How to Use the Damper

- 1. The damper generates torque in both the clockwise and counter-clockwise directions. (A one-way clutch is built in inside the damper.)
- 2. Please make sure that the shaft attached to a damper has a bearing, as the damper itself is not fitted with one.

Shaft's external dimensions	φ 10 $_{-0.03}^{0}$
Surface hardness	HRC55 or higher
Quenching depth	0. 5mm or higher
Surface roughness	1.0Z or lower
Chamfer end (Damper insertion side)	<u>C0.2~C0.3</u> (orR0.2~R0.3)

- FFD-30SS-**** (Dimension of FFD-30SW-**** are in [])
- 3. It can be used as a free-stop for a load that is smaller than the rated torque.
- 4. Please refer to the recommended dimensions below when creating a shaft for attachment to the damper. Using a shaft outside of the recommended dimensions may cause the shaft to slip out.
- 5. To insert a shaft into the damper, insert the shaft while spinning it in the opposite direction of the damper's direction of torque generation. (Do not force the shaft in from a regular direction. This may damage the built-in

* Max. angle	120°	* Main body material	Zinc die-cast (ZDC)
* Operating tempe	erature −5~50°C		+ silver coating
* Weight	410g	* Hinge material	SUS304

How to Use the Damper

1. There are two ways to attach the damper, as shown below. OAttached externally(FHD-A1-1***)

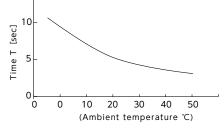

2. This damper is only for horizontal application. Please do not use this damper for vertical application.

Damper Characteristics

1. Temperature characteristics

Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well.

2. The working angle of the hinge is $120^\circ\,$.

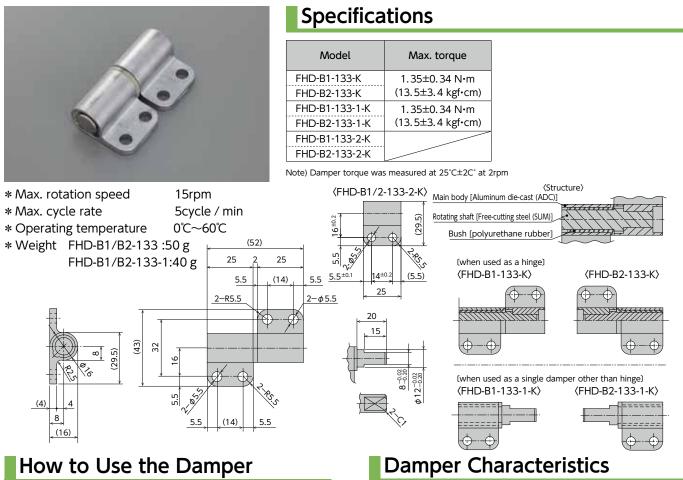

Operating the hinge beyond this angle will cause damage to the hinge. Please ensure that an external stopper is in place.

Friction Type Hinge Damper Fixed Type Adjustable type

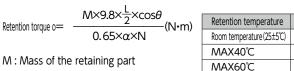

RoHS Compliant

FHD-B1/B2 Series

Products specification might be changed without notice.

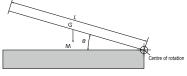

- 1. The damper generates torque in both clockwise and counter-clockwise directions.
- 2. A friction-type hinge damper can be used as a bearing.
- 3. Friction-type hinge dampers have a long product life and do not require lubrication.
- 4. Torque down will result if the damper part gets wet with water or oil.
- 5. It cannot be used for continuous rotation. Please use it in a vane motion.
- 6. Depending on the operating conditions, it can be used as a free-stop hinge. Please calculate the retention torque based on the following equation.

				01			
L	:	Distance	between	the	tip	of	retaining

- part and the centre of rotation
- θ : Retention angle from the retaining part's horizontal position
- α : Temperature coefficient of the max. temperature
- N: Number of dampers used

α

1.0

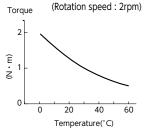

0.75

0.50

7. This damper is only for horizontal application. Please do not use this damper for vertical application.

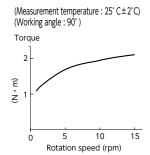

1. Temperature characteristics

Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the temperature of the shaft bush inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well.

2. Speed characteristics

The speed characteristics of a friction-type hinge damper are shown in the graph below. The damper torque is determined based on the speed characteristics at 2rpm.

MRF Damper

FMR-70S-403

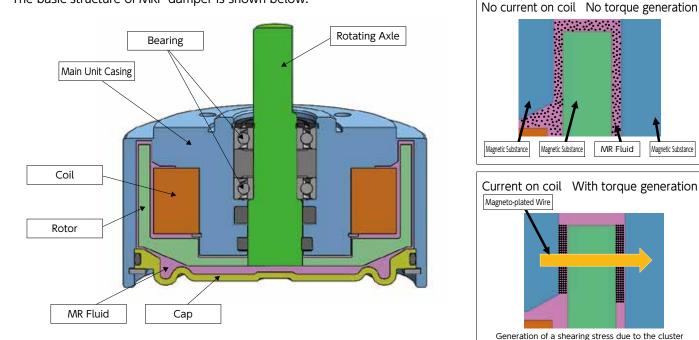

Characteristics

Electrically controlled	: Enabled electrically controlling the torque by using MR fluid (magnetic viscous fluid)
High response	: excellent electrical response makes realize a high response
Flexible mounting ways	: No restriction on the mounting direction
Not required Pre-conditioning operation	: Using MR fluid on friction part, it realized less humid effect and no requirement of pre-conditioning
Smooth motion	: Small differences between the static friction and dynamic friction allows a smooth actuation
Long life	: Our original sealing structure realizes a long life cycle
Seamless torque change	: Available a seamless torque control steplessly
Less susceptibility of temperature affect	: Comparing to a standard rotary damper, small effect by temperature
Less susceptibility of the rotational speed affect	t : Comparing to a standard rotary damper, small effect by the rotating speed

Basic Structure and Action

The basic structure of MRF damper is shown below.

Behavior

The rotating shaft is supported with the bearings for providing the freedom of rotation in the main unit casing.

A coil is implemented in the main unit casing, and a rotor having the shape of a cup is mounted on the rotating shaft.

There is a gap between the internal surface of the main unit casing and the external surface of the rotor. The MR fluid is filled in this gap. When a current is supplied to the coil, a magnetic field line runs through the gap between the main unit casing and rotor, and a magnetic force flows in the MR fluid. When a magnetic force flows in the MR fluid, the iron power is linked like a chain and the friction force of iron powder generates a force to restrict the rotation between the main unit casing and rotor.

What is the MR Fluid?

The MR (magneto-rheological) Fluid is a functional fluid that can be instantly reversibly changed between free liquid and semi-solid state by varying the applied magnetic field. The MR Fluid is featured with the wide shearing stress variation range based on the yield point determined by the semi-solid fluid due to the formation of chain type clusters of iron powder particles induced by the application of magnetic field in the dispersed micron size magnetic iron powders in the carrier fluid differently from general magnetic fluid.

MR Fluid

MR Fluid A magnet in the proximity

Main Applications

The applications for robots, welfare devices, logistics, amusements, operation levers, switchgears and the torque controls for vibration control devices are expected.

state of iron powder in MRF fluid

Magnetic Substance

Precautions for Use

Be sure to carefully read the owner's manual delivered with the product before using.

2 Rotary Dampei

Products specification might be changed without notice.

Specifications

Туре	D	Coil (23 ℃)

	50	No ristriction	Both directions	0.83	1.16	

φ28

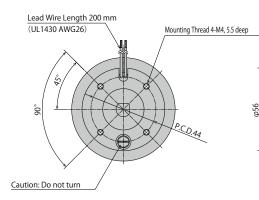

φ10 -0.1

 Temperature Range for Use: 0°C to 40°C The heat is generated from coil and the slipping friction during operation. The surface temperature of the product during operation shall not exceed 70°C.

 * For a continuous slipping application, the friction heat shal
 I be taken into consideration. The operation shall be within th
 e allowable slipping efficiency range.

Calculation

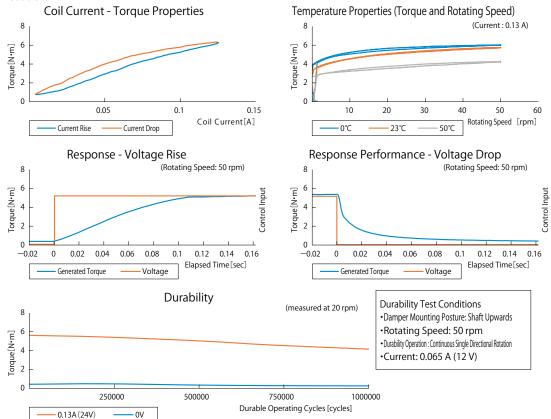

- Allowable slipping efficiency = $2 \times \pi / 60 \times n \times Tc$
- n : Rotating Speed (rpm)
- Tc: Slipping Torque (N-m)

<i></i>		

Test Data

Read these instructions before use

This owner's manual contains various safety cautions regarding the proper handling of this product, and preventing danger to the operator as well as damage to the plant and the machine. Please read this manual thoroughly before using the product.

Warning Definition of "Warning" applies to situations in which death or serious injuries may occur to the user, etc. if the potential dangers of the products are not avoided. Warning The decision on the suitability of MRF damper shall be made by an engineer of the equipment or a person who determine the specification. •Because of the wide variety of conditions of use, the decision on the suitability of MRF damper shall be made by an engineer of the equipment or a person who determine the specification, after the performance verification and life test as necessity.

Do not use the MRF damper outside the range of specification.

•Do not use outside the range of specification for such like operating temperature range, rated voltage and current of the coil, the rated torque, the allowable slip rate, maximum rotational speed.

- There is a risk to receive injury or to make damage for MRF damper and/or peripheral devices.
- There is a risk of Electric shock, burns or fire.
 Due to oil leakage or deterioration of parts, there is a possibility that the durability of the product is significantly decreased.
- Refer to the product page of MRF damper for details.
- •When used, it generates heat by energization and or the slip friction of the coil. If the temperature of MRF damper surface is high, adjust the condition and make its surface under 70 °C and prevent the generation of heat.

Implementation of Safety Measures for the Purposes Below.

- Implement the safety measures if used under the following conditions and environment, and consult our company for a judgment on the feasibility check beforehand. Also please take countermeasures against waterproofing, humid proofing as well as the designing of fail-safe, redundant and etc. for the The use in the environment other than those standard specifications clearly indicated in the catalog or owner's manual, outdoors, or place exposed to the direct sunlight.
- 2) Nuclear related devices, devices directly or indirectly related to the running of rail or ship, devices related to aviation or space, military devices, medical devices, devices contacting the potions and foods, combustion equipment, amusement devices that are related to the influence on human and properties, emergency shut off circuit, press machinery, the use for the devices or purposes to which especially the safety is required because of the expected serious influence on the human and properties. •Environment and the next safety exhibit can not be secured, please do not use the following devices that are required extremely high reliability and safety.
- 1) environment in which there is a possibility of ignition or explosion, or in water or a very high humid.
- 2) device in relate to the nuclear power, aviation, space, military, life supporting medical equipment, combustion etc.
- When you touch the MRF dampers, confirm the power supply of the coil and the peripheral devices are switched off and the temperature of MRF damper is cooled down. •There is a risk of Electric shock, burns or fire if to mount or dis-mount the MRF damper during the operation of peripheral device or powering the MRF damper.

Ensure the connection of coil lean of MRF damper.

There is a risk of operation failure, electrical shock or leak if the connection of the leads is incomplete electrically or mechanically.

Do not throw into a fire

As the products contain oil, throwing them into a fire may cause them to ignite, resulting in injuries.

Caution

Defifinition of "Caution" applies to situations in which minor injuries or property damage may **"Caution"** result if the operation or maintenance procedures are not strictly followed.

Do not operate without sufficient mounting strength

Operating with insufficient mounting strength may damage the main machine and cause injuries.

•Ensure sufficient mounting strength of load torque x safety factor

Do not pull or hang the MRF damper by the leads.

- •There is a risk of injury by the fall of MRF damper. Also there is a risk that the leads shall cut and results operational failure or electrical shock or short-circuit.
- ●Hold the MRF damper when mounting or dis-mounting.
- •After the installation, make sure to fix the leads not to contact with MRF damper or with peripheral devices.

Do not rotate the screw on top of MRF damper

Screw on top of MRF damper is the sealing for oil filling. Do not rotate it otherwise it may cause oil leakage or quality deterioration.

Usage environment

- •This product cannot be used in a vacuum or under high pressure as well as in the circumstance where is impact. It may cause damage to the MRF damper or Peripheral equipment Do not use in an environment where chips, cutting oil, water, etc. can come in contact with the linear damper. This will result in a malfunction due to an oil leak caused by damage.
- •Do not leave or use under the circumstance where is a high humid.

Do not discard oil more than is necessary

•Discarding the oil contained in MRF dampers more than is necessary will pollute the environment.

•Dispose the oil according to laws concerning waste management and cleaning.

Radial/Thrust load to the shaft

•Applying load to the rotating shaft (gear) in a radial/thrust direction may cause an oil leak, torque problems, and damage to the main unit (or to the gear, or cause the gear to become disengaged, if the gear is used).

Do not repair, disassemble or modify the MRF damper

- •MRF damper is not corresponded with repairing. In the even of failure and deterioration of performance, please replace it with a new one.
- It is contained the excitation coil and oil in inside of MRF damper. For safety reason, do not repair, disassemble or modify by yourself.
- If the remodeling to MRF damper (additional machining, painting, welding, hardening, etc.) has been carried out, we do not guarantee the MRF damper as well as peripheral equipment. Any damage or loss won't be indemnified if the customer performed the repairing, disassembly and modification of MRF damper.

Replacing time of MRF damper

- •Product reliable cycles are depended on the using circumstances and conditions; therefore, we cannot determine the life cycle however if there is phenomena such like below please consider that it is the time to replace to the new one.
 - 1. When the necessary torque is no longer performed even though given rated current.
- 2. When the torque started to be appeared without giving eclectic current.
- 3. When various torque started to be appeared under a same circumstance.
- 4. When abnormal noise, vibration or oil leakage are started to be appeared.
- In particular, high reliability and safeties is required, regardless the phenomenon such like above, we strongly recommend to replace to the new one periodically. Over-tightening of mounting screws

- Over-tightening the mounting screws when installing a MRF damper may cause damage to the main unit.
- Based on the types and sizes of the screws used, please apply an appropriate tightening torque to tighten the screws.
- ●Use a proper sized screw as the screwing hall of MRF damper is M4 x 5.5 depth. As for tighten torque, make sure under 550N.cm.

Dispose

In case to dispose the MRF damper, follow the local rules and dispose as industrial waste.

RoHS Compliant

•Products specification might be changed without notice.

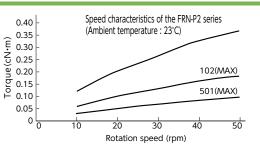

Characteristics

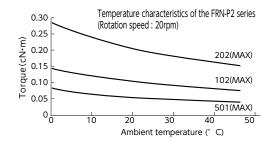

1. Speed characteristics

A rotary damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. In addition, please note that the starting torque slightly differs from the rated torque.

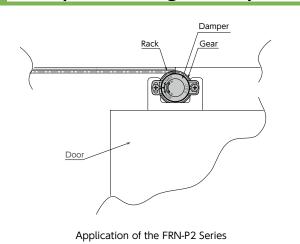

2. Temperature characteristics

A rotary damper's torque varies according to the ambient temperature. In addition, as shown in the graph to the right, the torque decreases as the ambient temperature increases, and the torque increases as the ambient temperature decreases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. When the temperature returns to normal, the torque will return to normal as well.

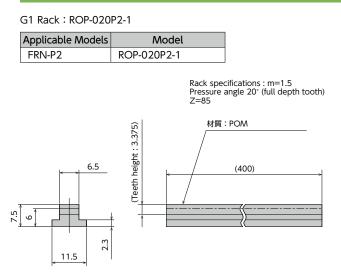

Example of Using a Damper

Option Rack

Damper Characteristics

1. Speed characteristics

A rotary damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. In addition, please note that the starting torque slightly differs from the rated torque.

2. Temperature characteristics

A rotary damper's torque varies according to the ambient temperature. In addition, as shown in the graph to the right, the torque decreases as the ambient temperature increases, and the torque increases as the ambient temperature decreases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. When the temperature returns to normal, the torque will return to normal as well.

Damper Characteristics

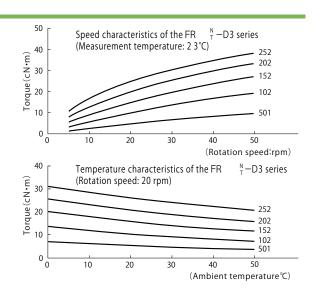

1. Speed characteristics

A rotary damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. In addition, please note that the starting torque slightly differs from the rated torque.

2. Temperature characteristics

A rotary damper's torque varies according to the ambient temperature. In addition, as shown in the graph to the right, the torque decreases as the ambient temperature increases, and the torque increases as the ambient temperature decreases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. When the temperature returns to normal, the torque will return to normal as well.

How to Use the Damper

When using the damper, please ensure that a shaft with specified angular dimensions is inserted in the damper's shaft opening. Also, please ensure a tight fit between the shaft and the damper shaft opening.

Without a tight fit, the non-damping range becomes larger in a closing motion, etc., and it may not slow down properly. Please see the diagrams to the right for the recommended shaft dimensions for a damper.

How to Use the Damper

1. FYN-B1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

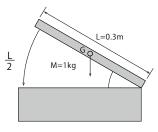

he damper torque becomes larger, preventing the lid from slowing down.

The damper torque becomes larger, preventing the lid from closing completely.

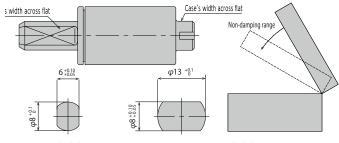

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque.

Example) Lid mass M : 1 kg Lid dimensions L: 0.3m Gravity Center Position : Assumed as Load torque : T=1.5×0.4×9.8÷2 =2.94N•m Based on the above calculation,

FYN-B1-*153 is selected.

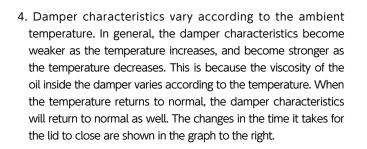

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

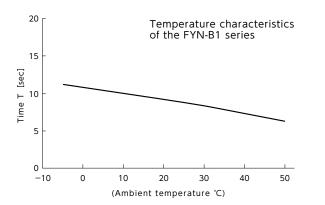

<Recommended dimensions for mounting a rotating shaft>

<Recommended dimensions for mounting the main body>

RoHS Compliant

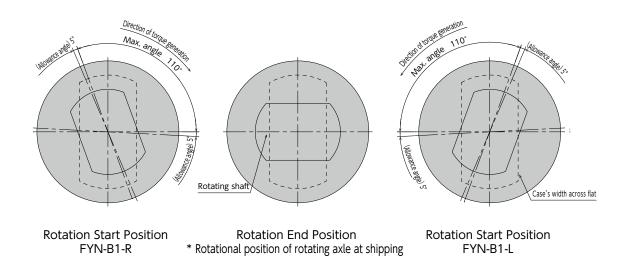

•Products specification might be changed without notice.

Fixed Type

5. The damper's working angle is 110°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

How to Use the Damper

1. FYN-D3 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

he damper torque becomes larger, preventing the lid from slowing down.

The damper torque becomes larger, preventing the lid from closing completely.

The angle in which the damper torque becomes large can be customized by modifying the inside orifice.

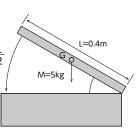

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque. Example)

Lid mass M: 5kg

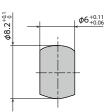

Lid dimensions L: 0.4m Gravity Center Position : Assumed as $\frac{L}{2}$ Load torque : T = $5 \times 9.8 \times 0.4 \div 2$ = 9.8N•m

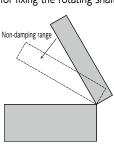

Based on the above calculation, FYN-D3-*104 is selected.

φ66 9

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

How to Use the Damper

- 1. The FYN-M1 Series is designed to generate a large torque up to 90° in a closing lid, as shown in Diagram A, and the lid is able to close completely. However, when the lid is closed from a vertical position, as shown in Diagram B, the lid cannot be slowed down, as the torque becomes small just before the lid is completely closed.
- 2. Below is a graph showing the relationship between the load torque and the time when a lid is closed from a 160° angle, as shown in the diagram.

Relationship between load torgue and time in the FYN-M1 serie

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing.

5+0.10

 $\phi 6.1^{+0.1}$

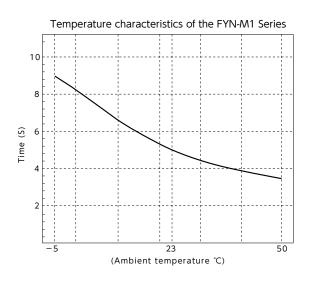

5. The standard for a damper's working angle is 180° with respect to the main body's attachment flange. Rotating the damper beyond this angle will cause damage to the damper. Please make sure that an external stopper is in place.

4. The time it takes for a lid with a damper to close variesaccording to the ambient temperature. As the temperature increases, it takes less time, and as the temperature decreases, it will take longer for the lid to close. This is because the viscosity of the oil inside the damper changes according to the temperature. When the temperature returns to normal, the required time will return to normal as well. The temperature characteristics are shown in the graph below.

How to Use the Damper

1. FYN-P1 is designed to generate a large torque just before a lid closing from a vertical position, as shown in Diagram A, comes to a full closure. When a lid is closed from a horizontal position, as shown in Diagram B, a strong torque is generated just before the lid is fully closed, causing the lid to not close properly.

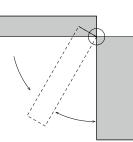

Diagram B

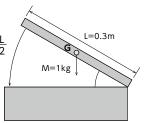

The damper torque becomes larger, preventing the lid from slowing down.

The damper torque becomes larger, preventing the lid from closing completely.

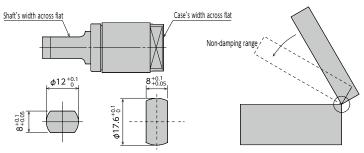

2. When using a damper on a lid, such as the one shown in the diagram, use the following selection calculation to determine the damper torque. Example)

Lid mass M: 1kg Lid dimensions L: 0.3m Gravity Center Position : Assumed as $\frac{L}{2}$ Load torque : T=1×9.8×0.3÷2

=1.47N•m Based on the above calculation, FYN-P1-*153 is selected.

3. When connecting the rotating shaft to other parts, please ensure a tight fit between them. Without a tight fit, the lid will not slow down properly when closing. The corresponding dimensions for fixing the rotating shaft and the main body are as follows.

Uni-Directional

RoHS Compliant

Time T [sec] 10 10 damper characteristics will return to normal as well. The time it takes for the lid to close is shown in the graph to the right. 5 20 30 10 40 50 0 (Ambient temperature °C) 5. The damper's working angle is 115°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

FYN-S1-L104	(100 kgf•cm)	(15 kgf•cm or lower)	Counter-clockwise

Note) Measured at 23° C \pm 2° C

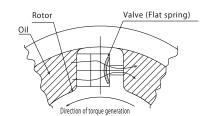

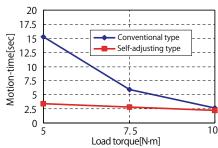

How to Use the Damper

1. Operating characteristics of self-adjusting oil pressure dam pers

In a conventional vane damper, the damping strength (damping constant) does not change regardless of the load torque used. Because of this, its working speed is slower when the load torque is small, and faster when the load torque is large. However, because the self-adjusting FYN-S1 series is designed to self-adjust the damping force (damping constant) according to the applied load, the working speed fluctuates less compared to conventional dampers when the applied load is altered. The acceptable range or torque is 5 ~ ~10N-m. Please select your damper by referring to the motion-time graph below.

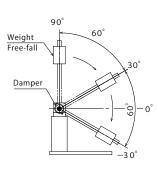

[Motion time graph]

[Operating principles of the self-adjusting type]

As shown in the diagram to the left, by changing the shape of the valve (flat spring), the amount of oil flow is altered, adjusting the damper's generated torque. (PAT.P)

[Measurement conditions for the motion-time graph]

Load torque T 5~10N·m

- Measured angle 30° \sim -30°
- Measurement temperature 23° C \pm 2° C

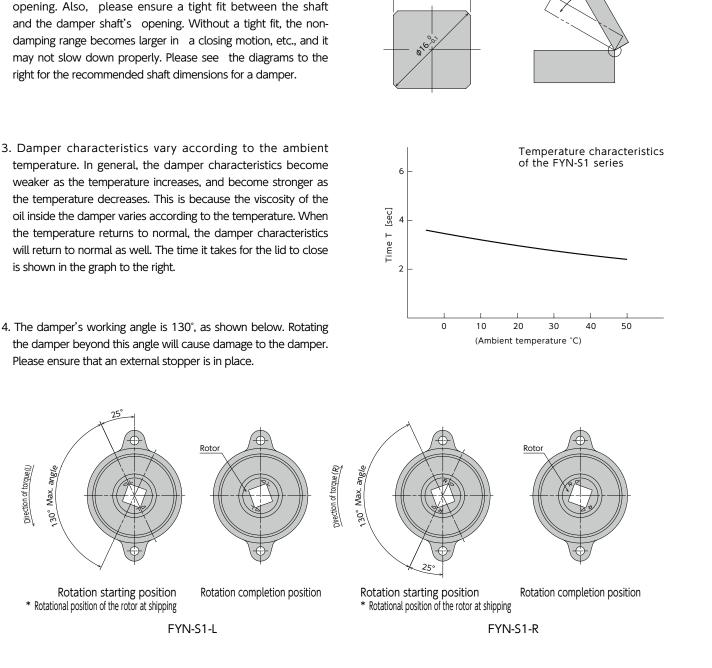

As the level of self-adjustment may vary depending on the range of the working angle of the actual work, please verify under actual working conditions before you select your damper.

Uni-Directional Self-adjusting

RoHS Compliant

Products specification might be changed without notice.

Non-damping rang

 $\Box 12^{-0.02}_{-0.10}$

- 5. Because the FYN-S1 series is a self-adjusting type, the torque cannot be adjusted manually. However, by altering the viscosity of the oil, its damper characteristics can be modified. (Please contact us, as this is a custom order.)
- 6. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

- 4. Damper characteristics vary according to the ambient temperature. In general, the damper characteristics become weaker as the temperature increases, and become stronger as the temperature decreases. This is because the viscosity of the oil inside the damper varies according to the temperature. When the temperature returns to normal, the damper characteristics will return to normal as well. The changes in the time it takes for the lid to close are shown in the graph to the right.
- 5. The damper's working angle is 110°, as shown below. Rotating the damper beyond this angle will cause damage to the damper. Please ensure that an external stopper is in place. The working angle is based on the width across flat for fixing, located towards the rear end of the main body. The position where the rotation is complete is at 90° with respect to the width across flat.

- 6. How to adjust the damper
- 1) In the FYT-H1 (H2) and FYN-H1 (H2) series, the amount of generated torque can be adjusted with the adjustment knob located towards the rear of the main body. Insert a screwdriver in the minus groove to turn.
- 2) Turn the adjustment knob in the H direction to increase torque.
- 3) Turn the adjustment knob in the L direction to reduce torque.
- 4) Do not turn the adjustment knob more than 360°. Turning the knob more than 360° causes the adjustment shaft to slip out, resulting in oil leakage.
- 5) Once the adjustment is complete, secure with a lock screw. Using the damper without securing it may result in fluctuating torque.

7. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.

<Range of torque adjustment>

Please refer to the graph below for the relationship between torque and the adjustment knob.

Non-damping rang

Instruction for Damper Attachment

- 1. When attaching a rotating shaft to its corresponding part, ensure that they are firmly attached together by making the gap between them as small as possible. A large gap may affect the damper's non-damping range, preventing the lid from slowing down properly.
- 2. The damper's working angle is $\pm 105^{\circ}$, as shown on the right (second diagram). Please determine where to attach it according to your needs.
- 3. The direction in which torque is generated varies according to the model. Please select the appropriate model for your purpose.
- 4. Do not use the damper as a stopper. An external stopper must be attached at the stopping position.
- 5. In FYN-LA3-L and FYN-LA3-R, the angular velocity in the reverse direction (opposite to the direction of torque generation) should be 1 rad/sec or less.

How to Calculate the Damping Constant for Vane Dampers

- 1. Delayed absorption in linear motion F = Force or mass applied to the lever tip (N) Formula (N·m/(rad/sec)) = $\frac{FL^2t}{A}$
- 2. Delayed absorption in rotation Formula (N·m/(rad/sec)) = $\frac{T}{\omega}$
- 3. Impact absorption in linear motion

Formula (N·m/(rad/sec)) = $\frac{MVL^2}{r}$

L = Distance between the centre of the damper shaft and the lever's point of application (m) d = Distance travelled by lever (m) t = Travelling time of the lever (sec)

T = Torque applied to shaft (N·m) ω = Angular velocity(rad/sec)

M = Mass(kg)V = Velocity(m/sec)L = Distance between the centre of the damper shaft and the lever's point of application (m) d = Distance travelled by lever (m)

- down properly when closing. Please see the diagrams to the right for the recommended shaft dimensions for a damper.

- 6. A damper shaft connecting to a part with slotted groove is also available. The slotted groove type is excellent for usage with spiral springs
- 7. Please contact us when a continuous rotation is planned.

2. Temperature characteristics

Damper torque (rated torque in this catalogue) varies according to the ambient temperature. As the temperature increases, the torque decreases, and as the temperature decreases, the torque increases. This is because the viscosity of the silicone oil inside the damper varies according to the temperature. The graph to the right illustrates the temperature characteristics

Damper Characteristics

1. Speed characteristics

A disk damper's torque varies according to the rotation speed. In general, as shown in the graph to the right, the torque increases as the rotation speed increases, and the torque decreases as the rotation speed decreases. Torque at 20rpm is shown in this catalogue. In a closing lid, the rotation speed is slow when the lid begins to close, resulting in the generation of torque that is smaller than the rated torque.

Precautions for Use

- * Use with an external stopper.
- * Ensure that sucient mounting strength is secured for this product.
- * 2 or more of this product can be used in parallel.
- * Do not use this product in a vacuum or a location where it may come in contact with oil.
- * Ensure that an eccentric load is not applied to the soft absorber.
- Allowable eccentric angle: within ±2.5°
- * Do not pull the soft absorber beyond the stroke used. (This will cause the damage or failure of the soft absorber.)
- * Do not press the piston rod of soft absorber in beyond the stroke used. (This will cause the incomplete return of the piston rod, and other failures.)
- * When the gap between the pressing time and the returning time of the piston rod is large, the durability may be aected. Conrm its performance in an actual machine before use.

Precautions in Use

* Do not use this product without carefully reading the attached owner's manual.

- * Use with an external stopper.
- * Ensure that sufficient mounting strength is secured for this product.
- * 2 or more of this product can be used in parallel.
- * Do not use this product in a vacuum or a location where it may come in contact with oil.
- * Ensure that an eccentric load (lateral load) is not applied to the soft absorber.
- * Do not pull the piston rod of the soft absorber more than stroke.
- (This will cause air to get inside the soft absorber, causing ineffective stroke, abnormal sounds, and other damage to the soft absorber.) * Do not push the piston rod of the soft absorber more than stroke.

(This will cause recovery failure and other damage to the soft absorber.)

- * The soft absorber generates the drag in the drawing direction.
- * Unusable to generate the resistance in the pushing direction.
- * Use with an external stopper.
- * Ensure that sufficient mounting strength is secured for this product.
- * 2 or more of this product can be used in parallel.
- * Do not use this product in a vacuum or a location where it may come in contact with oil.
- * Ensure that an eccentric load is not applied to the soft absorber.

- * Do not pull the soft absorber beyond the stroke used.
- (This will cause the damage or failure of the soft absorber.) * Do not press the soft absorber in beyond the stroke used. (This will cause the damage or failure of the soft absorber.)
- * When the gap between the pressing time and the returning time of the piston rod is large, the durability may be affected. Confirm its performance in an actual machine before use.
- * For the products with cover, do not pull the cover part. When you need to pull the product, insert a rod into the ϕ 4 through hole and pull the product by holding the rod.

Main unit m aterial	Resin
Range of operating te mperature, degree s C	5~40°C

Absorbable energy range under a horizontal inertial collision condition

Precautions for Use

- * Use with an external stopper.
- * Ensure that sucient mounting strength is secured for this product.
- * 2 or more of this product can be used in parallel.
- * Do not use this product in a vacuum or a location where it may come in contact with oil.
- * Ensure that an eccentric load is not applied to the soft absorber.
- * Do not press the piston rod of soft absorber in beyond the stroke used.
- (This will cause the incomplete return of the piston rod and other failures.)
- * Do not pull the soft absorber beyond the stroke used. (This will cause the damage or failure of the soft absorber.)
- * When the gap between the pressing time and the returning time of the piston rod is large, the durability may be aected. Conrm its performance in an actual machine before use.
- * * A falling impact will cause a deformation, damage, etc. Please handle with special care.

*The absorbable energy ranges above represent the properties under a condition where no thrusting force exists.
