U.S. GEOLOGICAL SURVEY URBAN-STORMWATER DATA BASE FOR 22 METROPOLITAN AREAS THROUGHOUT THE UNITED STATES

By Nancy E. Driver, Martha H. Mustard, R. Bret Rhinesmith, and Robert F. Middelburg

ABSTRACT

The U.S. Geological Survey has been collecting urban rainfall, runoff, and, more recently, water-quality data nationally for several decades. Previously, these data have been stored in many data bases and locations. Recently, a collective urban-stormwater data base has been assembled on magnetic tape and contains data from the U.S. Geological Survey's urban-stormwater program, that includes data from the Nationwide Urban Runoff Program.

Stations having simultaneous rainfall, runoff, and water-quality stormwater data were selected for the data base. Rigorous quality-assurance procedures were followed to ensure that the data were accurate. The resultant data base contains information for 717 storms from 99 stations in 22 metropolitan areas throughout the United States. Data for five or more storms are available for about two-thirds of the watersheds. This data base is available to the public in standardized format on magnetic tape. This publication explains the content and format of the tape.

INTRODUCTION

The U.S. Geological Survey has been involved, nationwide, in urban-runoff data collection and study efforts for the past several decades. Earlier studies involved only rainfall and runoff data; whereas, in recent years, many projects have included water-quality data collection and analysis. Some of the water-quality oriented projects were part of the Nationwide Urban Runoff Program (NURP), sponsored in coordination with the U.S. Geological Survey urban-hydrology studies program and the U.S. Environmental Protection Agency.

The U.S. Geological Survey urban rainfall, runoff, and water-quality data have been stored in many data bases. A collective urban-stormwater data base has now been compiled on magnetic tape containing data from urban-stormwater studies conducted by the U.S. Geological Survey. Stations having simultaneous rainfall, runoff, and water-quality stormwater data were selected for the data base. This report and the associated data tape provide a comprehensive compilation of urban-stormwater data, references to pertinent published reports, and contacts for further information.

The urban-studies data collected from the different study areas generally are of the same type because data from the NURP studies were collected according to a Technical Coordination Plan developed by an interagency group. The data have a few changes and modifications as a result of local conditions and requirements of the local agencies involved in the study. In each of the 22 metropolitan areas, several basins were selected that would characterize a special urban use or management practice. Within the basin, one or possibly more monitoring sites were established. These sites, provided with a unique identification number, will be referred to as stations in this report. A typical station contains, at least, a recording device to monitor the water stage on a continuous basis. For these studies, water stage is measured and recorded every 5 minutes, although occasionally, a recorder may be set to record at other regular intervals. Information collected by this procedure is stored in WATSTORE files (U.S. Geological Survey, 1983), referred to as the unit values for individual measurements and daily values for accumulated data representing conditions based on a 24-hour or daily basis. Unit-values data are stored only for periods related to storm runoff.

Another type of data collected on a continuous basis (at regular intervals) is rainfall. These data also are stored in the unit-values file for storms and may be stored in the daily-values file for the period of record.

Water-quality data were collected at all of the stations included in this compilation and are stored in the water-quality file. No constant time interval was used during collection; each sample collected and analyzed is referenced to its collection date and time. Stored water-quality data include a variety of constituents, and values for each constituent concentration are stored under a unique code called a parameter code. Not all constituents may be present for each analysis; but, in general, a fairly common list of constituents was used at each study. This water-quality list was established for NURP studies by the Technical Coordination Plan. A list of the different constituents and the corresponding parameter codes is given in the "Water Quality" section of this report.

Data-screening criteria were established to select the stations from which data have been recorded on the magnetic tape. The data-screening criteria are presented in the "Selection and Quality Assurance of Data" section. On the basis of these criteria, 99 stations from 22 urban-stormwater study (metropolitan) areas in the United States were selected (fig. 1).

Information describing the data on the magnetic tape is presented in tables 1 through 101 presented in the "Hydrologic Data" section at the back of the report. The references to pertinent published reports are listed in the "Selected Bibliography by Urban-Stormwater Study Area" section, and offices to contact for further information are listed in table 102 presented in the "Hydrologic Data" section at the back of the report.

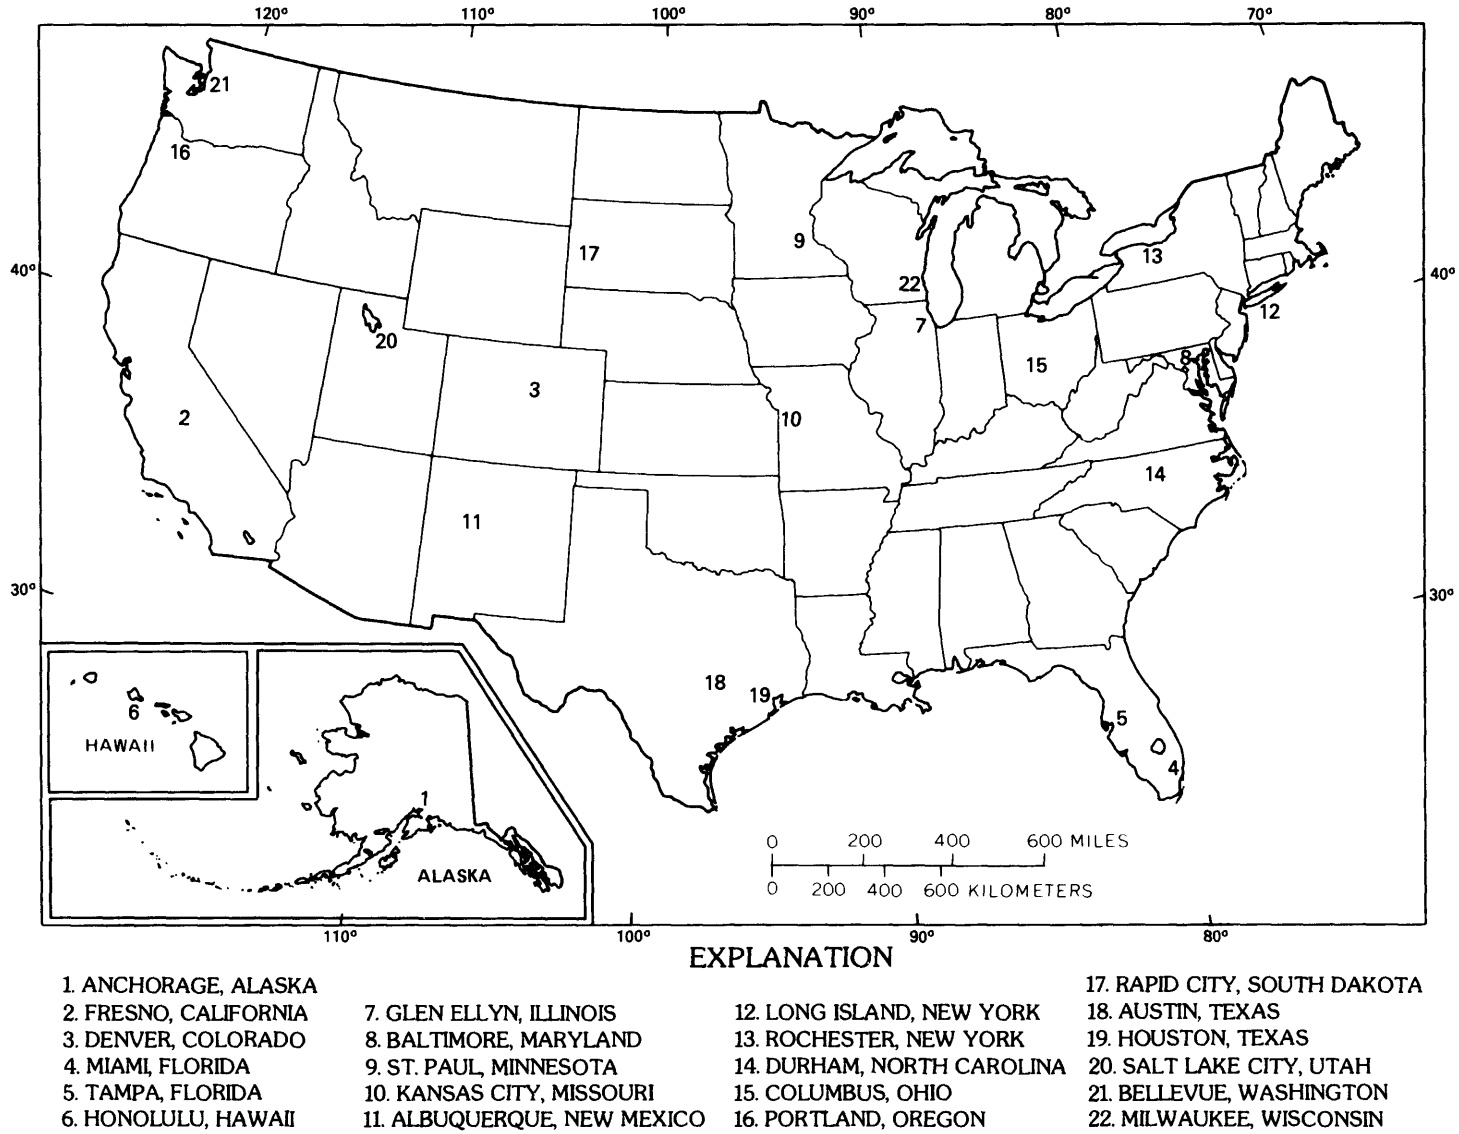

Figure 1.--Location of the urban-stormwater study areas.

Appreciation is extended to the U.S. Geological Survey districts and field offices that helped in compiling and accessing their data for this data base. Joy Lorens of the Gulf Coast Hydroscience Center of the U.S. Geological Survey was invaluable for her computer contributions and counseling. Timothy Liebermann of the Colorado District of the U.S. Geological Survey significantly contributed to the computer programming aspects of the project. The Gulf Coast Hydroscience Center and Colorado District staff were exceptionally cooperative and supportive when problems arose and deadlines had to be met.

U.S. GEOLOGICAL SURVEY URBAN-STORMWATER DATA-BASE DESCRIPTION

Water Quality

Data stored in the water-quality file consist of analyses of water samples collected as either discrete samples or composite samples. The data that are stored on magnetic tape for each station are listed in tables 2 through 100 in the "Hydrologic Data" section at the back of the report. The water-quality data on magnetic tape are limited to the following constituents listed with their parameter codes (U.S. Geological Survey, 1983):

Category	Parameter code	Properties or constituents included
Field measurements	00010	Water temperature, in degrees Celsius.
	00061	Instantaneous stream discharge, in cubic feet per second.
	00095	Specific conductance, in microsiemens per centimeter at 25° Celsius.
	00400	pH, in standard units.
Common ions (all concentrations in milligrams per liter)	00410	Alkalinity, titration to pH 4.5, as calcium carbonate.
	00440	Bicarbonate ion.
	00915	Calcium, dissolved.
	00920	Magnesium, as calcium carbonate.
	00925	Magnesium, dissolved.
	00930	Sodium, dissolved.
	00935	Potassium, dissolved.
	00940	Chloride, dissolved.
	00945	Sulfate, dissolved.
	00950	Fluoride, dissolved.
	00955	Silica, dissolved.
	70300	Dissolved solids, residue on evaporation at 180° Celsius.
	70301	Dissolved solids, sum of constituents.
	90410	Alkalinity, titration to pH 4.5, laboratory.
	90440	Bicarbonate, incremental titration, laboratory.

Category	Parameter code	Properties or constituents included
Nutrients (all concentrations in milligrams per liter)	00608	Nitrogen, ammonia, dissolved.
	00623	Nitrogen, ammonia plus organic, dissolved.
	00625	Nitrogen, ammonia plus organic, total.
	00630	Nitrogen, nitrite plus nitrate, total.
	00631	Nitrogen, nitrite plus nitrate, dissolved.
	00665	Phosphorus, total.
	00666	Phosphorus, dissolved.
	00671	Phosphorus, orthophosphate, dissolved.
Metals and trace elements (all concentrations in micrograms per liter)	01000	Arsenic, dissolved.
	01002	Arsenic, total.
	01025	Cadmium, dissolved.
	01027	Cadmium, total.
	01030	Chromium, dissolved.
	01034	Chromium, total.
	01040	Copper, dissolved.
	01042	Copper, total recoverable.
	01049	Lead, dissolved.
	01051	Lead, total.
	01090	Zinc, dissolved.
	01092	Zinc, total.
Sediment (all concentrations in milligrams per liter)	00505	Residue, total volatile.
	00530	Solids, residue at 105° Celsius, suspended.
	00545	Residue, settleable.
	80154	Sediment, suspended concentration.
Organic compounds (all concentrations in milligrams per liter)	00681	Carbon, organic, dissolved.
	00689	Suspended organic carbon.
Bacteria	31625	Fecal coliform, colonies per 100 milliliters.
Oxygen demand (all concentrations in milligrams per liter)	00310	Five-day biochemical oxygen demand, at 20° Celsius.
	00340	Chemical oxygen demand.
Miscellaneous	72005	Sample source codes
	82074	Ending time (24-hour time)

Water-quality samples stored in the data base can represent either discrete samples or composite samples. Discrete samples are collected instantaneously and, therefore, describe conditions at a particular time only. If discrete samples were collected during a storm, a series of discrete samples was collected to calculate storm loads and weighted mean concentrations of water-quality constituents. Base-flow samples are discrete samples collected prior to the runoff, and they are identified as such in the data base only if they were collected prior to the start time of the data in the unit-values files.

Composite samples listed in the data base represent a flow-weighted composite sample. The procedure followed when preparing a composite sample is based on obtaining a representative subsample from a discretely collected sample. The volume of the subsample is proportional to the volume of flow represented by the discretely collected sample. These flow-proportional subsamples then were mixed together into a single sample representing a period, generally the entire storm-runoff period.

Composite samples and base-flow samples are identified in the individual-station tables only. There is no way to distinguish between sample types from the data on the tape because the format is the same for both sample types.

Unit Values

Unit-values data are time-series data collected at regular intervals, 1 to 15 minutes. Accumulated values are totals for an interval of time. The time recorded in the data set is the end time for the interval. Instantaneous values are measured at the associated time. Unit-values data stored in the data base are listed for station by date and time. Data for two variables, rainfall and runoff, also are stored in the unit-values file. They are shown below with their parameter codes (U.S. Geological Survey, 1983):

Parameter code	Description
00045	Rainfall, accumulated, in inches.
00060	Discharge, instantaneous, in cubic feet per second.

Daily Values

Daily-values data stored in the data base are listed by date for each station. Data for two variables are present in the file. The variables and their parameter codes are:

Parameter code	Description
00045	Rainfall, accumulated, daily, in inches.
00060	Discharge, mean daily, in cubic feet per second.

Basin Characteristics

The basin-characteristics file contains selected basin characteristics that are available for a given station. Each characteristic is stored in the data file under a unique name of five or six characters as shown in the following listing (Doyle and Lorens, 1982). Total contributing drainage area, land use, and impervious area or effective impervious area for each basin are available on the file. Additional basin characteristics also are available on the data tape if they have been determined by the U.S. Geological Survey for the particular urban-stormwater study area. Basin characteristics in the file are:

Unique name	Description of basin characteristics
SITE	Site identification number, which is an 8- or 15-digit station-identification number.
TCAREA	Total contributing drainage area, in square miles.

The following characteristics refer to use of the basin as a percentage of drainage area (TCAREA):

LURUPA	Rural and pasture.
LUAGRI	Agriculture.
LULOWD	Low-density residential: one-half to two dwellings per acre.
LUMEDD	Medium-density residential: three to eight dwellings per acre.
LUHIGD	High-density residential: nine or more dwellings per acre.
LUCOMM	Commercial.
LUINDU	Industrial.
LUCONB	Under construction, normally bare surface.
LUIDLE	Idle or vacant land.
LUWETL	Wetland.
LUPARK	Parkland.

Unique name	Description of basin characteristics
LAND	Total percent of land use of the basin (should equal 100 percent).
IAREA	Impervious area, in percentage of drainage area (TCAREA).
EAREA	Effective impervious area, in percent of drainage area--includes only impervious surfaces connected directly to a sewer pipe or principal conveyance.
BSLOP	Average basin slope, in feet per mile, determined from an average of terrain slopes at 50 or more equispaced points using best available topographic map.
CSLOP	Main conveyance slope, in feet per mile, measured at points that are 10 and 85 percent of the distance from the streamflow-gaging station to the upstream basin divide along the principal conveyance.
PAHOR	Permeability of the A horizon of the soil profile, in inches per hour.
AWAABC	Available water capacity as an average of the A, B, and C soil horizons, in inches of water per inch of soil.
SWPHA	Soil-water pH of the A horizon.
HYSGR	Hydrologic soil group, either A, B, C, or D according to U.S. Soil Conservation Service methodology; coded as A=1, B=2, C=3, or D=4.
POPDEN	Population density, in persons per square mile.
STDEN	Street density, in lane miles per square mile--computed using lane width equal to 12 feet.
DETSTO	Detention storage, in acre-feet of storage.
PERWUD	Percent of watershed upstream from detention storage.
PERSEW	Percent of area drained by a storm-sewer system.
PERCAG	Percent of streets with curb and gutter drainage.
PERDAS	Percent of streets with ditch and swale drainage.
MANRNT	Mean annual rainfall, in inches.
TENYRR	Ten-year 1-hour rainfall intensity, in inches per hour.
AVFRSS	Average frequency of street sweeping, in days.
EAFENI	Estimated fertilizer applied to watershed annually, in pounds per acre of nitrogen.
EAFEPR	Estimated fertilizer applied to watershed annually, in pounds per acre of phosphorous.
AVSEFF	Average sewer-flushing frequency, in days.
AVBCFR	Average catch-basin cleaning frequency, in days.
EADVTR	Estimated average daily vehicle traffic, in vehicle miles per day.
MEFQSC	Method or type of street-sweeping equipment.
GAOINE	Grading and agricultural ordinances in effect.
RECOLP	Refuse-collection practice.

Unique name	Description of basin characteristics
SWASDP	Solid-waste-disposal areas in watershed.
FLREFE	Flood-retarding features, such as gravel filter strips.
LEAFDP	Leaf-disposal practice in watershed.
SEDSOU	Identification of major sediment source(s).
STPTCO	Street pavement and condition.
DEICCH	Deicing chemicals.
MRLXXXXX	Mean annual loads of water-quality constituents in runoff, in pounds per acre. XXXXX is the 5-digit WATSTORE parameter code.
MWLXXXXX	Mean annual loads of water-quality constituents in wetfall, in pounds per acre. XXXXX is the 5-digit WATSTORE parameter code.
MDLXXXXX	Mean annual loads of water-quality constituents in dryfall, in pounds per acre. XXXXX is the 5-digit WATSTORE parameter code.

SELECTION AND QUALITY ASSURANCE OF DATA

Data presented on the magnetic tape were compiled after receiving responses to a questionnaire sent to every District office of the U.S. Geological Survey. The purpose of the questionnaire was to identify all stations that met the following criteria:

1. The U.S. Geological Survey was a cooperating agency in the study. This requirement ensures that standard U.S. Geological Survey methods were used to collect the data and that standard quality-assurance criteria were used by the project personnel.
2. Documented basin characteristics are available for the drainage basin associated with the monitoring station. The minimally required characteristics were: contributing drainage area, land use, and impervious area or effective impervious area.
3. There are complete sets of data for at least five rainfall-runoff storms, including unit values of rainfall and runoff and water-quality analyses representing the entire period of storm runoff. The limitation of five storms was later relaxed because many stations did not meet this criterion.
4. If a station was used to gage the outflow from a detention pond, then data from a station used to gage the inflow to the detention pond also are available.
5. If a station was used to gage the intervening drainage area between two stations on a river or stream, then data for the upstream station are available in order for data for the downstream station to be included. The upstream station need not have basin characteristics or rainfall data.

Exceptions to the above criteria were made for the rainfall-simulation sites in the Denver, Colorado, metropolitan area (tables 22 through 30). These nine sites were a series of small artificial drainage basins constructed on a street surface and subjected to simulated rainfall for a research project (Mustard and others, 1985). Rainfall unit values were not available for the simulated rainfall-runoff storms at these sites; however, the simulated rainfall was applied to the sites at a constant rate for a given period. There was only one simulated storm at each of the nine sites.

The procedures below were followed to retrieve data from WATSTORE (U.S. Geological Survey, 1983) and to ensure quality control of the storm data. Each U.S. Geological Survey office for the particular urban-stormwater study area had performed a quality-control check to ensure validity of the data. The additional quality control described here was necessary to ensure that the data included on the magnetic tape were comprehensive enough to accurately describe water quality during storm runoff:

1. Unit values of rainfall and runoff were stored on a temporary disk as SAS[1] (SAS Institute Inc., 1979) datasets. The procedure followed is outlined in Doyle and Lorens (1982).
2. Water-quality data were stored as SAS datasets on the disk using the procedures outlined in Doyle and Lorens (1982).
3. Storm intervals were determined from SAS datasets for storms that contained water-quality data and rainfall and runoff unit-values data.
4. The unit values of rainfall and runoff were used in the procedure RRLIST (Doyle and Lorens, 1982), which produces an interval-by-interval listing of the runoff and rainfall for as many as three rain gages. RRLIST also calculates the volume of runoff, in inches, over the drainage area, and the percentage of runoff from the rainfall at each rain gage. The procedure RRLIST was modified to account for base flow. The ratio of runoff to rainfall for each storm was compared to the percentage of impervious area (or the percentage of effective impervious area if available). Any storm having a ratio of greater than about 1.10 (to allow for error in measurement and accuracy of rain gage representation) was excluded from the file unless base flow was present. (Although such data sets were not included on the urban-stormwater file, they are still available in WATSTORE.) If base flow was present and if an inaccuracy in its determination could account for the large ratio, then the storm was not excluded at this point in the quality-assurance check.
5. If the runoff for a storm was sampled by means of a composite sample or a series of composite samples, it was assumed that the sampling represented the duration of storm runoff.

---

[1]Use of the firm name in this report is for identification purposes only and does not constitute endorsement by the U.S. Geological Survey.

6. If the storm was sampled by a series of discrete samples, a plot program was used to plot the rainfall versus time, the hydrograph, and water-quality loadings versus time for as many as 20 water-quality constituents. A mark on the loadings graph indicated the times of the samples. These graphs were checked for obvious data-entry errors and for the timing of the discrete samples. Any storm for which the increasing discharge, near the peak discharge, and decreasing discharge were not sampled adequately was excluded from the data file. If a key chemical analysis of a particular constituent was missing, then the other analyses of that particular constituent during that storm were excluded from the data file to avoid misinterpretation of the data when using a chemical load-calculation program. (For example, if the nitrogen analysis was missing for the only sample collected during increasing discharge, then all nitrogen analyses for that storm were excluded from the data file; no other constituents would be affected.) A program, used in association with the plot program, calculated the constituent loads transported during the storm runoff. It also calculated the percentage of the runoff that occurred between the first and last sample. If the percentage was less than 50 percent, the storm was excluded from the data file. Because not every constituent was plotted, it still is necessary to check the data for each storm instead of using them indiscriminately in any urban-stormwater analysis.

If there were any questions about the data during quality-assurance procedures, U.S. Geological Survey project personnel for the particular study area were contacted to help resolve discrepancies. These quality-assurance procedures herein were used to compile data only for storms that had all of the following components: rainfall, runoff, and water quality. Not all errors can be detected by any particular method of quality assurance; therefore, it is necessary that any questions concerning the validity of the data be discussed with project personnel who collected and analyzed the data. They need to be consulted for any additional data, such as atmospheric deposition data and analyses, excluded from this compilation. The offices to contact are listed in table 102 in the "Hydrologic Data" section at the back of the report.

Data presented in the basin-characteristics files were obtained directly from the questionnaires. The only quality-assurance procedure applied to these data was a check to ensure that the land-use percentages totalled 100 percent.

The daily-values files in the urban-stormwater data base are files retrieved from WATSTORE (U.S. Geological Survey, 1983). These files contain daily values for the runoff stations and rainfall stations. The data were retrieved only for the period of project operation, as determined from the questionnaires. The retrieved data were put into SAS datasets and loaded on to the tape. No additional quality-assurance procedures were used for these data.

Quality-assurance procedures were applied to the data when in SAS format; however, following the screening, data have been converted to a universal format for storage on magnetic tape. Specific information regarding format is presented in the "Data Storage and Tape Format" section of this report.

STUDY AREAS

Information compiled in the data base is from the geographical areas of the United States shown in figure 1. All the stations included in the data base are listed in table 1 and are organized in alphabetical order by State and urban-stormwater study area. The station number and name, predominant land use, and other pertinent information also are summarized. The U.S. Geological Survey offices that can be contacted for further information for each study area are listed in table 102 in the "Hydrologic Data" section at the back of the report. Specific storm data for each station on the data tape are provided in tables 2 through 100 in the "Hydrologic Data" section at the back of the report. A list of references, organized by study area, are presented in the "Selected Bibliography by Urban-Stormwater Study Area" section. The bibliography contains both data and interpretive reports, where available, that pertain to stations in each of the 22 study areas.

DATA STORAGE AND TAPE FORMAT

A magnetic tape of 237 files contains the available, quality-assured, water-quality, unit-values, daily-values, and basin-characteristics data for 99 stations in the 22 urban-stormwater (metropolitan) areas studied. The data tape is organized in alphabetical order by State and study area. Within a study area, the stations are listed in ascending order by their station identification number in each type of file; however, 8-digit station numbers always precede 15-digit station numbers within a study area. Each study area has one water-quality file for an entire study area, and one unit-values file for each station in a study area containing runoff data and data from at least one rainfall gage; a basin-characteristics file for each station also is included. If daily-values data are available for a study area, one file contains the daily-values data for all the stations in the study area.

The data tape is formatted into 80-character records. The following format explanations for each type of file are described using notations in SAS (SAS Institute, Inc., 1979) language. The water-quality files have the constituents and properties listed by increasing numerical order according to parameter code. The constituent names and their corresponding parameter codes are listed in the "Water Quality" section. The water-quality files on the data tape have the following variables and format:

```

where: STATION = an 8- or 15-character alphanumeric variable for the station identification number;
$CHAR15. = an alphanumeric format for station with a field width of 15 characters;
@17 = the column at which the first character of the date variable is positioned;
DATE = a numeric variable for date with the format year-month-day (84-01-31);
YYMMDD8. = the format for date;
@26 = the column at which the first character of the time variable is positioned;
TIME = a four-character alphanumeric variable for time, in the 24-hour format;
$CHAR4. = an alphanumeric format for time with a field width of four characters;
@35 = the column at which the first digit of the first constituent variable is positioned;
P00010 = the five-digit water-quality parameter code with the preceding character, P;
10.3 = the format for the constituent, a real numeric variable with a field width of 10 characters with 3 characters to the right of the decimal; and
/ (slash) = a new data card (80-character record).

A period (.) on the data tape indicates that the value is missing.

The unit-values file for each station in a study area is composed of rainfall and runoff data and is stored on the data tape following the water-quality file. The rainfall data for each station in a study area follow the runoff data. There may be as many as three rainfall gages for each runoff station. The rainfall and runoff unit-values data have the following variables and format:

```
STATION $CHAR15. @17 PARMCODE Z5. @23 STATCODE 2. @26 DATE YYMMDD8.
  @35 TIME TIME8. @44 DATETIME DATETIME16. @61 VALUE 9.3;
```

where: STATION = an 8- or 15-digit character alphanumeric variable for station identification number;
$CHAR15. = an alphanumeric format for station with a field width of 15 characters;
@17 = the column at which the first digit of the parameter code is positioned;

PARMCODE = a five-digit numeric variable for the parameter code;
Z5. = a format of five integers with leading zeros for parameter code;
@23 = the column at which the first digit of the statistic code variable is positioned;
STATCODE = a two-digit numeric variable for statistic code;
2. = the format for the numeric variable, statistic code, with field width of two characters;
@26 = the column in which the first character of the date variable is placed;
DATE = a numeric variable for the date with the format year-month-day (84-01-31);
YYMMDD8. = the format for date;
@35 = the column in which the first character of the time variable is placed;
TIME = an eight-digit numeric variable for time with the format hours:minutes:seconds (23:31:55);
TIME8. = the format for time;
@44 = the column in which the first character of the datetime variable is placed;
DATETIME = a 16-digit numeric variable for date and time with the format day month year:hours:minutes:seconds (31JAN84:23:31:55);
DATETIME16. = the format for date and time;
@61 = the column in which the first digit of the value variable is placed;
VALUE = as many as a nine-digit numeric variable for the runoff unit value; and
9.3 = the format of value, a real numeric variable with a field width of nine characters with three characters to the right of the decimal.

PARMCODE is explained in the "Unit Values" section. STATCODE is a unique two-digit code identifying the frequency of the measurement or the statistical reduction of the data in the WATSTORE computer files (U.S. Geological Survey, 1983). Runoff data generally are collected as instantaneous values (statistical code 11), whereas rainfall data usually are collected as an accumulative value (statistical code 06). The statistical codes in the file are:

Statistical code	Description
03	Mean
06	Sum
11	Instantaneous

If an urban-stormwater study area has runoff or rainfall daily-values data, or both, a daily-values file follows the last unit-values file for that study area. The daily-values file contains rainfall data and runoff data for each station in the study area. The file has the following variables and format:

```
STATION $CHAR15. @17 PARMCODE Z5. @23 STATCODE 2. @26 DATE YYMMDD8.
  @35 DATETIME DATETIME16. @52 VALUE 9.3;
```

The variables and format are the same as those used for the unit-values data.

The last file presented for each urban-stormwater study area is a basin-characteristics file for each station in that study area. This file contains site-specific data described in the "Basin Characteristics" section; these data are all numeric entries. The basin-characteristics file has the following variables and format:

```
@5 'SITE' @10 SITE @30 'FILE CREATED' @43 DAY DATE7. /
TCAREA 5-15 2 @17 'CONTRIBUTING DRAINAGE AREA, SQUARE MILES' /

Where:  @5 = the column in which the first character of the word 'SITE'
          is placed;
        'SITE' = printed as such on the tape;
        @10 = the column in which the first character of the station
          identification variable is placed;
        SITE = an 8- or 15-digit variable for the station identification
          number;
        @30 = the column in which the first character of the words 'FILE
          CREATED' is positioned;
```

---

[1]Data for MRL00095, MWL00095, and MDL00095 actually are for constituent 70300, which is dissolved solids, residue on evaporation, in milligrams per liter at 180° Celsius.

[2]Data for MRL00500, MWL00500, and MDL00500 actually are for constituent 00530, which is suspended solids residue, in milligrams per liter at 105° Celsius.

[3]Data for MRL00600, MWL00600, and MDL00600 are for constituent 00600, which is nitrogen, total, in milligrams per liter.

'FILE CREATED' = printed as such on the tape,
@43 = the column in which the first character of the variable, day, is placed;
DAY = a seven-digit variable for the date with the format day-month-year (31JAN84); and
DATE7. = the format for date.

All the remaining variables are explained in the "Basin Characteristics" section.

The data tape is available on the U.S. Geological Survey's AMDAHL computer in Reston, Va. U.S. Geological Survey personnel may call Federal Telephone System (FTS) number 928-7178 or commercial number (703) 860-7178 for user-support information. The following example program will provide a listing of data:

```
//AG40ZHND JOB (*********,N001,5,5),'YOUR NAME',CLASS=B
/*SETUP    224532/H
//COPY     PROC F=,DSN=

//
```

Persons not affiliated with the U.S. Geological Survey may obtain a copy of the tape through the National Water-Data Exchange (NAWDEX). Charges for NAWDEX service are assessed for those requests resulting in charges for computer time, extensive personnel time, duplicating services, or other charges accrued by NAWDEX in the course of providing services. To request a copy of the data base, contact:

Program Office
National Water-Data Exchange (NAWDEX)
U.S. Geological Survey
421 National Center
12201 Sunrise Valley Drive
Reston, VA 22092
Telephone: (703) 860-6031
FTS 928-6031
Hours: 7:45 a.m. to 4:15 p.m., Eastern Standard Time.

This program, as formatted, will retrieve all the data for the Anchorage, Alaska, urban-stormwater study area. If the user is interested in another study area or a particular station, the user needs to refer to table 101 in the "Hydrologic Data" section at the back of the report to determine the dataset name and the label number for the area of interest. The numbers after '//S' and 'F=' on the example program correspond to the label numbers in table 101. The dataset names (DSN) on the execute cards correspond to the dataset names in table 101. The program needs no other changes, except the job card, to provide a listing of the data.

If the U.S. Geological Survey user is interested in knowing the contents of the data tape, for example, the dataset name, label, record format, or block size, the following program, when submitted to the U.S. Geological Survey's AMDAHL computer in Reston, Va., will provide the user with this information in addition to other contents of the tape volume. Only the job card needs to be changed.

```
//AG40ZHND JOB (*********,N001,1,70),'YOUR NAME',CLASS=B
/*SETUP    224532/H
// EXEC SAS
//TAPE1 DD UNIT=TAPE62,VOL=SER=224532,DISP=OLD
//SYSIN DD *
   PROC TAPELABEL DDNAME=(TAPE1);
/*
//
```

The label number, dataset name, city and State of study area, and type of data file are listed in table 101 in the "Hydrologic Data" section at the back of the report. The dataset name for unit-values files contains the last four digits of the station identification number for the runoff station after the letter 'S' in table 101. The water-quality, daily-values, and basin-characteristics files are listed in ascending order by station identification number. Refer to table 1 in the "Hydrologic Data" section at the back of the report to determine which stations correspond to each study area and each dataset name. For specific information on the type of data for each file, refer to tables 2 through 100 in the "Hydrologic Data" section at the back of the report.

In conclusion, the U.S. Geological Survey's national urban rainfall, runoff, and water-quality data have been compiled on magnetic tape. This report and associated data tape provide a comprehensive compilation of urban-stormwater data, references to pertinent reports, and contacts for further information.

Salt Lake City, Utah

Christensen, R.C., Stephens, D.W., Pyper, G.E., McCormack, H.F., and Weigel, J.F., 1984, Quality and quantity of runoff and atmospheric deposition in urban areas of Salt Lake County, Utah, 1980-81: U.S. Geological Survey Water-Resources Investigations Report 84-4011, 223 p.

McCormack, H.F., Christensen, R.C., Stephens, D.W., Pyper, G.E., Weigel, J.F., and Conroy, L.S., 1983, Surface water and climatologic data, Salt Lake County, Utah, water year 1981, with selected data for water years 1980 and 1982: U.S. Geological Survey Open-File Report 83-694, Utah Hydrologic-Data Report 40, 586 p.

Pyper, G.E., Christensen, R.C., Stephens, D.W., McCormack, H.F., and Conroy, L.S., 1981, Surface water and climatologic data, Salt Lake County, Utah, water year 1980: U.S. Geological Survey Open-File Report 81-1111, Utah Hydrologic-Data Report 36, 167 p.

Bellevue, Washington

Ebbert, J.C., Poole, J.E., and Poyne, K.L., 1984, Data collected by the U.S. Geological Survey during a study of urban runoff in Bellevue, Washington, 1979-82: U.S. Geological Survey Open-File Report 84-064, 256 p.

Milwaukee, Wisconsin

Bannerman, Roger, Baun, Ken, Bohn, Mike, Hughes, P.E., and Graczyk, D.A., 1983, Evaluation of urban nonpoint source pollution management in Milwaukee County, Wisconsin: Madison, Wisconsin Department of Natural Resources, U.S. Environmental Protection Agency, available from U.S. National Technical Information Service, Springfield, Va., as PB 84-1114149, 350 p.

HYDROLOGIC DATA

Table 1.--*Information for stations found in the urban-stormwater data base*

Urban-stormwster study area and station number	Station name	Predominant land use	Type of station	Drainage area (in square miles)	Number of storms
Anchorage, Alaska					
15274820	South Branch South Fork Chester Creek tributary near Baxter Road.	Low-density residential.	Subbasin outflow of 15275100.	0.0149	29
15275035	North Fork Chester Creek tributary near 20th Avenue.	Medium-density residential.	Subbasin outflow of 15275100.	.004	1
15275055	Chester Creek tributary near 36th Avenue.	Commercial.	Subbasin outflow of 15275100.	.06	10
Fresno, California					
364155119445000	Industrial urban-runoff site at Fresno.	Industrial; vacant.	Basin outflow.	.43	16
364746119445400	Single-dwelling residential urban-runoff site at Fresno.	Medium-density residential.	Basin outflow.	.15	12
364818119443800	Multi-dwelling residentisl urban-runoff site at Fresno.	High-density residential.	Basin outflow.	.07	19
364818119464700	Commercial urban-runoff site at Fresno.	Commercial.	Basin outflow.	.09	5
Denver, Colorado					
06710200	Big Dry Creek tributary at Littleton.	Medium-density residential.	Basin outflow.	.947	4
06710225	Big Dry Creek tributary at Easter Street near Littleton.	High-density residential.	Basin outflow.	.052	12
06710610	Rooney Gulch at Rooney Ranch near Morrison.	Rural and pasture.	Basin outflow.	.633	7
06711586	Asbury Park storm drain at Asbury Avenue at Denver.	Low-density residential.	Basin outflow.	.20	3
06711635 (1975-77 only)	North Avenue storm drain at Denver Federal Center at Lakewood.	Idle or vacant.	Basin outflow.	.120	3
06711635 (1980-81 only)	North Avenue storm drain at Denver Federal Center at Lakewood.	Idle or vacant.	Basin outflow and detention inflow of 06711637.	.11	28

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Urban-atormwater study area and station number	Station name	Predominant land use	Type of station	Drainage area (in square miles)	Number of storms
Denver, Colorado--Continued					
06711637	North Avenue storm drain at Denver Federal Center, North Avenue, at Lakewood.	Idle or vacant; high-density residential; commercial.	Detention outflow of 06711635.	0.13	9
06713010	Cherry Knolls storm drain at Denver.	High-density residential.	Basin outflow.	.089	12
06714100	36th Street storm drain at Denver.	Mixed residential; commercial.	Bssin outflow.	3.51	3
06720330	Grange Hall Creek at Grant Park at Northglenn.	Low-density residential.	Subbasin outflow of 06720415.	.55	5
06720415	Grange Hall Creek at Northglenn.	Low-density residential.	Basin outflow.	3.05	5
06720420	Storm drain at 116th Avenue and Claude Court at Northglenn.	Medium-density residential.	Basin outflow.	.26	12
394236105042400	Villa Italia storm drain at Lakewood.	Commercial.	Basin outflow.	.12	15
394322105073601	Denver Federal Center rainfall-runoff simulation plot 1 at Lakewood.	Street.	Basin outflow.	.0000359	1
394322105073602	Denver Federal Center rainfall-runoff simulation plot 2 at Lakewood.	Street.	Basin outflow.	.0000359	1
394322105073603	Denver Federal Center rainfall-runoff simulation plot 3 at Lakewood.	Street.	Basin outflow.	.0000359	1
394322105073604	Denver Federal Center rainfall-runoff simulation plot 4 at Lakewood.	Street.	Basin outflow.	.0000359	1
394322105073605	Denver Federal Center rainfall-runoff simulation plot 5 at Lakewood.	Street.	Basin outflow.	.0000359	1
394322105073606	Denver Federal Center rainfall-runoff simulation plot 6 at Lakewood.	Street.	Basin outflow.	.0000359	1

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Urban-stormwater study area and station number	Station name	Predominant land use	Type of station	Drainage area (in square miles)	Number of storms
Denver, Colorado--Continued					
394322105073607	Denver Federal Center rainfall-runoff simulation plot 7 at Lakewood.	Street.	Basin outflow.	0.0000359	1
394322105073608	Denver Federal Center rainfall-runoff simulation plot 8 at Lakewood.	Street.	Basin outflow.	.0000359	1
394322105073609	Denver Federal Center rainfall-runoff simulation plot 9 at Lakewood.	Street.	Basin outflow.	.0000359	1
Miami, Florida					
254031080191100	Apartment site at South Miami.	High-density residential.	Subbasin outflow.	.023	5
261002080070100	Commercial basin at Fort Lauderdale.	Commercial.	Subbasin outflow.	.032	12
261615080055900	Residential area at Pompano Beach.	Medium-density residential.	Subbasin outflow.	.064	17
261629080072400	Highway basin near Pompano Beach.	Idle or vacant.	Subbasin outflow.	.091	26
Tampa, Florida					
02306021	St. Louis Street drainage ditch at Tampa.	Medium-density residential.	Basin outflow.	.51	2
02307731	Allen Creek near Largo.	Medium-density residential.	Basin outflow.	1.79	1
Honolulu, Hawaii					
212553158011000	Mililani Drain B.	Medium-density residential.	Basin outflow.	.22	2
212604158012700	Mililani Drain A.	Medium-density residential.	Basin outflow.	.45	5

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Urban-stormwater study area and station number	Station name	Predominant land use	Type of station	Drainage area (in square miles)	Number of storms
Glen Ellyn, Illinois					
415302088033804	Main inlet of Lake Ellyn.	Low-density residential.	Detention inflow of 415311088032906 and 415311088032907.	0.83	10
415311088032906	Submerged outlet of Lake Ellyn.	Low-density residential.	Detention outflow of 415302088033802 and 415302088033804.	.83	3
415311088032907	Surface outlet of Lake Ellyn.	Low-density residential.	Detention outflow of 415302088033802 and 415302088033804.	.83	2
Baltimore, Maryland					
01589460	Hampden storm sewer at Baltimore.	High-density residential.	Basin outflow.	.0264	10
01589470	Reservoir Hill storm sewer at Baltimore.	Low-density residential.	Basin outflow.	.0164	3
01589475	Bolton Hill storm sewer at Baltimore.	High-density residential.	Basin outflow.	.0221	7
St. Paul, Minnesota					
445032092552801	Iverson Avenue storm sewer in Cottage Grove.	Agricultural.	Subbasin outflow of 445001092554101.	.15	6
445210093271701	Valley View Road storm sewer in Eden Prairie.	Low-density residential.	Subbasin outflow of 445210093271701.	.13	7
445937093230701	Wesley Park storm sewer in Golden Valley.	Medium-density residential.	Subbasin outflow of 450001093193901.	.33	4
450011093221901	Sandburg storm sewer in Golden Valley.	Commercial.	Subbasin outflow of 450001093193901.	.12	10
450100093205501	State Highway 100 at Scott Avenue storm sewer in Golden Valley.	Medium-density residential.	Subbssin outflow of 450001093193901.	.47	15

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Urban-stormwater study area and station number	Station name	Predominant land use	Type of atation	Drainage area (in square miles)	Number of storms
St. Paul, Minneaota--Continued					
450541093201201	Estatea Drive atorm sewer in Brooklyn Park.	Medium-density residential.	Subbasin outflow of 450518093201901.	0.22	11
450545093211501	Yates Avenue storm sewer in Brooklyn Park.	Medium-density residential.	Subbasin outflow of 450518093201901.	.35	3
Kansas City, Missouri					
06893520	Blue River at Gregory Boulevard.	Agricultural.	Main-atem inflow of 06893592.	209	4
06893566	Blue River at Coal Mine Road.	Agricultural.	Main-stem inflow of 06893592.	247	5
06893575	Blue Ridge Mall storm sewer.	Commercial.	Subbasin outflow.	.0781	3
Albuquerque, New Mexico					
08329900	North floodway channel near Alameda.	Medium-density residential.	Basin outflow.	80.54	9
Long Island, New York					
404713073273001	Plainview recharge basin.	Commercial.	Main-stem inflow.	.30	4
404815073294601	Syosset recharge basin.	Medium-density residential.	Main-stem inflow.	.045	2
405124073292601	Laurel Hollow recharge basin.	Low-density residential.	Main-stem inflow.	.156	3
405135073055101	Centereach recharge basin.	Commercial.	Main-atem inflow.	.108	3
Rocheater, New York					
04232040	Irondequoit Creek near Pittsford.	Rural and pasture; agricultural.	Basin outflow.	44.4	9
04232046	Thomas Creek at Fairport.	Mixed rural; vacant; medium-density residential.	Basin outflow.	28.5	10
430403077311500	Tributary to Barge Canal near Pittsford.	Low-density reaidential.	Basin outflow.	.26	13

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Rochester, New York--Continued					
430428077261100	White Brook tributary near Fairport.	Mixed commercial; low-density residential.	Basin outflow.	0.36	11
430649077285500	Tributary to Irondequoit Creek at East Rochester.	High-density residential.	Basin outflow.	[1].60	7
Durham, North Carolina					
02084904	R-2, Interstate 85 rest stop.	Commercial.	Basin outflow.	.00324	2
Columbus, Ohio					
03226900	Fishinger Road Creek at Upper Arlington.	Medium-density residential.	Basin outflow.	.45	1
03227050	Norman Ditch at Chambers Circle at Columbus.	Mixed residential.	Basin outflow.	.60	1
Portland, Oregon					
14206330	Beaverton Creek tributary at Southwest Murray Boulevard in Beaverton.	Medium-density residential.	Basin outflow.	.21	2
14206900	Fanno Creek at 56th Avenue.	Medium-density residential.	Basin outflow.	2.37	3
14211120	Willamette River tributary on Southeast River Road in Oak Grove.	Medium-density residential.	Basin outflow.	.74	2
14211301	Tryon Creek tributary.	Medium-density residential.	Basin outflow.	.36	1
Rapid City, South Dakota					
06412500	Rapid Creek above Canyon Lake near Rapid City.	Rural and pasture.	Main-stem inflow of 06413700.	371	12
06413700	Rapid Creek above water treatment plant at Rapid City.	Rural and pasture.	Main-stem outflow of 06412500.	32.79	12
06414000	Rapid Creek at Rapid City.	Rural and pasture.	Main-stem outflow of 06413700.	6.05	12

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Urban-stormwater study area and station number	Station name	Predominant land use	Type of station	Drainage area (in square miles)	Number of storms
Rapid City, South Dakota--Continued					
06414700	Rapid Creek at East Main Street at Rapid City.	Rural and pasture; mixed residential.	Main-stem outflow of 06414000.	5.70	12
06416000	Rapid Creek below Hawthorn ditch at Rapid City.	Commercial; idle or vacant.	Main-stem outflow of 06414700.	2.51	13
Austin, Texas					
08155300	Barton Creek at Loop 360.	Idle or vacant.	Basin outflow.	116	1
08156800	Shoal Creek at 12th Street.	Medium-density residential.	Basin outflow.	12.3	1
Houston, Texas					
08074400	Lazybrook Street storm sewer.	Medium-density residential.	Basin outflow.	.13	4
Salt Lake City, Utah					
10167220	Bells Canyon conduit at 1000 East and 11000 South at Sandy.	Medium-density residential.	Basin outflow.	.10	18
10168000	Little Cottonwood Creek at Jordon River near Salt Lake City.	Medium-density residential; vacant.	Main-stem outflow of 10167499.	14.0	3
10168840	Holladay drain at 4800 South at Big Cottonwood Creek near Murray.	Medium-density residential.	Subbasin outflow of 10169500.	4.0	7
10169500	Big Cottonwood Creek at Jordan River near Salt Lake City.	Medium-density residential.	Main-stem outflow of 10168499.	17.5	1
10170900	21st South conduit at Jordan River at Salt Lake City.	Medium-density residential; industrial; commercial.	Basin outflow.	1.9	2
10172372	8th South, middle conduit at Jordan River at Salt Lake City.	Commercial.	Basin outflow.	2.3	3

Table 1.--*Information for stations found in the urban-stormwater data base*--Continued

Urban-stormwater study area and station number	Station name	Predominant land use	Type of station	Drainage area (in square miles)	Number of storms
Salt Lake City, Utah--Continued					
10172373	8th South, north conduit at Jordan River at Salt Lake City.	Commercial; industrial.	Basin outflow.	0.8	5
10172520	North Temple conduit at Jordan River at Salt Lake City.	Mixed residential; idle or vacant.	Main-stem outflow of 10172499.	3.1	3
404653111545801	9th West conduit at 536 North at Salt Lake City.	Medium-density residential; commercial.	Basin outflow.	.23	10
Bellevue, Washington					
12119725	Lake Hills storm sewer outfall at Bellevue.	Medium-density residential.	Basin outflow.	.149	25
12119730	148th Avenue Southeast storm sewer below Lake Hills Boulevard.	Parkland; commercial.	Basin outflow.	.0375	16
12120005	Surrey Downs storm sewer outfall at Bellevue.	Medium-density residential.	Basin outflow.	.140	19
473542122083001	148th Avenue Southeast detention basin number 3 outlet at Bellevue.	Parkland; mixed residential.	Detention inflow of 473544122083001.	.0274	5
473544122083001	148th Avenue Southeast detention basin number 5 outlet at Bellevue.	Parkland; mixed residential.	Detention outflow of 473542122083001.	.0274	7
Milwaukee, Wisconsin					
04086941	Lincoln Creek at 54th Street at Milwaukee.	High-density residential.	Basin outflow.	.056	4
04086943	Lincoln Creek tributary at Milwaukee.	Commercial.	Basin outflow.	.019	10
04086945	Lincoln Creek tributary.	Commercial.	Basin outflow.	.019	11
04087056	Tributary to Little Menomonee River.	Medium-density residential.	Basin outflow.	.097	4
04087057	Little Menomonee River	Medium-density residential.	Basin outflow.	.051	6
04087115	Honey Creek tributary at West Allis.	Commercial.	Basin outflow.	0.045	9
04087133	Menomonee River tributary.	Commercial.	Basin outflow.	.070	7

[1]Noncontributing 0.061 square mile.

Table 2.--*Summary of available urban-stormwater data for Anchorage, Alaska--15274820, South Branch South Fork Chester Creek tributary near Baxter Road*

[Site description: subbasin outflow (base flow not prevalent). Total drainage area, in square miles: 0.0149. Impervious area, in percent of drainage area: 43. Predominant land use: low-density residential. Rainfall station(s): a, 15274820. h, hours; min, minutes; D, discrete sample; dashes, no data; *, storm interval contains missing unit values for runoff. Data pertaining to this station may be found on files labelled 1, 2, 5, and 6 on the data tape.]

Table 102.--*Addresses and telephone numbers of U.S. Geological Survey offices where additional information about data is available*

[WRD, Water Resources Division; FTS, Federal Telecommunications System.]

Urban-stormwater study areas	Addresses and telephone numbers
Anchorage, Alaska	U.S. Geological Survey, WRD Anchorage Subdistrict Office 1209 Orca Street Anchorage, AL 99501 Telephone: (907) 271-4153 FTS: (907) 271-4153
Fresno, California	U.S. Geological Survey, WRD Sacramento Subdistrict Office Room W-2235, Federal Building Sacramento, CA 95825 Telephone: (916) 484-4606 FTS: 468-4606
Denver, Colorado	U.S. Geological Survey, WRD Colorado District Office Box 25046, Mail Stop 415 Denver Federal Center Denver, CO 80225 Telephone: (303) 236-4886 FTS: 776-4886
Miami, Florida	U.S. Geological Survey, WRD Miami Subdistrict Office Federal Reserve Bank Building 9100 N.W. 36th Street, Suite 106 & 107 Miami, FL 33172 Telephone: (305) 594-0655 FTS: 350-5382
Tampa, Florida	U.S. Geological Survey, WRD Tampa Subdistrict Office 4710 Eisenhower Boulevard, Suite B-5 Tampa, FL. 33614 Telephone: (813) 228-2124 FTS: 826-2124
Honolulu, Hawaii	U.S. Geological Survey, WRD Hawaii District Office 300 Ala Moana Boulevard, Room 6110 P.O. Box 50166 Honolulu, HI 96850 Telephone: (808) 546-8331 FTS: (808) 546-8331

Table 102.--*Addresses and telephone numbers of U.S. Geological Survey offices where additional information about data is available*--Continued

Urban-stormwater study areas	Addresses and telephone numbers
Glen Ellyn, Illinois	U.S. Geological Survey, WRD Illinois District Office 4th Floor, 102 East Main Street Urbana, IL 61801 Telephone: (217) 398-5353 FTS: 958-5353
Baltimore, Maryland	U.S. Geological Survey, WRD Mid-Atlantic District Office 208 Carroll Building 8600 La Salle Road Towson, MD 21204 Telephone: (301) 828-1535 FTS: 922-7872
St. Paul, Minnesota	U.S. Geological Survey, WRD Minnesota District Office Room 702, Post Office Building St. Paul, MN 55101 Telephone: (612) 725-7841 FTS: 725-7841
Kansas City, Missouri	U.S. Geological Survey, WRD Field Headquarters Room 223, Federal Building 301 West Lexington Independence, MO 64050 Telephone: (816) 254-5824 FTS: (816) 254-5824
Albuquerque, New Mexico	U.S. Geological Survey, WRD New Mexico District Office 505 Marquette N.W., Room 720 Western Bank Building Albuquerque, NM 87102 Telephone: (505) 766-1738 FTS: 474-1738
Long Island, New York	U.S. Geological Survey, WRD Syosset Subdistrict Office 5 Aerial Way Syosset, NY 11791 Telephone: (212) 895-0243 FTS: (516) 938-8830

Table 102.--*Addresses and telephone numbers of U.S. Geological Survey offices where additional information about data is available*--Continued

Urban-stormwater study areas	Addresses and telephone numbers
Rochester, New York	U.S. Geological Survey, WRD Ithaca Subdistrict Office 521 West Seneca Street Ithaca, NY 14850 Telephone: (607) 272-8722 FTS: 882-4222, 4223
Durham, North Carolina	U.S. Geological Survey, WRD North Carolina District Office Room 436, Century Postal Station 300 Fayetteville Street Mall Raleigh, NC 27602 Telephone: (919) 755-4791 FTS: 672-4791
Columbus, Ohio	U.S. Geological Survey, WRD Ohio District Office 975 West Third Avenue Columbus, OH 43212 Telephone: (614) 469-5553, 5554 FTS: 943-5553, 5554
Portland, Oregon	U.S. Geological Survey, WRD Oregon District Office 847 N.E. 19th Avenue, Suite 300 Portland, OR 97232 Telephone: (503) 231-2292 FTS: 429-2292
Rapid City, South Dakota	U.S. Geological Survey, WRD Rapid City Subdistrict Office Federal Building, U.S. Courthouse Room 237, 515 9th Street Rapid City, SD 57701 Telephone: (605) 342-6812 FTS: 782-1445
Austin, Texas	U.S. Geological Survey, WRD Texas District Office 649 Federal Building 300 East 8th Street Austin, TX 78701 Telephone: (512) 482-5766 FTS: 770-5766
