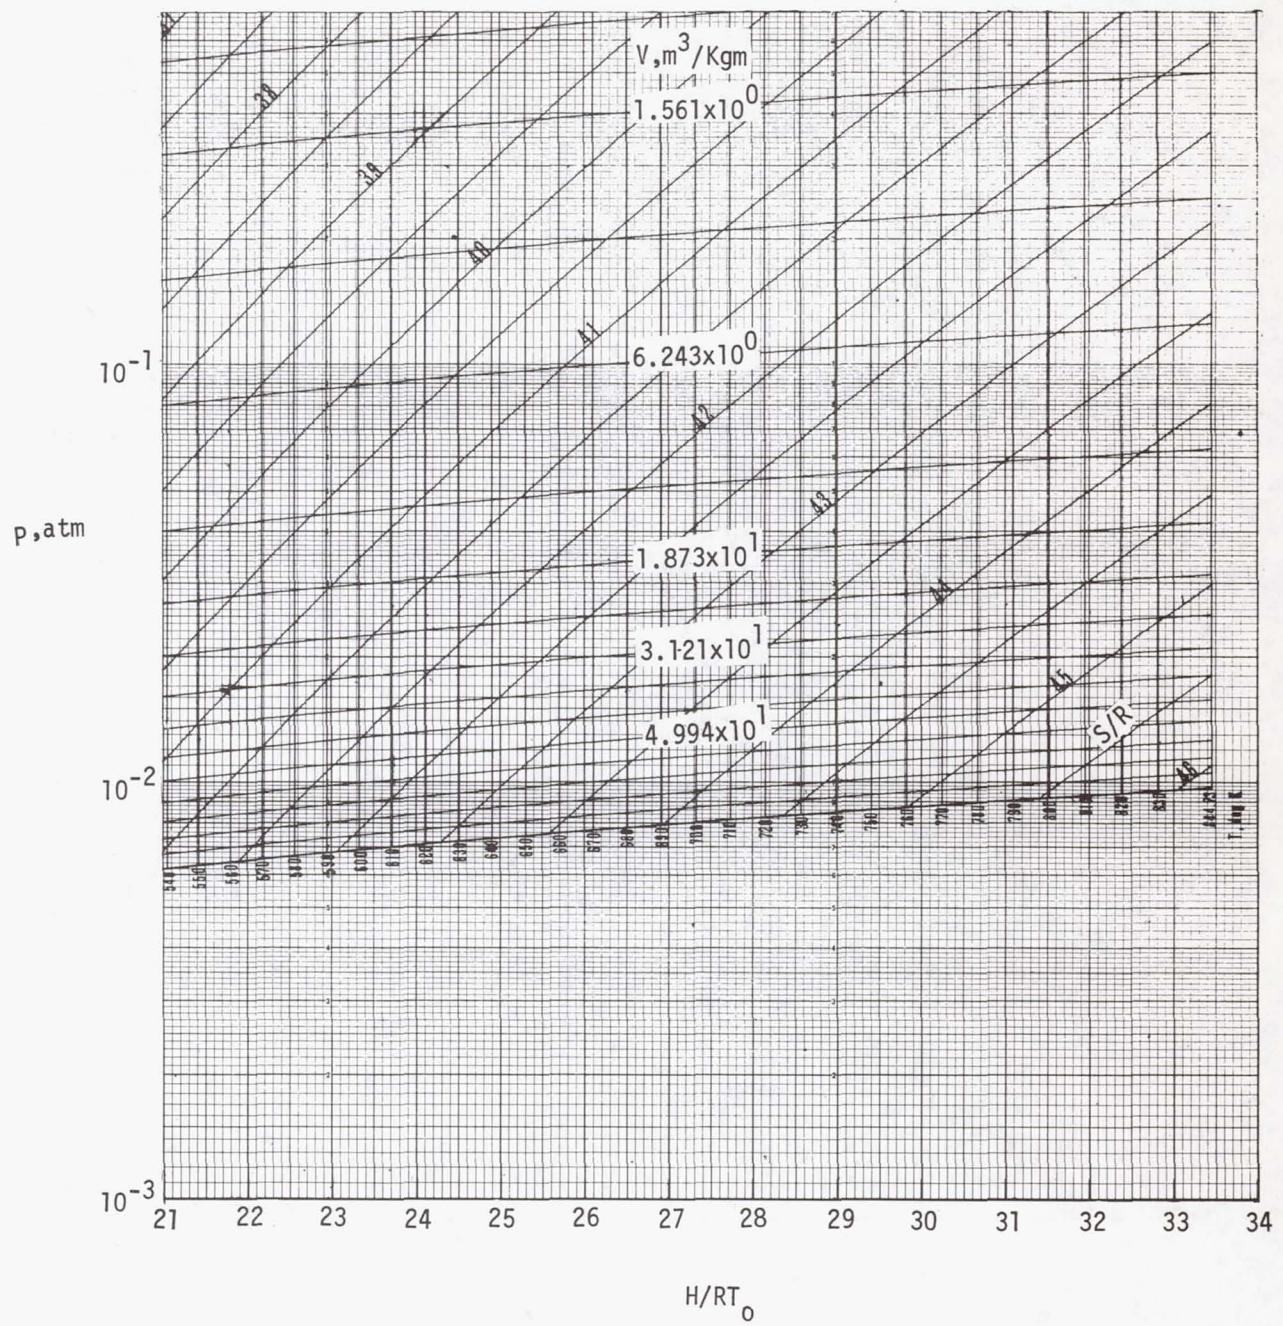

(c) Upper right quadrant.

Figure 3.- Continued.

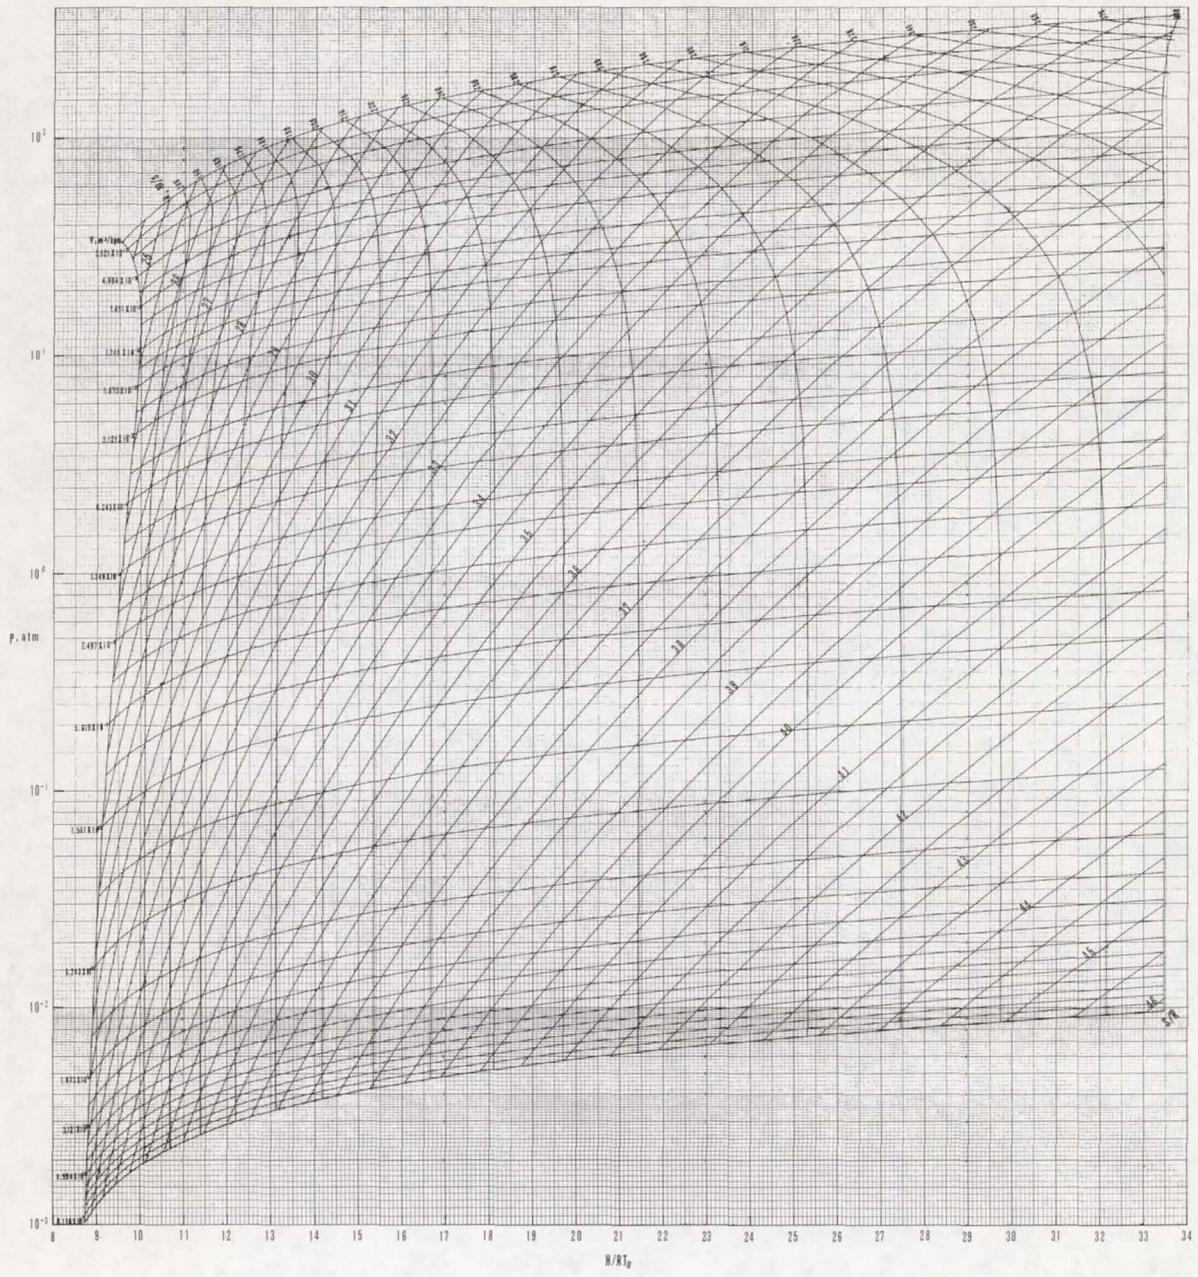

(d) Lower left quadrant.

Figure 3.- Continued.

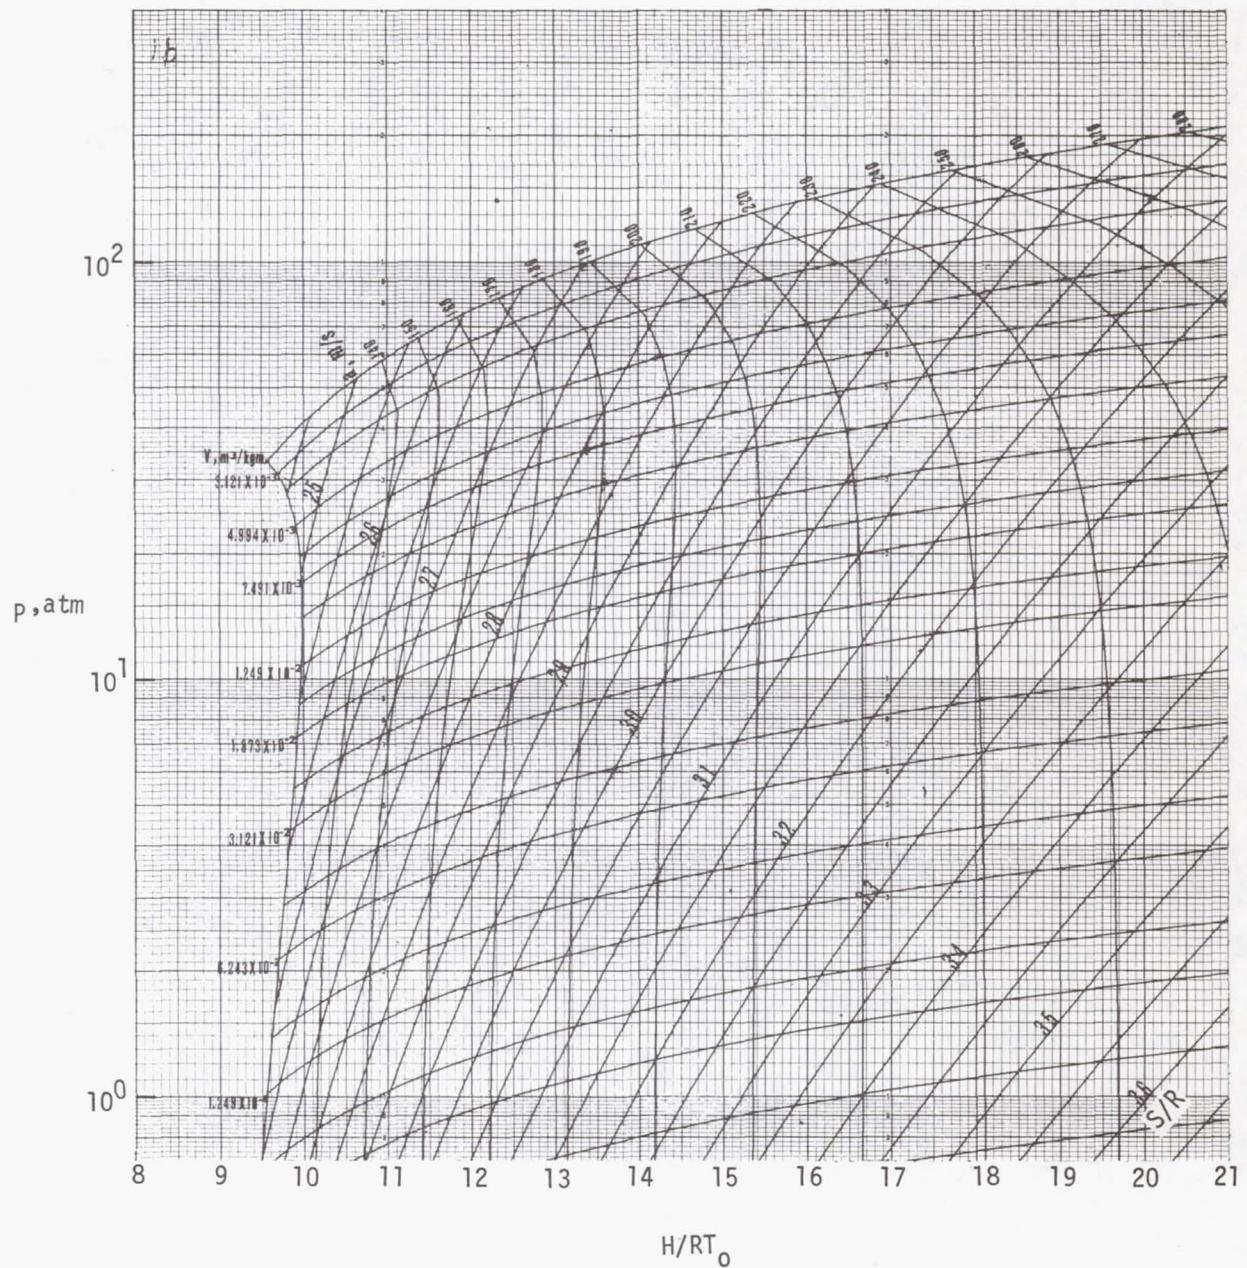

(e) Lower right quadrant.

Figure 3.- Concluded.

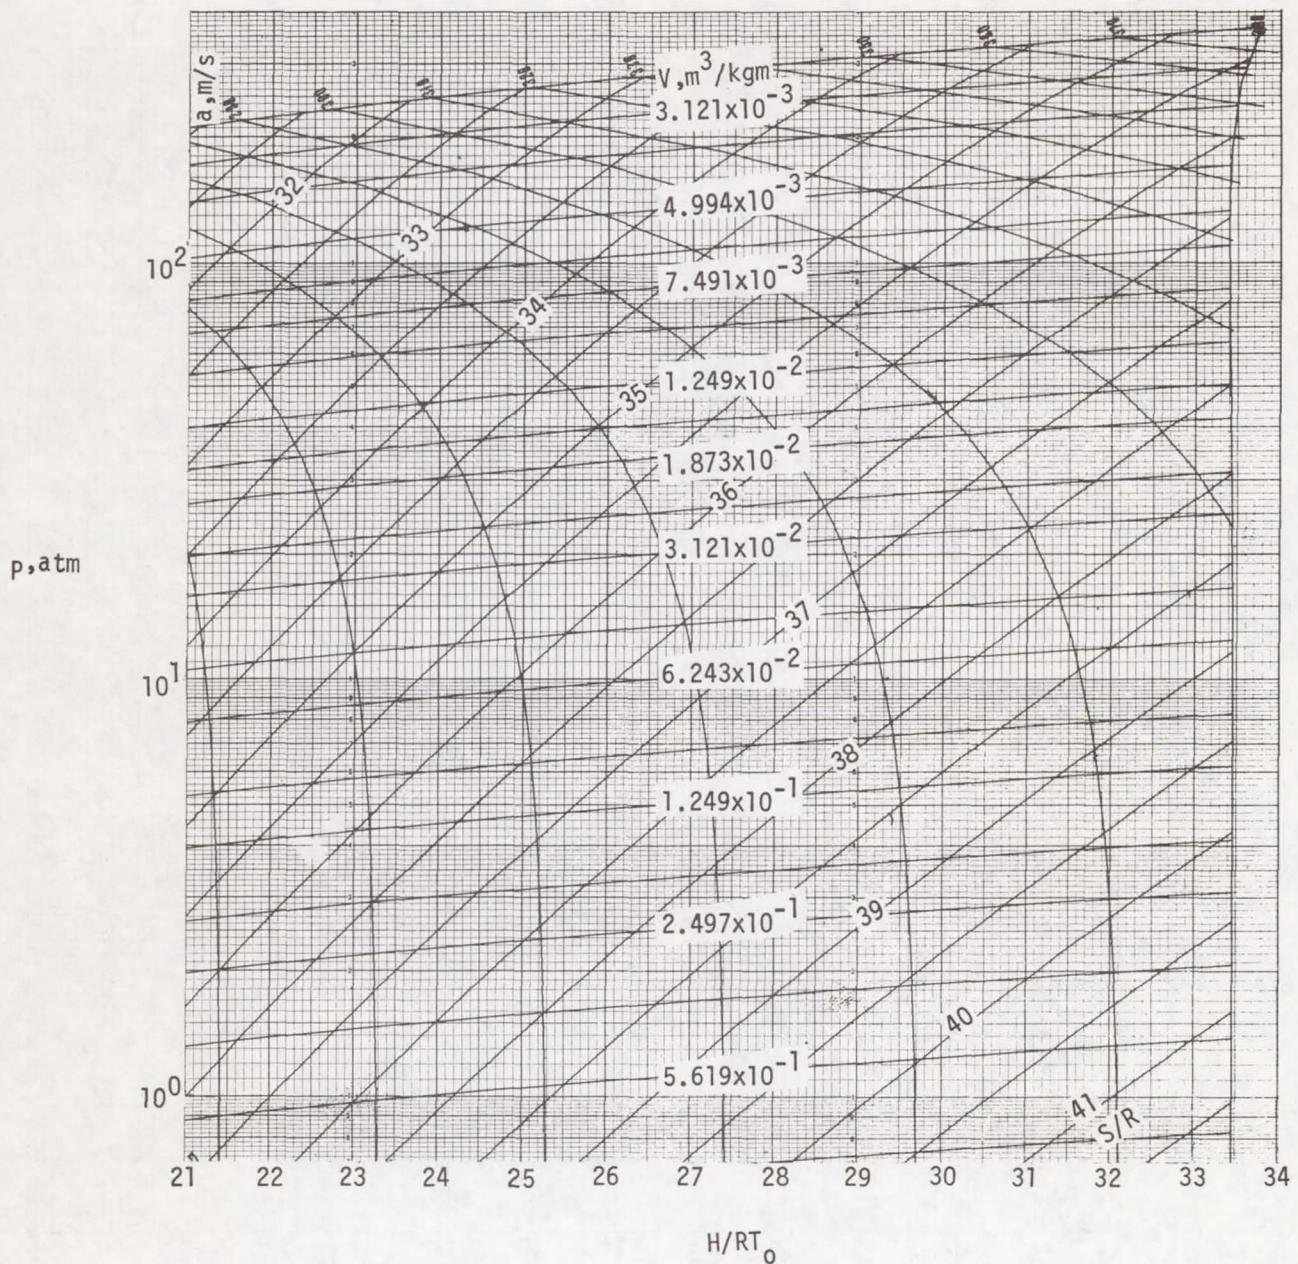

(a) Overall plot.

Figure 4.- Pressure enthalpy diagram for CF_4 with lines of constant entropy, volume, and speed of sound.

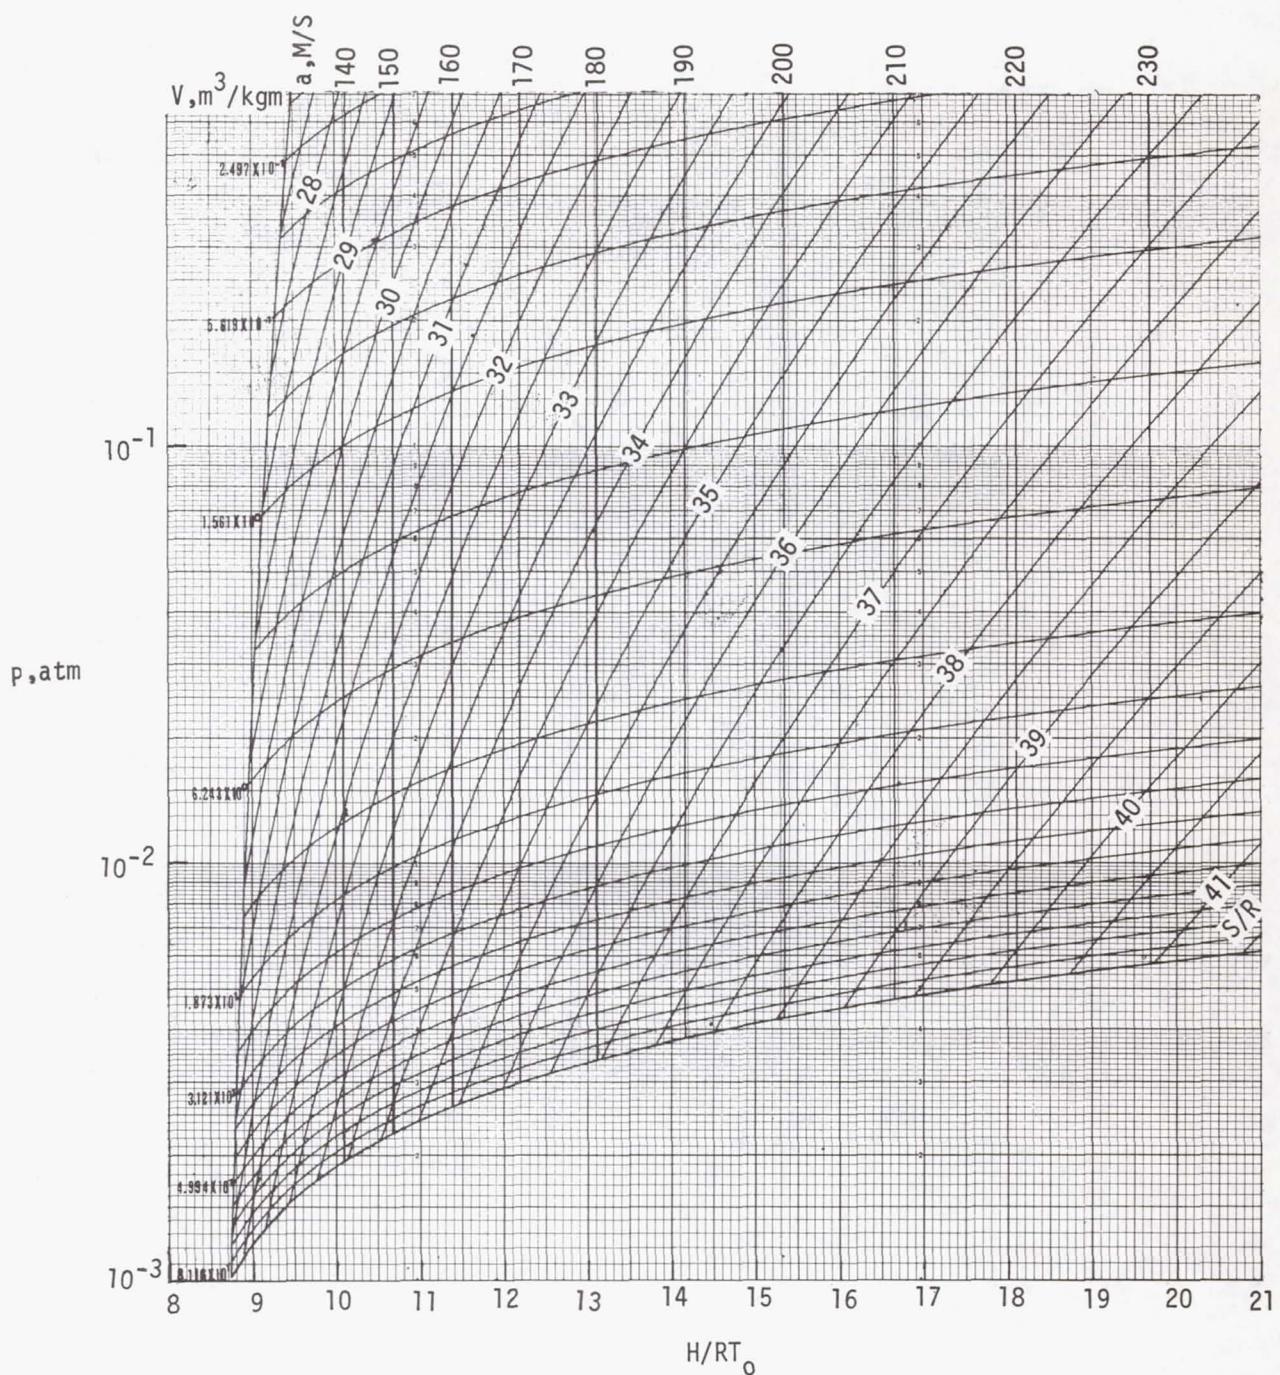

(b) Upper left quadrant.

Figure 4.- Continued.

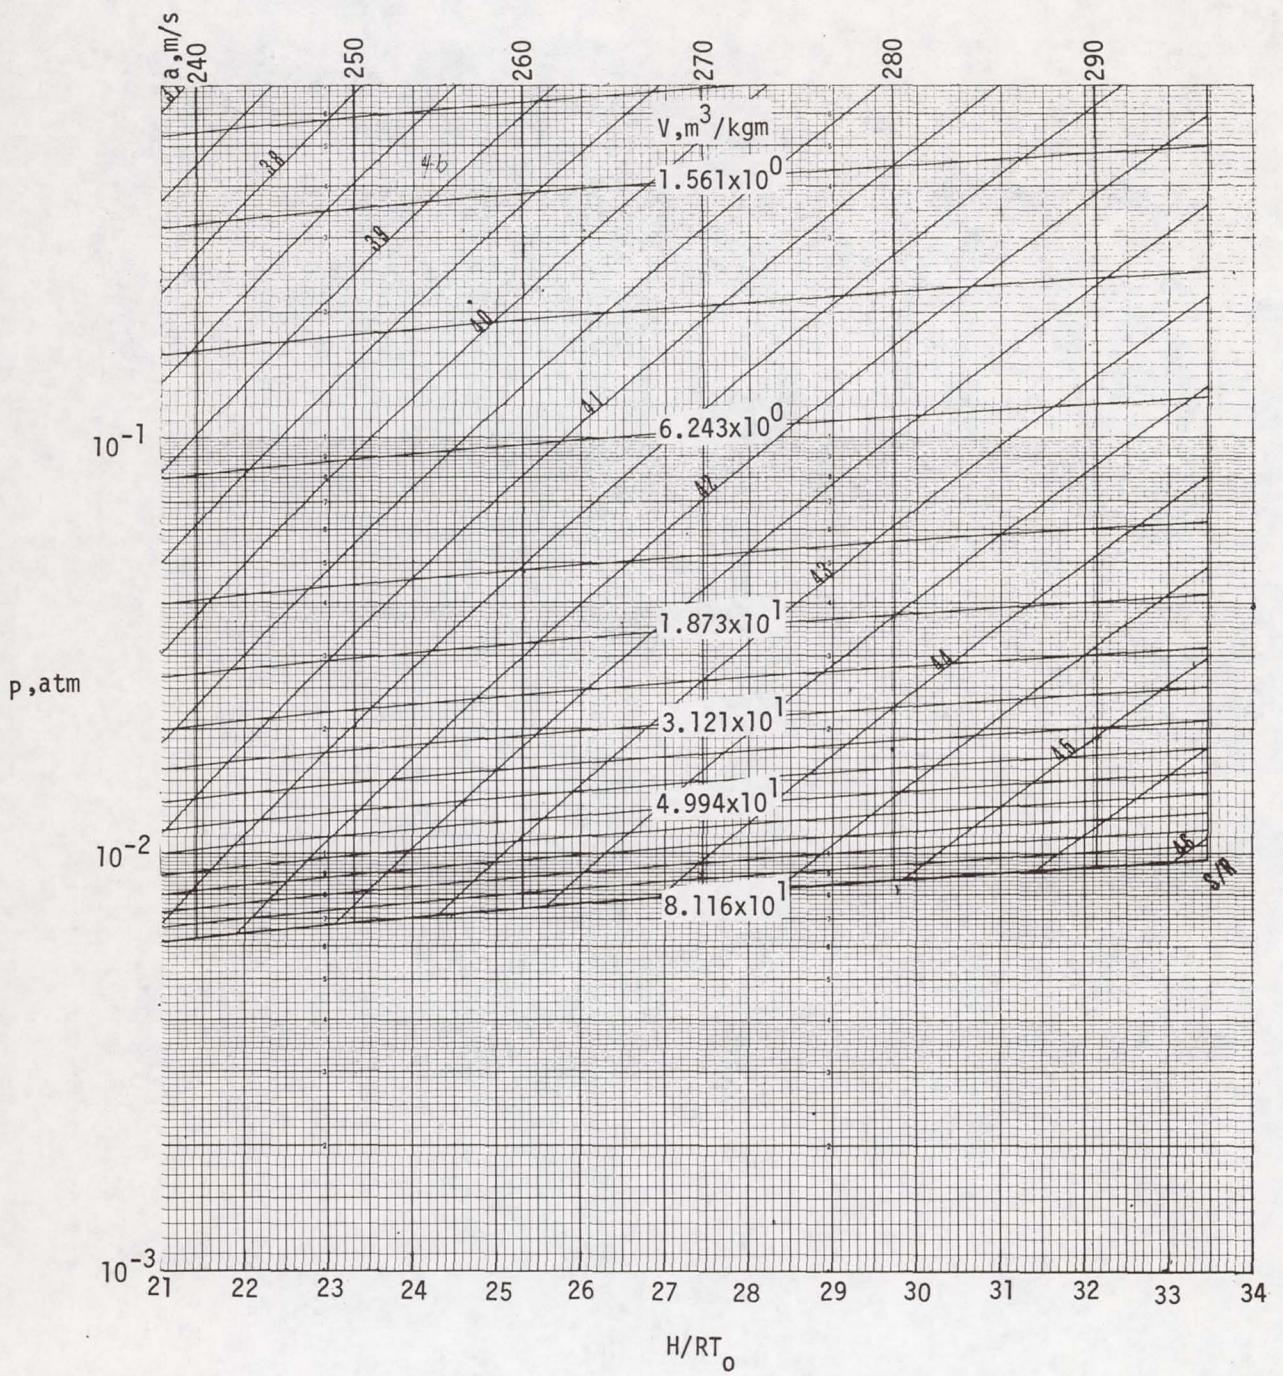

(c) Upper right quadrant.

Figure 4.- Continued.

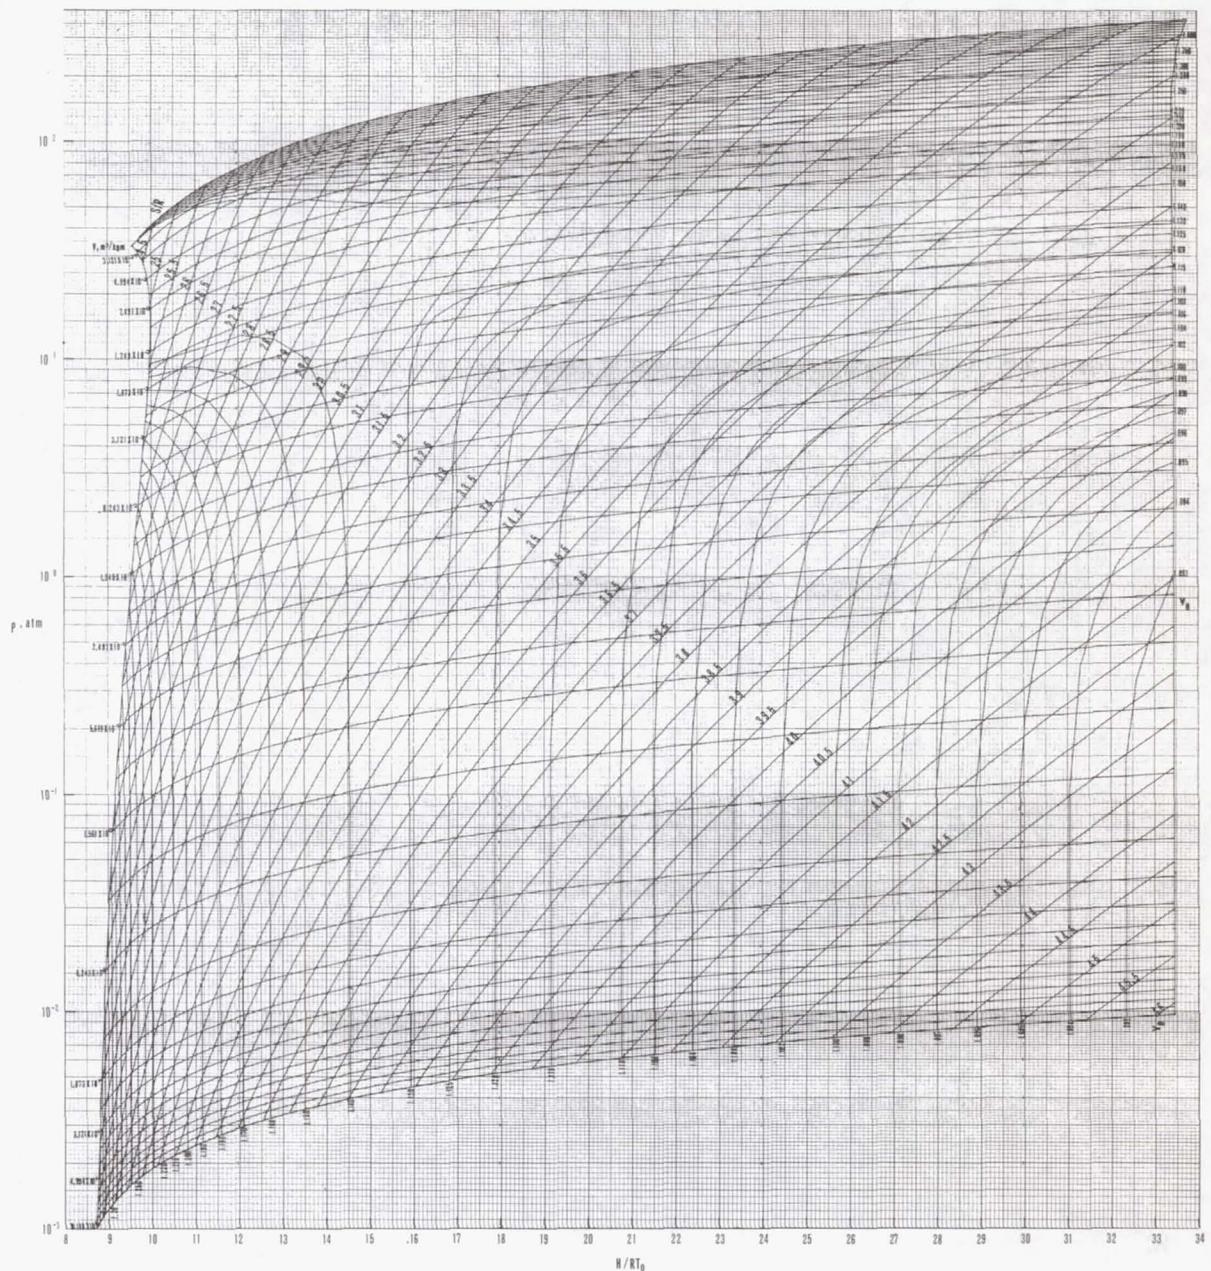

(d) Lower left quadrant.

Figure 4.- Continued.

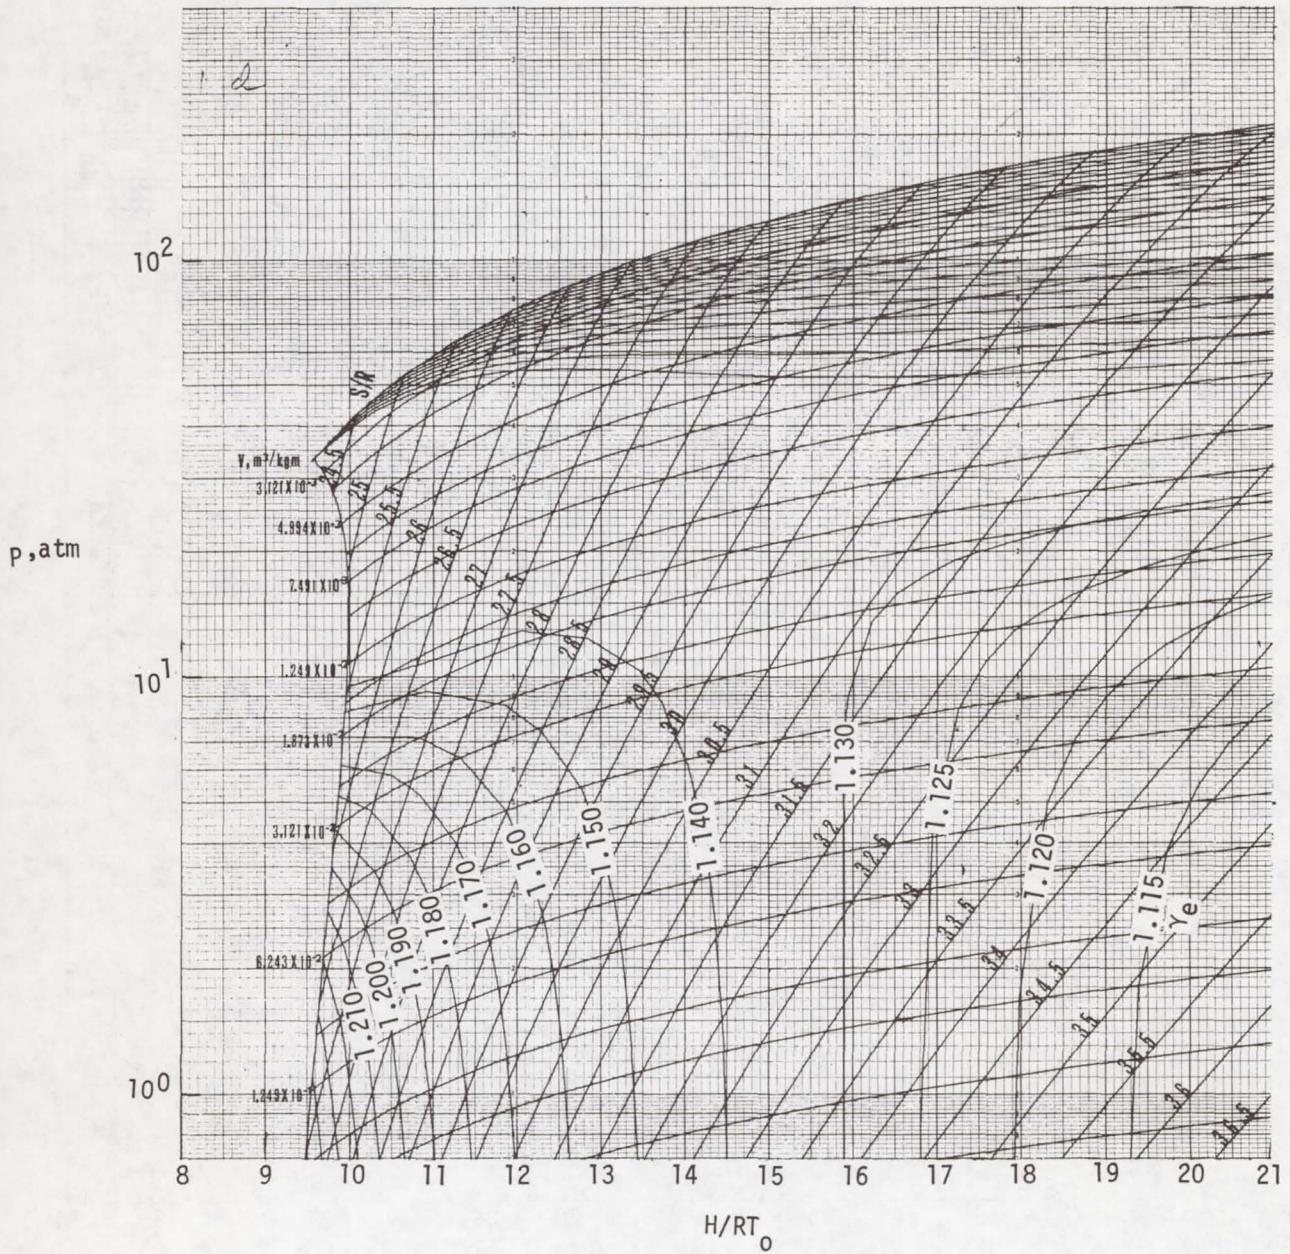

(e) Lower right quadrant.

Figure 4.- Concluded.

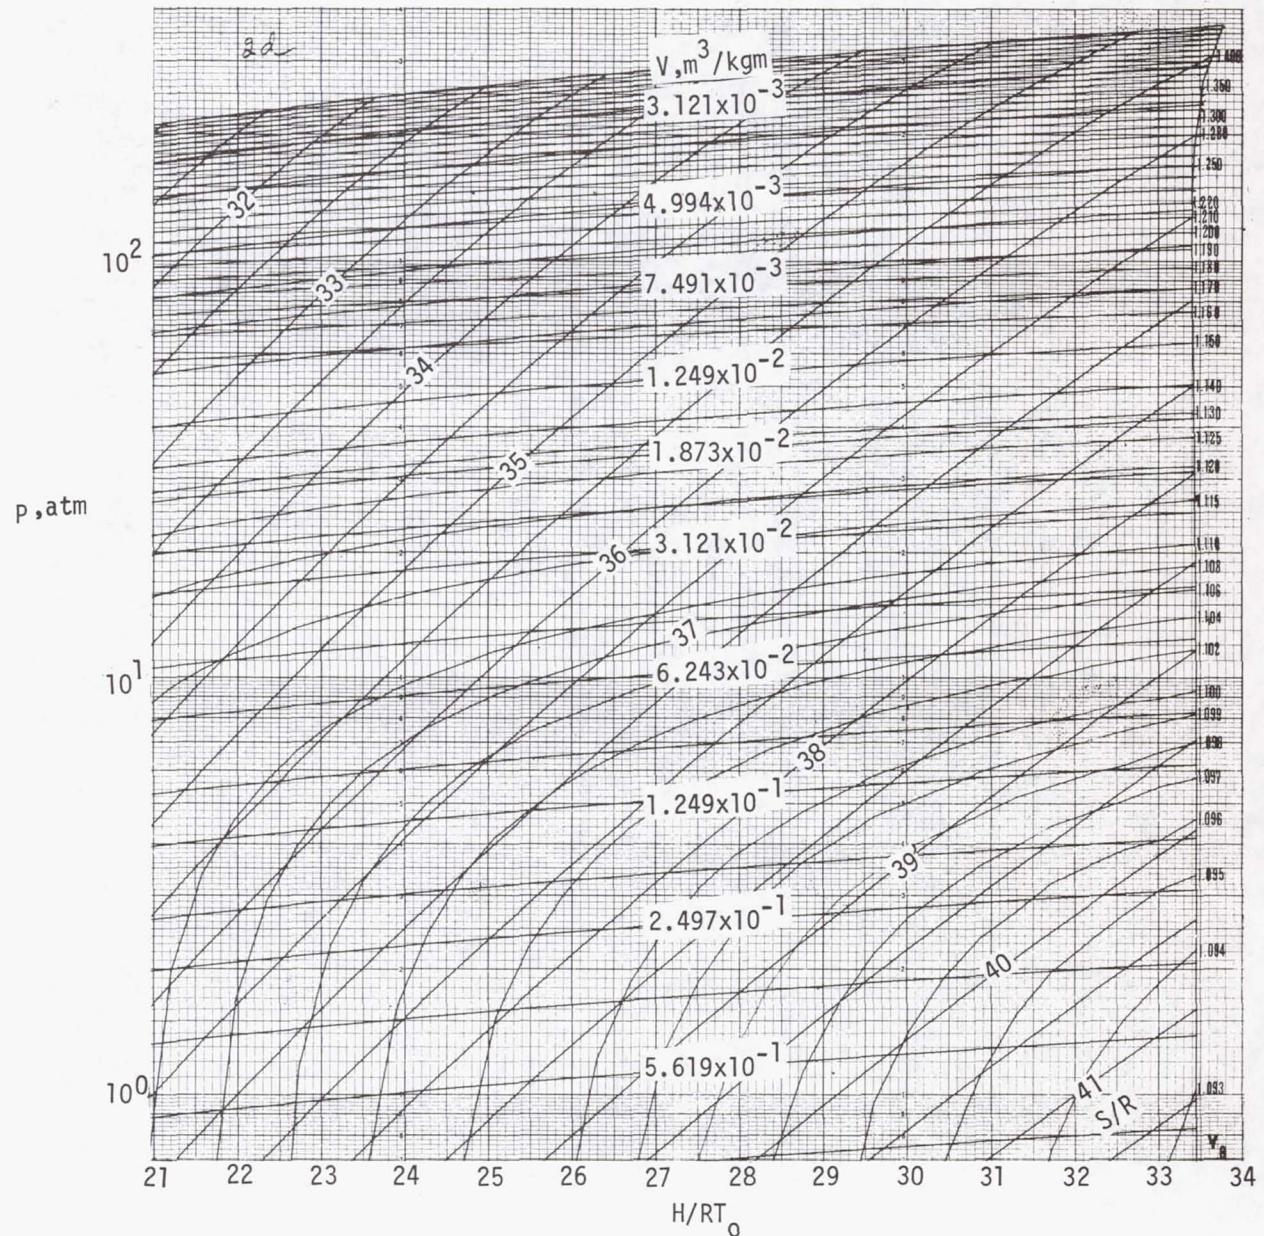

(a) Overall plot.

Figure 5.- Pressure-enthalpy diagram for CF_4 with lines of constant entropy, volume, and isentropic exponent.

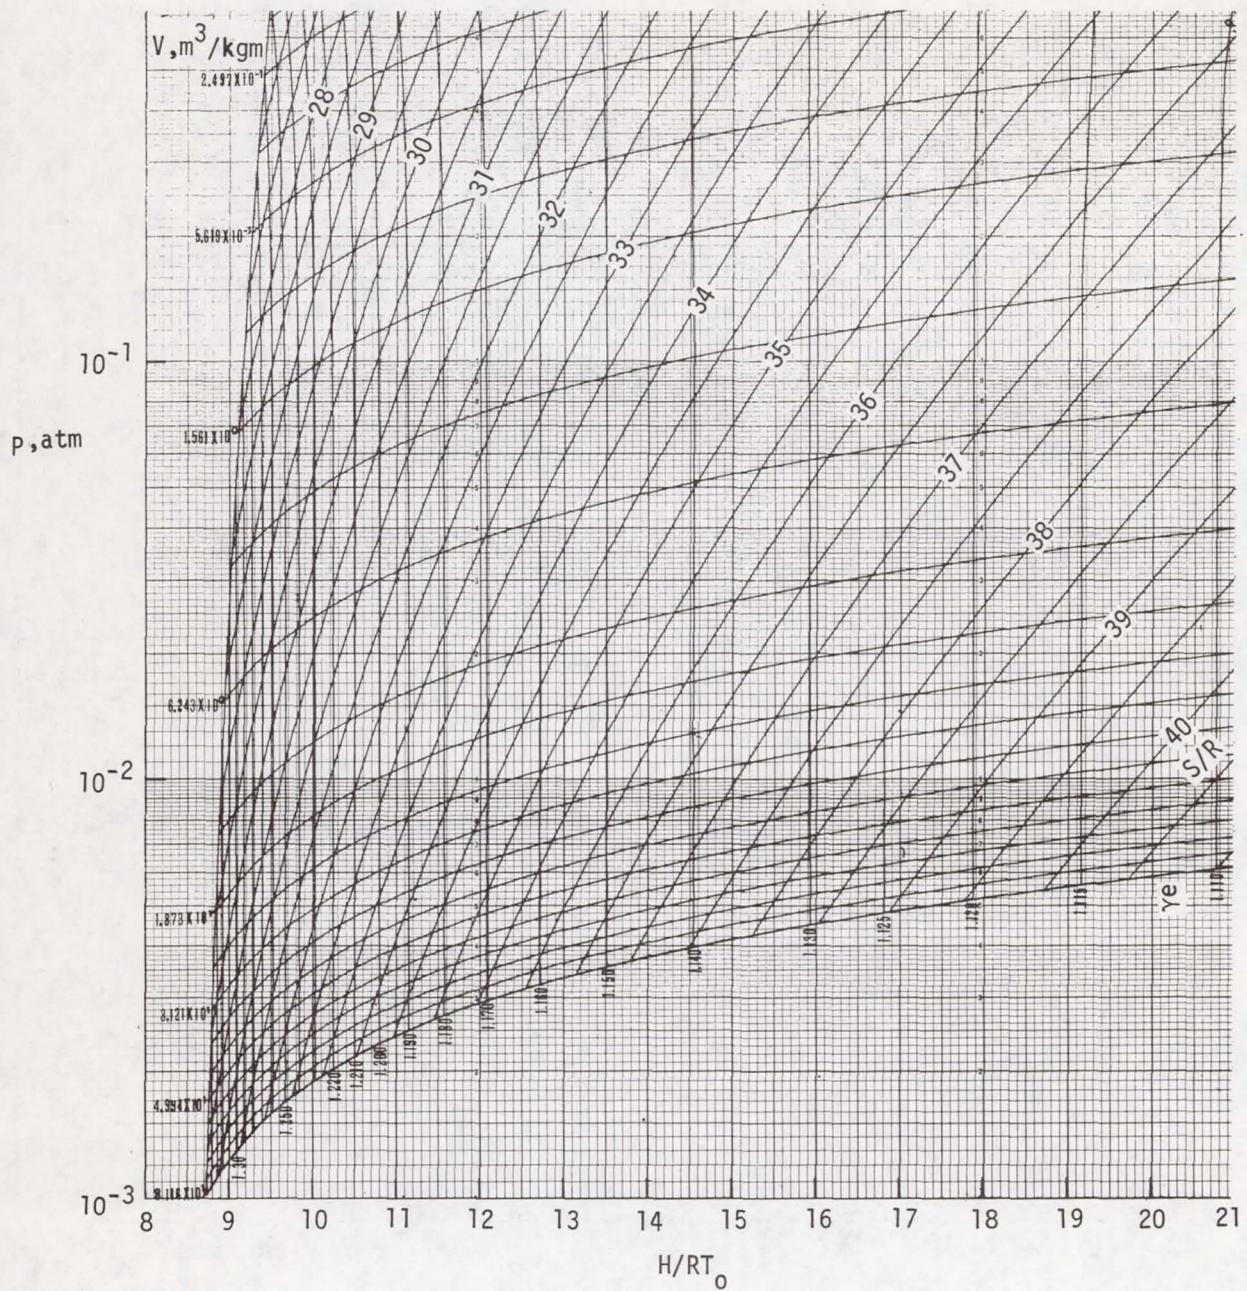

(b) Upper left quadrant.

Figure 5.- Continued.

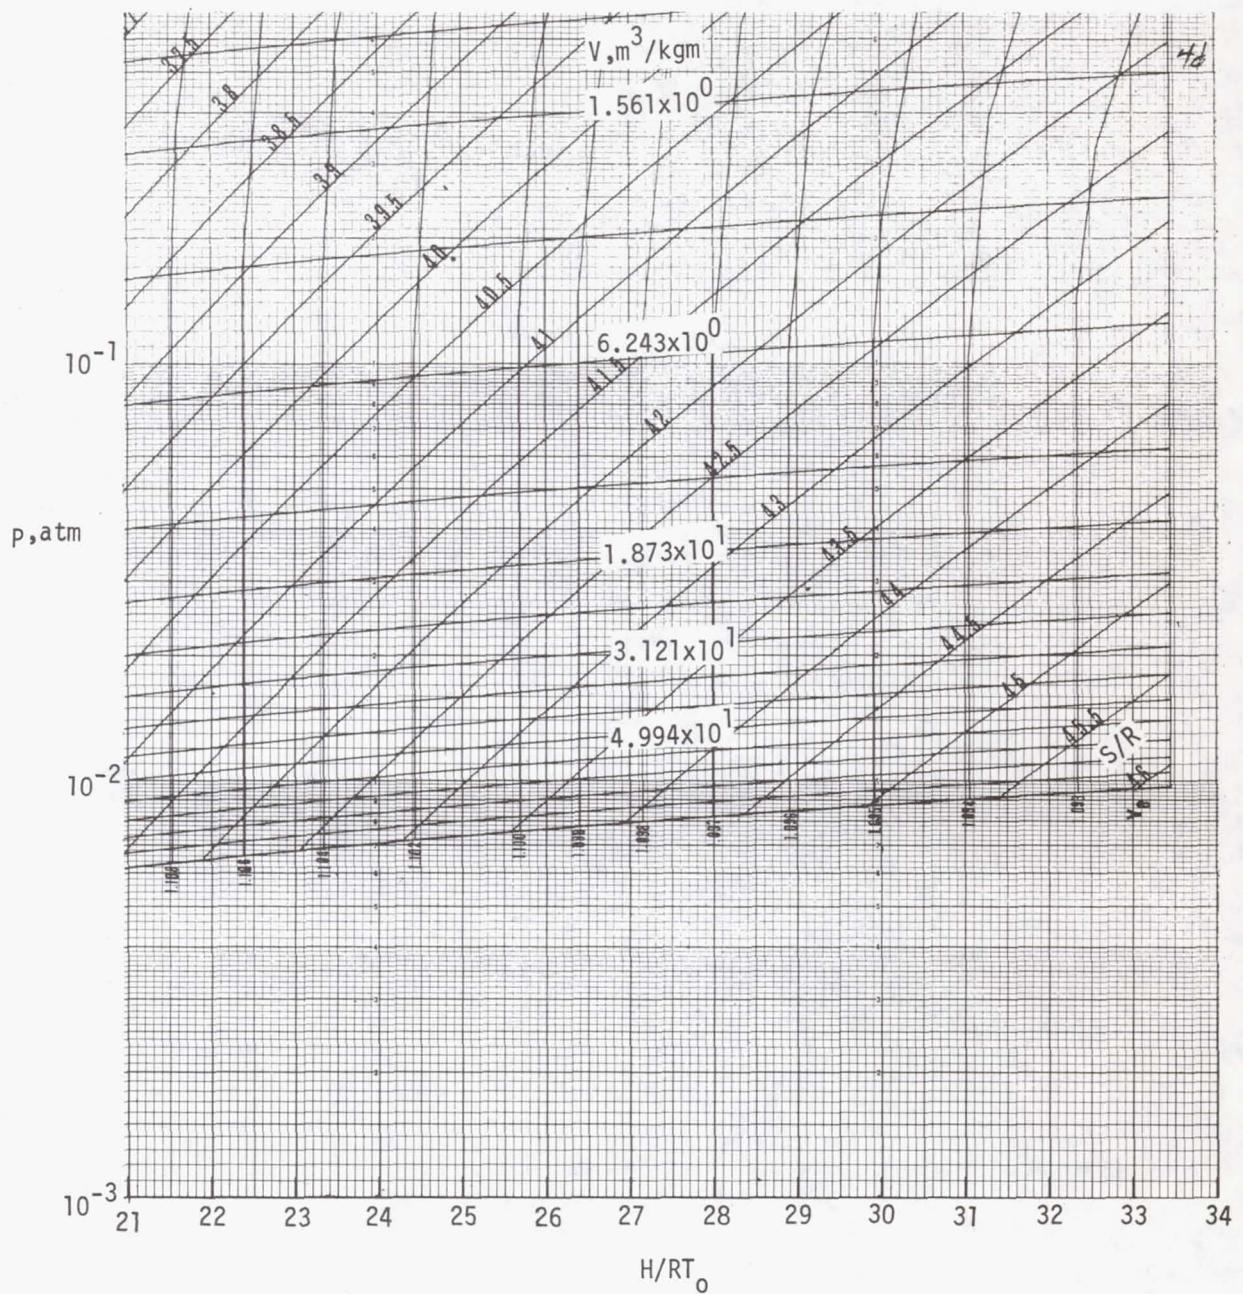

(c) Upper right quadrant.

Figure 5.- Continued.

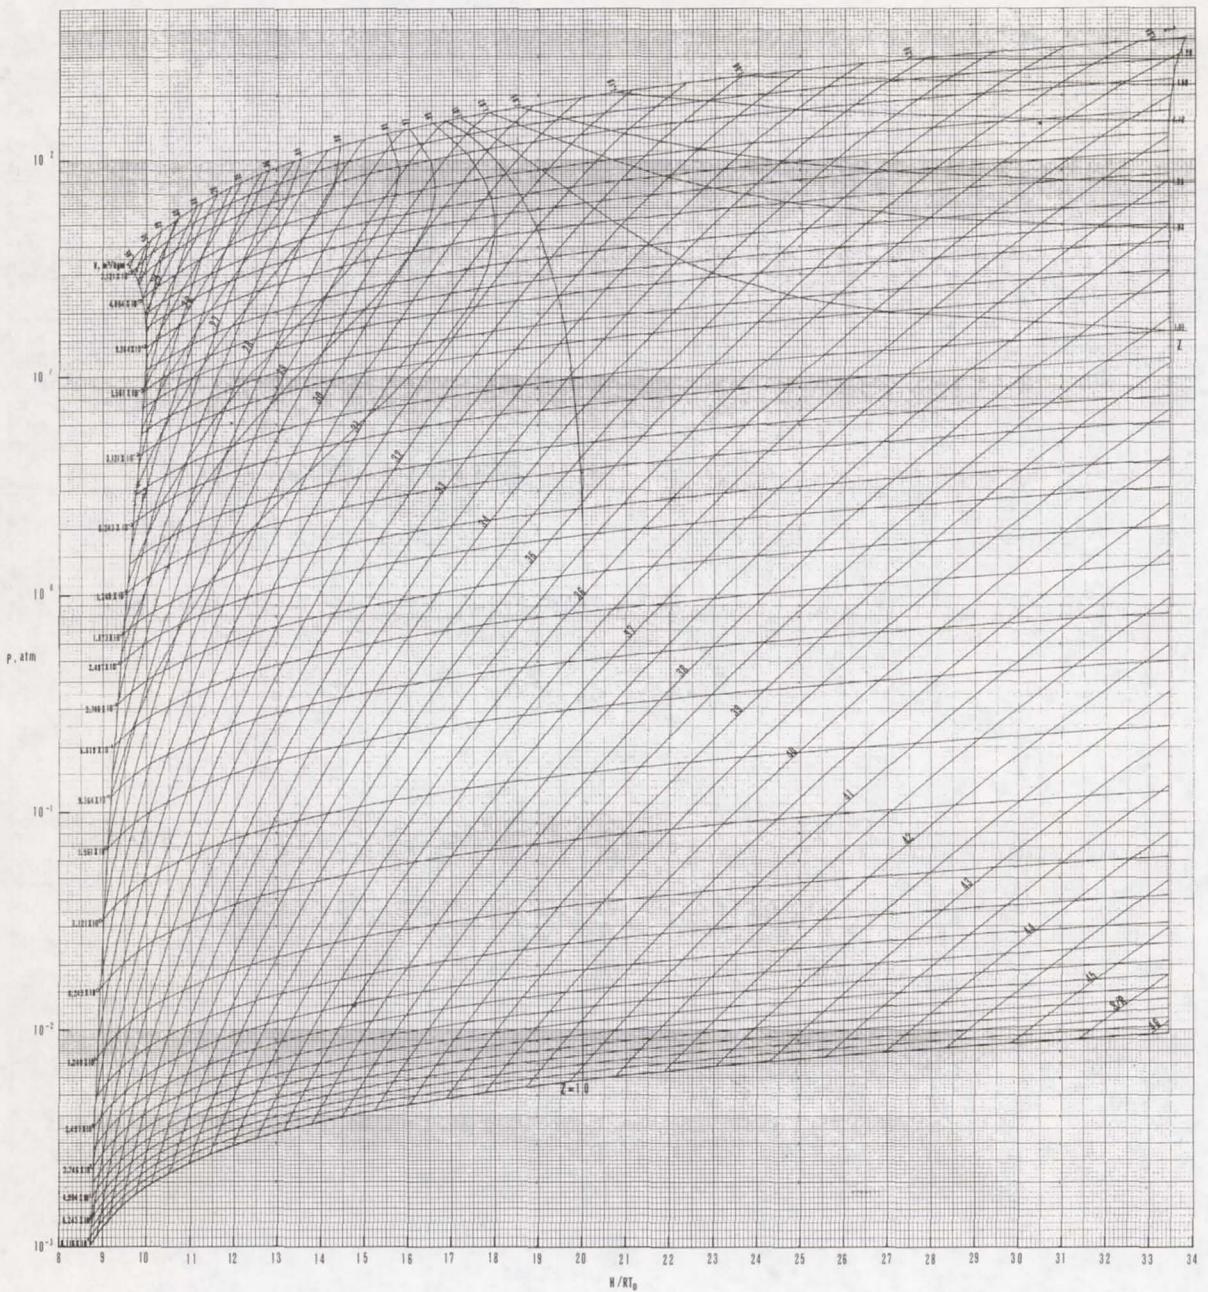

(d) Lower left quadrant.

Figure 5.- Continued.

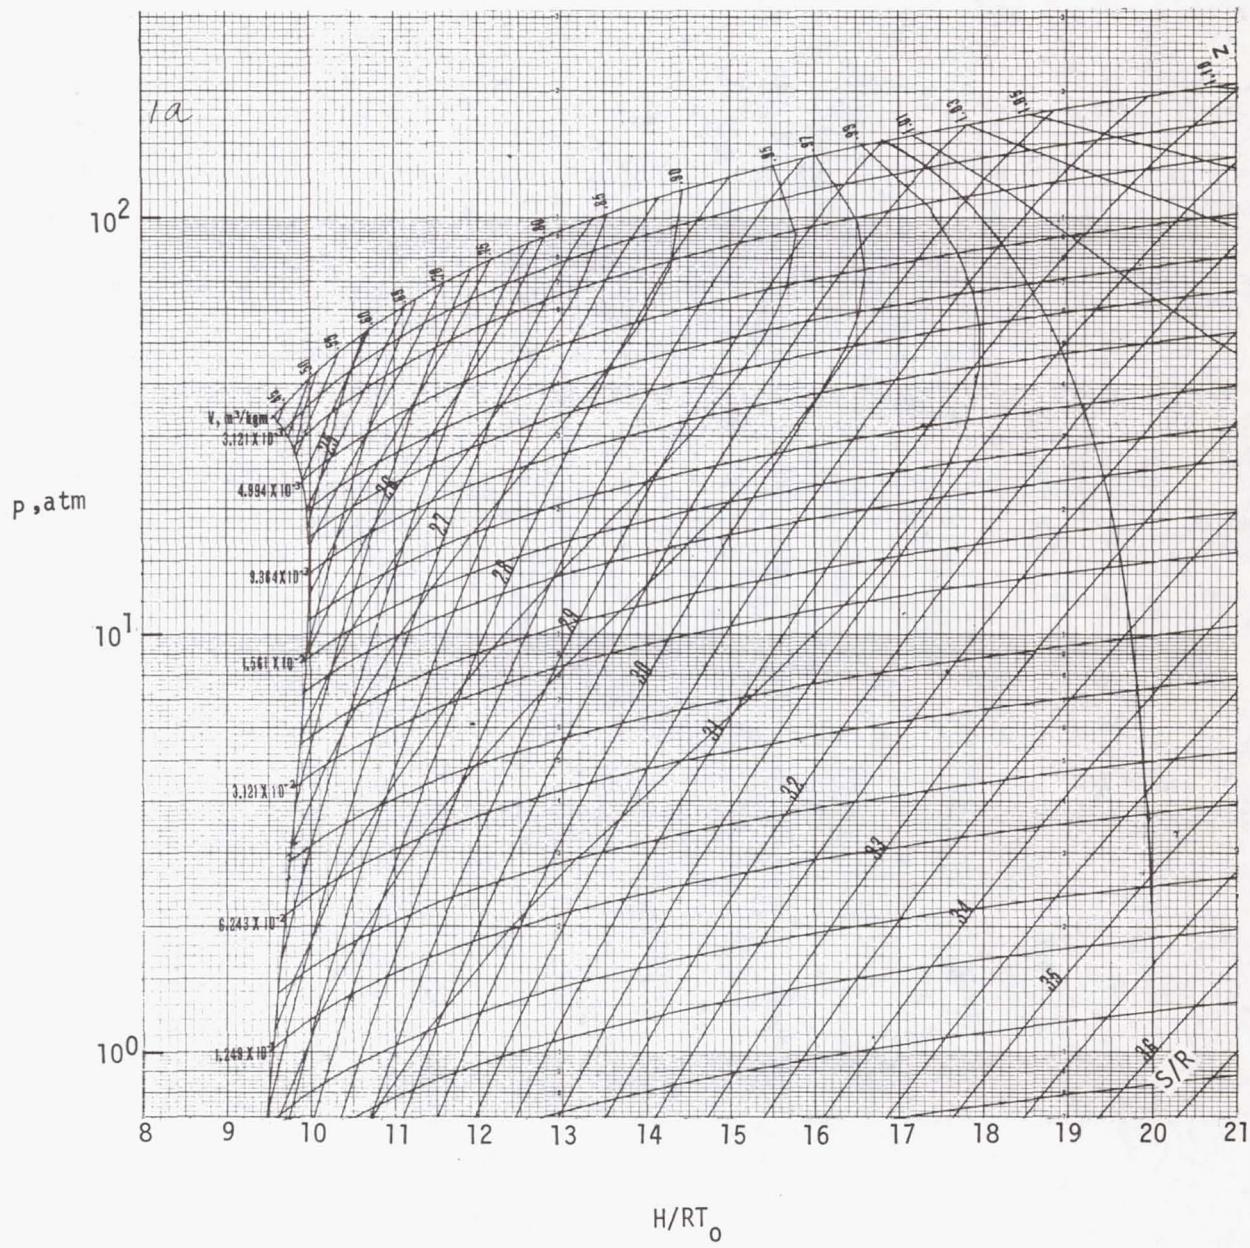

(e) Lower right quadrant.

Figure 5.- Concluded.

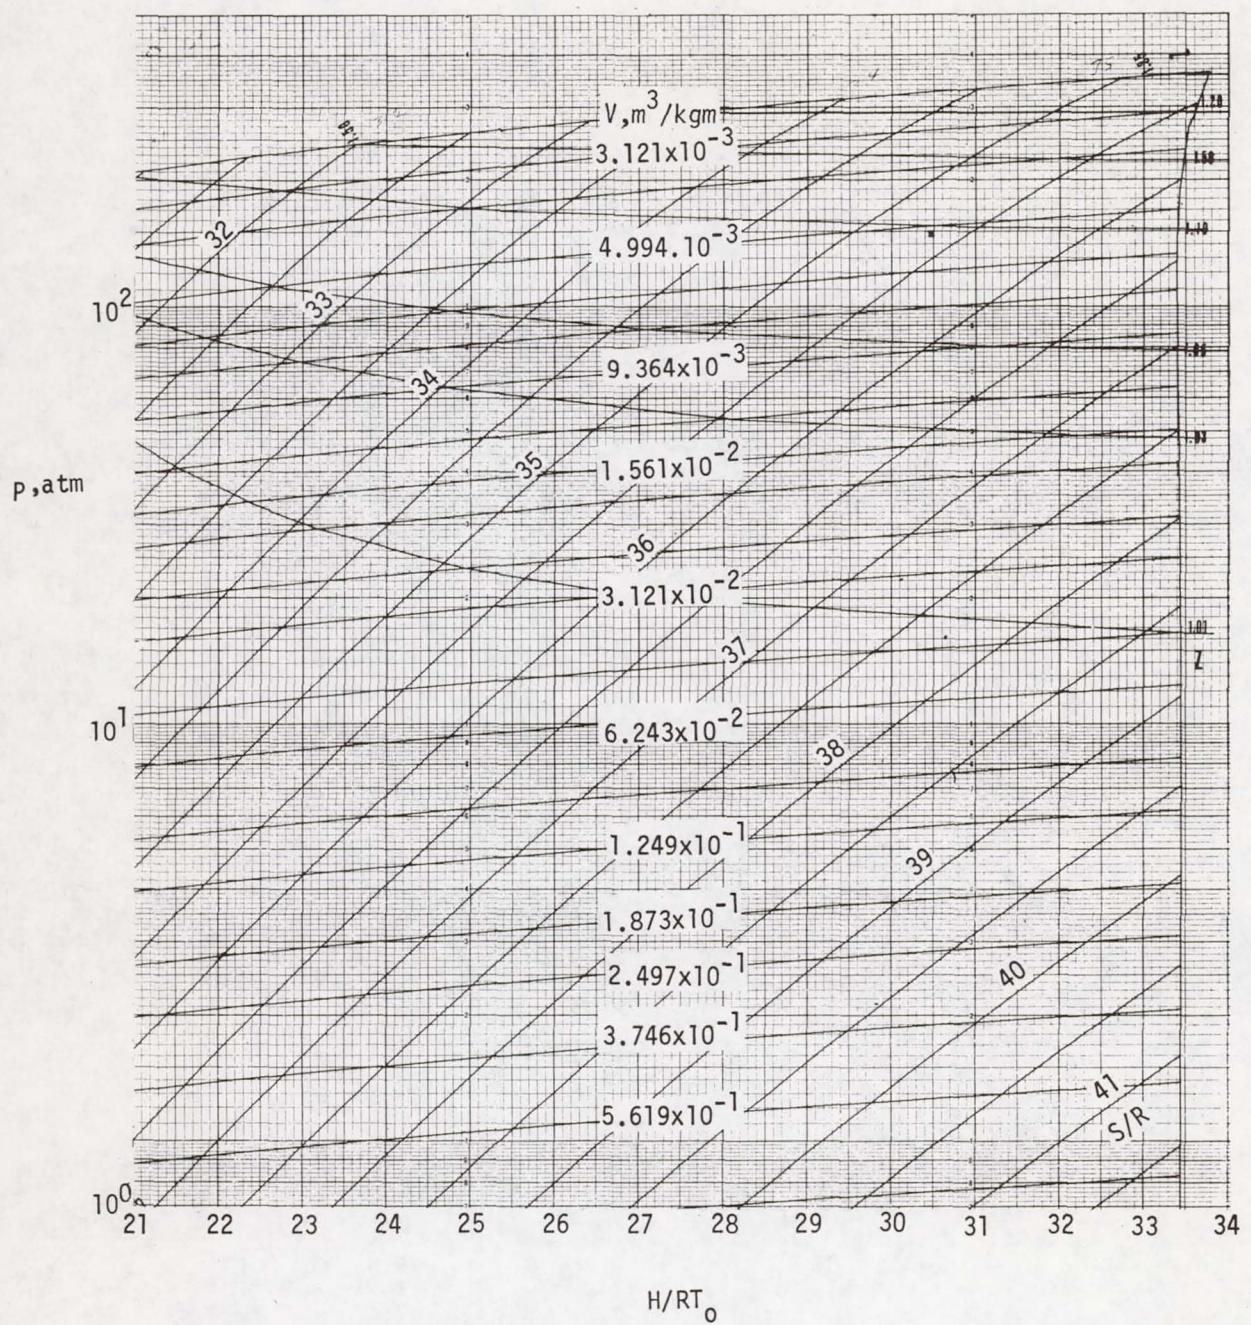

(a) Overall plot.

Figure 6.- Pressure enthalpy diagram for CF_4 with lines of constant entropy, volume, and compressibility factor.

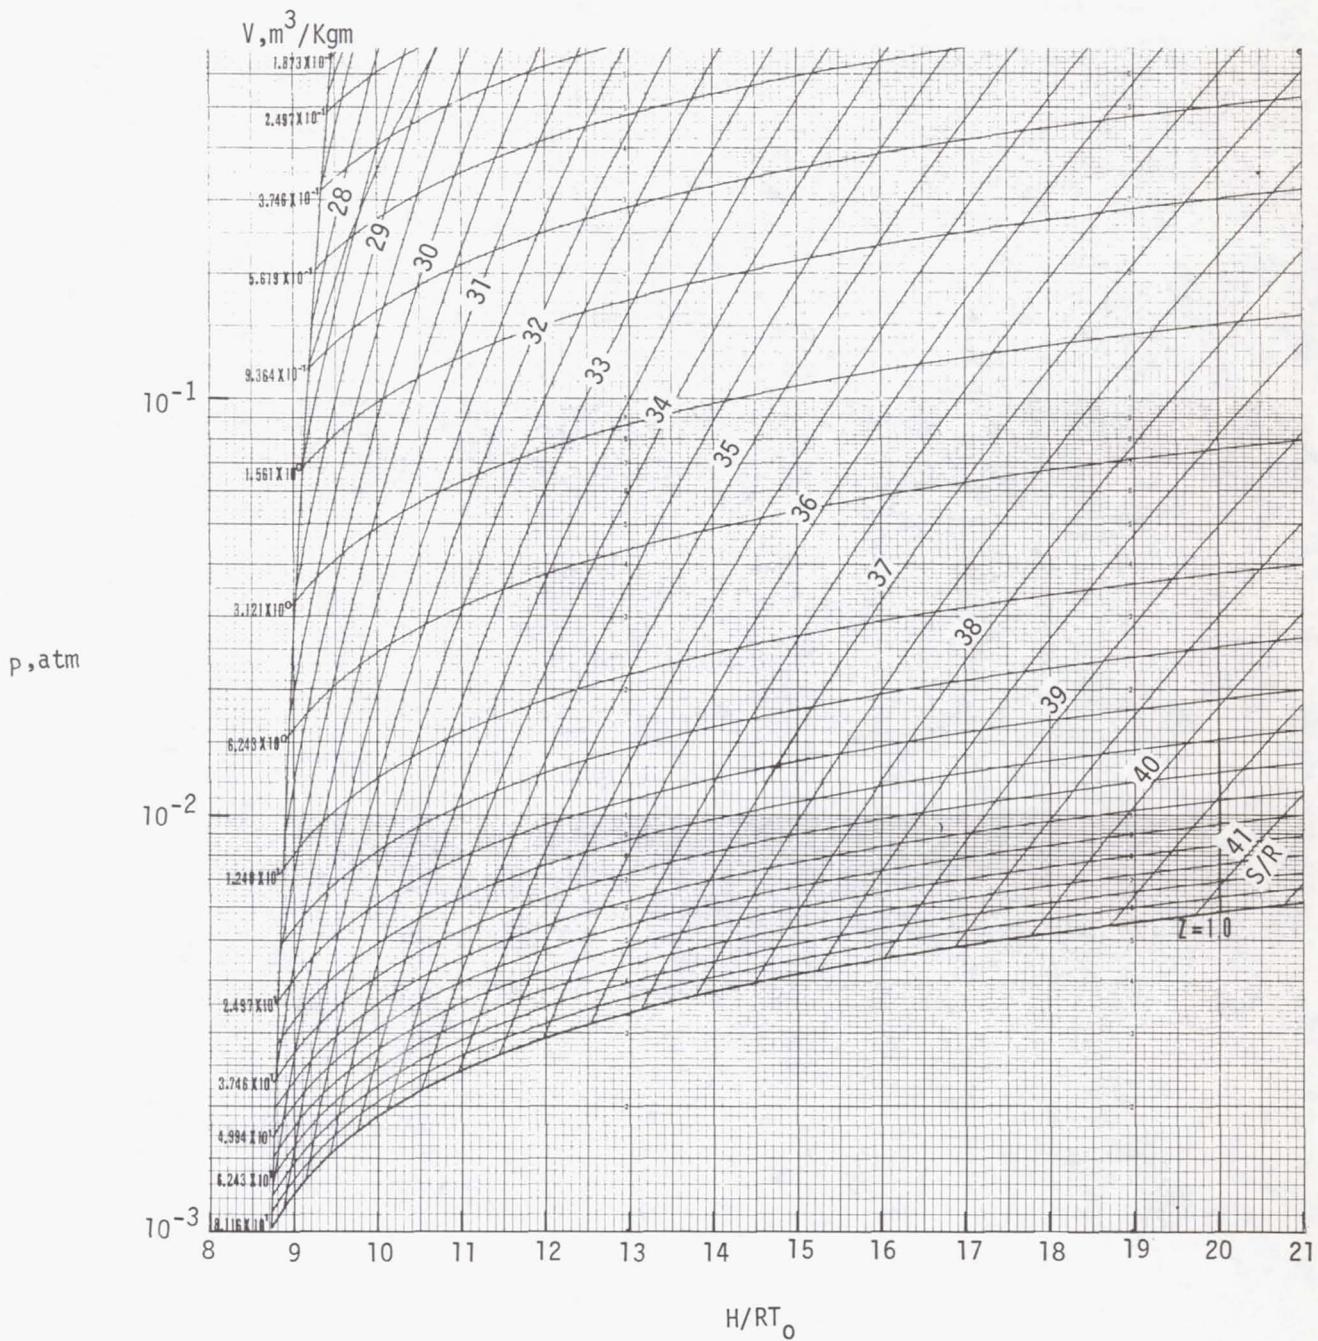

(b) Upper left quadrant.

Figure 6.- Continued.

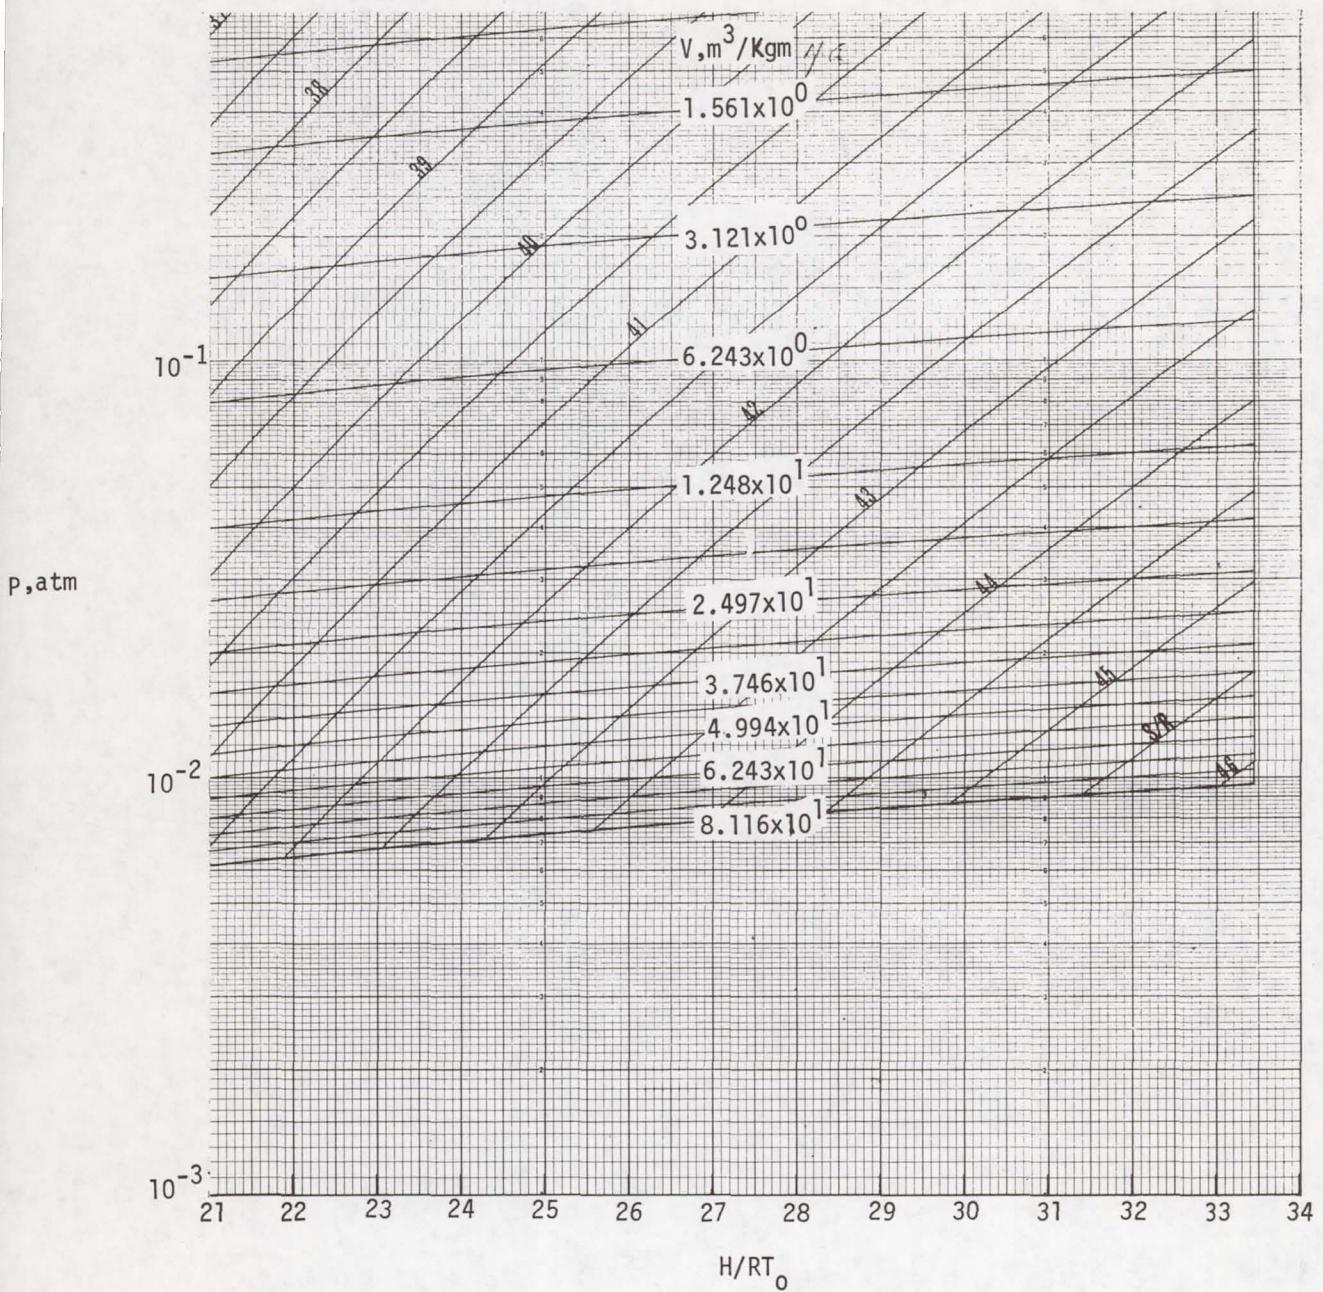

(c) Upper right quadrant.

Figure 6.- Continued.

(d) Lower left quadrant.

Figure 6.- Continued.

(e) Lower right quadrant.

Figure 6.- Concluded.

SPECIAL FOURTH-CLASS RATE
BOOK

POSTMASTER : If Undeliverable (Section 158
Postal Manual) Do Not Return

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons. Also includes conference proceedings with either limited or unlimited distribution.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include final reports of major projects, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

Details on the availability of these publications may be obtained from:
