Terms of Use

Any party may pass on this Work by electronic means and make it available for download under the terms and conditions of the Digital Peer Publishing License (DPPL) Version 3.0. The text of the license may be accessed and retrieved via Internet at <http://nbn-resolving.de/urn:nbn:de:0009-dppl-v3-en8>.

Beyond the conditions of the DPPL, the data which is contained in this catalog may only be used by any party for signal processing if the data is inserted into the source code of the program together with a reference to the catalog and if the program documentation (if available) also contains a reference to this catalog.

Exclusion of Liability

Deviating from paragraphs 12 and 13 of the DPPL Version 3.0, a comprehensive exclusion of liability applies. This states: This catalog is made available without any special or implied guarantee, which – among others – includes the implicit guarantee of the use of the catalog for a certain purpose. Under no circumstances is PTB responsible for any direct or indirect damage, independent of how it arose, through the use of the catalog. This also applies to damage due to errors of the catalog, which were already known at the occurrence of the damage.

1 Introduction

Window functions are used when a section of length T_w is to be cut out from a time varying signal for spectral analysis. Minimum sidelobe cosine-sum windows [1, 2] exhibit good properties with regard to the peak sidelobe level (PSL) and to the equivalent noise bandwidth (ENBW). In [3] (Open Access), the design of cosine-sum windows is described which have similarly good properties with regard to ENBW and PSL, but which can be designed exactly for a specified PSL value (PSL in exchange for ENBW). In contrast to conventional minimum sidelobe cosine-sum windows, this leads – in the case of a specified PSL – mostly to windows with a smaller ENBW.

This catalog contains parameters, coefficients and zeros of more than 6000 windows with a PSL greater than -350 dB and different values for the asymptotic decay of the sidelobes which have been designed for the above publication [3]. The absolute value of the difference of the PSL values of neighboring windows is not greater than 0.52 dB.

At this point the author would like to thank Dr. Martin Burghoff and Dr. Alfred Link from Physikalisch-Technische Bundesanstalt for their helpful comments.

1.1 The Cosine-Sum Window

The weighting function $w(t)$ of the cosine-sum window with the length T_w is

$$w(t) = \begin{cases} \sum_{p=0}^G (-1)^p A_p \cos\left(2\pi p \frac{t}{T_w}\right), & \text{for } 0 \leq t \leq T_w \\ 0, & \text{otherwise} \end{cases} \quad (1.1)$$

For given real coefficients A_p , the following is obtained for the absolute value of the Fourier transform of $w(t)$

$$|W(Q)| = \left| \frac{\sin(\pi Q)}{\pi} \sum_{p=0}^G (-1)^p A_p \frac{Q}{(Q+p)(Q-p)} \right| \quad (1.2)$$

with the limits

$$\lim_{Q \rightarrow 0} |W(Q)| = |A_0| \quad (1.3a)$$

$$\lim_{|Q| \rightarrow p} |W(Q)| = \frac{1}{2} |A_p|, \quad \text{for } p = 1, 2, \dots, G \quad (1.3b)$$

whereby $Q = fT_w$ is the normalized frequency. For real zero pairs $\pm Q_k$ of $W(Q)$, one obtains

$$|W(Q)| = \left| V_2 \frac{\sin(\pi Q)}{\pi Q} \prod_{k=0}^{G-L-1} \frac{Q^2 - Q_k^2}{Q_k^2} \cdot \prod_{k=1}^G \frac{k^2}{Q^2 - k^2} \right| \quad (1.4)$$

for $0 \leq L < G$ and $Q_k \neq 0$

with the limits

$$\lim_{Q \rightarrow 0} |W(Q)| = |V_2| \quad (1.5a)$$

$$\lim_{|Q| \rightarrow p} |W(Q)| = \left| V_2 \prod_{k=0}^{p-1} \frac{G-k}{G+k+1} \prod_{k=0}^{G-L-1} \frac{Q_k^2 - p^2}{Q_k^2} \right| \quad (1.5b)$$

for $p = 1, 2, \dots, G$

Here, G is the total number of the zero pairs, and L is the number of zero pairs which lie at infinity. The constant V_2 determines the peak signal gain of the window. Between the window coefficients A_p and the zeros Q_k , the following relationship exists

$$A_0 = V_2 \quad (1.6a)$$

$$A_p = V_2 \cdot 2 \prod_{k=0}^{p-1} \frac{G-k}{G+k+1} \prod_{k=0}^{G-L-1} \frac{Q_k^2 - p^2}{Q_k^2} \quad (1.6b)$$

for $p = 1, 2, \dots, G$ and $0 \leq L < G$

For the windows indicated in this catalog, the coefficients fulfill the condition $\sum_{p=0}^G A_p = 1$.

The data type used for the numerical calculation of $w(t)$ (equation (1.1)) has a decisive influence on the achievable PSL. With the double extended-precision floating-point data format [4], $w(t)$ can be calculated with sufficient accuracy for cosine-sum windows with a PSL of up to -350 dB. This data format was also used for the determination of the parameters, coefficients, and zeros of all the window functions indicated in this catalog.

1.2 The Catalog

The windows indicated in this catalog have been designed by optimization of the Fourier transform of the weighting function (1.1). They have an axially symmetric amplitude spectrum ($|W(Q)| = |W(-Q)|$) with the amplitude maximum of the mainlobe at $Q = 0$ (see chapter 5). Windows are frequently used in signal analysis with discrete Fourier transform. This use is treated in [1].

1.2.1 Composition and Use

In chapter 2, the catalog contains selected parameters, in chapter 3 the coefficients of the window functions, in chapter 4 the zeros of the Fourier-transformed window functions, and in chapter 5 plots of the normalized amplitude spectra ($|W_{norm}(Q)| = |W(Q)/W(0)|$) of minimum sidelobe windows. Within these chapters, windows with an identical asymptotic decay of the sidelobes have been combined in sections and arranged according to the PSL, starting with the greatest value. In the tables of the catalog, the following abbreviations are used:

| | |
|----------------|--|
| PSL: | peak sidelobe level |
| ENBW: | equivalent noise bandwidth |
| PSG: | peak signal gain |
| SC Loss: | scallop loss |
| 3.0-dB Bandw.: | 3.0-dB bandwidth of mainlobe |
| 6.0-dB Bandw.: | 6.0-dB bandwidth of mainlobe |
| ZC Bandw.: | zero crossing bandwidth of mainlobe |
| A_p : | coefficient of window function $w(t)$ (p : unsigned integer) |
| Q_k : | zero of Fourier-transformed window function $W(Q)$ (k : unsigned integer) |

Every window indicated in the catalog has a name in the form of w - xx - yy - $zzzzz$. Thereby, xx is the total number of the zero pairs G of the window function, yy is the number of zero pairs L lying at infinity, and $zzzzz$ is the absolute value of the PSL in dB indicated exactly to 2 digits after the decimal point (without a decimal point). If necessary, leading zeros are filled up. Minimum sidelobe windows – i. e. windows which exhibit the smallest possible PSL for the specified G and L – are marked by window names in a slanted font. The window w -11-05-28448 thus has 11 zero pairs, of which only 6 zero pairs have a finite value. The absolute value of the PSL of this window is 284.48 dB.

The windows between two neighboring minimum sidelobe windows have – with respect to the PSL – an almost identical distance ΔPSL . Their number has been minimized in such a way that for the arithmetic mean of the distances $\overline{\Delta PSL}$ the condition $|\overline{\Delta PSL}| \leq 0.5$ dB is fulfilled.

To find a suitable window in the catalog, the desired asymptotic decay of the sidelobes and the PSL should be known. As the names and parameters of all the windows contained in the catalog are shown as tables in chapter 2 and have been arranged according to the above-mentioned parameters, a window can easily be found. Via links in the *Table of Contents*, one gets to that section in chapter 2 which contains the parameters of all windows with the desired asymptotic decay of the sidelobes. Within the section, the windows are arranged according to the PSL. When the table line with the name and the parameters of the window that comes into question has been found, one gets – via links in the last table column – to the window coefficients A_p (chapter 3) and to the window zeros Q_k (chapter 4). With the aid of the spectra indicated in chapter 5, the amplitude spectrum can be estimated roughly for the selected window. With equations (1.2) or (1.4) it can be calculated exactly. Finally, here is an example: For a measurement task, a window with a PSL of ≤ -180 dB and with an asymptotic decay of the sidelobes of 100 dB/decade is required. In section 2.3, the window w -07-02-18021 with the largest possible PSL (-180.21 dB) is found, which fulfills the stated conditions. The coefficients of the window are stated on page 246 and the zeros on page 946.

1.2.2 Window Parameters, Window Coefficients and Window Zeros

For each window, the coefficients of the weighting function (1.1), the zeros of their Fourier transform and selected window parameters are indicated. The parameters equivalent noise bandwidth and peak signal gain were calculated from the coefficients A_p . The zero crossing bandwidth of the mainlobe results from the number of the zero pairs G and the zero Q_0 of the window function. The parameters PSL, scallop loss, as well as 3.0 dB and 6.0 dB bandwidth of the mainlobe have been determined by numerical evaluation of the equations (1.2) and (1.3). The asymptotic decay of the sidelobes (20(2L + 1) dB/decade) calculated from the number L of the zeros lying at infinity is a theoretical value for $|Q| \rightarrow \infty$.

Due to the finite accuracy of the indicated window coefficients A_p , the Fourier transform of equation (1.1) deviates for sidelobe levels < -350 dB with increasing $|Q|$ to an continuously increasing extent from the expected curve.

All the zero frequencies Q_k and bandwidths B indicated in the catalog are normalized to $1/T_w$, i.e. $Q_k = f_k \cdot T_w$ and $B = \Delta f \cdot T_w$. The PSL values have been rounded up. The values of the other parameters have been rounded to the nearest presentable number. The mantissa of the values for the window coefficients A_p and the zeros Q_k are indicated with 22 decimal places to ensure that the numerical values originally available in the computer-internal representation are well approximated in the representation in the decimal system.

1.2.3 Catalog Data as an ASCII File

The parameters, coefficients and zeros of all the windows indicated in the catalog are also available as an ASCII file. Here is an excerpt of this file:

=====
```

In contrast to the catalog, the data belonging to a window are indicated coherently. The windows are arranged according to the asymptotic decay of the sidelobes and then according to the PSL. As a field separator, the character ' ' is used, so that the data can be easily filtered. In this way, window coefficient vectors can, for example, be automatically generated in the syntax of the programming language used.
