# Modulator of Cystic Fibrosis Transmembrane Conductance Regulator, Pharmaceutical Compositions, Methods of Treatment, and Process for Making the Modulator 

[0001] Disclosed herein is a modulator of Cystic Fibrosis Transmembrane Conductance Regulator (CFTR), pharmaceutical compositions containing the modulator, methods of treatment of cystic fibrosis, and a process for making the modulator.
[0002] Cystic fibrosis (CF) is a recessive genetic disease that affects approximately 70,000 children and adults worldwide. Despite progress in the treatment of CF, there is no cure.
[0003] In patients with CF, mutations in CFTR endogenously expressed in respiratory epithelia lead to reduced apical anion secretion causing an imbalance in ion and fluid transport. The resulting decrease in anion transport contributes to enhanced mucus accumulation in the lung and accompanying microbial infections that ultimately cause death in CF patients. In addition to respiratory disease, CF patients typically suffer from gastrointestinal problems and pancreatic insufficiency that, if left untreated, result in death. In addition, the majority of males with cystic fibrosis are infertile, and fertility is reduced among females with cystic fibrosis.
[0004] Sequence analysis of the CFTR gene has revealed a variety of disease causing mutations (Cutting, G. R.et al. (1990) Nature 346:366-369; Dean, M. et al. (1990) Cell 61:863:870; and Kerem, B-S. et al. (1989) Science 245:1073-1080; Kerem, B-S et al. (1990) Proc. Natl. Acad. Sci. USA 87:8447-8451). To date, greater than 2000 mutations in the CF gene have been identified; currently, the CFTR2 database contains information on only 322 of these identified mutations, with sufficient evidence to define 281 mutations as disease causing. The most prevalent disease-causing mutation is a deletion of phenylalanine at position 508 of the CFTR amino acid sequence, and is commonly referred to as the F508del mutation. This mutation occurs in approximately $70 \%$ of the cases of cystic fibrosis and is associated with severe disease.
[0005] The deletion of residue 508 in CFTR prevents the nascent protein from folding correctly. This results in the inability of the mutant protein to exit the endoplasmic reticulum (ER) and traffic to the plasma membrane. As a result, the number of CFTR channels for anion transport present in the membrane is far less than
observed in cells expressing wild-type CFTR, i.e., CFTR having no mutations. In addition to impaired trafficking, the mutation results in defective channel gating. Together, the reduced number of channels in the membrane and the defective gating lead to reduced anion and fluid transport across epithelia. (Quinton, P. M. (1990), FASEB J. 4: 2709-2727). The channels that are defective because of the F508del mutation are still functional, albeit less functional than wild-type CFTR channels. (Dalemans et al. (1991), Nature Lond. 354: 526-528; Pasyk and Foskett (1995), J. Cell. Biochem. 270: 12347-50). In addition to F508del, other disease causing mutations in CFTR that result in defective trafficking, synthesis, and/or channel gating could be upor down-regulated to alter anion secretion and modify disease progression and/or severity.
[0006] CFTR is a cAMP/ATP-mediated anion channel that is expressed in a variety of cell types, including absorptive and secretory epithelia cells, where it regulates anion flux across the membrane, as well as the activity of other ion channels and proteins. In epithelial cells, normal functioning of CFTR is critical for the maintenance of electrolyte transport throughout the body, including respiratory and digestive tissue. CFTR is composed of approximately 1480 amino acids that encode a protein which is made up of a tandem repeat of transmembrane domains, each containing six transmembrane helices and a nucleotide binding domain. The two transmembrane domains are linked by a large, polar, regulatory (R)-domain with multiple phosphorylation sites that regulate channel activity and cellular trafficking.
[0007] Chloride transport takes place by the coordinated activity of ENaC and CFTR present on the apical membrane and the $\mathrm{Na}^{+}-\mathrm{K}^{+}$-ATPase pump and CI- channels expressed on the basolateral surface of the cell. Secondary active transport of chloride from the luminal side leads to the accumulation of intracellular chloride, which can then passively leave the cell via $\mathrm{CI}^{-}$channels, resulting in a vectorial transport. Arrangement of $\mathrm{Na}^{+} / 2 \mathrm{C} 17 \mathrm{~K}^{+}$co-transporter, $\mathrm{Na}^{+}-\mathrm{K}^{+}$-ATPase pump and the basolateral membrane $\mathrm{K}^{+}$ channels on the basolateral surface and CFTR on the luminal side coordinate the secretion of chloride via CFTR on the luminal side. Because water is probably never actively transported itself, its flow across epithelia depends on tiny transepithelial osmotic gradients generated by the bulk flow of sodium and chloride.
[0008] Accordingly, there is a need for novel treatments of CFTR mediated diseases.
[0009] Disclosed herein are novel compounds, including compounds of Formulae (I)-(VI) and pharmaceutically acceptable salts thereof. For example, compounds of Formula (I) can be depicted as:

[0038] The term "alkoxy" as used herein refers to an alkyl or cycloalkyl covalently bonded to an oxygen atom. Alkoxy groups may be substituted or unsubstituted.
[0039] As used herein, "cycloalkyl" refers to a cyclic, bicyclic, tricyclic, or polycyclic non-aromatic hydrocarbon groups having 3 to 12 carbons (such as, for example 3-10 carbons). "Cycloalkyl" groups encompass monocyclic, bicyclic, tricyclic, bridged, fused, and spiro rings, including mono spiro and dispiro rings. Non-limiting examples of cycloalkyl groups are cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl,
adamantyl, norbornyl, and dispiro[2.0.2.1]heptane. Cycloalkyl groups may be substituted or unsubstituted.
[0040] "Substituted," whether preceded by the term "optionally" or not, indicates that at least one hydrogen of the "substituted" group is replaced by a substituent. Unless otherwise indicated, an "optionally substituted" group may have a suitable substituent at each substitutable position of the group, and when more than one position in any given structure may be substituted with more than one substituent chosen from a specified group, the substituent may be either the same or different at each position.
[0041] As used herein, "deuterated derivative(s)" means the same chemical structure, but with one or more hydrogen atoms replaced by a deuterium atom.
[0042] As used herein, "CFTR" means cystic fibrosis transmembrane conductance regulator.
[0043] As used herein, "mutations" can refer to mutations in the CFTR gene or the CFTR protein. A "CFTR gene mutation" refers to a mutation in the CFTR gene, and a "CFTR protein mutation" refers to a mutation in the CFTR protein. A genetic defect or mutation, or a change in the nucleotides in a gene in general results in a mutation in the CFTR protein translated from that gene, or a frame shift(s).
[0044] The term "F508del" refers to a mutant CFTR protein which is lacking the amino acid phenylalanine at position 508.
[0045] As used herein, a patient who is "homozygous" for a particular gene mutation has the same mutation on each allele.
[0046] As used herein, a patient who is "heterozygous" for a particular gene mutation has this mutation on one allele, and a different mutation on the other allele.
[0047] As used herein, the term "modulator" refers to a compound that increases the activity of a biological compound such as a protein. For example, a CFTR modulator is a compound that increases the activity of CFTR. The increase in activity resulting from a CFTR modulator includes but is not limited to compounds that correct, potentiate, stabilize and/or amplify CFTR.
[0048] As used herein, the term "CFTR corrector" refers to a compound that facilitates the processing and trafficking of CFTR to increase the amount of CFTR at the
cell surface. Compounds of Formulae (I), (II), (III), (IV), (V), and (VI), and Compound II, and their pharmaceutically acceptable salts thereof disclosed herein are CFTR correctors.
[0049] As used herein, the term "CFTR potentiator" refers to a compound that increases the channel activity of CFTR protein located at the cell surface, resulting in enhanced ion transport. Compound III disclosed herein is a CFTR potentiator.
[0050] As used herein, the term "active pharmaceutical ingredient" ("API") refers to a biologically active compound.
[0051] As used herein, the term "pharmaceutically acceptable salt" refers to a salt form of a compound of this disclosure wherein the salt is nontoxic. Pharmaceutically acceptable salts of the compounds of this disclosure include those derived from suitable inorganic and organic acids and bases. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge, etal. describe pharmaceutically acceptable salts in detail in J. Pharmaceutical Sciences, 1977, 66, 1-19.
[0052] As used herein, the term "amorphous" refers to a solid material having no long range order in the position of its molecules. Amorphous solids are generally supercooled liquids in which the molecules are arranged in a random manner so that there is no well-defined arrangement, e.g., molecular packing, and no long range order. Amorphous solids are generally isotropic, i.e. exhibit similar properties in all directions and do not have definite melting points. For example, an amorphous material is a solid material having no sharp characteristic crystalline peak(s) in its X-ray power diffraction (XRPD) pattern (i.e., is not crystalline as determined by XRPD). Instead, one or several broad peaks (e.g., halos) appear in its XRPD pattern. Broad peaks are characteristic of an amorphous solid. See, US 2004/0006237 for a comparison of XRPDs of an amorphous material and crystalline material.
[0053] As used herein, the term "substantially amorphous" refers to a solid material having little or no long range order in the position of its molecules. For example, substantially amorphous materials have less than $15 \%$ crystallinity (e.g., less than $10 \%$ crystallinity or less than $5 \%$ crystallinity). It is also noted that the term 'substantially amorphous' includes the descriptor, 'amorphous', which refers to materials having no (0\%) crystallinity.
[0054] As used herein, the term "dispersion" refers to a disperse system in which one substance, the dispersed phase, is distributed, in discrete units, throughout a second substance (the continuous phase or vehicle). The size of the dispersed phase can vary considerably (e.g. colloidal particles of nanometer dimension, to multiple microns in size). In general, the dispersed phases can be solids, liquids, or gases. In the case of a solid dispersion, the dispersed and continuous phases are both solids. In pharmaceutical applications, a solid dispersion can include a crystalline drug (dispersed phase) in an amorphous polymer (continuous phase); or alternatively, an amorphous drug (dispersed phase) in an amorphous polymer (continuous phase). In some embodiments, a solid dispersion includes the polymer constituting the dispersed phase, and the drug constitute the continuous phase. Or, a solid dispersion includes the drug constituting the dispersed phase, and the polymer constituting the continuous phase.
[0055] The terms "patient" and "subject" are used interchangeably and refer to an animal including humans.
[0056] The terms "effective dose" and "effective amount" are used interchangeably herein and refer to that amount of a compound that produces the desired effect for which it is administered (e.g., improvement in CF or a symptom of CF, or lessening the severity of CF or a symptom of CF). The exact amount of an effective dose will depend on the purpose of the treatment, and will be ascertainable by one skilled in the art using known techniques (see, e.g., Lloyd (1999) The Art, Science and Technology of Pharmaceutical Compounding).
[0057] As used herein, the terms "treatment," "treating," and the like generally mean the improvement of CF or its symptoms or lessening the severity of CF or its symptoms in a subject. "Treatment," as used herein, includes, but is not limited to, the following: increased growth of the subject, increased weight gain, reduction of mucus in the lungs, improved pancreatic and/or liver function, reduction of chest infections, and/or reductions in coughing or shortness of breath. Improvements in or lessening the severity of any of these symptoms can be readily assessed according to standard methods and techniques known in the art.
[0058] As used herein, the term "in combination with," when referring to two or more compounds, agents, or additional active pharmaceutical ingredients, means the
administration of two or more compounds, agents, or active pharmaceutical ingredients to the patient prior to, concurrent with, or subsequent to each other.
[0059] The terms "about" and "approximately", when used in connection with doses, amounts, or weight percent of ingredients of a composition or a dosage form, include the value of a specified dose, amount, or weight percent or a range of the dose, amount, or weight percent that is recognized by one of ordinary skill in the art to provide a pharmacological effect equivalent to that obtained from the specified dose, amount, or weight percent.
[0060] Each of compounds of Formulae (I), (II), (III), (IV), (V), and (VI), and Compounds II, III, IV, and pharmaceutically acceptable salts thereof, and their deuterated derivatives described herein independently can be administered once daily, twice daily, or three times daily. In some embodiments, at least one compound chosen from Compounds of Formulae (I), (II), (III), (IV), (V), and (VI), and pharmaceutically acceptable salts thereof, and their deuterated derivatives is administered once daily. In some embodiments, at least one compound chosen from Compounds of Formulae (I), (II), (III), (IV), (V), and (VI), and pharmaceutically acceptable salts thereof, and their deuterated derivatives are administered twice daily. In some embodiments, at least one compound chosen from Compound II and pharmaceutically acceptable salts thereof is administered once daily. In some embodiments, at least one compound chosen from Compound II and pharmaceutically acceptable salts thereof is administered twice daily. In some embodiments, at least one compound chosen from Compound III and pharmaceutically acceptable salts thereof is administered once daily. In some embodiments, at least one compound chosen from Compound III and pharmaceutically acceptable salts thereof is administered twice daily. In some embodiments, at least one compound chosen from Compound IV and pharmaceutically acceptable salts thereof is administered once daily. In some embodiments, at least one compound chosen from Compound IV and pharmaceutically acceptable salts thereof is administered twice daily. In some embodiments, a deuterated derivative of Compound II, III, and/or IV or a pharmaceutically acceptable salt thereof is employed in any one of these embodiments.
[0061] In some embodiments, 10 mg to $1,500 \mathrm{mg}$ of a compound disclosed herein, a pharmaceutically acceptable salt thereof, or a deuterated derivative of such compound or salt are administered daily.
[0062] One of ordinary skill in the art would recognize that, when an amount of "a compound or a pharmaceutically acceptable salt thereof is disclosed, the amount of the pharmaceutically acceptable salt form of the compound is the amount equivalent to the concentration of the free base of the compound. It is noted that the disclosed amounts of the compounds or their pharmaceutically acceptable salts thereof herein are based upon their free base form. For example, " 10 mg of at least one compound chosen from compounds of Formula (I) and pharmaceutically acceptable salts thereof includes 10 mg of a compound of Formula (I) and a concentration of a pharmaceutically acceptable salt of compounds of Formula (I) equivalent to 10 mg of compounds of Formula (I).

[00115] In some embodiments, the pharmaceutical compositions are a tablet. In some embodiments, the tablets are suitable for oral administration.
[00116] The compounds, pharmaceutically acceptable salts thereof, and deuterated analogs of any of the foregoing, and pharmaceutical compositions, of this disclosure, either in monotherapies or in combo-therapies are useful for treating cystic fibrosis.
[00117] In some embodiments, disclosed herein are methods of treating, lessening the severity of, or symptomatically treating cystic fibrosis in a patient comprising administering an effective amount of a compound, pharmaceutically acceptable salt thereof, or a deuterated analog of any of the foregoing; or a pharmaceutical composition, of this disclosure to a patient, such as a human, wherein said patient has cystic fibrosis. In some embodiments, the patient has F508del/minimal function (MF) genotypes, F508del/F508del genotypes, F508del/gating genotypes, or F508del/residual function (RF) genotypes.
[00118] Patients with an F508del/minimal function genotype are defined as patients that are heterozygous F508del-CFTR with a second CFTR allele containing a mutation that is predicted to result in a CFTR protein with minimal function and that is not expected to respond to Compound II, Compound III, or the combination of Compound II and Compound III. These CFTR mutations were defined using 3 major sources:

- biological plausibility for the mutation to respond (i.e., mutation class)
- evidence of clinical severity on a population basis (per CFTR2 patient registry; accessed on 15 February 2016)
o average sweat chloride $>86 \mathrm{mmol} / \mathrm{L}$, and
o prevalence of pancreatic insufficiency ( PI ) $>50 \%$
- in vitro testing
o mutations resulting in baseline chloride transport < $10 \%$ of wild-type CFTR were considered minimal function
o mutations resulting in chloride transport $<10 \%$ of wild-type CFTR following the addition of Compound II and/or Compound III were considered nonresponsive.
[00119] Patients with an F508del/residual function genotype are defined as patients that are heterozygous F508del-CFTR with a second CFTR allele that contains a mutation that results in reduced protein quantity or function at the cell surface which can produce partial CFTR activity. CFTR gene mutations known to result in a residual function phenotype include in some embodiments, a CFTR residual function mutation selected from $2789+5 \mathrm{G}^{\wedge} \mathrm{A}, 3849+1 \mathrm{OkbC}{ }^{\wedge} \mathrm{T}$, $3272-26 \mathrm{~A}^{\wedge} \mathrm{G}, 711+3 \mathrm{~A}^{\wedge} \mathrm{G}, \mathrm{E} 56 \mathrm{~K}$, P67L, R74W, D110E, D110H, R117C, L206W, R347H, R352Q, A455E, D579G, E831X, S945L, S977F, F1052V, R1070W, F1074L, D1152H, D1270N, E193K, and K1060T. In some embodiments, the CFTR residual function mutation is selected from R117H, S1235R, I1027T, R668C, G576A, M470V, L997F, R75Q, R1070Q, R31C,

D614G, G1069R, R1162L, E56K, A1067T, E193K, or K1060T. In some embodiments, the CFTR residual function mutation is selected from R1 17H, S1235R, I1027T, R668C, G576A, M470V, L997F, R75Q, R1070Q, R31C, D614G, G1069R, R1162L, E56K, or A1067T.
[00120] Patients with an F508del/gating mutation genotype are defined as patients that are heterozygous F508del-CFTR with a second CFTR allele that contains a mutation associated with a gating defect and clinically demonstrated to be responsive to Compound III. Examples of such mutations include: G178R, S549N, S549R, G551D, G551S, G1244E, S 125 IN, S1255P, and G1349D.
[00121] In some embodiments, the methods of treating, lessening the severity of, or symptomatically treating cystic fibrosis disclosed herein are each independently produces an increase in chloride transport above the baseline chloride transport of the patient.
[00122] In some embodiments, in the methods of treating, lessening the severity of, or symptomatically treating cystic fibrosis disclosed herein, the patient is heterozygous for F508del, and the other CFTR mutation is any CF-causing mutation. In some embodiments, the paitent is heterozygous for F508del, and the other CFTR mutation is any CF-causing mutation, and is expected to be and/or is responsive to any of the novel compounds disclosed herein, such as Compound 1, Compound II, Compound III and/or Compound IV genotypes based on in vitro and/or clinical data. In some embodiments, the paitent is heterozygous for F508del, and the other CFTR mutation is any CF-causing mutation, and is expected to be and/or is responsive to any combinations of (i) the novel compounds disclosed herein, such as Compound 1, and (ii) Compound II, and/or Compound III and/or Compound IV genotypes based on in vitro and/or clinical data.

In some embodiments, in the methods of treating, lessening the severity of, or symptomatically treating cystic fibrosis disclosed herein, the patient possesses a CFTR mutation selected from any of the mutations listed in Table 5.

[00154] In some embodiments, the composition disclosed herein is useful for treating, lessening the severity of, or symptomatically treating cystic fibrosis in patients who exhibit residual CFTR activity in the apical membrane of respiratory and nonrespiratory epithelia. The presence of residual CFTR activity at the epithelial surface can be readily detected using methods known in the art, e.g., standard electrophysiological, biochemical, or histochemical techniques. Such methods identify CFTR activity using in vivo or ex vivo electrophysiological techniques, measurement of sweat or salivary $\mathrm{CI}^{-}$concentrations, or ex vivo biochemical or histochemical techniques to monitor cell surface density. Using such methods, residual CFTR activity can be readily detected for patients that are heterozygous or homozygous for a variety of different mutations, including patients heterozygous for the most common mutation, F508del, as well as other mutations such as the G551D mutation, or the R1 17H
mutation. In some embodiments, compositions disclosed herein are useful for treating, lessening the severity of, or symptomatically treating cystic fibrosis in patients who exhibit little to no residual CFTR activity. In some embodiments, compositions disclosed herein are useful for treating, lessening the severity of, or symptomatically treating cystic fibrosis in patients who exhibit little to no residual CFTR activity in the apical membrane of respiratory epithelia.
[00155] In some embodiments, the compositions disclosed herein are useful for treating or lessening the severity of cystic fibrosis in patients who exhibit residual CFTR activity using pharmacological methods. Such methods increase the amount of CFTR present at the cell surface, thereby inducing a hitherto absent CFTR activity in a patient or augmenting the existing level of residual CFTR activity in a patient.
[00156] In some embodiments, the compositions disclosed herein are useful for treating or lessening the severity of cystic fibrosis in patients with certain genotypes exhibiting residual CFTR activity.
[00157] In some embodiments, compositions disclosed herein are useful for treating, lessening the severity of, or symptomatically treating cystic fibrosis in patients within certain clinical phenotypes, e.g., a mild to moderate clinical phenotype that typically correlates with the amount of residual CFTR activity in the apical membrane of epithelia. Such phenotypes include patients exhibiting pancreatic sufficiency.
[00158] In some embodiments, the compositions disclosed herein are useful for treating, lessening the severity of, or symptomatically treating patients diagnosed with pancreatic sufficiency, idiopathic pancreatitis and congenital bilateral absence of the vas deferens, or mild lung disease wherein the patient exhibits residual CFTR activity.
[00159] In some embodiments, this disclosure relates to a method of augmenting or inducing anion channel activity in vitro or in vivo, comprising contacting the channel with a composition disclosed herein. In some embodiments, the anion channel is a chloride channel or a bicarbonate channel. In some embodiments, the anion channel is a chloride channel.
[00160] The exact amount of a pharmaceutical composition required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the disease, the particular agent, its mode of administration, and the like.

The compounds of this disclosure may be formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of this disclosure will be decided by the attending physician within the scope of sound medical judgment. The specific effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed, and like factors well known in the medical arts. The term "patient", as used herein, means an animal, such as a mammal, and even further such as a human.
[00161] In some embodiments, the disclosure also is directed to methods of treatment using isotope-labelled compounds of the afore-mentioned compounds, which have the same structures as disclosed herein except that one or more atoms therein have been replaced by an atom or atoms having an atomic mass or mass number which differs from the atomic mass or mass number of the atom which usually occurs naturally (isotope labelled). Examples of isotopes which are commercially available and suitable for the disclosure include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, for example ${ }^{2} \mathrm{H},{ }^{3} \mathrm{H},{ }^{1} \mathrm{C},{ }^{4} \mathrm{C},{ }^{15} \mathrm{~N}, 1^{8} \mathbf{0}, 1^{7} \mathbf{0},{ }^{3} \mathrm{P},{ }^{32} \mathrm{P},{ }^{35} \mathrm{~S},{ }^{1} \mathrm{~F}$ and ${ }^{36} \mathrm{C} 1$, respectively.
[00162] The isotope-labelled compounds and salts can be used in a number of beneficial ways. They can be suitable for medicaments and/or various types of assays, such as substrate tissue distribution assays. For example, tritium $\left({ }^{3} \mathrm{H}\right)$ - and/or carbon-14 $\left({ }^{4} \mathrm{C}\right)$-labelled compounds are particularly useful for various types of assays, such as substrate tissue distribution assays, due to relatively simple preparation and excellent detectability. For example, deuterium $\left({ }^{2} \mathrm{H}\right)$-labelled ones are therapeutically useful with potential therapeutic advantages over the non- ${ }^{2} \mathrm{H}$-labelled compounds. In general, deuterium $\left({ }^{2} \mathrm{H}\right)$-labelled compounds and salts can have higher metabolic stability as compared to those that are not isotope-labelled owing to the kinetic isotope effect described below. Higher metabolic stability translates directly into an increased in vivo
half-life or lower dosages, which could be desired. The isotope-labelled compounds and salts can usually be prepared by carrying out the procedures disclosed in the synthesis schemes and the related description, in the example part and in the preparation part in the present text, replacing a non-isotope-labelled reactant by a readily available isotope-labelled reactant.
[00163] In some embodiments, the isotope-labelled compounds and salts are deuterium $\left({ }^{2} \mathrm{H}\right)$-labelled ones. In some specific embodiments, the isotope-labelled compounds and salts are deuterium $\left({ }^{2} \mathrm{H}\right)$-labelled, wherein one or more hydrogen atoms therein have been replaced by deuterium. In chemical structures, deuterium is represented as ${ }^{2}{ }^{2} \mathrm{H}$ " or "D."
[00164] The deuterium $\left({ }^{2} \mathrm{H}\right)$-labelled compounds and salts can manipulate the oxidative metabolism of the compound by way of the primary kinetic isotope effect. The primary kinetic isotope effect is a change of the rate for a chemical reaction that results from exchange of isotopic nuclei, which in turn is caused by the change in ground state energies necessary for covalent bond formation after this isotopic exchange. Exchange of a heavier isotope usually results in a lowering of the ground state energy for a chemical bond and thus causes a reduction in the rate-limiting bond breakage. If the bond breakage occurs in or in the vicinity of a saddle-point region along the coordinate of a multi-product reaction, the product distribution ratios can be altered substantially. For explanation: if deuterium is bonded to a carbon atom at a nonexchangeable position, rate differences of $\mathrm{k}_{\mathrm{M} / \mathrm{k}_{\mathrm{D}}}=2-7$ are typical. For a further discussion, see S. L. Harbeson and R. D. Tung, Deuterium In Drug Discovery and Development, Ann. Rep. Med. Chem. 201 1, 46, 403-417; and T.G. Gant "Using deuterium in drug discovery: leaving the label in the drug" J. Med. Chem. 2014, 57, 3595-361 1, relevant portions of which are independently incorporated herein by reference.
[00165] The concentration of the isotope(s) (e.g., deuterium) incorporated into the isotope-labelled compounds and salt of the disclosure may be defined by the isotopic enrichment factor. The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. In some embodiments, if a substituent in a compound of the disclosure is denoted deuterium, such compound has an isotopic enrichment factor for each designated deuterium atom of at least 3500 ( $52.5 \%$ deuterium incorporation at each designated
deuterium atom), at least 4000 ( $60 \%$ deuterium incorporation), at least $4500(67.5 \%$ deuterium incorporation), at least 5000 ( $75 \%$ deuterium incorporation), at least 5500 ( $82.5 \%$ deuterium incorporation), at least 6000 ( $90 \%$ deuterium incorporation), at least 6333.3 ( $95 \%$ deuterium incorporation), at least 6466.7 ( $97 \%$ deuterium incorporation), at least 6600 ( $99 \%$ deuterium incorporation), or at least 6633.3 ( $99.5 \%$ deuterium incorporation).
[00166] When discovering and developing therapeutic agents, the person skilled in the art attempts to optimize pharmacokinetic parameters while retaining desirable in vitro properties. It may be reasonable to assume that many compounds with poor pharmacokinetic profiles are susceptible to oxidative metabolism.
[00167] One of ordinary skill in the art would understand that deuteration of one or more metabolically labile positions on a compound or active metabolite may lead to improvement of one or more superior DMPK properties while maintaining biological activity as compared to the corresponding hydrogen analogs. The superior DMPK property or properties may have an impact on the exposure, half-life, clearance, metabolism, and/or even food requirements for optimal absorption of the drug product. Deuteration may also change the metabolism at other non-deuterated positions of the deuterated compound.
[00168] In some embodiments, the disclosure includes deuterated derivatives of the novel compounds disclosed herein and of their pharmaceutically acceptable salts. Nonlimiting examples of deuterated compounds are disclosed in FIG. 1.

[00201] Reagents and starting materials were obtained by commercial sources unless otherwise stated and were used without purification. Proton and carbon NMR spectra were acquired on either of a Bruker Biospin DRX 400 MHz FTNMR spectrometer operating at a ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ resonant frequency of 400 and 100 MHz respectively, or on a 300 MHz NMR spectrometer. One dimensional proton and carbon spectra were acquired using a broadband observe (BBFO) probe with 20 Hz sample rotation at 0.1834 and $0.9083 \mathrm{~Hz} / \mathrm{Pt}$ digital resolution respectively. All proton and carbon spectra were acquired with temperature control at $30^{\circ} \mathrm{C}$ using standard, previously published pulse sequences and routine processing parameters. Final purity of compounds was determined by reversed phase UPLC using an Acquity UPLC BEH C ${ }_{18}$ column (50 $\chi$ $2.1 \mathrm{~mm}, 1.7 \mu \mathrm{\tau} \mathrm{c}$ particle) made by Waters ( $\mathrm{pn}: 186002350$ ), and a dual gradient run from 1-99\% mobile phase B over 3.0 minutes. Mobile phase $A=\mathrm{H}_{2} \mathrm{O}(0.05 \%$ $\left.\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}\right)$. Mobile phase $\mathrm{B}=\mathrm{CH}_{3} \mathrm{CN}\left(0.035 \% \mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}\right)$. Flow rate $=1.2 \mathrm{~mL} / \mathrm{min}$, injection volume $=1.5 \mu \mathrm{~L}$, and column temperature $=60{ }^{\circ} \mathrm{C}$. Final purity was calculated by averaging the area under the curve (AUC) of two UV traces ( $220 \mathrm{~nm}, 254$
$n m$ ). Low-resolution mass spectra were reported as $[\mathrm{M}+\mathrm{H}]^{+}$species obtained using a single quadrupole mass spectrometer equipped with an electrospray ionization (ESI) source capable of achieving a mass accuracy of 0.1 Da and a minimum resolution of 1000 (no units on resolution) across the detection range. Optical purity of methyl (2S)-2,4-dimethyl-4-nitro-pentanoate was determined using chiral gas chromatography (GC) analysis on an Agilent 7890A/MSD 5975C instrument, using a Restek Rt-PDEXcst ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mathrm{um} \_\mathrm{df}$ ) column, with a $2.0 \mathrm{~mL} / \mathrm{min}$ flow rate ( $3 / 4$ carrier gas), at an injection temperature of $220^{\circ} \mathrm{C}$ and an oven temperature of $120^{\circ} \mathrm{C}, 15$ minutes.

## [00202] Powder X-ray Diffraction

[00203] The powder x-ray diffraction measurements were performed using
PANalytical's X-pert Pro diffractometer at room temperature with copper radiation $(1.54060 \mathbf{A})$. The incident beam optic was comprised of a variable divergence slit to ensure a constant illuminated length on the sample and on the diffracted beam side; a fast linear solid state detector was used with an active length of 2.12 degrees 2 theta measured in a scanning mode. The powder sample was packed on the indented area of a zero background silicon holder and spinning was performed to achieve better statistics. A symmetrical scan was measured from 4-40 degrees 2 theta with a step size of 0.017 degrees and a scan step time of 15.5 s.
[00204] Figure 2 shows the XRPD spectrum of Form A of Compound 1. The single crystal structure of Form A has been elucidated. The crystal structure confirms the absolute configuration of the molecule, and the calculated XRPD patterns show good agreement with the experimental patterns. Form A of Compound 1 forms as an orthorhombic unit cell of $\mathrm{P} 21_{1} 2_{1}, \mathrm{a}=15.74 \mathrm{~b}=22.86 \mathrm{c}=26.59$ (angstroms), $\alpha=\beta=\gamma=90$, $\mathrm{Z}=12 \mathrm{~V}=9575$ Flack $=0.08$. One of ordinary skill in the art would recognize that there may be variation in these crystal parameters depending, for example, on the temperature, pressure, or instrument to instrument variability.
[00205] Figure 3 shows an experimental XRPD of Form A of Compound 1 (top) compared to a calculated XRD (bottom), which is calculated from the single crystal data. Figure 3 shows an overlay of the experimental and calculated XRPD of Form A of Compound 1 from Figure 3.
[00206] Figure 5 shows the XRPD spectrum of amorphous Compound 1 prepared by spray dried dispersion (SDD) of $50 \mathrm{wt} \%$ Compound 1 in HPMCAS-HG.

## [00207] Modulated Differential Scanning Calorimetry (MDSC)

[00208] MDSC was used to determine the glass transition temperature of the amorphous material. MDSC was performed using TA Discovery DSC differential scanning calorimeter (TA Instruments, New Castle, DE). The instrument was calibrated with indium. Samples of approximately $1-3 \mathrm{mg}$ were weighed into hermetic pans that were crimped using lids with one hole. The MDSC sample was scanned from $-20^{\circ} \mathrm{C}$ to $200^{\circ} \mathrm{C}$ at a heating rate of $2^{\circ} \mathrm{C} / \mathrm{min}$ with $+/-1^{\circ} \mathrm{C}$ of modulation within 1 minute. Data was collected and analyzed by TA Instruments Trios Software (TA Instruments, New Castle, DE).
[00209] Figure 6 shows a MDSC spectrum of a spray dried dispersion (SDD) of 50 $\mathrm{wt} \%$ Compound 1 in HPMCAS-HG, and shows that the SDD has a midpoint temperature of about $106^{\circ} \mathrm{C}$.

## [00210] Single-Crystal Analysis

[00211] X-ray diffraction data were acquired at 100 K or 298 K on a Bruker diffractometer equipped with Mo $\mathrm{K}_{\alpha}$ radiation $(\lambda=0.71073 \mathrm{~A})$ or $\mathrm{Cu}_{\alpha}$ radiation $(\boldsymbol{\lambda}=$ 1.5478) and an CCD detector. The structure was solved and refined using SHELX program (Sheldrick, G.M., Acta Cryst, (2008) A64, 112-122).
[00212] Thermogravimetric Analysis (TGA)
[00213] TGA was used to investigate the presence of residual solvents in the lots characterized, and identify the temperature at which decomposition of the sample occurs. TGA data were collected on a TA Discovery Thermogravimetric Analyzer or equivalent instrumentation. A sample with weight of approximately $1-5 \mathrm{mg}$ was scanned from $25^{\circ} \mathrm{C}$ to $350{ }^{\circ} \mathrm{C}$ at a heating rate of $10^{\circ} \mathrm{C} / \mathrm{min}$. Data were collected and analyzed by Trios software (TA Instruments, New Castle, DE) or collected by Thermal Advantage Q SeriesTM software and analyzed by Universal Analysis software (TA Instruments, New Castle, DE).
[00214] Differential Scanning Calorimetry (DSC)
[00215] DSC data were acquired using a TA Instruments Q2000 or equi valent instrumentation. A sample with a weight between I and 10 mg was weighed into an aluminum pan. This pan was placed in the sample position in the calorimeter cell. An empty pan was placed in the reference position. The calorimeter cell was closed and a flow of nitrogen was passed through the ceil. The heating program was set to heat the sample at a heating rate of $10^{\circ} \mathrm{C} . / \mathrm{mm}$ to a temperature of $200-350^{\circ} \mathrm{C}$. When the run was completed, the data were analyzed using the DSC analysis program in the system software. The observed endo- and exotherms were integrated between baseline temperature points that were above and below the temperature range over which the endotherm was observed. The data reported were the onset of decomposition temperature, peak temperature and enthalpy.

## [00216] Synthetic Examples

[00217] Synthesis of Compound II: (R)-l-(2,2-Difluorobenzo[d][1,3]dioxol-5-yl)-N-(l-(2,3-dihydroxypropyl)-6-fluoro-2-(l-hydroxy-2-methylpropan-2-yl)-lH-indol-5-yl)cyclopropanecarboxamide

[00218] Step 1: (R)-Benzyl 2-(l-((2,2-dimethyl-1,3-dioxolan-4-yl)methyl)-6-
fluoro-5-nitro-lH-indol-2-yl)-2-methylpropanoate and ((S)-2,2-Dimethyl-1,3-
dioxolan-4-yl)methyl 2-(l-(((R)-2,2-dimethyl-l,3-dioxolan-4-yl)methyl)-6-fluoro-5-nitro-lH-indol-2-yl)-2-methylpropanoate
[00219] Cesium carbonate ( $8.23 \mathrm{~g}, 25.3 \mathrm{mmol}$ ) was added to a mixture of benzyl 2-(6-fluoro-5-nitro-lH-indol-2-yl)-2-methylpropanoate $\quad(3.0 \mathrm{~g}, 8.4 \mathrm{mmol})$ and (S)-(2,2-dimethyl-1,3-dioxolan-4-yl)methyl 4-methylbenzenesulfonate (7.23 g, 25.3 mmol) in DMF (N,N-dimethylformamide) ( 17 mL ). The reaction was stirred at $80^{\circ} \mathrm{C}$ for 46 hours
under a nitrogen atmosphere. The mixture was then partitioned between ethyl acetate and water. The aqueous layer was extracted with ethyl acetate. The combined ethyl acetate layers were washed with brine, dried over $\mathrm{MgSG}_{4}$, filtered and concentrated. The crude product, a viscous brown oil which contains both of the products shown above, was taken directly to the next step without further purification. (R)-Benzyl 2-(l-((2,2-dimethyl-1,3-dioxolan-4-yl)methyl)-6-fluoro-5-nitro-lH-indol-2-yl)-2methylpropanoate, ESI-MS m/z calc. 470.2, found $471.5(\mathrm{M}+\mathrm{l})^{+}$. Retention time 2.20 minutes. ((S)-2,2-Dimethyl-1,3-dioxolan-4-yl)methyl 2-(l-(((R)-2,2-dimethy 1-1,3-dioxolan-4-yl)methyl)-6-fluoro-5-nitro-lH-indol-2-yl)-2-methylpropanoate, ESI-MS $\mathrm{m} / \mathrm{z}$ calc. 494.5 , found $495.7(\mathrm{M}+1)^{+}$. Retention time 2.01 minutes.

## [00220] Step 2: (R)-2-(l-((2,2-dimethyl-1,3-dioxolan-4-yl)methyl)-6-fluoro-5-nitro-1H-indol-2-yl)-2-methylpropan- l-ol

[00221] The crude reaction mixture obtained in step (A) was dissolved in THF (tetrahydrofuran) $(42 \mathrm{~mL})$ and cooled in an ice-water bath. $\mathrm{LiAlH}_{4}(16.8 \mathrm{~mL}$ of 1 M solution, 16.8 mmol ) was added drop-wise. After the addition was complete, the mixture was stirred for an additional 5 minutes. The reaction was quenched by adding water $(1 \mathrm{~mL}), 15 \% \mathrm{NaOH}$ solution $(1 \mathrm{~mL})$ and then water $(3 \mathrm{~mL})$. The mixture was filtered over Celite, and the solids were washed with THF and ethyl acetate. The filtrate was concentrated and purified by column chromatography (30-60\% ethyl acetatehexanes) to obtain (R)-2-(1-((2,2-dimethyl-1,3-dioxolan-4-yl)methyl)-6-fluoro-5-nitro-1H-indol-2-yl)-2-methylpropan-l-ol as a brown oil ( $2.68 \mathrm{~g}, 87 \%$ over 2 steps). ESI-MS $m / z$ calc. 366.4 , found $367.3(\mathrm{M}+1)+$. Retention time 1.68 minutes. ${ }^{1} \mathrm{H}$ NMR (400 MHz, DMSO-d6) $\delta 8.34$ (d, J = 7.6 Hz, 1H), 7.65 (d, J = $13.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), $6.57(\mathrm{~s}, 1 \mathrm{H})$, $4.94(\mathrm{t}, \mathrm{J}=5.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.64-4.60(\mathrm{~m}, 1 \mathrm{H}), 4.52-4.42(\mathrm{~m}, 2 \mathrm{H}), 4.16-4.14(\mathrm{~m}, 1 \mathrm{H})$, 3.76-3.74(m, 1H), 3.63-3.53(m, 2H), $1.42(\mathrm{~s}, 3 \mathrm{H}), 1.38-1.36(\mathrm{~m}, 6 \mathrm{H})$ and $1.19(\mathrm{~s}$, $3 \mathrm{H}) \mathrm{ppm}$. (DMSO is dimethylsulfoxide).
[00222] Step 3: (R)-2-(5-amino-l-((2,2-dimethyl-l,3-dioxolan-4-yl)methyl)-6-fluoro-lH-indol-2-yl)-2-methylpropan- l-ol
[00223] (R)-2-(l-((2,2-dimethyl-1,3-dioxolan-4-yl)methyl)-6-fluoro-5-nitro-lH-indol-2-yl)-2-methylpropan-l-ol ( $2.5 \mathrm{~g}, 6.82 \mathrm{mmol}$ ) was dissolved in ethanol ( 70 mL ) and the reaction was flushed with $\mathrm{N}_{2}$. Then Pd-C ( 250 mg , $5 \% \mathrm{wt}$ ) was added. The reaction was flushed with nitrogen again and then stirred under $3 / 4$ (atm). After 2.5 hours only partial
conversion to the product was observed by LCMS. The reaction was filtered through Celite and concentrated. The residue was re-subjected to the conditions above. After 2 hours LCMS indicated complete conversion to product. The reaction mixture was filtered through Celite. The filtrate was concentrated to yield the product ( $1.82 \mathrm{~g}, 79 \%$ ). ESI-MS m/z calc. 336.2, found $337.5(\mathrm{M}+\mathrm{l})^{+}$. Retention time 0.86 minutes. ${ }^{1} \mathrm{H}$ NMR (400 MHz, DMSO-d6) $\delta 7.17(\mathrm{~d}, \mathrm{~J}=12.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.76(\mathrm{~d}, \mathrm{~J}=9.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.03(\mathrm{~s}$, $1 \mathrm{H}), 4.79-4.76(\mathrm{~m}, 1 \mathrm{H}), 4.46(\mathrm{~s}, 2 \mathrm{H}), 4.37-4.31(\mathrm{~m}, 3 \mathrm{H}), 4.06(\mathrm{dd}, \mathrm{J}=6.1,8.3 \mathrm{~Hz}$, $1 \mathrm{H}), 3.70-3.67(\mathrm{~m}, 1 \mathrm{H}), 3.55-3.52(\mathrm{~m}, 2 \mathrm{H}), 1.41(\mathrm{~s}, 3 \mathrm{H}), 1.32(\mathrm{~s}, 6 \mathrm{H})$ and $1.21(\mathrm{~s}, 3 \mathrm{H})$ ppm.
[00224] Step 4: (R)-l-(2,2-difluorobenzo[d] [1,3]dioxol-5-yl)-N-(l-((2,2-dimethyl-1,3-dioxolan-4-yl)methyl)-6-fluoro-2-(l-hydroxy-2-methylpropan-2-yl)-lH-indol-5yl)cyclopropanecarboxamide
[00225] DMF (3 drops) was added to a stirring mixture of 1-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)cyclopropanecarboxylic acid (1.87 g, 7.7 mmol ) and thionyl chloride ( $1.30 \mathrm{~mL}, 17.9 \mathrm{mmol}$ ). After 1 hour a clear solution had formed. The solution was concentrated under vacuum and then toluene ( 3 mL ) was added and the mixture was concentrated again. The toluene step was repeated once more and the residue was placed on high vacuum for 10 minutes. The acid chloride was then dissolved in dichloromethane $(10 \mathrm{~mL})$ and added to a mixture of ( R )-2-(5-amino-1-((2,2-dimethy 1-1,3-dioxolan-4-y l)methy 1)-6-fluoro- 1H-indol-2-y 1)-2-methy Ipropan- 1-ol $(1.8 \mathrm{~g}, 5.4 \mathrm{mmol})$ and triethylamine $(2.24 \mathrm{~mL}, 16.1 \mathrm{mmol})$ in dichloromethane $(45 \mathrm{~mL})$. The reaction was stirred at room temperature for 1 hour. [00229] Part A : Synthesis of 4-oxo-1,4-dihydroquinoline-3-carboxylic acid

[00230] Step 1: 2-Phenylaminomethylene-malonic acid diethyl ester
[00231] A mixture of aniline ( $25.6 \mathrm{~g}, 0.275 \mathrm{~mol}$ ) and diethyl 2-
(ethoxymethylene)malonate $(62.4 \mathrm{~g}, 0.288 \mathrm{~mol})$ was heated at $140-150{ }^{\circ} \mathrm{C}$ for 2 h . The mixture was cooled to room temperature and dried under reduced pressure to afford 2-phenylaminomethylene-malonic acid diethyl ester as a solid, which was used in the next step without further purification. ${ }^{1} \mathrm{H}$ NMR (DMSO-i³/4) $\delta 11.00(\mathrm{~d}, 1 \mathrm{H}), 8.54(\mathrm{~d}, J=$ $13.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.36-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.13-7.17(\mathrm{~m}, 3 \mathrm{H}), 4.17-4.33(\mathrm{~m}, 4 \mathrm{H}), 1.18-1.40(\mathrm{~m}$, $6 \mathrm{H})$.
[00232] Step 2: 4-Hydroxyquinoline-3-carboxylic acid ethyl ester
[00233] A I L three-necked flask fitted with a mechanical stirrer was charged with 2-phenylaminomethylene-malonic acid diethyl ester ( $26.3 \mathrm{~g}, 0.100 \mathrm{~mol}$ ), polyphosphoric acid ( 270 g ) and phosphoryl chloride ( 750 g ). The mixture was heated to $70^{\circ} \mathrm{C}$ and stirred for 4 h . The mixture was cooled to room temperature and filtered. The residue was treated with aqueous $\mathrm{Na} 2 \mathrm{CO}_{3}$ solution, filtered, washed with water and dried. 4-Hydroxyquinoline-3-carboxylic acid ethyl ester was obtained as a pale brown solid $(15.2 \mathrm{~g}, 70 \%)$. [00235] 4-Hydroxyquinoline-3-carboxylic acid ethyl ester ( $15 \mathrm{~g}, 69 \mathrm{mmol}$ ) was suspended in sodium hydroxide solution ( $2 \mathrm{~N}, 150 \mathrm{~mL}$ ) and stirred for 2 h at reflux. After cooling, the mixture was filtered, and the filtrate was acidified to pH 4 with 2 N HCl . The resulting precipitate was collected via filtration, washed with water and dried under vacuum to give 4-oxo-1,4-dihydroquinoline-3-carboxylic acid as a pale white solid ( $10.5 \mathrm{~g}, 92 \%$ ). ${ }^{1} \mathrm{H}$ NMR (DMSO-i $\left.{ }^{3} / 4\right) \delta 15.34(\mathrm{~s}, 1 \mathrm{H}), 13.42(\mathrm{~s}, 1 \mathrm{H}), 8.89(\mathrm{~s}, 1 \mathrm{H})$, $8.28(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.88(\mathrm{~m}, 1 \mathrm{H}), 7.81(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.60(\mathrm{~m}, 1 \mathrm{H})$.

[00237] Step 1: Carbonic acid 2,4-di-feri-butyl-phenyl ester methyl ester
[00238] Methyl chloroformate ( $58 \mathrm{~mL}, 750 \mathrm{mmol}$ ) was added dropwise to a solution of 2,4-di-fert-butyl-phenol ( $103.2 \mathrm{~g}, 500 \mathrm{mmol}$ ), $\mathrm{Et}_{3} \mathrm{~N}(139 \mathrm{~mL}, 1000 \mathrm{mmol})$ and DMAP ( $3.05 \mathrm{~g}, 25 \mathrm{mmol}$ ) in dichloromethane $(400 \mathrm{~mL})$ cooled in an ice-water bath to 0 ${ }^{\circ} \mathrm{C}$. The mixture was allowed to warm to room temperature while stirring overnight, then filtered through silica gel (approx. 1L) using 10\% ethyl acetate - hexanes ( $\sim 4 \mathrm{~L}$ ) as the eluent. [00239] Step 2: Carbonic acid 2,4-di-feri-butyl-5-nitro-phenyl ester methyl ester and Carbonic acid 2,4-di-feri-butyl-6-nitro-phenyl ester methyl ester
[00240] To a stirring mixture of carbonic acid 2,4-di-fert-butyl-phenyl ester methyl ester ( $4.76 \mathrm{~g}, 180 \mathrm{mmol}$ ) in cone. sulfuric acid ( 2 mL ), cooled in an ice-water bath, was added a cooled mixture of sulfuric acid $(2 \mathrm{~mL})$ and nitric acid $(2 \mathrm{~mL})$. The addition was done slowly so that the reaction temperature did not exceed $50^{\circ} \mathrm{C}$. The reaction was allowed to stir for 2 h while warming to room temperature. The reaction mixture was then added to ice-water and extracted into diethyl ether. The ether layer was dried ( $\mathrm{MgSC}>4$ ), concentrated and purified by column chromatography ( $0-10 \%$ ethyl acetate - hexanes) to yield a mixture of carbonic acid 2,4-di-fert-butyl-5-nitro-phenyl ester methyl ester and carbonic acid 2,4-di-fert-butyl-6-nitro-phenyl ester methyl ester as a pale yellow solid ( 4.28 g ), which was used directly in the next step.
[00241] Step 3: 2,4-Di-fert-butyl-5-nitro-phenol and 2,4-Di-fert-butyl-6-nitrophenol
[00242] The mixture of carbonic acid 2,4-di-fert-butyl-5-nitro-phenyl ester methyl ester and carbonic acid 2,4-di-fert-butyl-6-nitro-phenyl ester methyl ester (4.2 g, 14.0 mmol ) was dissolved in $\mathrm{MeOH}(65 \mathrm{~mL})$ before $\mathrm{KOH}(2.0 \mathrm{~g}, 36 \mathrm{mmol})$ was added. The mixture was stirred at room temperature for 2 h . The reaction mixture was then made acidic ( $\mathrm{pH} 2-3$ ) by adding cone. HC 1 and partitioned between water and diethyl ether. The ether layer was dried $\left(\mathrm{MgSC}^{\wedge}\right)$, concentrated and purified by column chromatography (0-5 \% ethyl acetate - hexanes) to provide 2,4-di-fert-butyl-5-nitrophenol ( $1.31 \mathrm{~g}, 29 \%$ over 2 steps) and 2,4-di-fert-butyl-6-nitro-phenol. 2,4-Di-tert-butyl-5-nitro-phenol: 3/4NMR (400 MHz, DMSO- $d_{6}$ ) $\delta 10.14$ (s, IH, OH), 7.34 (s, IH),

## [00243] Step 4: 5-Amino-2,4-di-fert-butyl-phenol

[00244] To a refluxing solution of 2,4-di-fert-butyl-5-nitro-phenol (1.86 g, 7.40 mmol ) and ammonium formate ( 1.86 g ) in ethanol ( 75 mL ) was added $\mathrm{Pd}-5 \% \mathrm{wt}$. on activated carbon ( 900 mg ). [00249] Scheme IV-A depicts the preparation of 1-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)cyclopropanecarbonyl chloride, which is used in Scheme IV-C to make the amide linkage of Compound IV.
[00250] The starting material, 2,2-difluorobenzo[d][1,3]dioxole-5-carboxylic acid, is commercially available from Saltigo (an affiliate of the Lanxess Corporation).

Reduction of the carboxylc acid moiety in 2,2-difluorobenzo[d][1,3]dioxole-5carboxylic acid to the primary alcohol, followed by conversion to the corresponding chloride using thionyl chloride (SOCI2), provides 5-(chloromethyl)-2,2difluorobenzo[d][1,3]dioxole, which is subsequently converted to 2-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)acetonitrile using sodium cyanide. Treatment of 2-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)acetonitrile with base and l-bromo-2chloroethane provides 1-(2,2-difluorobenzo[d][1,3]dioxol-5-
yl)cyclopropanecarbonitrile. The nitrile moiety in 1-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)cyclopropanecarbonitrile is converted to a carboxylic acid using base to give 1-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)cyclopropanecarboxylic acid, which is converted to the desired acid chloride using thionyl chloride.

## Scheme IV-B. Alternative synthesis of the acid chloride moiety.

2. HCl

[00251] Scheme IV-B depicts an alternative synthesis of the requisite acid chloride. 5 -bromomethyl-2,2-difluoro-1,3-benzodioxole is coupled with ethyl cyanoacetate in the presence of a palladium catalyst to form the corresponding alpha cyano ethyl ester. Saponification of the ester moiety to the carboxylic acid gives the cyanoethyl Compound IV. Alkylation of the cyanoethyl compound with 1-bromo-2-chloro ethane in the presence of base gives the cyanocyclopropyl compound. Treatment of the cyanocyclopropyl compound with base gives the carboxylate salt, which is converted to the carboxylic acid by treatment with acid. Conversion of the carboxylic acid to the acid chloride is then accomplished using a chlorinating agent such as thionyl chloride or the like.

[00252] Scheme IV-C depicts the preparation of the requisite tert-butyl 3-(6-amino-3-methylpyridin-2-yl)benzoate, which is coupled with 1-(2,2-difluorobenzo[d][1,3]dioxol-5-yl)cyclopropanecarbonyl chloride in Scheme IV-C to give Compound IV. Palladiumcatalyzed coupling of 2-bromo-3-methylpyridine with 3-(tertbutoxycarbonyl)phenylboronic acid gives tert-butyl 3-(3-methylpyridin-2-yl)benzoate, which is subsequently converted to the desired compound.

## [00254] Syntheses of Compounds

## [00255] Synthesis of Compound 1

[00256] Part A : Synthesis of (4S)-2,2,4-trimethylpyrrolidine hydrochloride

[00257] Step 1: methyl-2,4-dimethyl-4-nitro-pentanoate

[00258] Tetrahydrofuran (THF, 4.5 L) was added to a 20 L glass reactor and stirred under $\mathrm{N}_{2}$ at room temperature. 2-Nitropropane ( $1.5 \mathrm{~kg}, 16.83 \mathrm{~mol}$ ) and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) ( $1.282 \mathrm{~kg}, 8.42 \mathrm{~mol})$ were then charged to the reactor, and the jacket temperature was increased to $50^{\circ} \mathrm{C}$. Once the reactor contents were close to $50^{\circ} \mathrm{C}$, methyl methacrylate ( $1.854 \mathrm{~kg}, 18.52 \mathrm{~mol}$ ) was added slowly over 100 minutes. The reaction temperature was maintained at or close to $50^{\circ} \mathrm{C}$ for 21 hours. The reaction mixture was concentrated in vacuo then transferred back to the reactor and diluted with methyl tert-butyl ether (MTBE) (14 L). $2 \mathrm{M} \mathrm{HC1}$ (7.5 L) was added, and this mixture was stirred for 5 minutes then allowed to settle. Two clear layers were visible - a lower yellow aqueous phase and an upper green organic phase. The aqueous layer was removed, and the organic layer was stirred again with $2 \mathrm{M} \mathrm{HC1}$ (3 L). After separation, the HC 1 washes were recombined and stirred with MTBE ( 3 L ) for 5 minutes. The aqueous layer was removed, and all of the organic layers were combined in the reactor and stirred with water ( 3 L ) for 5 minutes. After separation, the organic layers were concentrated in vacuo to afford a cloudy green oil. Crude product was treated with $\mathrm{MgSC}^{\wedge}$ and filtered to afford methyl-2,4-dimethyl-4-nitro-pentanoate as a clear green oil ( $3.16 \mathrm{~kg}, 99 \%$ yield).
[00259] ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , Chloroform-cO $\delta 3.68$ (s, 3H), 2.56-2.35 (m, 2H), 2.11 - $2.00(\mathrm{~m}, 1 \mathrm{H}), 1.57(\mathrm{~s}, 3 \mathrm{H}), 1.55(\mathrm{~s}, 3 \mathrm{H}), 1.19(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H})$.
[00260] Step 2: Synthesis of methyl (2S)-2,4-dimethyl-4-nitro-pentanoate

[00261] A reactor was charged with purified water ( $2090 \mathrm{~L} ; 10 \mathrm{vol}$ ) and then potassium phosphate monobasic ( $27 \mathrm{~kg}, 198.4$ moles; $13 \mathrm{~g} / \mathrm{L}$ for water charge). The pH of the reactor contents was adjusted to $\mathrm{pH} 6.5( \pm 0.2)$ with $20 \%(\mathrm{w} / \mathrm{v})$ potassium carbonate solution. The reactor was charged with racemic methyl-2,4-dimethyl-4-nitropentanoate ( 209 kg ; 1104.6 moles), and Palatase 20000 L lipase ( $13 \mathrm{~L}, 15.8 \mathrm{~kg}$; 0.06 vol).
[00262] The reaction mixture was adjusted to $32 \pm 2{ }^{\circ} \mathrm{C}$ and stirred for $15-21$ hours, and pH 6.5 was maintained using a pH stat with the automatic addition of $20 \%$ potassium carbonate solution. When the racemic starting material was converted to $>98 \%$ ee of the $S$-enantiomer, as determined by chiral GC, external heating was switched off. The reactor was then charged with MTBE ( $35 \mathrm{~L} ; 5 \mathrm{vol}$ ), and the aqueous layer was extracted with MTBE (3 times, 400-1000L). The combined organic extracts were washed with aqueous $\mathrm{Na}_{2} \mathrm{CC}_{3}(4$ times, $522 \mathrm{~L}, 18 \% \mathrm{w} / \mathrm{w} 2.5$ vol), water ( 523 L ; 2.5 vol ), and $10 \%$ aqueous NaCl ( $314 \mathrm{~L}, 1.5 \mathrm{vol}$ ). The organic layer was concentrated in vacuo to afford methyl ( $2<$ S)-2,4-dimethyl-4-nitro-pentanoate as a mobile yellow oil (>98\% ee, $94.4 \mathrm{~kg} ; 45 \%$ yield).
[00263] Step 3: Synthesis of (J.S)-3,5,5-trimethylpyrrolidin-2-one

[00264] A 20 L reactor was purged with $\mathrm{N}_{2}$. The vessel was charged sequentially with DI water-rinsed, damp Raney® ${ }^{\circledR} \mathrm{Ni}(2800$ grade, 250 g), methyl (2S)-2,4-dimethyl-4-nitro-pentanoate $(1741 \mathrm{~g}, 9.2 \mathrm{~mol})$, and ethanol ( $13.9 \mathrm{~L}, 8 \mathrm{vol}$ ). The reaction was stirred
at 900 rpm , and the reactor was flushed with $\mathrm{H}_{2}$ and maintained at -2.5 bar. The reaction mixture was then warmed to $60{ }^{\circ} \mathrm{C}$ for 5 hours. The reaction mixture was cooled and filtered to remove Raney nickel, and the solid cake was rinsed with ethanol ( $3.5 \mathrm{~L}, 2 \mathrm{vol}$ ). The ethanolic solution of the product was combined with a second equal sized batch and concentrated in vacuo to reduce to a minimum volume of ethanol (-1.5 volumes). Heptane ( 2.5 L ) was added, and the suspension was concentrated again to -1.5 volumes. This was repeated 3 times; the resulting suspension was cooled to $0-5{ }^{\circ} \mathrm{C}$, filtered under suction, and washed with heptane ( 2.5 L ). The product was dried under vacuum for 20 minutes then transferred to drying trays and dried in a vacuum oven at 40 ${ }^{\circ} \mathrm{C}$ overnight to afford (35)-3,5,5-trimethylpyrrolidin-2-one as a white crystalline solid (2.042 kg, $16.1 \mathrm{~mol}, 87 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , Chloroform-i/) $\delta 6.39$ (s, 1H), 2.62 (ddq, J = 9.9, 8.6, $7.1 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.17(\mathrm{dd}, \mathrm{J}=12.4,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.56(\mathrm{dd}, \mathrm{J}=12.5,9.9$ $\mathrm{Hz}, 1 \mathrm{H}), 1.31(\mathrm{~s}, 3 \mathrm{H}), 1.25(\mathrm{~s}, 3 \mathrm{H}), 1.20(\mathrm{~d}, \mathrm{~J}=7.1 \mathrm{~Hz}, 3 \mathrm{H})$.

[00266] A glass lined 120 L reactor was charged with lithium aluminum hydride pellets $(2.5 \mathrm{~kg}, 66 \mathrm{~mol})$ and dry THF $(60 \mathrm{~L})$ and warmed to $30^{\circ} \mathrm{C}$. The resulting suspension was charged with $\mathrm{f} 3 / 4$ )-3,5,5-trimethylpyrrolidin-2-one ( $7.0 \mathrm{~kg}, 54 \mathrm{~mol}$ ) in THF ( 25 L ) over 2 hours while maintaining the reaction temperature at 30 to $40{ }^{\circ} \mathrm{C}$. After complete addition, the reaction temperature was increased to $60-63{ }^{\circ} \mathrm{C}$ and maintained overnight. The reaction mixture was cooled to $22^{\circ} \mathrm{C}$, then cautiously quenched with the addition of ethyl acetate (EtOAc) (1.0 L, 10 moles), followed by a mixture of THF ( 3.4 L ) and water ( $2.5 \mathrm{~kg}, 2.0 \mathrm{eq}$ ), and then a mixture of water ( 1.75 kg ) with 50 \% aqueous sodium hydroxide $(750 \mathrm{~g}, 2$ equiv water with 1.4 equiv sodium hydroxide relative to aluminum), followed by 7.5 L water. After the addition was complete, the reaction mixture was cooled to room temperature, and the solid was removed by filtration and washed with THF ( $3 \times 25 \mathrm{~L}$ ). The filtrate and washings were combined and treated with 5.0 L ( 58 moles) of aqueous $37 \% \mathrm{HCl}$ ( 1.05 equiv.) while maintaining the temperature below $30^{\circ} \mathrm{C}$. [00268] Preparation of starting materials:
[00269] 3,3,3-Trifluoro-2,2-dimethyl-propan- l-ol

[00270] A 1 L 3 neck round bottom flask was fitted with a mechanical stirrer, a cooling bath, an addition funnel, and a J-Kem temperature probe. The vessel was charged with lithium aluminum hydride (LAH) pellets ( $6.3 \mathrm{~g}, 0.1665 \mathrm{~mol}$ ) under a nitrogen atmosphere. The vessel was then charged with tetrahydrofuran ( 200 mL ) under a nitrogen atmosphere. The mixture was allowed to stir at room temperature for 0.5 hours to allow the pellets to dissolve. The cooling bath was then charged with crushed
ice in water and the reaction temperature was lowered to $0^{\circ} \mathrm{C}$. The addition funnel was charged with a solution of 3,3,3-trifluoro-2,2-dimethyl-propanoic acid ( $20 \mathrm{~g}, 0.1281$ $\mathrm{mol})$ in tetrahydrofuran $(60 \mathrm{~mL})$ and the clear pale yellow solution was added drop wise over 1 hour. After the addition was complete the mixture was allowed to slowly warm to room temperature and stirring was continued for 24 hours. The suspension was cooled to $0^{\circ} \mathrm{C}$ with a crushed ice-water in the cooling bath and then quenched by the very slow and drop wise addition of water ( 6.3 ml ), followed by sodium hydroxide solution ( 15 weight $\% ; 6.3 \mathrm{~mL}$ ) and then finally with water ( 18.9 mL ). The reaction temperature of the resulting white suspension was recorded at $5^{\circ} \mathrm{C}$. The suspension was stirred at $\sim 5^{\circ} \mathrm{C}$ for 30 minutes and then filtered through a 20 mm layer of Celite. The filter cake was washed with tetrahydrofuran ( $2 \times 100 \mathrm{~mL}$ ). The filtrate was dried over sodium sulfate ( 150 g ) and then filtered. The filtrate was concentrated under reduced pressure to provide a clear colorless oil ( 15 g ) containing a mixture of the product 3,3,3-trifluoro-2,2-dimethyl-propan-l-ol in THF ( $73 \%$ weight of product $\sim 10.95 \mathrm{~g}$, and 27 wt.\% THF as determined by $1 \mathrm{H}-\mathrm{NMR}$ ). The distillate from the rotary evaporation was distilled at atmospheric pressure using a 30 cm Vigreux column to provide 8.75 g of a residue containing $60 \%$ weight of THF and $40 \%$ weight of product ( -3.5 g ). The estimated total amount of product is 14.45 g ( $79 \%$ yield). 1H NMR ( 400 MHz , DMSOd6) $\delta 4.99(\mathrm{t}, \mathrm{J}=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.38(\mathrm{dd}, \mathrm{J}=5.8,0.9 \mathrm{~Hz}, 2 \mathrm{H}), 1.04(\mathrm{~d}, \mathrm{~J}=0.9 \mathrm{~Hz}, 6 \mathrm{H})$.
[00271] tert-Butyl 3-oxo-2,3-dihydro-IH-pyrazole-I-carboxylate

[00272] A 50L Syrris controlled reactor was started and jacket set to $20^{\circ} \mathrm{C}$, stirring at 150 rpm , reflux condenser $\left(10^{\circ} \mathrm{C}\right)$ and nitrogen purge. $\mathrm{MeOH}(2.860 \mathrm{~L})$ and methyl (E)-3-methoxyprop-2-enoate ( $2.643 \mathrm{~kg}, 22.76 \mathrm{~mol}$ ) were added and the reactor was capped. The reaction was heated to an internal temperature of $40^{\circ} \mathrm{C}$ and the system was set to hold jacket temp at $40^{\circ} \mathrm{C}$. Hydrazine hydrate ( 1300 g of $55 \% \mathrm{w} / \mathrm{w}, 22.31 \mathrm{~mol}$ ) was added portion wise via addition funnel over 30 min . The reaction was heated to 60 ${ }^{\circ} \mathrm{C}$ for 1 h . The reaction mixture was cooled to $20^{\circ} \mathrm{C}$ and triethyamine ( $2.483 \mathrm{~kg}, 3.420$ $\mathrm{L}, 24.54 \mathrm{~mol}$ ) was added portion wise (exothermic), maintaining reaction temp $<30^{\circ} \mathrm{C}$.

A solution of Boc anhydride (di-tert-butyl dicarbonate) (4.967 kg, 5.228 L, 22.76 mol) in $\mathrm{MeOH}(2.860 \mathrm{~L})$ was added portion wise maintaining temperature $<45{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred at $20^{\circ} \mathrm{C}$ for 16 h . The reaction solution was partially concentrated to remove MeOH , resulting in a clear light amber oil. The resulting oil was transferred to the 50 L reactor, stirred and added water $(7.150 \mathrm{~L})$ and heptane $(7.150 \mathrm{~L})$. The additions caused a small amount of the product to precipitate. The aqueous layer was drained into a clean container and the interface and heptane layer were filtered to separate the solid (product). The aqueous layer was transferred back to the reactor, and the collected solid was placed back into the reactor and mixed with the aqueous layer. A dropping funnel was added to the reactor and loaded with acetic acid $(1.474 \mathrm{~kg}, 1.396 \mathrm{~L}$, 24.54 mol ), then began dropwise addition of acid. The jacket was set to $0^{\circ} \mathrm{C}$ to absorb the quench exotherm. After addition ( $\mathrm{pH}=5$ ), the reaction mixture was stirred for 1 h . The solid was collected by filtration and washed with water (7.150 L), and washed a second time with water ( 3.575 L ) and pulled dry. The crystalline solid was scooped out of the filter into a 20L rotovap bulb and heptane ( 7.150 L ) was added. The mixture was slurried at $45^{\circ} \mathrm{C}$ for 30 mins, and then distilled off 1-2 volumes of solvent. The slurry in the rotovap flask was filtered and the solids washed with heptane ( 3.575 L ) and pulled dry. The solid was further dried in vacuo ( $50{ }^{\circ} \mathrm{C}, 15 \mathrm{mbar}$ ) to give tert-butyl 5-oxo-lH-pyrazole-2-carboxylate ( $2921 \mathrm{~g}, 71 \%$ ) as coarse, crystalline solid. $3 / 4 \mathrm{NMR}$ ( 400 MHz , DMSO-d6) $\delta 10.95(\mathrm{~s}, 1 \mathrm{H}), 7.98(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.90(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.54(\mathrm{~s}$, 9H).

[00296] Alternative Synthesis of 3-(3,3,3-trifluoro-2,2-dimethyl-propoxy)-IHpyrazole

Step 1: Preparation of 3,3,3-trifluoro-2,2-dimethylpropan-l-ol

A reactor was loaded with toluene ( 300 mL ) and 3,3,3-trifluoro-2,2-dimethylpropanoic acid ( $30 \mathrm{~g}, 192.2 \mathrm{mmol}$ ), capped, purged under nitrogen. The reaction was set to control the internal temperature to $40^{\circ} \mathrm{C}$. A solution of Vitride ( $65 \%$ in toluene. approximately 119.6 g of $65 \% \mathrm{w} / \mathrm{w}, 115.4 \mathrm{~mL}$ of $65 \% \mathrm{w} / \mathrm{w}, 384.4 \mathrm{mmol}$ ) was set up for addition via syringe, and addition was begun at $40^{\circ} \mathrm{C}$, with the target addition temperature between 40 and $50^{\circ} \mathrm{C}$. The reaction was stirred at $40^{\circ} \mathrm{C}$ for 90 min . The reaction was cooled to $10{ }^{\circ} \mathrm{C}$ then the remaining Vitride was quenched with slow addition of water ( 6 mL ). A solution of $15 \%$ aq $\mathrm{NaOH}(30 \mathrm{~mL})$ was added in portions, and solids precipitated half way through the base addition. Water $(60.00 \mathrm{~mL})$ was added. The mixture was warmed to $30^{\circ} \mathrm{C}$ and held for at least 15 mins. The mixture was then cooled to $20^{\circ} \mathrm{C}$. The
aqueous layer was removed. The organic layer was washed with water ( $60 \mathrm{~mL} x 3$ ), and then washed with brine $(60 \mathrm{~mL})$. The washed organic layer was dried under $\mathrm{Na} 2 \mathrm{SC}>4$, followed with $\mathrm{MgSG}_{4}$. The mix was filtered through Celite, and the cake washed with toluene $(60.00 \mathrm{~mL})$ and pulled dry. The product 3,3,3-trifluoro-2,2-dimethyl-propan-1ol ( $22.5 \mathrm{~g}, 82 \%$ ) was obtained as clear colorless solution.

## Step 2 : Preparation of 1-(tert-butyl) 4-ethyl 3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lH-pyrazole-1,4-dicarboxylate

A reactor was charged with 3,3,3-trifluoro-2,2-dimethylpropan-l-ol (17.48 g, 123.0 mmol ) solution in toluene $(250 \mathrm{~g})$, 1-(tert-butyl) 4-ethyl 3-hydroxy-lH-pyrazole-1,4dicarboxylate $(30.0 \mathrm{~g}, 117.1 \mathrm{mmol})$, and $\mathrm{PPh}_{3}(35.33 \mathrm{~g}, 134.7 \mathrm{mmol})$. The reaction was heated to $40^{\circ} \mathrm{C}$. DIAD ( $26.09 \mathrm{~mL}, 134.7 \mathrm{mmol}$ ) was weighed and placed into a syringe and added over 10 minutes while maintaining an internal temperature ranging between 40 and $50{ }^{\circ} \mathrm{C}$. The reaction was then heated to $100^{\circ} \mathrm{C}$ over 30 minutes. After holding at $100{ }^{\circ} \mathrm{C}$ for 30 minutes, the reaction was complete, and the mixture was cooled to $70{ }^{\circ} \mathrm{C}$ over 15 minutes. Heptane ( 180.0 mL ) was added, and the jacket was cooled to $15{ }^{\circ} \mathrm{C}$ over 1 hour. (TPPO began crystallizing at $-35{ }^{\circ} \mathrm{C}$ ). The mixture stirring at $15{ }^{\circ} \mathrm{C}$ was filtered (fast), the cake was washed with a pre-mixed solution of toluene ( 60 mL ) and heptane ( 60 mL ) and then pulled dry. The clear solution was concentrated to a waxy solid ( $45{ }^{\circ} \mathrm{C}$, vacuum, rotovap). Crude 1-(tert-butyl) 4-ethyl 3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lH-pyrazole-1,4-dicarboxylate ( 53.49 g ) was obtained as a waxy solid, ( $-120 \%$ of theoretical mass recovered).

Step 3: Preparation of 3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lH-pyrazole-4carboxylic acid

A solution of 1-(tert-butyl) 4-ethyl 3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-1H-pyrazole-1,4-dicarboxylate ( $50.0 \mathrm{~g}, 131 \mathrm{mmol}$ ) in 2-methyltetrahydrofuran ( 500 mL ) was prepared in a reactor and stirred at $40^{\circ} \mathrm{C}$. Portions of KOt-Bu (80.85 g, 720.5 $\mathrm{mmol})$ were then added over 30 minutes. Addition was exothermic. After 2053.49 g UPLC-MS showed complete removal of the Boc group, so water ( $3.53 \mathrm{~g}, 3.53 \mathrm{~mL}, 196$ mmol ) was added drop-wise addition via syringe over 20 min to keep the reaction temperature between $40-50{ }^{\circ} \mathrm{C}$. The mixture was then stirred for 17 hours to complete the reaction. The mixture was then cooled to $20^{\circ} \mathrm{C}$ and water ( 400 mL ) was added. The stirring was stopped and the layers were separated. The desired product in the aqueous layer was returned to the reactor and the organic layer was discarded. The aqueous layer was washed with 2-Me-THF ( 200 mL ). Isopropanol ( 50 mL ) was added followed by dropwise addition of aqueous $\mathrm{HC} 1(131 \mathrm{~mL}$ of $6.0 \mathrm{M}, 786.0 \mathrm{mmol}$ ) to adjust the pH to $<3$ while maintaining the temperature below $30^{\circ} \mathrm{C}$. The resulting solid was then isolated by filtration and the filter cake washer with water $(100 \mathrm{~mL})$ then pulled dry until a sticky cake was obtained. The solids were then dried under vacuum at $55^{\circ} \mathrm{C}$ to afford 3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-1H-pyrazole-4-carboxylic acid (23.25 g) as an off-white fine solid.

## [00297] Step 4: Preparation of 3-(3,3,3-trifluoro-2,2-dimethyl-propoxy)-IH-

 pyrazole3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lH-pyrazole-4-carboxylic acid (1.0 equiv) was added to a reactor followed by DMF ( $6.0 \mathrm{vol}, 2.6 \mathrm{wt}$ equiv). The mixture was stirred at 18-22 ${ }^{\circ} \mathrm{C}$. DBU ( 0.2 equiv.) was charged to the reaction mixture at a rate of approximately $45 \mathrm{~mL} / \mathrm{min}$. The reaction temperature was then raised to $98-102{ }^{\circ} \mathrm{C}$ over 45 minutes. The reaction mixture was stirred at $98-102^{\circ} \mathrm{C}$ for no less than 10 h . The reaction mixture was then cooled to $-2^{\circ} \mathrm{C}$ to $2^{\circ} \mathrm{C}$ over approximately 1 hour and was used without isolation to make ethyl 2-chloro-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lH-pyrazol-l-yl)nicotinate.
[00298] Alternate procedure for the preparation of 2-chloro-6-[3-(3,3,3-trifluoro-2,2-dimethyl-propoxy)pyrazol-l-yl]pyridine-3-carboxylic acid

Step 1. Ethyl 2-chloro-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-

## lH-pyrazol- l-yl)nicotinate

[00300] A solution of ethyl 2,6-dichloronicotinate ( $256 \mathrm{~g}, 1.16 \mathrm{~mol}$ ) and 3-(3,3,3-trifluoro-2,2-dimethyl-propoxy)-lH-pyrazole ( $242 \mathrm{~g}, 1.16 \mathrm{~mol}$ ) in DMF ( 1.53 L ) was treated with potassium carbonate $(209 \mathrm{~g}, 1.51 \mathrm{~mol})$ and $\mathrm{DABCO}(19.6 \mathrm{~g}, 174 \mathrm{mmol})$. The resultant suspension was stirred allowed to exotherm from 14 to $25^{\circ} \mathrm{C}$ and then maintained at $20-25^{\circ} \mathrm{C}$ with external cooling for 3 days. The suspension was cooled to below $10{ }^{\circ} \mathrm{C}$ when water $(2.0 \mathrm{~L})$ was added in a thin stream while maintaining the temperature below $25^{\circ} \mathrm{C}$. After the addition was complete, the suspension was stirred for an additional 1 h . The solid was collected by filtration (sintered-glass/polypad) and the filter-cake was washed with water ( $2 \times 500-\mathrm{mL}$ ) and dried with suction for 2 h to afford water-damp ethyl 2-chloro-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-1H-pyrazol-l-yl)nicotinate ( $512 \mathrm{~g} ; 113 \%$ yield) as white powder which was used without further steps in the subsequent reaction.
[00301] Step 2. 2-chloro-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lh-pyrazol-l-yl)nicotinic acid

[00302] The water-damp ethyl 2-chloro-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lH-pyrazol-l-yl)nicotinate (455 g, 1.16 mol ; assumed $100 \%$ yield from previous step) in $\mathrm{EtOH}(1.14 \mathrm{~L})$ and THF ( 455 mL ) was stirred at ambient temperature $\left(17{ }^{\circ} \mathrm{C}\right)$ when $1 \mathrm{MNaOH}(1.16 \mathrm{~L}, 1.16 \mathrm{~mol})$ was added. The reaction mixture exothermed to $30^{\circ} \mathrm{C}$ and was further warmed at $40^{\circ} \mathrm{C}$ for 2 h . The solution was quenched with $1 \mathrm{M} \mathrm{HC1}(1.39 \mathrm{~L}, 1.39 \mathrm{~mol})$ which resulted in an immediate precipitation which became thicker as the acid was added. The creamy suspension was allowed to cool to room temperature and was stirred overnight. The solid was collected by filtration (sintered-glass/poly pad). The filter-cake was washed with water ( $2 \times 500-$ mL ). The filter-cake was dried by suction for 1 h but remained wet. The damp solid was transferred to a $10-\mathrm{L}$ Buchi flask for further drying ( $50{ }^{\circ} \mathrm{C} / 20$ torr), but was not effective. Further effort to dry by chasing with i-PrOH was also ineffective. Successful drying was accomplished after the damp solid was backfilled with i-PrOAc (3 L), the suspension was heated at $60^{\circ} \mathrm{C}$ (homogenization), and re-concentrated to dryness (50 ${ }^{\circ} \mathrm{C} / 20$ torr) to afford dry 2-chloro-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-lh-pyrazol-l-yl)nicotinic acid (408 g ; 97\% yield for two steps) as a fine, white powder. The product was further dried in a vacuum oven ( $50^{\circ} \mathrm{C} / 10$ torr/ N 2 bleed) for 2 h but marginal weight loss was observed. 1H NMR ( 400 MHz , DMSO-d6) $\delta 13.64$ (s, 1H), $8.49-8.36(\mathrm{~m}, 2 \mathrm{H}), 7.77(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.26(\mathrm{~d}, \mathrm{~J}=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.28(\mathrm{~s}, 2 \mathrm{H}), 1.24$ (s, 6H). 19F NMR ( 376 MHz , DMSO-d6) $\delta-75.2$. KF analysis: $0.04 \%$ water.

## 2. Preparation fiform Ag Compound 1

[00303] The crystalline Form A of Compound 1 was obtained as a result of the following synthesis. Combined 2-chloro-N-(1,3-dimethylpyrazol-4-yl)sulfonyl-6-[3-(3,3,3-trifluoro-2,2-dimethyl-propoxy)pyrazol-l-yl]pyridine-3-carboxarnide(108 g, 207.3 mmol ), (4S)-2,2,4-trimethylpyrrolidine (Hydrochloride salt) ( $77.55 \mathrm{~g}, 518.2$ mmol), was combined with $\mathrm{K}_{2} \mathrm{CO}_{3}(143.2 \mathrm{~g}, 1.036 \mathrm{~mol})$ in DMSO (432.0 mL) and 1,2-
diethoxy ethane $(108.0 \mathrm{~mL})$ in a 1-L RB flask with a reflux condenser. The resulting suspension was heated at $120^{\circ} \mathrm{C}$ and was stirred at temperature overnight. Then the reaction was diluted with $\mathrm{DCM}(1.080 \mathrm{~L})$ and $\mathrm{HC} 1(933.0 \mathrm{~mL}$ of $2 \mathrm{M}, 1.866 \mathrm{~mol})$ was slowly added. The liquid phases were separated, and the aqueous phase was extracted with DCM ( 540.0 mL ).The organic phases were combined, washed with water ( 540.0 $\mathrm{mL})(3 \mathrm{x})$, then dried with $(\mathrm{Na} 2 \mathrm{SC}>4)$ to afford an amber solution. Silica gel ( 25 g ) was added and then the drying agent/silica gel was filtered off. The filter-bed was washed with DCM (3 x 50-mL). The organic phases were combined and concentrated ( $40{ }^{\circ} \mathrm{C} / 40$ torr) to afford crude $\boldsymbol{N}$-(l, 3-dimethylpyrazol-4-yl)sulfonyl-6-[3-(3,3, 3-trifluoro-2,2-dimethyl-propoxy)pyrazol-l-yl]-2-[(4S)-2,2,4-trimethylpyrrolidin-l-yl]pyridine-3carboxamide ( $198.6 \mathrm{~g}, 160 \%$ theory) as an off-white solid. The solid was diluted with MTBE ( 750 mL ), warmed at $60^{\circ} \mathrm{C}$ (external temperature), and mixed to a homogenous suspension. The suspension was cooled to $30{ }^{\circ} \mathrm{C}$ with stirring and the solid was collected by filtration, air-dried, and vacuum-dried to afford Compound 1 (111.1 g; 90 \%) as a fine, white powder.
[00304] The crystalline Form A of Compound 1 was also obtained through the following procedure. A suspension of Compound $1(150.0 \mathrm{~g}, 228.1 \mathrm{mmol})$ in iPrOH $(480 \mathrm{~mL})$ and water $(120 \mathrm{~mL})$ was heated at $82{ }^{\circ} \mathrm{C}$ to obtain a solution. The solution was cooled with a J-Kem controller at a cooling rate of $10^{\circ} \mathrm{C} / \mathrm{h}$. Once the temperature reached $74{ }^{\circ} \mathrm{C}$, the solution was seeded with a sample of Compound 1 in crystalline Form A. Crystallization occurred immediately. The suspension was cooled to $20^{\circ} \mathrm{C}$. The solid was collected by filtration, washed with i-PrOH ( $2 \times 75 \mathrm{~mL}$ ), air-dried with suction, and vacuum-dried $\left(55{ }^{\circ} \mathrm{C} / 300\right.$ torr/ $\mathrm{N}_{2}$ bleed) to afford Compound 1 , Form A $(103.3 \mathrm{~g})$ as a white powder.. The sample was cooled to $\sim 5^{\circ} \mathrm{C}$, let stir for 1 h , and then the solid was collected by filtration (sintered glass/paper). the filter-cake was washed with i-PrOH ( 75 mL ) ( 2 x ), air-dried with suction, air-dried in a drying dish (120.6 g mostly dried), vacuum-dried ( $55^{\circ} \mathrm{C} / 300$ torr/ N 2 bleed) for 4 h , and then RT overnight. Overnight drying afforded $118.3 \mathrm{~g}(87 \%$ yield) of a white powder.

[00318] Synthesis of tert-butyl 2,6-dichloropyridine-3-carboxylate

A solution of 2,6-dichloropyridine-3-carboxylic acid ( $10 \mathrm{~g}, 52.08 \mathrm{mmol}$ ) in THF (210 mL ) was treated successively with di-tert-butyl dicarbonate ( $17 \mathrm{~g}, 77.89 \mathrm{mmol}$ ) and 4(dimethylamino)pyridine ( $3.2 \mathrm{~g}, 26.19 \mathrm{mmol}$ ) and stirred overnight at room temperature. At this point, HCI IN ( 400 mL ) was added, and the mixture was stirred vigorously for about 10 minutes. The product was extracted with ethyl acetate ( $2 \times 300$ mL ), and the combined organic layers were washed with water ( 300 mL ) and brine ( 150 mL ) and dried over sodium sulfate and concentrated under reduced pressure to give 12.94 g ( $96 \%$ yield) of tert-butyl 2,6-dichloropyridine-3-carboxylate as a colorless oil. ESI-MS $\boldsymbol{m} / \boldsymbol{z}$ calc. 247.02 , found $248.1(\mathrm{M}+1)^{+}$; Retention time: 2.27 minutes. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCI}_{3}$ ) ppm $1.60(\mathrm{~s}, 9 \mathrm{H}), 7.30(\mathrm{~d}, \boldsymbol{J}=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 8.05(\mathrm{~d}, \boldsymbol{J}=8.2 \mathrm{~Hz}, 1 \mathrm{H})$.
[00319] Synthesis of tert-buty $\backslash$ 3-oxo-2,3-dihydro-I $\boldsymbol{H}$-pyrazole-l-carboxylate

A 50 L reactor was started, and the jacket was set to $20^{\circ} \mathrm{C}$, with stirring at 150 rpm , reflux condenser $\left(10^{\circ} \mathrm{C}\right)$ and nitrogen purge. $\mathrm{MeOH}(2.860 \mathrm{~L})$ and methyl $(E)$-3-methoxyprop-2-enoate ( $2.643 \mathrm{~kg}, 22.76 \mathrm{~mol}$ ) were added, and the reactor was capped. The reaction was heated to an internal temperature of $40^{\circ} \mathrm{C}$, and the system was set to hold jacket temperature at $40^{\circ} \mathrm{C}$. Hydrazine hydrate ( 1300 g of $55 \% \mathrm{w} / \mathrm{w}, 22.31 \mathrm{~mol}$ ) was added portion wise via addition funnel over 30 min . The reaction was heated to 60 ${ }^{\circ} \mathrm{C}$ for 1 h . The reaction mixture was cooled to $20^{\circ} \mathrm{C}$ and triethyamine $(2.483 \mathrm{~kg}, 3.420$ $\mathrm{L}, 24.54 \mathrm{~mol}$ ) was added portion-wise, maintaining reaction temperature $<30^{\circ} \mathrm{C}$. A solution of Boc anhydride (di-tert-butyl dicarbonate) ( $4.967 \mathrm{~kg}, 5.228 \mathrm{~L}, 22.76 \mathrm{~mol}$ ) in $\mathrm{MeOH}(2.860 \mathrm{~L})$ was added portion-wise maintaining temperature $<45{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred at $20^{\circ} \mathrm{C}$ for 16 h . The reaction solution was partially concentrated to remove MeOH , resulting in a clear, light amber oil. The resulting oil was transferred to the 50 L reactor, stirred and water $(7.150 \mathrm{~L})$ and heptane $(7.150 \mathrm{~L})$ were added. The additions caused a small amount of the product to precipitate. The aqueous layer was drained into a clean container, and the interface and heptane layer were filtered to separate the solid (product). The aqueous layer was transferred back to the reactor, and the collected solid was placed back into the reactor and mixed with the aqueous layer. A dropping funnel was added to the reactor and loaded with acetic acid ( $1.474 \mathrm{~kg}, 1.396 \mathrm{~L}$, $24.54 \mathrm{~mol})$ and added dropwise. The jacket was set to $0{ }^{\circ} \mathrm{C}$ to absorb the quench exotherm. After the addition was complete $(\mathrm{pH}=5)$, the reaction mixture was stirred for 1 h . The solid was collected by filtration and washed with water ( 7.150 L ), and washed a second time with water ( 3.575 L ). The crystalline solid was transferred into a 20 L rotovap bulb, and heptane ( 7.150 L ) was added. The mixture was slurried at $45^{\circ} \mathrm{C}$ for 30 mins, and 1-2 volumes of solvent were distilled off. The slurry in the rotovap flask was filtered, and the solids were washed with heptane ( 3.575 L ). The solid was further dried in vacuo ( $50{ }^{\circ} \mathrm{C}$, 15 mbar ) to give tert-butyl 5 -oxo-l H -pyrazole-2-carboxylate (2921 g, 71\%) as a coarse, crystalline solid. ${ }^{1}$ H NMR ( 400 MHz , DMSO-d6) $\delta 10.95$ (s, $1 \mathrm{H}), 7.98(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.90(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.54(\mathrm{~s}, 9 \mathrm{H})$.

Synthesis of (l-trifluoromethyl-cyclobutyl)-methanol

1-Trifluoromethyl-cyclobutanecarboxylic acid ( $5.0 \mathrm{~g}, 30 \mathrm{mmol}$ ) was dissolved in diethyl ether ( 60 mL ) and cooled to $0^{\circ} \mathrm{C}$. Lithium aluminum hydride ( $38.66 \mathrm{~mL}, 1 \mathrm{M}$ in diethyl ether) was added dropwise, and the solution was allowed to warm to room temperature overnight. The reaction solution was cooled to $0^{\circ} \mathrm{C}$ with stirring, and sodium sulfate decahydrate was added, which resulted in gradual evolution of gas. Portionwise addition was continued until no more bubbling was observed at room temperature. The reaction solution was then filtered over a bed of Celite, washing with diethyl ether. The filtrate was concentrated under reduced pressure to give 5.44 g of a mixture containing the desired product and some diethyl ether residue ( $36 \%$ by NMR integration). This afforded 1-trifluoromethyl-cyclobutyl-methanol ( $3.46 \mathrm{~g}, 78 \%$ ) as a
colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $250 \mathrm{MHz}, \mathrm{CDC} 13$ ) $\delta(\mathrm{ppm}): 3.82(\mathrm{~s}, 2 \mathrm{H}), 2.39-2.14(\mathrm{~m}, 2 \mathrm{H})$, 2.10-1.85 (m, 4H).

The solution was degassed by sonication and flushed with nitrogen gas. Triphenylphosphine ( $2.55 \mathrm{~g}, 9.73 \mathrm{mmol}$ ) was added, and diisopropyl azodicarboxylate ( $1.92 \mathrm{~mL}, 9.73 \mathrm{mmol}$ ) was then added dropwise. Upon completion of addition, the reaction was heated to $50^{\circ} \mathrm{C}$ for 16 hours. After cooling to room temperature, the reaction was diluted with ethyl acetate $(100 \mathrm{~mL})$ and washed with 1 M sodium hydroxide solution ( $2 \times 100 \mathrm{~mL}$ ), then brine ( 125 mL ). The organics were dried over sodium sulfate, filtered, and concentrated under reduced pressure. The reaction was stirred at room temperature overnight, then water $(150 \mathrm{~mL})$ was added and the aqueous layer was extracted with 4:1 ethyl acetate :hexanes ( 100 mL ). The organic phase was washed with brine ( 70 mL ), dried over sodium sulfate, and concentrated under reduced pressure. Stirring was commenced, and the pot temperature was recorded at $19^{\circ} \mathrm{C}$. The vessel was then charged with [1-(trifluoromethyl)cyclopropyl]methanol ( $58.56 \mathrm{~g}, 0.4180 \mathrm{~mol}$ ) added neat in one portion followed by triphenylphosphine ( $109.6 \mathrm{~g}, 0.4180 \mathrm{~mol}$ ) added as a solid in one portion. The resulting clear pale yellow solution was then treated with diisopropyl azodicarboxylate (clear reddish-orange liquid) ( $82.3 \mathrm{~mL}, 0.4180 \mathrm{~mol}$ ) added neat dropwise over 1 hour which resulted in a gradual exotherm to $40^{\circ} \mathrm{C}$ and a clear light amber solution. The reaction mixture was then heated to a pot temperature of 50 ${ }^{\circ} \mathrm{C}$, and the condition was maintained for 2 hours, when analysis by LC/MS indicated complete consumption of the starting material. The clear amber reaction mixture was concentrated under reduced pressure, and the resulting clear dark amber oil was suspended in toluene ( 560 mL ) and stirred at room temperature for 1 hour, during which time a solid (triphenylphosphine oxide MW $=278.28$ ) precipitated. The thick slurry was filtered through a glass frit Buchner funnel, and the filter cake was displacement washed with toluene ( 150 mL ) and then pulled for 30 minutes. The clear amber filtrate was concentrated under reduced pressure to provide a clear amber oil. The material was purified by silica gel column flash chromatography (solid load on Celite 1.5 kg RediSep column) eluting with a gradient of $100 \%$ hexane to $20 \% \mathrm{EtOAc}$ in hexane collecting 450 mL fractions. The resulting clear pale yellow solution was then treated with potassium carbonate ( $39.22 \mathrm{~g}, 0.2838 \mathrm{~mol}$ ) added as a solid in one portion followed by 1,4-diazabicyclo[2.2.2]octane $(3.67 \mathrm{~g}$, 0.03274 mol ) added as a solid in one portion. The resulting pale yellow suspension was allowed to stir at room temperature for 24 hours. The reaction mixture was cooled to 10 ${ }^{\circ} \mathrm{C}$ with a crushed ice/water cooling bath. The addition funnel was charged with water $(540 \mathrm{~mL})$ added dropwise over 45 minutes which resulted in a thick suspension and an exotherm to $15{ }^{\circ} \mathrm{C}$. The resulting suspension was continued to stir at $15^{\circ} \mathrm{C}$ for 30 minutes and then filtered through a glass frit Buchner funnel. The filter cake was displacement washed with water ( $2 \times 500 \mathrm{ml}$ ) and then pulled in the Buchner for 2 hours. Stirring was commenced, and the pot temperature was recorded at $19^{\circ} \mathrm{C}$. The addition funnel was charged with aqueous $6 \mathrm{M} \mathrm{HCl}(139.6 \mathrm{~mL}, 0.8375 \mathrm{~mol})$ which was added dropwise over 10 minutes which resulted in an exotherm to $30^{\circ} \mathrm{C}$. The resulting suspension was then heated to reflux (pot temperature $-82^{\circ} \mathrm{C}$ ). Upon heating the suspension turns to a clear pale yellow solution (pot temperature $-75{ }^{\circ} \mathrm{C}$ at this point). After stirring at reflux for -30 minutes a solid began to precipitate. Step 1: Methyl-d34-methyl-2-(methyl-i/3)-4-nitropentanoate-3,3-i/2

A $500-\mathrm{mL}$, three-neck round bottom flask equipped with a magnetic stir bar, a nitrogen line and a J-Kem thermocouple with heating mantle was charged with 2-nitropropane ( $34.3 \mathrm{~g}, 385 \mathrm{mmol}$ ), c3/4-methyl methacrylate $(50.0 \mathrm{~g}, 460 \mathrm{mmol}$ ), and was stirred at ambient temperature when 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU, $1.47 \mathrm{~g}, 9.62$ mmol ) was added in one portion. The reaction solution exothermed from 20 to $-40{ }^{\circ} \mathrm{C}$ and was allowed to stir without heating or cooling for 16 h . The reaction was only partially completed (HPLC) so the solution was warmed at $80^{\circ} \mathrm{C}$ for 4 h . The reaction mixture is diluted with MTBE ( 170 mL ), washed with $1 \mathrm{M} \mathrm{HCI}(15 \mathrm{~mL})$, dried over
magnesium sulfate, filtered and concentrated ( $29^{\prime \prime} \mathrm{Hg}$ at $60^{\circ} \mathrm{C}$ ) to remove solvent and any residual starting materials to afford product as light yellow oil ( $75 \mathrm{~g}, 99 \%$ ). It was used to the next step without further purification by distillation.

Step 2 : Methyl- $\boldsymbol{d}_{3}$ (,S)-4-methyl-2-(methyl-</3)-4-nitropentanoate-3,3-</2

A 5-L, three-neck round bottom flask equipped an overhead mechanical stirrer, a nitrogen line and a J-Kem thermocouple with heating mantle was charged with methyl${ }^{\text {c3/4 }} 4$-methyl-2-(methyl-i 3)-4-nitropentanoate-3,3-i2 (75 g, 380 mmol ) and 2000 mL of pH 7.5 Na-phosphate buffer @ 0.8 M . To this was added lipase from Rhizomucor miehei (sigma L4277, palatase from Novozymes) ( 0.5 vol ) and stirred at $30{ }^{\circ} \mathrm{C}$ for 25 h . Chiral HPLC (ADH $4.6 \times 250 \mathrm{~mm}, 5 \mu \mathrm{\eta}, 1.0 \mathrm{~mL} / \mathrm{min}$, $98 \%$ Heptane $12 \% \mathrm{IPA}$ ) shows 99.8/0.2 ratio of enantiomers. The reaction mixture was extracted twice with MTBE (1 Leach time). The organic included any emulsion formed during the extractions. The combined organics were washed two times with an aqueous solution of sodium bicarbonate ( 5 vol ), brine ( 5 vol ), dried over sodium sulfate and concentrated under vacuum to afford the desired product methyl-^ (5)-4-methyl-2-(methyl-<i ${ }_{3}$ )-4-nitropentanoate-3,3-i 2 as pale yellow oil ( $32.5 \mathrm{~g}, 43 \%$ yield).

Step 3: (.S)-5,5-Dimethyl-3-(methyl-i/3)pyrrolidin-2-one-4,4-i/2

A high-pressure vessel (Parr shaker bottle, 500 mL ) was purged with and maintained under $\mathrm{N}_{2}$. The vessel was charged sequentially with deionized water rinsed ( 3 times) damp Raney®2800 Ni (6.1 g), methyl-<3/4 (5)-4-methyl-2-(methyl-<i3)-4-nitropentanoate-$3,3-£ 3 / 4(32.5 \mathrm{~g}, 165 \mathrm{mmol})$, and ethanol ( 290 mL ). The vessel was sealed and evacuated/backfilled with $\mathrm{N}_{2}$ (3 times). With no stirring, the vessel was then evacuated and backfilled with $\mathrm{H}_{2}(30 \mathrm{psi})$. The Parr bottle was shaken while heating the contents to $60^{\circ} \mathrm{C}$, and the $\mathrm{H}_{2}$ pressure was maintained at 30 psi for 8 hours. The vessel was
evacuated/backfilled with $\mathrm{N}_{2}$ (3 times) and the contents were removed by vacuum filtration (Celite pad; $\mathrm{N}_{2}$ blanket). The flask/filter-pad was washed with ethanol (3 $\times 50$ $\mathrm{mL})$. After the final wash, the solvent-wet filter-cake was transferred to another receiver and covered with water for disposal. Note: At no time should the catalyst be fully dried (keep damp throughout the filtration process). The filtrate and washes were combined and concentrated ( $40{ }^{\circ} \mathrm{C} / 40$ torr) to afford (5)-5,5-dimethyl-3-(methyl-<i3)pyrrolidin-2-one-4,4-<3/4 as white solid ( $20 \mathrm{~g}, 92 \%$ ).

Step 4: (4S)-3,3-Dideuterio-2,2-dimethyl-4-(trideuteriomethyl)pyrrolidine

## Hydrochloride

A 1-L, three-neck round bottom flask equipped an overhead mechanical stirrer, a nitrogen line and a J -Kem thermocouple was charged with lithium aluminum hydride pellets ( $7.6 \mathrm{~g}, 202 \mathrm{mmol}$ ) in THF ( $80 \mathrm{~mL}, 4 \mathrm{vol}$ ) warmed from $20-36^{\circ} \mathrm{C}$ (heat of mixing). A solution of (5)-5,5-dimethyl-3-(methyl-<i3)pyrrolidin-2-one-4,4-ii2 (20. g, 150 mmol ) in THF ( $120 \mathrm{~mL}, 6 \mathrm{vol}$ ) was added to the suspension over 30 minutes while allowing the reaction temperature to rise to $-60{ }^{\circ} \mathrm{C}$. The reaction temperature was increased to near reflux $\left(-68{ }^{\circ} \mathrm{C}\right)$ and maintained there for 16 h . The reaction mixture was cooled to below $40^{\circ} \mathrm{C}$ and diluted with $200 \mathrm{~mL}(10 \mathrm{vol})$ of MTBE. The mixture was quenched slowly with drop-wise addition of a saturated aqueous solution of sodium sulfate ( 1 vol ) over 2 h . Note: Vigorous degassing $\left(\mathrm{H}_{2}\right)$ was observed, the mixture becomes thick then thins, and the dark gray mixture turns white. After the addition was completed, the reaction mixture was cooled to room temperature. The solid was removed by filtration (Celite pad) and washed with ethyl acetate (4 vol). With external cooling and $\mathrm{N}_{2}$ blanket, the filtrate and washings were combined and treated with drop-wise addition of anhydrous $4 \mathrm{M} \mathrm{HC1}$ in dioxane ( $38 \mathrm{~mL}, 152 \mathrm{mmol}$ ) while maintaining the temperature below $20^{\circ} \mathrm{C}$. After the addition was completed ( 20 minutes), the resultant suspension was concentrated under vacuum at $45^{\circ} \mathrm{C}$. The suspension was backfilled with heptanes $(4 \mathrm{vol})$ twice during concentration. The suspension was cooled to below $30^{\circ} \mathrm{C}$ when the solid was collected by filtration under a
$\mathrm{N}_{2}$ blanket. The solid was dried under $\mathrm{N}_{2}$ suction and further dried under high vacuum at $45^{\circ} \mathrm{C}$ to afford (4S)-3,3-dideuterio-2,2-dimethyl-4-(trideuteriomethyl)pyrrolidine hydrochloride ( $17.5 \mathrm{~g}, 75 \%$ ). The product is quite hygroscopic so it was manipulated under nitrogen.

Step 5 : (,S)-^-((1,3-dimethyl-l H -pyrazol-4-yl)sulfonyl)-2-(2,2-dimethyl-4-(methyl-i/3)pyrrolidin-l-yl-3,3-i/2)-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-l H -pyrazol-

Potassium carbonate (approximately $2.654 \mathrm{~g}, 19.20 \mathrm{mmol}$ ) and (45)-3,3-dideuterio-2,2-dimethyl-4(trideuteriomethyl)pyrrolidine (Hydrochloride salt) (approximately $1.485 \mathrm{~g}, 9.598$ $\mathrm{mmol})$ were added and the resulting slurry was heated at $130^{\circ} \mathrm{C}$ for 28 h . The reation mixture was cooled and poured into rapidly stirred ice water $(60.00 \mathrm{~mL})$ and acetic acid (approximately $3.458 \mathrm{~g}, 3.275 \mathrm{~mL}, 57.58 \mathrm{mmol}$ ). After stirring for 20 min the solids were filtered off and washed with water. The resulting solid was dissolved in ethyl acetate and washed with water, then brine. The organics were dried over sodium sulfate and concentrated. The resulting material was heated in heptanes and the resulting solid was collected and dried to give $(S)-N-((1,3-d i m e t h y l-1 H$-pyrazol-4-yl)sulfonyl)-2-(2,2-dimethyl-4-(methyl-i 3)pyrrolidin-1-yl-3,3-d 2)-6-(3-(3,3,3-trifluoro-2,2-dimethylpropoxy)-1 H-pyrazol-1-yl)nicotinamide ( $0.8 \mathrm{~g}, 35 \%$ ). This mixture was heated to $65^{\circ} \mathrm{C}$ and the heat was turned off and methyl 2-(hydroxymethyl)acrylate ( $25 \mathrm{~mL}, 243 \mathrm{mmol}$ ) was added dropwise. The heat was then turned back on at $80^{\circ} \mathrm{C}$. The reaction mixture was cooled in a dry ice/acetone bath to keep the reaction vessel below $0{ }^{\circ} \mathrm{C}$ during the quench. As quench progresses, a grey/purple solid forms. Following complete addition of aqueous sulfuric acid, the solid never went into solution. The mixture was stirred at $0^{\circ} \mathrm{C}$ for 1 hr . The precipitate was filtered through celite using a medium frit and the precipitate washed with diethyl ether $(900 \mathrm{~mL})$. The filtrate was transferred to a seperatory funnel and the organic phase was washed with brine ( 1 L ), saturated sodium bicarbonate (1L), and brine (1L). The organic phase was dried over magnesium sulfate, filtered over celite, and the solvent was evaporated in vacuo at 100 torr and the water bath set at $20^{\circ} \mathrm{C}$. The crude product was stored at $-23{ }^{\circ} \mathrm{C}$ overnight and used without further purification. 1cyclopropylcyclopropanol ( $61 \mathrm{~g}, 83 \%$ ) was found to contain $-50 \%$ solvent (THF and $\mathrm{iPrOH})$ and used as is in the next step.

## Step 2: 1-bromo-l-cyclopropyl-cyclopropane

A solution of triphenylphosphine ( $56.1 \mathrm{~g}, 213.9 \mathrm{mmol}$ ) in DCM ( 200 mL ) was cooled to $-10{ }^{\circ} \mathrm{C}$. A solution of bromine ( $11.0 \mathrm{~mL}, 214 \mathrm{mmol}$ ) in DCM ( 40 mL ) was added and the reaction was stirred at $-10^{\circ} \mathrm{C}$ for an additional 15 minutes. The reaction was then cooled to $-30^{\circ} \mathrm{C}$ and pyridine ( $3.3 \mathrm{~mL}, 41 \mathrm{mmol}$ ) was added. A solution of $1-$ cyclopropylcyclopropanol ( $20.0 \mathrm{~g}, 204 \mathrm{mmol}$ ), pyridine ( $17.3 \mathrm{~mL}, 214 \mathrm{mmol}$ ), and DCM ( 100 mL ) was added dropwise while maintaining the temperature between $-15^{\circ} \mathrm{C}$ to $-20^{\circ} \mathrm{C}$. After 30 minutes, the addition was complete and the reaction was allowed to gradually warm to rt. ${ }^{1} \mathrm{H}$ NMR analysis showed some product. The reaction was allowed to stir at $40^{\circ} \mathrm{C}$ overnight. GCMS analysis showed $89 \%$ product. The reaction was cooled to rt and then quenched with water $(100 \mathrm{~mL})$. The reaction was stirred for 10 minutes and then the phases were separated. The organic phase succesively washed with

1 M HC1 ( 102 mL ), sat. sodium bicarbonate ( 50 mL ), dried over sodium sulfate, and concentrated ( $30^{\circ} \mathrm{C} /$ house vacuum -300 torr) to remove most of the DCM. The crude reaction mixture was flash distilled $\left(40^{\circ} \mathrm{C} / 20\right.$ torr $)$ to provide the product (approximately 50 g ). The solid residue (PI13PO and product) was re-heated and distilled ( $50-60^{\circ} \mathrm{C} / 20$ torr) to afford 60.4 g . After combining all of the above and rinsing with DCM, concentration afforded $21.5 \mathrm{~g}\left(65 \%\right.$ yield) of a turbid, colorless liquid. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, Chloroform-d) $\delta 5.30(\mathrm{~s}, 1 \mathrm{H}), 1.61(\mathrm{tt}, \mathrm{J}=8.2,5.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.07-1.02(\mathrm{~m}$, $2 H), 0.78-0.66(\mathrm{~m}, 2 \mathrm{H}), 0.67-0.51(\mathrm{~m}, 2 \mathrm{H}), 0.35-0.21(\mathrm{~m}, 2 \mathrm{H})$.

Step 3: cyclopropylidenecyclopropane

A solution of potassium tert-butoxide ( $16.7 \mathrm{~g}, 148.8 \mathrm{mmol}$ ) in DMSO ( 100 mL ) was stirred at RT in a 3-neck 250-mL RB flask. 1-bromo-l-cyclopropyl-cyclopropane (20.0 $\mathrm{g}, 124.2 \mathrm{mmol}$ ) was added dropwise and the reaction immediately turned dark and then brown. The reaction was mildly exothermic (maintained temperature between $18^{\circ} \mathrm{C}$ to $22^{\circ} \mathrm{C}$ using an ice-water bath). After 10 minutes, the addition was completed. The icewater bath was removed and the reaction was allowed to stir at RT. After 90 minutes, ${ }^{1} \mathrm{H}$ NMR analysis showed that the reaction was nearly complete. The reaction mixture was vacuum distilled using a bulb-to-bulb distillation. The distillation took place from $60^{\circ} \mathrm{C}$ to $80^{\circ} \mathrm{C}$ between 40 and 100 torr. The distillate slowly collected in the receiver to afford $18.2 \mathrm{~g}(-95 \%$ for olefin/t-BuOH combined; ) of a colorless liquid which was analyzed by ${ }^{1} \mathrm{H}$ NMR to contain ( 7.28 grams of olefin) along with t-BuOH.

The distillate was further washed with water ( 5 x 10 mL ). DCM ( 10 mL ) was added and the reaction phases were separated with each washing. The organic layers were dried over magnesium sulfate, filtered, and evaporated to afford 17.30 g (containing 7.30 g product; $73 \%$ ) as a colorless liquid (solution). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , Chloroform-d) $\delta$ $1.19(\mathrm{~s}, 8 \mathrm{H})$. The ${ }^{1} \mathrm{H}$ NMR confirms the presence of DCM and a small amount of tertbutanol.

To a solution of cyclopropylidenecyclopropane ( $49.5 \mathrm{~g}, 617.8 \mathrm{mmol}$ ) in DCM ( 110 mL ) at $0^{\circ} \mathrm{C}$ under a nitrogen atmosphere was added rhodium(II) acetate ( $4.2 \mathrm{~g}, 9.503 \mathrm{mmol}$ ). To the mixture at $0^{\circ} \mathrm{C}$ was added ethyl 2-diazoacetate ( $106.8 \mathrm{~mL}, 1.016 \mathrm{~mol}$ ) using a syringe pump set at an addition rate of $0.02 \mathrm{~mL} / \mathrm{min}(1.2 \mathrm{~mL} / \mathrm{hr})$. The addition was continuous for 89 hr . The crude reaction mixture was filtered through a plug of silica, washing 3 X with 150 mL of DCM. The volatile materials were removed in vacuo affording a dark yellow oil, containing $20 \%$ DCM, diethyl (E)-but-2-enedioate and diethyl (Z)-but-2-enedioate as by-products. Ethyl dispiro[2.0.2.1]heptane-7-carboxylate ( $100 \mathrm{~g}, 97 \%$ ), 3/4NMR ( 400 MHz , chloroform-d) $\delta 4.13(\mathrm{q}, \mathrm{J}=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.23$ (s, $1 \mathrm{H}), 1.24(\mathrm{t}, \mathrm{J}=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.08-0.93(\mathrm{~m}, 4 \mathrm{H}), 0.90-0.82(\mathrm{~m}, 2 \mathrm{H}), 0.77(\mathrm{ddd}, \mathrm{J}=$ $8.2,5.0,3.5 \mathrm{~Hz}, 2 \mathrm{H})$.

Step 5: dispiro[2.0.2.1]heptan-7-yl\}methanol

To a slurry of $\mathrm{L}^{2} \mathrm{AIH}_{4}(7.8 \mathrm{~g}, 200.2 \mathrm{mmol})$ in diethyl ether ( 300 mL ) chilled with an icebath was slowly added ethyl dispiro[2.0.2.1]heptane-7-carboxylate (10.77 g, 64.79 mmol ). The mixture was allowed to warm to a gentle reflux during the addition and continued to stir at ambient temperature for 1 hr . By ${ }^{1} \mathrm{H} N \mathrm{NR}$, the reaction was complete. The reaction was chilled with an ice-bath and slowly quenched with the addition of water $(8.0 \mathrm{~mL}, 440 \mathrm{mmol})$, followed by sodium hydroxide $(8.0 \mathrm{~mL}$ of 2 M , $16 \mathrm{mmol})$ and then water ( $24.0 \mathrm{~mL}, 1.33 \mathrm{~mol}$ ). The light yellow slurry was filtered over celite and washed 3 X with 150 mL of MTBE. The filtrate was concentrated in vacuo affording 8.87 g of a clear oil. \{dispiro[2.0.2.1]heptan-7-yl\}methanol ( $8.87 \mathrm{~g}, 110 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( 400 MHz , Chloroform-d) $\delta 3.71$ (dd, J = 6.7, $5.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), 1.76-1.65 (m, $1 \mathrm{H}), 1.46(\mathrm{t}, \mathrm{J}=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 0.87(\mathrm{q}, \mathrm{J}=1.9 \mathrm{~Hz}, 4 \mathrm{H}), 0.72-0.61(\mathrm{~m}, 2 \mathrm{H}), 0.60-0.50$ (m, 2H).

Step 6: 7-(bromomethyl)dispiro[2.0.2.1]heptane

A 1000 mL 3 neck RB flask was fitted with a mechanical stirrer, a cooling bath, an addition funnel, a J-Kem temperature probe and a nitrogen inlet/outlet. The vessel was charged under a nitrogen atmosphere with triphenylphosphine ( $102.7 \mathrm{~mL}, 443.2 \mathrm{mmol}$ ) and dichloromethane ( 1 L ) which provided a clear colorless solution. Stirring was commenced and the cooling bath was charged with acetone. Dry ice was added in portions until a pot temperature of $-15{ }^{\circ} \mathrm{C}$ was obtained. The addition funnel was charged with a solution of bromine ( $22.82 \mathrm{~mL}, 443.0 \mathrm{mmol}$ ) in dichloromethane ( 220 $\mathrm{mL}, 10 \mathrm{~mL} / \mathrm{g}$ ) which was subsequently added dropwise over 1 hour. Dry ice was added in portions during the addition to maintain the pot temperature at $-15{ }^{\circ} \mathrm{C}$. After the addition was completed, the pale yellow suspension was continued to stir at $-15{ }^{\circ} \mathrm{C}$ for 15 minutes at which point the suspension was cooled to $-30^{\circ} \mathrm{C}$. The addition funnel was charged with a solution of dispiro[2.0.2.1]heptan-7-ylmethanol (50 g, 402.6 mmol), pyridine ( $35.82 \mathrm{~mL}, 442.9 \mathrm{mmol}$ ) and dichloromethane ( $250 \mathrm{~mL}, 5 \mathrm{~mL} / \mathrm{g}$ ). The clear pale yellow solution was then added dropwise over 1.5 hours maintaining the pot temperature at $-30^{\circ} \mathrm{C}$. The resulting clear light yellow reaction mixture was allowed to gradually warm to a pot temperature of $-5^{\circ} \mathrm{C}$ and then continue to stir at $-5^{\circ} \mathrm{C}$ for 1 hour. An aliquot was removed, diluted with hexane which resulted in the formation of a precipitate. The suspension was filtered through a plug of celite. The clear filtrate was concentrated under reduced pressure (water bath temperature at $20^{\circ} \mathrm{C}$ ) to provide a clear yellow oil. Analysis by ${ }^{1} \mathrm{H}$ NMR indicated no remaining starting material. Reaction completion was determined by disappearance of starting material doublet at 3.71 ppm and appearance of product doublet at 3.49 ppm . The reaction mixture was poured into hexane ( 2000 mL ) which resulted in the formation of a precipitate. The suspension was stirred at room temperature for 30 minutes and then filtered through a glass frit Buchner
funnel with a 20 mm layer of Celite. The clear filtrate was concentrated under reduced pressure (water bath temperature at $20^{\circ} \mathrm{C}$ ) to provide a yellow oil with some precipitates present. The oil was diluted with hexane, allowed to stand at room temperature for 15 minutes and then filtered through a glass frit Buchner funnel with a 20 mm layer of celite. Stirring was commenced and the pot temperature was recorded at $19^{\circ} \mathrm{C}$. The vessel was then charged with sodium cyanide $(11.46 \mathrm{~g}, 233.8 \mathrm{mmol})$ added as a solid in one portion which resulted in a dark solution and a gradual exotherm to $49^{\circ} \mathrm{C}$ over 15 minutes. After a few minutes the pot temperature began to decrease and the mixture was continued to stir at room temperature overnight (about 15 hours). The dark reaction mixture was quenched with ice cold saturated sodium carbonate solution $(500 \mathrm{~mL})$ and then transferred to a separatory funnel and partitioned with diethyl ether ( 500 mL ). The organic was removed and the residual aqueous was extracted with diethyl ether ( $2 \times 250 \mathrm{~mL}$ ). The combined organic was washed with water ( 500 mL ), dried over sodium sulfate ( 200 g ) and then filtered through a glass frit Buchner funnel. After the completed addition, the pot temperature of the resulting greyish-brown suspension was recorded at $5^{\circ} \mathrm{C}$. The mixture was allowed to slowly warm to room temperature and continue to stir at RT for 24 hours. The suspension was cooled to $0^{\circ} \mathrm{C}$ with a crushed ice/water cooling bath and then quenched by the very slow dropwise addition of water ( 6.483 mL ) , followed by $15 \mathrm{wt} \%$ sodium hydroxide solution $(6.483 \mathrm{~mL}$ ) and then finally with water $(19.45 \mathrm{~mL})$. ## Synthesis of N-(1,3-dimethylpyrazol-4-yl)sulfonyl-6- [3-(norbornan-7- <br> ylmethoxy)pyrazol-l-yl]-2-[(4S)-2,2,4-trimethylpyrrolidin-l-yl]pyridine-3carboxamide (Compound 52)

Steps 1-3: tert-Butyl 3-(7-bicyclo [2.2.1]hept-2-enylmethoxy)pyrazole-l-carboxylate

Step 1: bicyclo[2.2.1]hept-2-ene-7-carbaldehyde
7-bromobicyclo[2.2.1]hept-2-ene ( $400 \mathrm{mg}, 2.311 \mathrm{mmol}$ ) and magnesium ( $67 \mathrm{mg}, 2.757$ mmol ) (surface scratched) were combined in a vial in anhydrous diethyl ether ( 4 mL ), and heated to $40^{\circ} \mathrm{C}$ for 2 hours, at which time the magnesium was mostly, but not completely consumed. The reaction mixture was then cooled to $0^{\circ} \mathrm{C}$, and DMF (220 $\mu \mathrm{L}, 2.841 \mathrm{mmol}$ ) was added dropwise, resulting in the formation of a solid white precipitate. The reaction mixture was returned to $40^{\circ} \mathrm{C}$ for an additional 2 hours, then cooled to room temperature and quenched with 3 mL 0.1 M HCl . After diluting with 25 mL water and 25 mL diethyl ether the layers were seperated, and the aqueous layer was
extracted with an additional $3 \times 20 \mathrm{~mL}$ diethyl ether. The combined organics were washed with brine and dried over sodium sulfate, then partially concentrated to a volume under 1 mL , then used in the next step without isolation.

Step 2: 7-bicyclo[2.2.1]hept-2-enylmethanol
The mixture from the previous step was dilluted with methanol ( 3 mL ) and cooled to 0 ${ }^{\circ} \mathrm{C}$ in an ice bath. Sodium Borohydride ( $262 \mathrm{mg}, 6.925 \mathrm{mmol}$ ) was added, and the reaction mixture was stirred for 2 hours, during which time the ice mostly melted. The reaction mixture was quenched with 3 mL saturated ammonium chloride, then diluted with 20 mL water and 20 mL ethyl acetate. The organics were seperated, and the aqueous layer was extracted an additional $4 \times 20 \mathrm{~mL}$ ethyl acetate. The combined organics were washed with brine and dried over sodium sulfate, then concentrated to an oil. The resulting crude mixture was used in the next step without further purification.

## Step 3:

After 30 minutes the reaction mixture was allowed to warm to room temperature and stirred for 1 hour. The reaction temperature was then increased to $50^{\circ} \mathrm{C}$ for 1 hour, but appeared to rapidly become messier and was returned to room temperature for an additional 16 hours. The reaction mixture was then diluted with 100 mL ethyl acetate, and washed with 50 mL aqueous 1 M NaOH , and the aqueous layer was extracted with an additional 50 mL ethyl acetate. The combined organics were then washed with brine, dried over sodium sulfate and concentrated. The resulting material was purified by flash chromatography on silica gel to give tert-butyl 3-(7-bicyclo[2.2.1]hept-2-enylmethoxy)pyrazole-l-carboxylate ( $20 \mathrm{mg}, 2 \%$ ) ESI-MS m/z calc. 290.16306, found 291.3 (M+1)+; Retention time: 0.74 minutes with a significant impurity unidentified.

## [00312] Assays for Detecting and Measuring F508del-CFTR modulator

 Properties of Compounds
## Membrane potential optical methods for assaying properties of F508del-CFTR modulators

[00313] The assay utilizes fluorescent voltage sensing dyes to measure changes in membrane potential using a fluorescent plate reader (e.g., FLIPR III, Molecular Devices, Inc.) as a readout for increase in functional F508del in NIH 3T3 cells. The driving force for the response is the creation of a chloride ion gradient in conjunction with channel activation and concurrent with compound treatment by a single liquid addition step after the cells have previously been loaded with a voltage sensing dye.

## Al. Identification of F508del-CFTR modulators

To identify modulators of F508del, a fluorescence based HTS assay format was developed. This HTS assay utilizes fluorescent voltage sensing dyes to measure changes in membrane potential on the FLIPR III as a measurement for increase in gating (conductance) of F508del NIH 3T3 cells. The driving force for the response is the creation of a chloride ion gradient in conjunction with channel activation and concurrent with compound treatment by a single liquid addition step after the cells have previously been loaded with a voltage sensing dye. Data for Compounds 1-65 that were obtained using the assay described here are summarized in Table 9 below. For
example, using this method, Compound 1 had an $\mathrm{EC} 5{ }_{0}$ of less than $3 \mu \mathrm{M}$ and a $\%$ Efficacy of $\geq 100 \%$ relative to Compound II.

## Solutions

[00314] Bath Solution \# 1: (in mM) $\mathrm{NaCl} 160, \mathrm{KC1} 4.5, \mathrm{CaCl}_{2} 2, \mathrm{MgCl}_{2}$ 1, HEPES 10, pH 7.4 with NaOH , Glucose 10.
[00315] Chloride-free bath solution: Chloride salts in Bath Solution \# 1 (above) are substituted with gluconate salts.

## Cell Culture

[00316] NIH3T3 mouse fibroblasts stably expressing F508del were used for optical measurements of membrane potential. The cells were maintained at $37^{\circ} \mathrm{C}$ in $5 \% \mathbf{C O 2}$ and $90 \%$ humidity in Dulbecco's modified Eagle's medium supplemented with 2 mM glutamine, $10 \%$ fetal bovine serum, 1 X NEAA, $\beta$-ME, 1 X pen/strep, and 25 mM HEPES in $175 \mathrm{~cm}^{2}$ culture flasks. For all optical assays, the cells were seeded at 12,000 cells/well in 384-well matrigel-coated plates and cultured for $18-24 \mathrm{hrs}$ at $37{ }^{\circ} \mathrm{C}$ for the potentiator assay. For the correction assay, the cells were cultured at $37{ }^{\circ} \mathrm{C}$ with and without compounds for 18-24 hours.
[00317] Electrophysiological Assays for assaying F508del modulation properties of compounds.

Ussing Chamber Assay
[00318] Ussing chamber experiments were performed on polarized airway epithelial cells expressing F508del to further characterize the F508del modulators identified in the optical assays . Non-CF and CF airway epithelia were isolated from bronchial tissue, cultured as previously described (Galietta, L.J.V., Lantero, S., Gazzolo, A., Sacco, O., Romano, L., Rossi, G.A, \& Zegarra-Moran, O. (1998) In Vitro Cell. Dev. Biol. 34, 478-481), and plated onto Costar ${ }^{\circledR}$ Snapwell ${ }^{\text {TM }}$ filters that were precoated with NIH3T3-conditioned media. After four days the apical media was removed and the cells were grown at an air liquid interface for $>14$ days prior to use. This resulted in a monolayer of fully differentiated columnar cells that were ciliated, features that are characteristic of airway epithelia. Non-CF HBE were isolated from non-smokers that did not have any known lung disease. CF-HBE were isolated from patients
homozygous for F508del or compound heterozygous for F508del with an different disease causing mutation on the other allele.
[00319] HBE grown on Costar® Snapwell ${ }^{\text {TM }}$ cell culture inserts were mounted in an Ussing chamber (Physiologic Instruments, Inc., San Diego, CA), and the transepithelial resistance and short-circuit current in the presence of a basolateral to apical $\mathrm{CI}^{-}$gradient (Isc) were measured using a voltage-clamp system (Department of Bioengineering, University of Iowa, IA). Briefly, HBE were examined under voltage-clamp recording conditions $\left(\mathrm{V}_{\mathrm{h}_{0}} \mathbf{i}_{\mathrm{d}}=0 \mathrm{mV}\right)$ at $37^{\circ} \mathrm{C}$. The basolateral solution contained (in mM$) 145$ $\mathrm{NaCl}, 0.83 \mathrm{~K}_{2} \mathrm{HPO}{ }_{4}, 3.3 \mathrm{KH}_{2} \mathrm{P0} 4,1.2 \mathrm{MgCl}_{2}, 1.2 \mathrm{CaCl}_{2}, 10$ Glucose, 10 HEPES (pH adjusted to 7.35 with NaOH ) and the apical solution contained (in mM ) 145

NaGluconate, $1.2 \mathrm{MgCl}_{2}, 1.2 \mathrm{CaCl}_{2}, 10$ glucose, 10 HEPES ( pH adjusted to 7.35 with $\mathrm{NaOH})$.

## A2. Identification of F508del-CFTR modulators

[00320] Typical protocol utilized a basolateral to apical membrane $\mathrm{CI}^{-}$concentration gradient. To set up this gradient, normal ringers was used on the basolateral membrane, whereas apical NaCl was replaced by equimolar sodium gluconate (titrated to pH 7.4 with NaOH ) to give a large $\mathrm{CI}^{-}$concentration gradient across the epithelium.

Modulators were added either to the basolateral side 18-24 prior to assay or to the apical side during the assay. Forskolin $(10 \mu \mathrm{M})$ was added to the apical side during the assay to stimulate CFTR -mediated $\mathrm{CI}^{-}$transport.

## Patch-clamp Recordings

[00321] Total $\mathrm{CI}^{-}$current in F508del-NIH3T3 cells was monitored using the perforated-patch recording configuration as previously described (Rae, J., Cooper, K., Gates, P., \& Watsky, M. (1991) J. Neurosci. Methods 37, 15-26). Voltage-clamp recordings were performed at $22{ }^{\circ} \mathrm{C}$ using an Axopatch 200B patch-clamp amplifier (Axon Instruments Inc., Foster City, CA). The pipette solution contained (in mM) 150 $N$-methyl-D-glucamine (NMDG)-Cl, $2 \mathrm{MgCl}_{2}, 2 \mathrm{CaCl}_{2}, 10$ EGTA, 10 HEPES , and 240 $\mu \mathrm{g} / \mathrm{mL}$ amphotericin- B ( pH adjusted to 7.35 with HC 1 ). The extracellular medium contained (in mM) 150 NMDG-C1, $2 \mathrm{MgCl}_{2}, 2 \mathrm{CaCl}_{2}, 10$ HEPES ( pH adjusted to 7.35 with HC 1 ). Pulse generation, data acquisition, and analysis were performed using a PC
equipped with a Digidata 1320 A/D interface in conjunction with Clampex 8 (Axon Instruments Inc.). To activate F508del, $10 \mu \mathrm{M}$ forskolin and $20 \mu \mathrm{M}$ genistein were added to the bath and the current-voltage relation was monitored every 30 sec .

## A3. Identification of F508del-CFTR modulators

The ability of F508del-CFTR modulators to increase the macroscopic F508del $\mathrm{CI}^{-}$ current (1F508dei) in NIH3T3 cells stably expressing F508del was also investigated using perforated-patch-recording techniques. Modulators identified from the optical assays evoked a dose-dependent increase in $\mathrm{IA}_{\mathrm{F}} 508$ with similar potency and efficacy observed in the optical assays.

## Cell Culture

[00322] NIH3T3 mouse fibroblasts stably expressing F508del are used for whole-cell recordings. The cells are maintained at $37^{\circ} \mathrm{C}$ in 5\% $\mathbf{C O 2}$ and $90 \%$ humidity in Dulbecco's modified Eagle's medium supplemented with 2 mM glutamine, $10 \%$ fetal bovine serum, 1 X NEAA, $\beta$-ME, 1 X pen/strep, and 25 mM HEPES in $175 \mathrm{~cm}^{2}$ culture flasks. For whole-cell recordings, 2,500-5,000 cells were seeded on poly-L-lysinecoated glass coverslips and cultured for $18-24 \mathrm{hrs}$ in the presence or absence of modulators $37{ }^{\circ} \mathrm{C}$.

## Single-channel recordings

[00323] Gating activity of F508del-CFTR expressed in NIH3T3 cells following modulator treatment was observed using excised inside-out membrane patch recordings as previously described (Dalemans, W., Barbry, P., Champigny, G., Jallat, S., Dott, K., Dreyer, D., Crystal, R.G., Pavirani, A., Lecocq, J-P., Lazdunski, M. (1991) Nature 354, 526-528) using an Axopatch 200B patch-clamp amplifier (Axon Instruments Inc.). The pipette contained (in mM): $150 \mathrm{NMDG}, 150$ aspartic acid, $5 \mathrm{CaCl}_{2}, 2 \mathrm{MgCl}_{2}$, and 10 HEPES ( pH adjusted to 7.35 with Tris base). The bath contained (in mM): 150 NMDG-C1, $2 \mathrm{MgCl}_{2}, 5$ EGTA, 10 TES, and 14 Tris base ( pH adjusted to 7.35 with $\mathrm{HC} 1)$. After excision, both wt- and F508del were activated by adding 1 mM Mg -ATP, 75 nM of the catalytic subunit of cAMP-dependent protein kinase (PKA; Promega Corp. Madison, WI), and 10 mM NaF to inhibit protein phosphatases, which prevented current rundown. The pipette potential was maintained at 80 mV . Channel activity was analyzed from membrane patches containing $\leq 2$ active channels. The maximum
number of simultaneous openings determined the number of active channels during the course of an experiment. To determine the single-channel current amplitude, the data recorded from 120 sec of F508del activity was filtered "off-line" at 100 Hz and then used to construct all-point amplitude histograms that were fitted with multigaussian functions using Bio-Patch Analysis software (Bio-Logic Comp. France). The total microscopic current and open probability $\left(\mathrm{P}_{0}\right)$ were determined from 120 sec of channel activity. The $P_{0}$ was determined using the Bio-Patch software or from the relationship $\mathrm{P}_{0}=\mathrm{I} / \mathrm{i}(\mathrm{N})$, where $\mathrm{I}=$ mean current, $\mathrm{i}=$ single-channel current amplitude, and $\mathrm{N}=$ number of active channels in patch.

## Cell Culture

[00324] NIH3T3 mouse fibroblasts stably expressing F508del are used for excisedmembrane patch-clamp recordings. The cells are maintained at $37^{\circ} \mathrm{C}$ in $5 \%$ CO2 and 90 \% humidity in Dulbecco's modified Eagle's medium supplemented with 2 mM glutamine, $10 \%$ fetal bovine serum, 1 X NEAA, $\beta$-ME, 1 X pen/strep, and 25 mM HEPES in $175 \mathrm{~cm}^{2}$ culture flasks. For single channel recordings, 2,500-5,000 cells were seeded on poly-L-ly sine-coated glass coverslips and cultured for $18-24$ hrs in the presence or absence of modulators at $37^{\circ} \mathrm{C}$.
[00325] B. Chromatographic determination of Human Serum Albumin (HSA) Assay
[00326] Chromatographic determination of Human Serum Albumin (HSA) values was performed on a UPLC-MS system using a ChiralPak® HSA column ( $\mathrm{p} / \mathrm{n}$ : 58469AST ) from Sigma Aldrich. Mobile phase A consisted of 50 mM ammonium acetate buffer in water adjusted to $\mathrm{pH}=7.4$, and mobile phase B was 2-propanol. The column compartment was kept at constant temperature of $30^{\circ} \mathrm{C}$. Determination of retention time on the HSA column was performed by injecting 3 mL of 0.5 mM of compound (in DMSO) using a linear gradient from $0 \%-30 \%$ B in 2.5 minutes, followed by a hold at $30 \% \mathrm{~B}$ for 2 minutes, and the final equilibration step from $30 \%$ $0 \%$ B in 1.5 minutes, for a total run time of 6 minutes. Flow rate was kept constant throughout the gradient and set to $1.8 \mathrm{~mL} / \mathrm{min}$. Compound retention time on the HSA column was converted to \%HSA values according to a previously published protocol (Valko, et. al, 2003) correlating column retention times to standard plasma protein
binding (PPB) values obtained from dialysis experiments. HSA data for certain compounds are summarized below in Table 9 below.

## [00328] C. Experimental Protocol for Rat IV and PO PK studies

[00329] The tested compound was administered to male Sprague-Dawley rats as a single nominal intravenous dose of $3.0 \mathrm{mg} / \mathrm{kg}$ as a solution in $10 \%$ NMP, $10 \%$ solutol, $15 \% \mathrm{EtOH}, 35 \%$ PEG400 and $30 \%$ D5W. The tested compound was also administered to male Sprague-Dawley rats at single nominal oral dose of $3 \mathrm{mg} / \mathrm{kg}$ as a solution in 5\% NMP, 30\% PEG400, 10\% TPGS, 5\% PVP-K30 at $5 \mathrm{~mL} / \mathrm{kg}$ dose volume. Analyses of plasma and dose preparations were performed using LC/MS/MS.
[00330] Plasma concentration-time profiles of the tested compound in SpragueDawley rats at scheduled (nominal) sampling times were analyzed by noncompartmental pharmacokinetic methods using PK function within Watson LIMS software, Version 7.4.2 (Thermo Scientific Inc, Waltham, MA). AUC values were calculated using the linear trapezoidal rule.

## [00331] D. Experimental Protocol for PXR assay

[00332] The propensity for PXR mediated CYP3A4 induction is assessed using the DPX-2 cell line in vitro. This cell line, which has been licensed from Puracyp Inc. was derived from HepG2 cells and has been stably transfected with genes encoding human PXR as well as a modified luciferase reporter linked to the CYP3A4 promoter region and related distal and proximal enhancers.
[00333] The assay is run in 384 well format and each test article is administered in 11 doses ranging from 0.1 to $60 \mu \mathrm{M}$. On day 1, DPX-2 cells which have previously been expanded in-house and cryopreserved are thawed and seeded in tissue culture plates. The following day, media is changed and cells are cultured in media containing test article, vehicle control or the positive control compound, the clinically validated CYP3A4 inducer rifampicin. Cells are cultured in the presence of test article for 48 hours and then cell viability is assessed using fluorescence based assay (Cell TiterFluor, Promega) with an EnVision Plate Reader (PerkinElmer). Subsequently, CYP3A4
transactivation, which is proportional to luciferase activity, is measured by reading luminescense using the Promega One-Glo reagent system using the same plate reader.
[00334] Data processing within the Genedata software package allows reporting of max fold induction compared to vehicle control, an $E C 5{ }_{0}$ value for CYP3A4 inducers and an 11 point-dose response curve. Wells with cell viability less than $70 \%$ are not used for the analysis and plates where the rifampicin positive control response falls outside of the expected range, either in potency or max fold induction, are not reported.

[00338] F. Metabolites
[00339] It has been determined that Compound 1 is metabolized both in vitro and in vivo, mostly by oxidative metabolism. Compounds $30,31,36,39,45$, and 57 are metabolites of Compound 1.

## [00340] Example G: Chloride Transport Experiments

[0035] In one Ussing Chamber experiment with F508del/F508del-HBE cells, Compound 1 enhanced chloride transport. The effect of Compound 1 on chloride transport was additive to the effect of Compound II. In addition, F508del-CFTR delivered to the cell surface by either Compound 1 alone or in combination with Compound II was potentiated by Compound III. The triple combination of Compound 1 / Compound II / Compound III provided a superior increase in chloride transport compared to the 3 dual regimens under most conditions tested.
[0036] Example G2: F508del-CFTR Processing and Trafficking In Vitro Experiments
[0037] The combination of Compound 1 and Compound II resulted in more than additive improvement in CFTR processing and trafficking compared to either CFTR corrector alone, suggesting that the two CFTR correctors act through different mechanisms of action, which act synergistically to increase the amount of F508del-CFTR delivered to the cell surface.
[0038] In addition, the more than additive effect of the combination of Compound 1 and Compound II on the processing and trafficking of CFTR suggests that the two CFTR correctors act through different mechanisms to result in the delivery of more CFTR protein to the cell surface compared to either CFTR corrector alone.
