## Spiro compounds As Hepatitis C Virus Inhibitors

## FIELD OF TIE INVENTION

[0001] The present invention is in the field of medicine. The invention relates to spiro compounds for treating Hepatitis C virus (HCV) infection, compositions comprising such compounds, the use and the methods thereof. In particular, the invention relates to use of heterocyclic compounds as NS5A protein inhibitors. More specifically, the invention relates to compounds which can inhibit the function of the NS5A protein encoded by Hepatitis C virus (HCV), pharmaceutical compositions comprising such compounds, and methods for inhibiting the function of the NSSA protein by the compounds and pharmaceutical compositions disclosed herein.

## BACKGROUND OF THE INVENTION

[0002] HCV is a major human pathogen, infecting an estimated 170 million persons worldwide - roughly five times the number infected by human immunodeficiency virus type 1. A substantial fraction of these HCV infected individuals develop serious progressive liver disease, including cirhosis and hepatocellular carcinoma. Chronic HCV infection is thus a major worldwide cause of liver-related premature montality.
[0003] Presently, the most effective HCV therapy employs a combination of alpha-interferon and ribavirin, leading to sustained efficacy in $40 \%$ of patients. Recent clinical results demonstrate that pegylated alpha-interferon is superior to unmodified alpha-interferon as monotherapy. However, even with experimental therapeutic regimens involving combinations of pegylated alpha-interferon and ribavirin, a substantial fraction of patients do not have a sustained reduction in viral load. The treatment has side effects in many patients, so they do not durably respond to treatment. Thus, new and effective methods of treating HCV infection are urgently needed.
[0004] HCV is a positive-stranded RNA virus. Based on a comparison of the deduced amino acid sequence and the extensive similanty in the 5 'untranslated region, HCV has been classified as a separate genus in the Flaviviridae family. All members of the Flaviviridae family have enveloped virions that contain a positive stranded RNA
genome encoding all known virus-specific proteins via translation of a single, uninterrupted, open reading frame (ORF).
[0005] Considerable heterogeneity is found within nucleotide and encoded amino acid sequence throughout the HCV genome. At least seven major genotypes have been characterized, and more than 50 subtypes have been described. In HCV infected cells, viral RNA is translated into a polyprotein that is cleaved into ten individual proteins. At the amino terminus are structural proteins, follows E1 and E2. Additionally, there are six non-structural proteins, NS2, NS3, NS4A, NS4B, NS5A and NS5B, which play a function role in the HCV lifecycle (see, for example, Lindenbach et al., Nomre, 2005, 436, 933-938.).
[0006] The major genotypes of HCV differ in their distribution wotldwide, and the clinical significance of the genetic heterogeneity of HCV remains elusive despite numerous studies of the possible effect of genotypes on pathogenesis and therapy.
[0007] The single strand HCV RNA genome is approximately 9500 nucleotides in length and has a single open reading frame (ORF) encoding a single large polyprotein of about 3000 amino acids. In infected cells, this polyprotein is cleaved at multiple sites by cellular and viral proteases to produce the structural and non-structural (NS) proteins. In the case of HCV, the generation of mature non-structural proteins (NS2, NS3, NS4A, NS4B, NS5A and NS5B) is effected by two viral proteases. The first one is believed to be a metalloprotease and cleaves at the NS2-NS3 junction; the second one is a serine protease within the N-terminal region of NS3 (also referred herein as NS3 protease) and mediates all the subsequent cleavages downstream of NS3, both in cis, at the NS3-NS4A cleavage site, and in trans, for the remaining NS4A-NS4B, NS4B-NS5A, NS5A-NS5B sites. The NS4A protein appears to serve multiple functions, acting as a cofactor for the NS3 protease and possibly assisting in the membrane localization of NS3 and other viral replicase components. The complex formation of the NS3 protein with NS4A seems necessary to the processing events, enhancing the proteolytic efficiency at all of the sites. The NS3 protein also exhibits nucleoside
triphosphatase and RNA helicase activities. NS5B (also referred to herein as HCV polymerase) is a RNA-dependent RNA polymerase that is involved in the replication of HCV.
[0008] Compounds useful for treating HCV-infected patients are desired which selectively inhibit HCV viral replication. In particular, compounds which are effective to inhibit the function of the NS5A protein are desired. The HCV NS5A protein is described, for example, in Tan et al, Virology, 2001, 284, 1-12; and in Park et al., J. Biol. Chem, 2003, 278, 30711-30718.

## SUMMARY OF THE INVENTION

[00150] The term "spiro bicyclylene" refers to spiro bicyclyl system having two connection points connected to the rest of the molecule, wherein the spiro bicyclyl radical is as defined herein.
[00151] The term "spiro heterobicyclyl" refers to a ring originating from a particular annular carbon of another ring. For example, as depicted above, ring $A$ and ring $B$ share a carbon atom between the two saturated ring system, which terms as a "spirocyclyl". For example, Formula (a) represents possible substitution in any of the positions on the $W 1, W 2$, and $W$ ring.

(a)
[00153] As described herein, two attaching points either E or E ', within a ring system (as shown in Formula (b)), attach to the rest of the molecule, e.g., E and E' may be used interchangeably with each other.

[00154] As described herein, a dot line drawn together with a bond within a ring system (as shown in Formula (c)) represents either a double bond or a single bond. For example, structure in Formula (c) represents any structures selected from Formula (d).

Therefore, single
stereochemical isomers as well as enantiomeric, diastereomeric, or geometric (or conformational) mixtures of the present compounds are within the scope disclosed herein.
[00156] The term "prodrug" refers to a compound that is transformed in vivo into a compound of formula (I). Such a transformation can be affected, for example, by bydrolysis in blood or enzymatic transformation of the prodrug form to the parent form in blood or tissue. Prodrugs of the compounds disclosed herein may be, for example, esters. Esters that may be utilized as prodrugs in the present invention are phenyl esters, aliphatic ( $\mathrm{C}_{1}-\mathrm{C}_{24}$ ) esters, acyloxymethyl esters, carbonates, carbamates, and amino acid esters. For example, a compound disclosed herein that contains an OH group may be acylated at this position in its prodrug form. Other prodrug forms include phosphates, such as, for example those phosphates resulting from the phosphonation of an OH group on the parent compound. A thorough discussion of prodrugs is provided in Higuchi et al., Pro-drugs as Novel Delivery Systems, Vol. 14, A.C.S. Symposium Series; Roche, et al. ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, Rautio et al., Prodrugs: Design and Clinical Applications, Noture Reviews Drug Discovery, 2008, 7, 255-270, and Fecker et al, Prodrugs of Phosphates and Phosphonates, J. Such products may result for example from the oxidation, reduction, hydrolysis, amidation, deamidation, esterification, deesterification, enzyme cleavage, and the like, of the administered compound. Accordingly, the invention includes metabolites of compounds disclosed herein, including compounds produced by a process comprising contacting a compound disclosed herein with a mammal for a period of time sufficient to yield a metabolic product thereof.
[00159] Stereochemical definitions and conventions used herein generally follow Parker et al., McGraw-Hill Dictionary of Chemical Terms (1984) McGraw-Hill Book Company, New York and Eliel et al., "Stereochemistry of Organic Compounds", John Wiley \& Sons, Inc., New York, 1994. The compounds disclosed herein may contain asymmetric or chiral centers, and therefore exist in different stereoisomeric forms. It is intended that all stereoisomeric forms of the compounds disclosed herein, including but not limited to, diastereomers, enantiomers and atropisomers, as well as mixtures thereof such as racemic mixtures, form part of the present invention. Many organic compounds exist in optically active forms, i.e, they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes $D$ and $L$, or $R$ and $S$, are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes $d$ and 1 or $(+)$ and ( - ) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or 1 meaning that the compound is levorotatory. A compound prefixed with $(+)$ or $d$ is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomenic mixture. A $50: 50$ mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where there has been no stereoselection or stereospecificity in a chemical reaction or process. The term "racemic mixture" or "racemate" refers to an equimolar mixture of two enantiomeric species, devoid of optical activity.
[00160] The term "tautomer" or "tautomenic form" refers to structural isomers of different energies which are interconvertible via a low energy barrier. Some non-limiting examples of proton tautomers (also known as prototropic tautomers) include interconversions via migration of a proton, such as keto-enol reorganization of some of the bonding electrons.
[00161] A "pharmaceutically acceptable salts" refers to organic or inorganic salts of a compound disclosed herein. Pharmaceutically acceptable salts are well known in the art. For example, Berge et al, describe pharmaceutically acceptable salts in detail in $J$. Pharmacol Sci, 1977, 66: 1-19, which is incorporated herein by reference. Some non-limiting examples of pharmaceutically salts include salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2 -hydroxy-ethanesulfonate, lactobionate, lactate, laurate, laurylsulfate, malate, malonate, methanesulfonate, 2 -naphthalenesulfonate, nicotinate, nitrate, oleate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, stearate, thiocyanate, $p$-toluenesulfonate, undecanoate, valerate salts, and the like. Salts derived from appropriate bases include alkali metal, alkaline earth metal, ammonium and $\mathrm{N}^{+}\left(\mathrm{C}_{1.4} \text { alkyl }\right)_{4}$ salts. This invention also envisions the quatemization of any basic nitrogen-containing groups of the compounds disclosed herein. Water or oil soluble or dispersible products may be obtained by such quaternzation. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further phamaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, $\mathrm{C}_{1-8}$
sulfonate or aryl sulfonate.
[00162] A "solvate" refers to an association or complex of one or more solvent molecules and a compound disclosed herein. Some non-limiting examples of solvents that form solvates include water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, and ethanolamine. The term "hydrate" refers to the complex where the solvent molecule is water.
[00163] The term "protecting group" or "Pg" refers to a substituent that is commonly employed to block or protect a particular functionahty while reacting with other functional groups on the compound. For example, an "amino-protecting group" is a substituent attached to an amino group that blocks or protects the amino functionality in the compound. Some non-limiting examples of suitable amino-protecting groups include acetyl, trifluoroacetyl, $t$-butoxycarbonyl (BOC), benzyloxycarbonyl (CBZ) and 9-fluorenylmethylenoxycarbonyl (Fmoc). Similarly, a "hydroxy-protecting group" refers to a substituent of a hydroxy group that blocks or protects the hydroxy functionality. Some non-limiting examples of suitable hydroxy-protecting groups include acetyl and silyl. Some non-limiting examples of common carboxy-protecting groups include $-\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{SO}_{2} \mathrm{Ph}$, cyanoethyl, 2-(timethylsilyl)ethyl, 2-(timethylsilyl)ethoxymethyl, 2 -( $p$-toluenesulfonyl)ethyl, $\quad 2$-( $p$-nitrophenylsulfonyl)ethyl, $\quad 2$ (diphenylphosphino)-ethyl, nitroethyl, and the like. For a general description of protecting groups and their use, see Greene et al, Protective Groups in Organic Synthesis, John Wiley \& Sons, New York, 1991 and Kocienski et al, Protecting Groups, Thieme, Stutgart, 2005.

## COMPOSITION, FORMULATIONS AND ADMINISTRATION OF COMPOUNDS OF THE INVENTION

[00222] When it is possible that, for use in therapy, therapeutically effective amounts of a compound of formula (I), as well as pharmaceutically acceptable salts thereof, may be administered as the raw chemical, it is possible to present the active ingredient as a pharmaceutical compositions, which include therapeutically effective amounts of compounds of formula (I) or pharmaceutically acceptable salts thereof, and one or more pharmaceutically acceptable carriers, diluents, or excipients. The term "therapentically effective amount" refers to the total amount of each active component that is sufficient to show a meaningful patient benefit (e.g., a reduction in viral load). When applied to individual active ingredient, administered alone, the term refers to that ingredient alone. When applied to a combination, the term refers to combined amounts of the active ingredients that result in the therapeutic effect, whether administered in combination, serially, or simultaneously. The compounds of formula (I) and pharmaceutically acceptable salts thereof, are as described above. The camer(s), diluents(s), or excipient(s) must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to recipient thereof. In accordance with another aspect of the present disclosure there is also provided a process for the preparation of a pharmaceutical formulation including admixing a compound of formula (I), or a pharmaceutically acceptable salt thereof, with one or more pharmaceutically acceptable carriers, diluents, or excipients. The term "pharmaceutically acceptable" refers to those compounds, materials, composition, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of patients without
excessive toxicity, irritation, allergic response, or other problem or complication commensurate with a reasonable benefit/risk ratio, and are effective for their intended use.
[00223] Pharmaceutical formulations may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Dosage levels of between about 0.01 and about 250 milligram per kilogram (" $\mathrm{mg} / \mathrm{kg}$ ") body weight per day, preferably between about 0.05 and about $100 \mathrm{mg} / \mathrm{kg}$ body weight per day of the compounds of the present disclosure are typical in a monotherapy for the prevention and treatment of HCV mediated disease. Typically, the pharmaceutical compositions of this disclosure will be administered from about 1 to about 5 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending on the condition being treated, the severity of the condition, the time of administration, the route of administration, the rate of excretion of the compound employed, the duration of treatment, and the age, gender, weight, and condition of the patient. Preferred unit dosage formulations are those containing a daily dose or sub-dose, as herein above recited, or an appropriate fraction thereof, of an active ingredient. Treatment may be initiated with small dosages substantially less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. In general, the compound is most desirably administered at a concentration level that will generally afford antivirally effective results without causing any harmful or deleterious side effects.
[00224] When the compositions of this disclosure comprise a combination of a compound of the present disclosure and one or more additional therapeutic or prophylactic agent, both the compound and the additional agent are usually present at dosage levels of between about 10 to $150 \%$, and more preferably between about 10 to $80 \%$ of the dosage normally administered in a monotherapy regimen. Pharmaceutical formulations may be adapted for administration by any appropriate route, for example by the oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual, or transdermal), vaginal, or parenteral (including subcutaneous, intracutaneous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, intralesional, intravenous, or intradermal injections or infusions) route. Such formulations may be prepared by any method known in the art of pharmacy, for example by bringing into association the active ingredient with the carrier(s) or excipient(s). Oral administration or administration by injection is preferred. as discrete units such as capsules or tablets; powders or granules; solution or suspensions in aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil emulsions.
[00226] For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inent carrier such as ethanol, glycerol, water, and the like. Powders are prepared by comminuting the compound to a suitable fine size and mixing with a similarly comminuted pharmaceutical carrier such as an edible carbohydrate, for example, starch or mannitol. Flavoring, preservative, dispersing, and coloring agent can also be present.
[00227] Capsules are made by preparing a powder mixture, as described above, and filling formed gelatin sheaths. Glidants and lubricants such as colloidal silica, talc, magnesium stearate, calcium stearate, or solid polyethylene glycol can be added to the powder mixture before the filling operation. A disintegrating or solubilizing agent such as agar-agar, calcium carbonate, or sodium carbonate can also be added to improve the availability of the medicament when the capsule is ingested.
[00228] Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents, and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose, $\beta$-lactose, com sweetener, natural gum and synthetic resin, such as Arabic gum, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, and the like. Lubricants used in these dosage forms include sodium oleate, sodium chloride, and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum, and the like. Tablets are fomulated, for example, by preparing a powder mixture, granulating or slugging, adding a lubricant and disintegrant, and pressing into tablets. A powder mixture is prepared by mixing the compound, suitable comminuted, with a diluent or base as described above, and optionally, with a binder such as carboxymethylcellulose, an alginate, gelatin, or polyvinyl pyrrolidone, a solution retardant such as paraffin, a resorption accelerator such as a quaternary salt and/or and absorption agent such as bentonite, kaolin, or dicalcium phosphate. The powder mixture can be granulated by wetting with a binder such as syrup, starch paste, acadiamucilage, or solution of cellulosic
or polymeric materials and forcing through a screen. As an alternative to granulation, the powder mixture can be run through the tablet machine and the result is imperfectly formed slugs broken into granules. The gramules can be lubricated to prevent sticking to the tablet forming dies by means of the addition of stearic acid, a stearate salt, talc, or mineral oll. The lubricated mixture is then compressed into tablets. The compounds of the present disclosure can also be combined with a free flowing inert carier and compressed into tablets directly without going through the granulating or slugging steps. A clear or opaque protective coating consisting of a sealing coat of shellac, a coating of sugar or polymeric material, and a polish coating of wax can be provided. Dyestuffs can be added to these coatings to distinguish different unit dosages.
[00229] Oral fluids such as solution, syrups, and elixirs can be prepared in dosage unit form so that a given quantity contains a predetermined amount of the compound. Syrups can be prepared by dissolving the compound in a suitably flavored aqueous solution, while clixirs are prepared through the use of a non-toxic vehicle. Solubilizers and emulsifiers such as ethoxylated isostearyl alcohols and polyoxyethylene sorbitol ethers, preservatives, flavor additives such as peppermint oil or natural sweeteners, or saccharin or other artificial sweeteners, and the like can also be added.
[00230] Where appropnate, dosage unit formulations for oral administration can be microencapsulated. The formulation can also be prepared to prolong or sustain the release as for example by coating of embedding particulate material in polymers, wax, or the like.
[00231] The compounds of formula (I), and pharmaceutically acceptable salts thereof, can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, or phosphatidylcholines.
[00232] The compounds of formula (I) and pharmaceutically acceptable salts thereof may also be delivered by the use of monoclonal antibodies as individual carrier to which the compound molecules are coupled. The compounds may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamidephenol, polyhydroxyethylaspartamidephenol,
or polyethyleneoxidepolylysine substituted with palmitoyl residues. Furthermore, the compounds may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, poly(e-caprolactone), polyhydroxy butynic acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates, and cross-linked or amphipathic block copolymers of hydrogels

[00238] Generally, the compounds disclosed herein may be prepared by methods described herein, wherein the substituents are as defined for formula (I) above, except where further noted. The following non-limiting schemes and examples are presented to further exemplify the invention.
[00239] Persons skilled in the art will recognize that the chemical reactions described may be readily adapted to prepare a number of other compounds disclosed herein, and altemative methods for preparing the compounds disclosed herein are deemed to be within the scope disclosed herein. For example, the synthesis of non-exemplified compounds according to the invention may be successfully performed by modifications apparent to those skilled in the art, eg, by appropriately protecting interfering groups, by utilizing other suitable reagents known in the art other than those described, andor by making routine modifications of reaction conditions. Altematively, other reactions disclosed herein or known in the art will be recognized as having applicability for preparing other compounds disclosed herein.
[00240] In the examples described below, unless otherwise indicated all temperatures are set forth in degrees Celsius. Reagents were purchased from commercial suppliers such as Aldrich Chemical Company, Inc., Arco Chemical Company and Alfa Chemical Company,
and were used without further purification unless otherwise indicated. Common solvents were purchased from commercial suppliers such as Shantou XiLong Chemical Factory, Guangdong Guanghua Reagent Chemical Factory Co. Ltd., Guangzhou Reagent Chemical Factory, Tianjin YuYu Fine Chemical Ltd, Qingdao Tenglong Reagent Chemical Ltd., and Qingdao Ocean Chemical Factory.
[00241] Anhydrous THF, dioxane, toluene, and ether were obtained by refluxing the solvent with sodium. Anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{CHCl}_{3}$ were obtained by refluxing the solvent with $\mathrm{CaH}_{2}$. EtOAc, PE, hexane, DMAC and DMF were treated with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ prior to use.

When peak multiplicities are reported, the following abbreviations are used: $s$ (singlet), $d$ (doublet), $t$ (triplet), $m$ (multiplet), br (broadened), dd (doublet of doublets), dt (doublet of triplets). Coupling constants, when given, are reported in Hertz ( Hz ).

[00270] Synthetic routes

Step 1) the preparation of compound 1-1
[00271] To methanoic acid ( 3.7 mL ) was added $\mathrm{Et}_{3} \mathrm{~N}(5.4 \mathrm{~mL})$ dropwise slowly in an ice bath. At the end of the addition, 2,5-dimethoxybenzaldehyde ( $2.0 \mathrm{~g}, 12 \mathrm{mmol}$ ) and Meldrum's acid $(1.73 \mathrm{~g}, 12 \mathrm{mmol})$ were added to the mixture in turn. The reaction mixture was stirred at $100^{\circ} \mathrm{C}$ for 5 hours and ice water ( 20 mL ) was added. The mixture was adjusted to pH 1 with HCl aqueous solution ( 2 N )
and extracted with EtOAc ( $25 \mathrm{~mL} \times 3$ ). The combined organic phases were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The residue was purfied by silica gel column chromatography ( $\mathrm{PE} / \mathrm{EtOAc}(\mathrm{v} / \mathrm{v})=3 / 1$ ) to give the title compound as a white solid ( $2.1 \mathrm{~g}, 83 \%$, HPLC: $95 \%$ ). The compound was characterized by the following spectroscopic data:

## BIOLOGICALACTIVITY

[00779] An HCV Replicon assay was utlized in the present disclosure, and was prepared, developed and validated as described in Science, 1999, 285 (5424), 110-3 and J. Virol., 2003, 77 (5), 3007-19.
[00780] HCV GT1a, GT1b and GT2a replicon cells were used to test the currently described compound series as well as wild-type cells HCV 1 b and resistant cells Y93H, L31F, P32L and 3302V. GTla, GT1b and GT2a are HCV Replicon System which is transfected HCV 1a, $1 \mathrm{~b}, 2 \mathrm{a}$ genotype respectively. The system containing G 418 resistance gene NEO and Luciferase Reporter Gene can be used to detemine the level of HCV replication, and evaluate the effects of the compounds inhibiting HCV replication, by using a real-time quantitative polymerase chain reaction (qPCR) method to detect NEO, and chemiluminescence method to test Luciferase Reporter Gene.
[00781] Operating procedure:
[00782] 1. Testing $\mathrm{EC}_{50}$ of the compounds by luciferase assay
[00783] The GTla cells and GT1b cells were seeded into 96 -well plates ( 8,000 cells in $125 \mu /$ well) respectively; each compound was diluted to desired concentration using 5 -fold serial dilutions protocol, 10 dose in duplicate, and added to wells with $P O D^{\mathrm{TM}} 810$ Plate Assembler. The final concentration of DMSO was $0.5 \%$; the plates were incubated in a $\mathrm{CO}_{2}$ incubator for 72 hours; after that, $40 \mu$ of Luciferase assay substrate (Promega Bright-Gio) was added to each well, and detected by a chemiluminescence detection system (Topcount Microplate Scintillation and Luminescence Counter) 5 minutes later, data analysis.
[00784] 2. Testing $\mathrm{EC}_{50}$ of the compounds by detecting antibiotic G418 resistance gene NEO gene $125 \mu /$ / well) respectively, each compound was diluted to desired concentration using 5 -fold serial dilutions protocol, 10 dose in duplicate, and added to wells with $\mathrm{POD}^{\mathrm{TM}} 810$ Plate Assembler, the final concentration of DMSO was $0.5 \%$; the cells were incubated in a $\mathrm{CO}_{2}$ incubator for 72 hours; quantitative PCR .
[00786] - Sample preparation: the supematant was removed, $100 \mu \mathrm{l}$ of FCW buffer solution was added to each well, washed carefully and discarded the solution; $50 \mu$ of lysate FCP was added to each well, the cells was lysed as PCR template and PCR template was diluted with DEPC water as sample template.
[00787] - Quantitative PCR: preparation of reaction mixture according to PCR system; the reaction mixture was dispensed into a 384 -well PCR reaction plate (specially for quantitative); and a standard template which was diluted in proportion was distributed into the plate; and the sample template was distributed into the plate; then the 384 -well plate was sealed with closure plate membrane; the qualitative PCR machine was operated by procedures; data analysis.
[00788] 3. Data processing: $\mathrm{EC}_{50}$ values of compounds were analyzed by GRAPHPAD PRISM ${ }^{\text {® }}$ software.
[00789] The compounds of the present disclosure can be effective against the HCV H genotype according to the experiment data. $\mathrm{EC}_{50}$ ranges of compounds having different groups against HCV 1 b are $1-999 \mathrm{pM}$ and $1-99 \mathrm{nM}$. The compounds of the present disclosure can inhibit multiple genotypes of HCV (such as HCV la or HCV 2 a ). Table 2 shows the $\mathrm{EC}_{50}$ values of representative compounds of the present disclosure against the HCV 1 a and HCV Ib genotypes. In one embodiment compounds of the present disclosure are active against the 1a, $1 \mathrm{~b}, 2 \mathrm{a}, 2 \mathrm{~b}, 3 \mathrm{a}, 3 \mathrm{~b}, 4 \mathrm{a}$, and 5 a genotypes. EC50 ranges against HCV 1 a and HCV 1 b are as follows: $\mathrm{A}=0.001-0.100 \mathrm{nM} ; \mathrm{B}=0.101-1.000 \mathrm{nM} ; \mathrm{C}=1.001-10.000 \mathrm{nM}$; and $\mathrm{D}>10$ nM .
[00790] The experimental results of wild-type and resistance cells and the simulation results of molecular modeling and computer aided docking design show that compounds in the present disclosure play an excellent anti-HCV role, which suggest a novel anti-HCV mechanism by interfering with HCV NS5A protein.
