➤ **HX8353-C**

132RGB x 162 dot, 262K Color, with Internal GRAM, TFT Mobile Single Chip Driver

Himax Technologies, Inc.
<http://www.himax.com.tw>

Preliminary Version 01

February, 2008

1. General Description

This manual describes the Himax's HX8353-C 132RGB*162 dots resolution driving controller. The HX8353-C(N) is designed to provide a single-chip solution that combined a gate driver, a source driver, power supply circuit, and internal graphics RAM for 262,144 colors to drive a TFT panel with 128RGB*160 dots at maximum.

The HX8353-C can be operated in low-voltage (1.65V) condition to the interface and integrated internal boosters that produce the liquid crystal voltage, breeder resistance and the voltage follower circuit for liquid crystal driver. In addition, The HX8353-C also supports various functions to reduce the power consumption of a LCD system via software control.

The HX8353-C is suitable for any small portable battery-driven product and requiring long-term driving capabilities, such as small PDAs, digital cellular phones and bi-directional pagers.

2. Features

- Single chip solution to drive a TFT panel
- 132RGB x 162-dot graphics display LCD controller/driver and 262,144 TFT colors
- Support resolution:
 - 132RGB x 162-dot: Display with 132 x 18-bits x 162 display RAM (S45AP)
 - 128RGB x 160-dot
 - Type 1: Display with 128 x 18-bits x 160 display RAM (S44AP)
 - Type 2: Display with 132 x 18-bits x 162 display RAM (S43AP)
 - 128RGB x 128-dot
 - 120RGB x 160-dot
 - 96RGB x 68-dot: Display with 96 x 18-bits x 68 display RAM (S31AL)
 - 96RGB x 64-dot
- Internal operation circuit of liquid crystal display:
 - Source channel: 396ch (132RGB)
 - Gate line: 162 Gate output
- Display mode (Color modes):
 - Full colors
 - 262k colours (18bit 6(R):6(G):6(B))
 - Reduce color mode:
 - 65k colours (16bit 5(R):6(G):5(B))
 - 4k colours (12bit 4(R):4(G):4(B))
 - 8 colors (Idle mode on): 8 colors (3 bit binary mode)
- Internal graphics RAM capacity: 132 x 162 x 18-bit = 0.38M bit:
- Support interface mode:
 - I80 System interface: 8-bits / 9-bits / 16-bits / 18bits bus
 - m68 System interface: 8-bits / 9-bits / 16-bits / 18bits bus
 - 3W/4W Serial Data Transfer Interface
- Display features
 - Area scrolling
 - Partial display mode
 - Software programmable color depth mode
- On chip features:
 - DC/DC converter
 - OTP to store initialization register setting
 - Oscillator for display clock generation

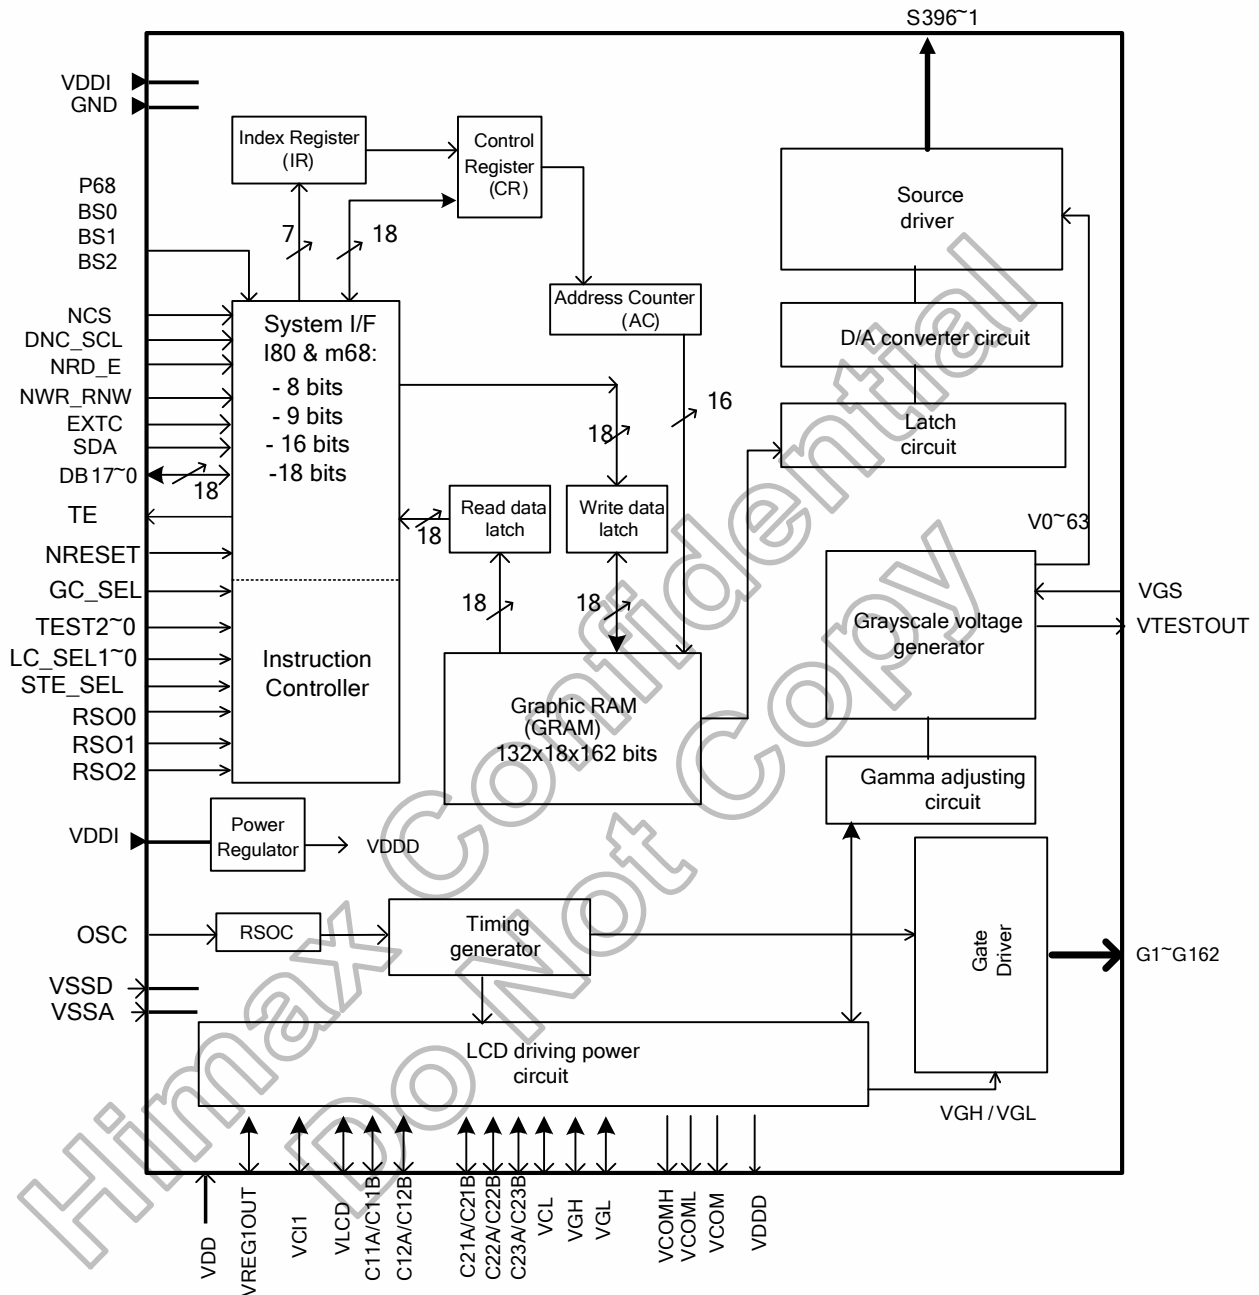

- Line inversion, frame inversion
- OTP to store initialization register setting
- Support default value for factory use
- Low-power consumption architecture supports:
 - Logic supply voltage range for VDDI to VSSD: 1.65 to 3.3V
 - Analog supply voltage range for VDD to VSSA: 2.3 to 3.3V
- Output voltage range:
 - VLCD = 4.0 to 5.5V
 - VCL = -2V to -3.3V
 - VREG1OUT = 3.0 to (VLCD-0.5V) (Source output reference voltage range)
 - VCOMH = 2.5V to 4.5V (Common electrode output high voltage)
 - VCOML = -2V to 0V (Common electrode output low voltage)
 - VGH = +9.0 to +16V (Positive Gate output voltage range)
 - VGL = -9.0 to -16V (Negative Gate output voltage range)

(note: $VDD - VCL \leq 6V$, $VGH - VGL \leq 32V$)
- Low power consumption, suitable for battery operated systems
- Suitable for all brand LCM module
 - Command set:
 - 128RGB x 160-dot : DMIF-S43AP-J124 but support LUT table
 - 132RGB x 162-dot : DMIF-S45AP-J12
 - 128RGB x 160-dot : DMIF-S44AP-J12
 - 96RGB x 68-dot : DMIF-S31AL-J124 but support LUT table
 - Himax defined command set
- CMOS compatible inputs
- Optimized layout for COG assembly
- OTP memory to store initialization register settings
- Temperature range: -30 ~ 85°C

Note: (1) Blank display means: Normal White Display = White, Normal Black Display = Black.

(2) Timing and voltage level specification apply for the complete display module including LCD glass, Flex cable (FPC) and driver IC. Signal timings and levels are measured on the host interface connector.

3. Block Diagram

4. Pin Description

4.1 Pin Description

Input Parts									
Signals	I/O	Pin Number	Connected with	Descriptions					
P68, BS2,BS1,BS0	I	4	VSSD/ VDDI	Select the MPU interface mode as listed below					
				P68	BS2	BS1	BS0	Interface mode	DB pins
				0	1	0	0	8-bit bus interface, 80-system,	DB17-DB8:Unused, DB7-DB0: Data
				0	1	0	1	16-bit bus interface, 80-system,	DB17-DB16:Unused, DB15-DB0: Data
				0	1	1	0	9-bit bus interface, 80-system,	DB17-DB9:Unused, DB8-DB0: Data
				0	1	1	1	18-bit bus interface, 80-system,	DB17-DB0: Data
				1	1	0	0	8-bit bus interface, 68-system,	DB17-DB8:Unused, DB7-DB0: Data
				1	1	0	1	16-bit bus interface, 68-system,	DB17-DB16:Unused, DB15-DB0: Data
				1	1	1	0	9-bit bus interface, 68-system,	DB17-DB9:Unused, DB8-DB0: Data
				1	1	1	1	18-bit bus interface, 68-system,	DB17-DB0: Data
x	0	x	x	3W/4W Serial interface	DB17-DB0:Unused SDA: Data input/output				
Note:Must be connected to VSSD or VDDI.(latch type)									
SPI_SEL	I	1	MPU	Interface format select pin (latch type)					
				SPI_SEL	Serial Interface Format Selection				
				0	3W Serial Interface (default)				
1	4W Serial Interface								
NCS	I	1	MPU	Chip select signal. Low: chip can be accessed; High: chip cannot be accessed. Must be connected to VSSD or VDDI if not in use. (latch type)					
DNC_SCL	I	1	MPU	The signal for command or parameter select under parallel mode(i.e. Not serial interface): Low: command. High: parameter. When under serial interface, it servers as SCL. If not used, let it open or connected to VDDI.. (latch type)					
NRD_E	I	1	MPU	I80 system: Serves as a read signal and read data at the low level. M68 system: 0: Read/Write disable, 1: Read/Write enable. Fix it to VDDI or VSSD level when using serial interface. (latch type)					
NWR_RNW	I	1	MPU	I80 system: Serves as a write signal and writes data at the rising edge. M68 system: 0: Write, 1: Read. If not used, let it open or connected to VDDI. (latch type)					
EXTC	I	1	MPU	Extended command set enable. (Only support Command-Parameter Interface mode) Low (VSSD): extended command set is discarded High (VDDI): extended command set is accepted If not used, let it open or connected to VSSD.(weak pull low)					
STE_SEL	I	1	MPU	This Pin is only valid for RSO[2:0]=3'b000. There is a internal pull-high resistor on this pad. (latch type) Low (VSSD): Scrolling function enable and TE lines is meet definition of S45AP (162 lines) → Support document of S45AP. High (VDDI): Scrolling function disable and TE lines is meet definition of S43AP (160 lines) → Support document of S43AP.					
GC_SEL	I	1	MPU	This signal is used to select gamma curve order. (latch type) Low (VSSD): GC0(1.0), GC1(2.5), GC2(2.2), GC3(1.8) High (VDDI): GC0(2.2), GC1(1.8), GC2(2.5), GC3(1.0)					
LC_SEL1-0	I	2	MPU	The selection pins of different liquid crystal type. (latch type)					
				LC_SEL1	LC_SEL0	Different liquid crystal type Selection			
				0	0	LC type 1			
				0	1	LC type 2			
1	0	LC type 3							

Input Parts								
				1	1	LC type 4		
Input Parts								
Signals	I/O	Pin Number	Connected with	Description				
RS00	I	1	MPU	Resolution selection pins. RSO[2:0] is used for selecting resolution. If not used, please let it open. (latch type)				
				RSO2	RSO1	RSO0	Resolution	
RS01	I	1	MPU	0	0	0	GRAM resolution (Size): 132RGBx162 Display resolution: Type1 :132RGBx162 (S1~S396 and G1~G162)→S45AP Type2 :128RGBx160 (S7~S390 and G2~G161)→S43AP	
				0	0	1	GRAM resolution (Size): 128RGBx128 Display resolution: 128RGBx128 (S7~S390 and G2~G129)	
				0	1	0	GRAM resolution (Size): 120RGBx160 Display resolution: 120RGBx160 (S7~S366, G2~G161)	
RSO2	I	1	MPU	0	1	1	GRAM resolution (Size): 128RGBx160 Display resolution: 128RGBx160 (S7~S390 and G2~G161) →S44AP	
				1	0	0	GRAM resolution: 96RGBx68 Display resolution: 96RGBx68 (S55~S342, G1~G68)	
				1	0	1	GRAM resolution: 96RGBx64 Display resolution: 96RGBx64 (S55~S342, G1~G64)	
				1	1	0	Setting disable	
				1	1	1	Setting disable	
NRESET	I	1	MPU or reset circuit	Reset pin. Setting this pin low initializes the LSI. Must be reset after power is supplied. Must be connected to VSSD or VDD1. (latch type)				
VDC_ENB				Input pin to select the logice power. (latch type) VSSD : Enable internal VDDD generator VDDI : Disable internal VDDD generator, VDDD should connect to external 1.65v~1.95v power				
SS_PANEL	I	1	MPU	Input pin to select the source driver scan direction on panel module. (1: VDDI, 0: VSSD) (latch type)				
				SS_Panel	Module source output direction			
					RSO[2:0] =3b'011	RSO[2:0] =3b'010	RSO[2:0] =3b'001	RSO[2:0] =3b'000
				0	S7 -> S390	S7 -> S366	S7 -> S390	S1 -> S396
				1	S390 -> S7	S366 -> S7	S390 -> S7	S396 -> S1
GS_PANEL	I	1	MPU	Input pin to select the Gate driver scan direction on panel module. (1: VDDI, 0: VSSD) (latch type)				
				GS_Panel	Module Gate output direction			
					RSO[2:0] =3b'011	RSO[2:0] =3b'010	RSO[2:0] =3b'001	RSO[2:0] =3b'000
				0	G2 -> G161	G2 -> G161	G2 -> G129	G1 -> G162
				1	G161 -> G2	G161 -> G2	G129 -> G2	G162 -> G1
REV_PANEL	I	1	MPU	Input pin to select the display reversion (1: VDDI, 0: VSSD) (latch type)				
				REV_Panel	Mapping data			
				0	"0" to minimum pixel voltage for normal white panel			
				1	"0" to maximum pixel voltage for normal black panel			
BGR_PANEL	I	1	MPU	Input pin to select the color mapping. (1: VDDI, 0: VSSD) (latch type)				
				BGR_panel	Color mapping			
				0	R->G->B			
				1	B->G->R			
TEST1	I	1	VSSD	A test pin. Make sure to fix it to the VSSD level. (weak pull low)				
TEST2	I	1	VSSD	A test pin. Make sure to fix it to the VSSD level. (weak pull low)				
TEST3	I	1	VSSD	A test pin. Make sure to fix it to the VSSD level. (weak pull low)				
OSC	I	1	Open or Connect to VSSD	Oscillator input for test purpose. If not used, please let it open or connected to VSSD. (weak pull low)				

Input Parts				
BURN	I	1	MPU	Free Running mode (weak pull low) If BURN=Hi, this can enable free running mode for burn in test. The display data alternates between full black and full white independent of input data in free running mode.

Output Part				
Signals	I/O	Pin Number	Connected with	Description
S1~396	O	396	LCD	Output voltages applied to the liquid crystal. The shift direction of segment signal outputs is changeable with the SS bit. For example, if SS=0, DATA IN THE ram address "0000" is output from S1.If SS=1, the same data in the ram address "0000" is output from S396. S1,S4,S7,...display red (R),S2,S5,S8,...display green (G),and S3,S6,S9,...display blue(B) (SS=0, BGR=0).
G1~162	O	160	LCD	Output signals from gate lines. VGH: the level to select the gate lines VGL: the level not to select the gate lines
VCOM	O	2	TFT common electrode	The power supply of common voltage in TFT driving. The voltage amplitude between VCOMH and VCOML is output. The alternation cycle can be set by the POL pin. Connect this pin to the common electrode in TFT panel.
VCOMH	O	1	Stabilizing capacitor or open	Connect this pin to the capacitor for stabilization. This pin indicates a high level of VCOM amplitude generated in driving the VCOM alternation.
VCOML	O	1	Stabilizing capacitor or open	When the VCOM alternation is driven, this pin indicates a low level of VCOM amplitude. Connect this pin to a capacitor for stabilization. When the VCOMG bit is low, the VCOML output stops and a capacitor for stabilization is not needed.
VREG1OUT	O	1	Stabilizing capacitor or open	Internal generated stable power for source driver unit .VREG1OUT = 3.0 ~ (VLCD - 0.5)V
VLCD	O	1	Stabilizing capacitor	An output from the step-up circuit1, of twice the VDD level. Connect to a stabilizing capacitor 1uF between VLCD and VSSD. VLCD=4.0 to 5.5V, Connect to VLDCD.
VGL	O	1	Stabilizing capacitor	An output from the step-up circuit2.or -3~-5 time the VDD level. The step-up rate is determined with BT3-0 bits. Connect to a stabilizing capacitor 1uF between VSSD and VGL. Min. VGL = -16V
VCL	O	1	Stabilizing capacitor	A power supply for the VCOML level. Connect to a stabilizing capacitor 1uF between VSSD and VCL. VCL=-2V ~ -3.3V
TE	O	1	MPU or open	A frame start pulse output (amplitude: VDDI-VSSD). Use when writing data to RAM in synchronization with FLM. When FLM is not used, disconnect it
VTESTOUT	O	1	Open	A test pin. Disconnect it.
VDDD	O	4	Stabilizing capacitor	A stabilizing capacitor for logic power. Connect with the capacitor 1uF.
VREF	0	1	Open	Reference voltage for power circuit Please open this pads.
VGH	O	1	Stabilizing capacitor	An output from the step-up circuit2.or 4-6 time the VDD level. The step-up rate is determined with BT3-0 bits. Connect to a stabilizing capacitor 1uF between VGH and VSSD. Place a Schottky barrier diode between VDD and VGH. (See "configuration of the power supply"). Max. VGH=16V.

Input/Output Part				
Signals	I/O	Pin Number	Connected with	Description
C11A,C11B	I/O	2	Step-up Capacitor	Connect to the step-up capacitors according to the step-up factor. Leave this pin open if the internal step-up circuit is not used.
C12A, C12B C23A, C23B	I/O	2	Open	Dummy pads. Please open this pin.
C21A, C21B C22A, C22B	I/O	8	Step-up Capacitor	Connect these pins to the capacitors for the step-up circuit 2. According to the step-up rate. When not using the step-up circuit2, disconnect them.
DB0_SDA	I/O	1	MPU	When it Operates in system interface mode, This pin (DB0) is used on bi-directional data bus. For serial interface, this pin (SDA) is for serial data pin when operate on serial data transfer interface mode of Command-parameter Interface mode. Data would be latched on the rising edge of the SCL signal. Let it open if this pin is not used.
DB0~17	I/O	18	MPU	When Operates in system interface mode, it is used liked an 18-bit bi-directional data bus. 8-bit bus: use DB7-DB0 9-bit bus: use DB8-DB0 16-bit bus: use DB15-DB0 18-bit bus: use DB17-DB0 Let unused data pins open.
DUMMY	-	16	Open	Dummy pads. Disconnect them.
DUMMYR1~R2	-	2	-	Dummy pads. Available for measuring the COG contact resistance. DUMMYR1 and DUMMYR2 are short-circuited within the chip.

Power Part				
Signals	I/O	Pin Number	Connected with	Description
VDDI	P	1	Power supply	Power supply for interface pin. VDDI = 1.65 ~3.3 V.
VSSD	P	1	Power supply	Ground for the logic side. VSSD = 0V
VSSA	P	1	Power supply	Analog ground. VSSA = 0V. When using the COG method, connect to VSSD on the FPC to prevent noise.
VDD	P	1	Power supply	A power supply for the analog circuit. VDD = 2.3 ~ 3.3V

4.2 Pin assignment

Chip size : 9900um x 670um
Including : Seal-ring : 15um*2
Scribe line : 40um*2

- Chip thickness : 300 um(typ.) / 400 um
- Pad coordinate : PAD center
- Coordinate Origin : Chip Center
- Au Bump Size
Bump height tolerance +/- 3um
Bump size tolerance:
Output bump width: 16 +/- 2um
Output bump length: 98 +/- 3um
Input bump width: 35/40 +/- 3um
Input bump length: 90 +/- 3um
- Au bump height : 15 um +/- 3um
- Numbers in the figure corresponds to pad coordinate numbers
- Alignment Mark
Arrangement : Two places
A1: Coordinate (X,Y) = (-4841 , -220)
A2: Coordinate (X,Y) = (4841 , -220)

4.5 Bump arrangement

5. Function Description

5.1 System Interface

The HX8353-C supports parallel 80-system and 68-system 18-/16-/9-/8-bits bus interface mode and 3W/4W serial interface mode. When NCS = “L”, the parallel and serial bus system interface of the HX8353-C become active and data transfer through the interface circuit is available. The DNC_ SCL pin specifies whether the system interface circuit access is to the register command or to the GRAM. The input bus width format of system interface circuit is selected by external pins BS(2-0). For selecting the format of input bus, please refer to Table 5.1 and Table 5.2.

HX8353-C includes command code and the following parameter and GRAM data. The command code can be written through data bus by setting DNC_ SCL=0. Then the command or GRAM data can be written to register at which that index pointer pointed by setting DNC_ SCL=1.

Furthermore, there are two 18-bit bus control registers used to temporarily store the data written to or read from the GRAM. When the data is written into the GRAM from the MPU, it is first written into the write-data latch and then automatically written into the GRAM by internal operation. Data is read through the read-data latch when reading from the GRAM. Therefore, the first read data operation is invalid and the following read data operations are valid.

SPI_SEL	P68	BS2	BS1	BS0	Interface
x	0	1	0	0	80-system 8-bit Parallel
x	0	1	0	1	80-system 16-bit Parallel
x	0	1	1	0	80-system 9-bit Parallel
x	0	1	1	1	80-system 18-bit Parallel
x	1	1	0	0	68-system 8-bit Parallel
x	1	1	0	1	68-system 16-bit Parallel
x	1	1	1	0	68-system 9-bit Parallel
x	1	1	1	1	68-system 18-bit Parallel
0	x	0	x	x	3 wire serial Interface only
1	x	0	x	x	4 wire serial Interface only

Table 5. 1 Interface selection

Interface	E_NRD	RW_NWR	DNC_SCL	SDA	DB17 – DB0

Table 5. 2 Interface Mode Selection

5.1.1 Parallel Bus System Interface

The input / output data from data pins (DB17-0) and signal operation of the I80/M68 series parallel bus interface as listed in Table 5.3 and Table 5.4.

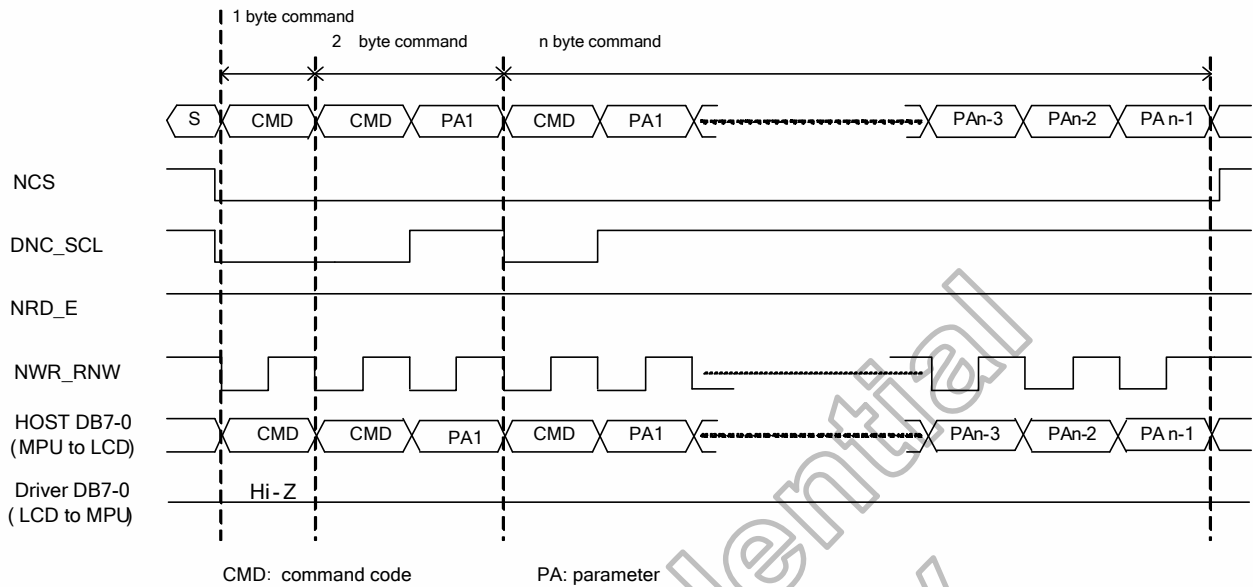

Operations	NWR_RNW	NRD_E	DNC_SCL
Writes command code	0	1	0
Reads internal status	1	0	0
Writes parameter into command or data into GRAM	0	1	1
Reads parameter from command or data from GRAM	1	0	1

Table 5. 3 Data Pin Function for I80 Series CPU

Operations	NWR_RNW	NRD_E	DNC_SCL
Writes command code	1	0	0
Reads internal status	1	1	0
Writes parameter into command or data into GRAM	1	0	1
Reads parameter from command or data from GRAM	1	1	1

5.1.2 Serial Interface

The HX8353-C supports serial data transfer interface. The interface selection by setting BS2=0 for serial interface mode. The 3 wires serial bus and 4 wires serial bus is select by SPI_SEL pin. When SPI_SEL pin is low (VSSD), it is selected by 3 wires serial bus and use: chip select line (NCS), serial input/output data (SDA), and the serial transfer clock line (DNC _SCL). When SPI_SEL pin is high (VDDI), it is selected by 4 wires serial bus and use: chip select line (NCS), serial input/output data (SDA), and the serial transfer clock line (DNC _SCL) and NWR_RNW.

Serial data write mode

The 3-Pin serial data packet contains a control bit DNC and a transmission byte and in 4-pin serial case, data packet contains just transmission byte and control bit DNC is transferred by NWR_RNW pin. If NWR_RNW is low, the transmission byte is command byte. If NWR_RNW is high, the transmission byte is stored to command register or GRAM. The MSB is transmitted first. The serial interface is initialized when NCS is high. In this state, DNC_SCL clock pulse or SDA data have no effect. A falling edge on NCS enables the serial interface and indicates the start of data transmission.

3 wire Serial Data Stream Format

4 wire Serial Data Stream Format

Figure 5. 21 Serial Interface protocol data stream format

3 wire Serial Interface Protocol

4 wire Serial Interface Protocol

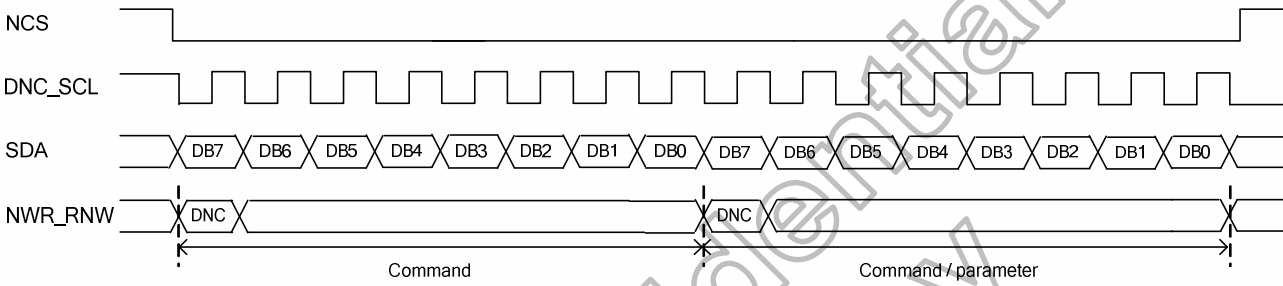

Figure 5. 22 Serial Interface protocol 3 wire/4 wire, write mode

Himax Confidential
Do Not Copy

Serial data read mode

The micro controller first has to send a command and then the following byte is transmitted in the opposite direction. The read mode has three type command data transmitted (8- / 24- / 32-bit) is according command code.

3 Wires Serial Interface Protocol

Figure 5. 23 3 Wires Serial Interface protocol, read mode

4 Wires Serial Interface Protocol

Figure 5. 24 4 wire Serial Interface protocol, read mode

There are four types of data format to write display data at Serial data bus Interface and it is the same as 8-bit bus Interface.

The data format that write display data to SRAM at Serial data bus Interface is shown as Figure5. 25 ~ Figure5. 30.

Figure 5. 25 3W Serial write data for RGB (6-6-6) bits input (LUT_EN=1)

Figure 5. 28 4W Serial write data for RGB (6-6-6) bits input (LUT_EN=1)

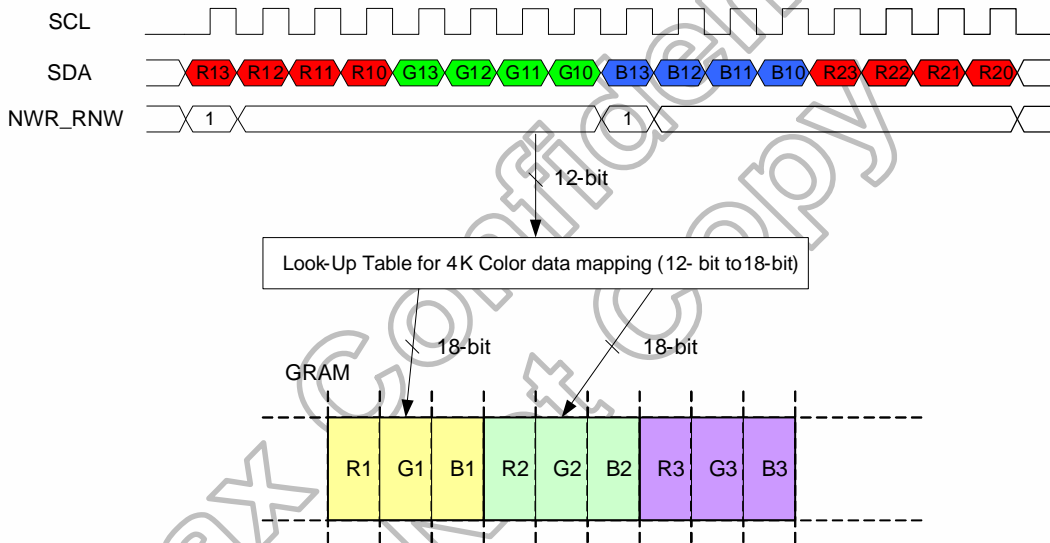

Figure 5. 29 4W Serial write data for RGB 4-4-4-bits input (support Look-up table and LUT_EN=0)

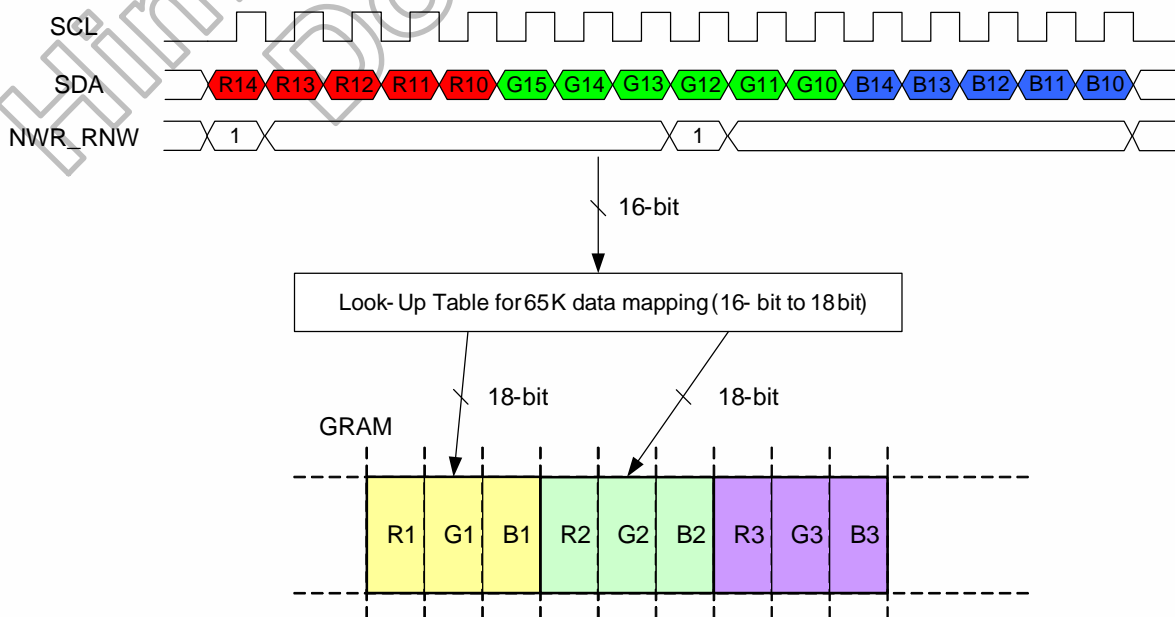

Figure 5. 30 4W Serial write data for RGB 5-6-5-bits input (support Look-up table and LUT_EN=0)

5.1.3 Display Module Data Transfer Recovery

If there is a break on data transmission when transmitting a command before a whole byte has been completed, then the display module will reset the interface so that it will be ready to receive the same byte re-transmitted when the chip select line (NCS) is next activated. See the following figure.

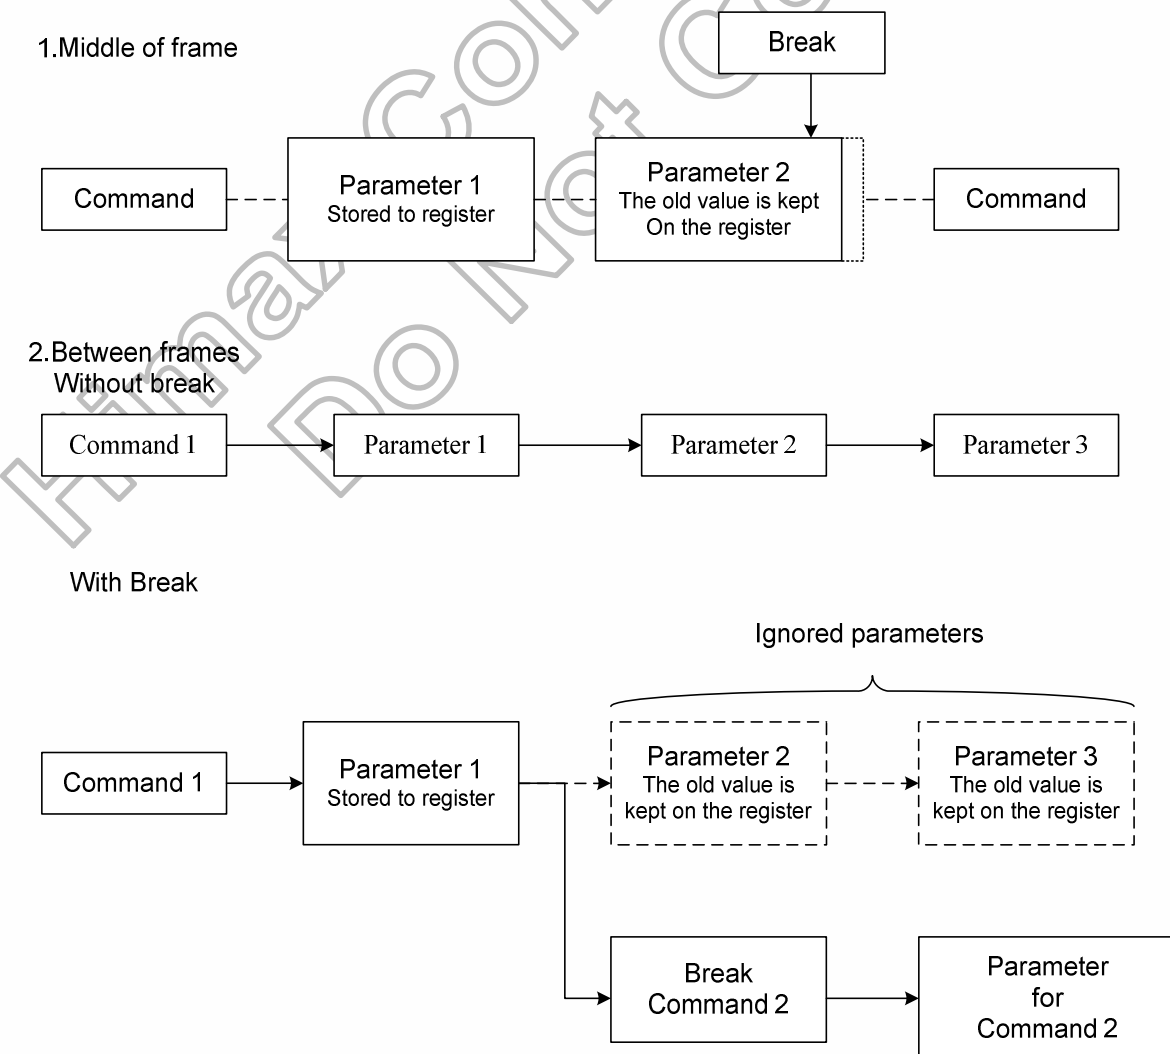

Figure 5. 31 Display Module Data Transfer Recovery

If 1 or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown:

5.1.4 Display Module Data Transfer Pause

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select Line is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then the Display Module will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select Line is released after a whole byte of a command has been completed, then the Display Module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below:

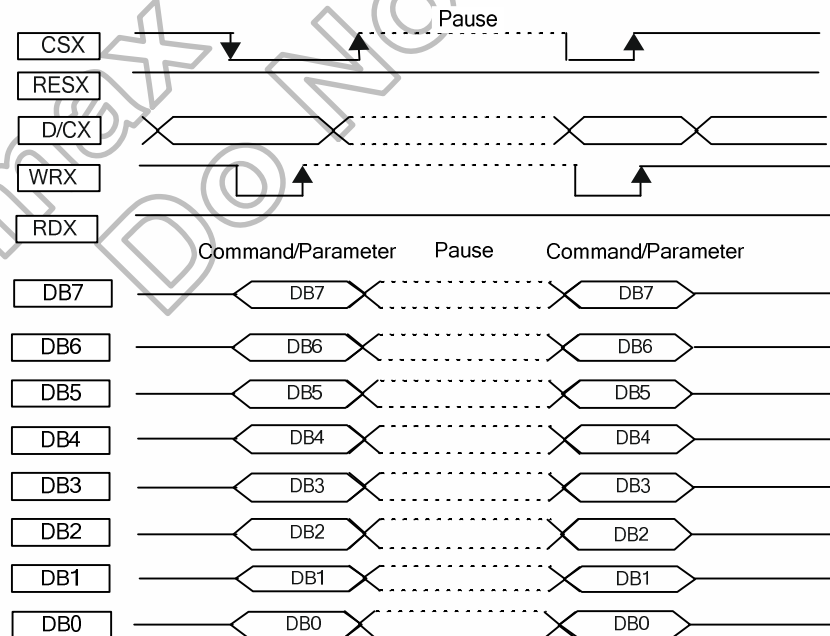

Serial Interface Pause

This applies to the following 4 conditions:

- a. Command-Pause-Command
- b. Command-Pause-Parameter
- c. Parameter-Pause-Command
- d. Parameter-Pause-Parameter

Parallel Interface Pause

This applies to the following 4 conditions:

- a. Command-Pause-Command
- b. Command-Pause-Parameter
- c. Parameter-Pause-Command
- d. Parameter-Pause-Parameter

5.1.5 Display Module Data Transfer Modes

The Module has three colour modes for transferring data to the display RAM. These are 12-bit colour per pixel, 16-bit colour per pixel and 18-bit colour per pixel. The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

Method 1:

The Image data is sent to the Frame Memory in successive Frame writes, each time the Frame Memory is filled, the Frame Memory pointer is reset to the start point and the next Frame is written.

Method 2:

Image Data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Write. Then Start Memory Write command is sent, and a new Frame is downloaded.

- Note:** (1) These apply to all Data Transfer Colour modes on both Serial and Parallel interfaces.
 (2) The Frame Memory can contain both odd and even number of pixels for both Methods. Only complete pixel data will be stored in the Frame Memory.

5.2 Address Counter (AC)

The HX8353-C contains an address counter (AC) which assigns address for writing/reading pixel data to/from GRAM. The address pointers set the position of GRAM whose addresses range X=0~131d (0~83h) and Y=0~161d (0~A1h).

Every time when a pixel data is written/read the GRAM, the X address or Y address of AC will be automatically increased by 1 (or decreased by 1), which is decided by the register (MV, MX and MY bit) setting.

To simplify the address control of GRAM access, the window address function allows for writing data only to a window area of GRAM specified by registers. After data being written to the GRAM, the AC will be increased or decreased within setting window address-range which is specified by the horizontal address register (start: SC, end: EC) or the vertical address register (start: SP, end: EP). Therefore, the data can be written consecutively without thinking a data wrap by those bit function.

5.2.1 MCU to memory write/read direction

Figure 5.32 MCU to memory write/read direction

The data is written in the order illustrated above. The Counter which dictates where in the physical memory the data is to be written is controlled by “Memory Data Access Control” Command, Bits MY, MX, MV as described below.

Figure 5.33 MY, MX, MV Setting

MV	MX	MY	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Page Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (161-Physical Page Pointer) Direct to (131-Physical Page Pointer)

5.3.8.7 96x64 resolution (RSO[2:0]=3'b101)

(a)Normal Display On

In this mode, contents of the frame memory within an area where column pointer is 00h to 5Fh and page pointer is 00h to 43h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 5. 19

5.4 Vertical Scrolling Display

The vertical scrolling display is specified by SCRLAR instruction (R33h) and VSCSAD instruction (R37h). The Vertical scrolling is only enable when using 132 x 162 GRAM resolution, display resolution 132RGB x 162 and support S45AP spec (RSO[2:0]=3'b000 & STE_SEL=0)

Figure 5. 42

Himax Confidential
Do Not Copy

RSO[2:0]=3'b000 (132RGBx162)

When RSO[2:0]=3'b000(132RGB x 162) and Vertical Scrolling Definition Parameters (TFA+VSA+BFA)=162 (other setting is prohibited). In this case, scrolling is applied as shown below.

Example 1: RSO=2'b00(132RGB x 162), TFA =3, VSA=157, BFA=2, VSP=4, MADCTR(ML)=0: Scrolling

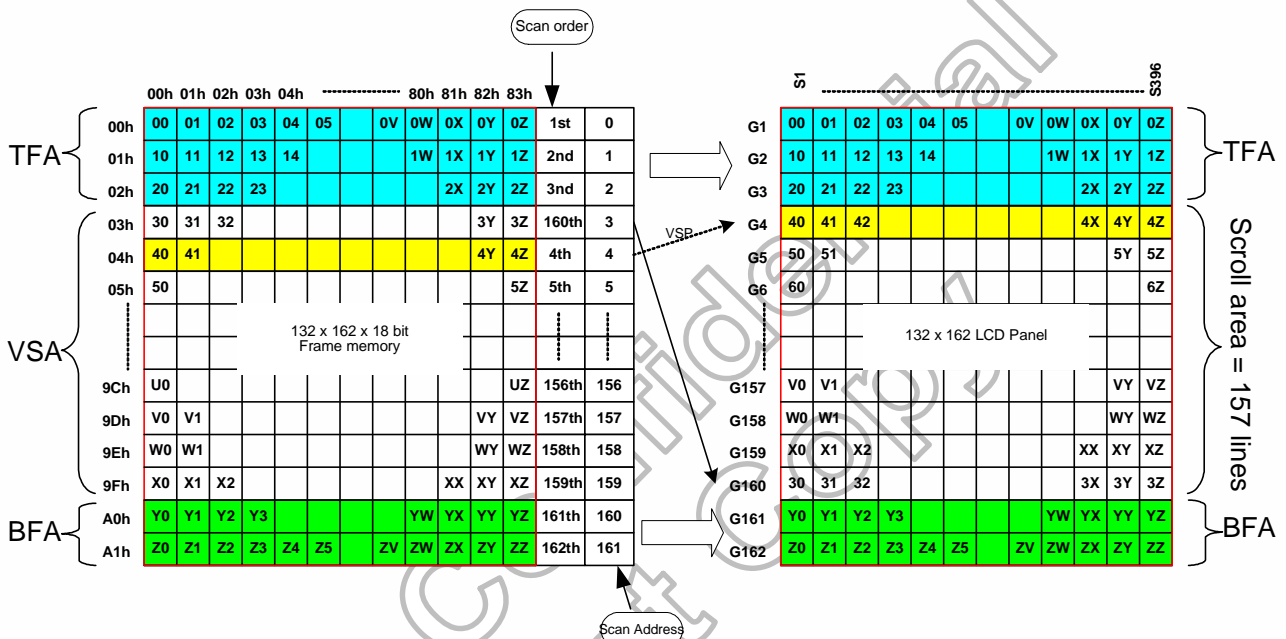

Figure 5. 43

Example 2: RSO=2'b00(132RGB x 162), TFA =3, VSA=157, BFA=2, SSA=4, MADCTR (ML)=1: Scrolling (TFA and BFA are exchanged)

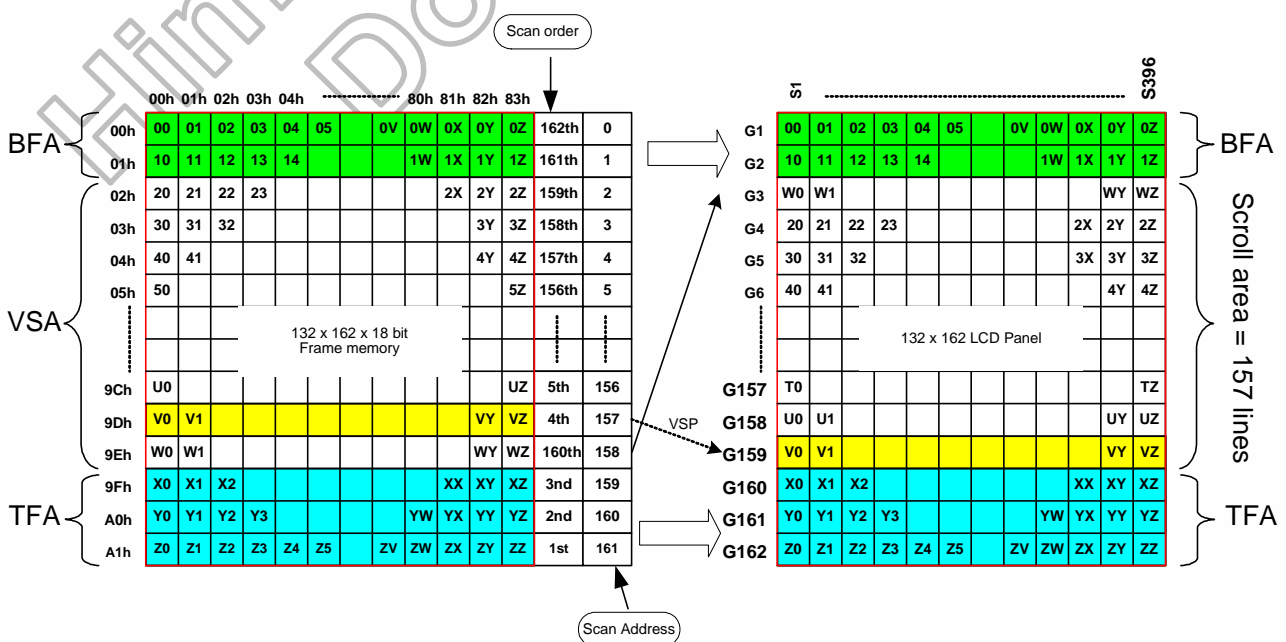

Figure 5. 44

5.5 Tearing Effect Output Line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

5.5.1 Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

Figure 5. 45

t_{VREG1} = The LCD display is not updated from the Frame Memory

t_{vdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see below)

Mode 2, The Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and N H-sync pulses per field on different resolution.

128RGBx160 (Support S43AP and S44AP): N=160

132RGBx162 (Support S45AP): N=162

96x68: N=68

96x64: N=64

Figure 5. 46

t_{hdh} = The LCD display is not updated from the Frame Memory

t_{hdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see above.)

Note: During Sleep In Mode, the Tearing Output Pin is active Low

Figure 5. 47

5.5.2 Tearing Effect Line Timing

The Tearing Effect signal is described below.

Figure 5. 48

Idle Mode Off (Frame Rate = TBDHz)

Symbol	Parameter	Min.	Max.	Unit	Description
t _{vdl}	Vertical Timing Low Duration	TBD	-	ms	-
t _{VREG1}	Vertical Timing High Duration	1000	-	us	-
t _{hdl}	Horizontal Timing Low Duration	TBD	-	us	-
t _{hdh}	Horizontal Timing High Duration	TBD	500	us	-

Note: The timings in Table 5.12 apply when MADCTL ML=0 and ML=1

Table 5. 20 AC characteristics of Tearing Effect Signal

The signal's rise and fall times (t_f, t_r) are stipulated to be equal to or less than 15ns.

Figure 5. 49

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

5.5.3 Example 1: MPU Write is faster than Panel Read

Figure 5. 50

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

Figure 5. 51

5.5.4 Example 2: MPU Write is slower than Panel Read

Figure 5. 52

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer “catches” the MPU to Frame memory write position.

5.7 Oscillator

The HX8353-C has an internal oscillator without extra external components that provide a source for system clock generator.

5.8 Source Driver

The HX8353-C contains a 396 channels of source driver (S1~S396) which is used for driving the source line of TFT LCD panel. The source driver converts the digital data from GRAM into the analog voltage for 396 channels and generates corresponding gray scale voltage output, which can realize a 262,144 colors display simultaneously. Since the output circuit of this source driver incorporates an operational amplifier, a positive and a negative voltage can be alternately output from each channel.

5.9 Gate Driver

The HX8353-C contains a 160 gate channels of gate driver (G1~G160) which is used for driving the gate. The gate driver level is VGH when scan some line, VGL the other lines.

5.10 LCD POWER GENERATION CIRCUIT

5.10.1 LCD Power Generation Scheme

The boost voltage generated is shown as below.

Figure 5. 53 LCD power generation scheme

5.10.2 Various Boosting Steps

The boost steps of each boosting voltage are selected according to how the external capacitors are connected. Different booster applications are shown as below.

Figure 5. 54 Block Diagram of Power Supply Circuit

5.11 Gray Voltage Generator for Source Driver

The HX8353-C incorporates gamma adjustment function for the 262,144-color display (64 grayscale for each R, G, B color). Gamma adjustment operation is implemented by deciding the 8 grayscale levels firstly in gamma adjustment control registers to match the LCD panel. These registers are available for both polarities.

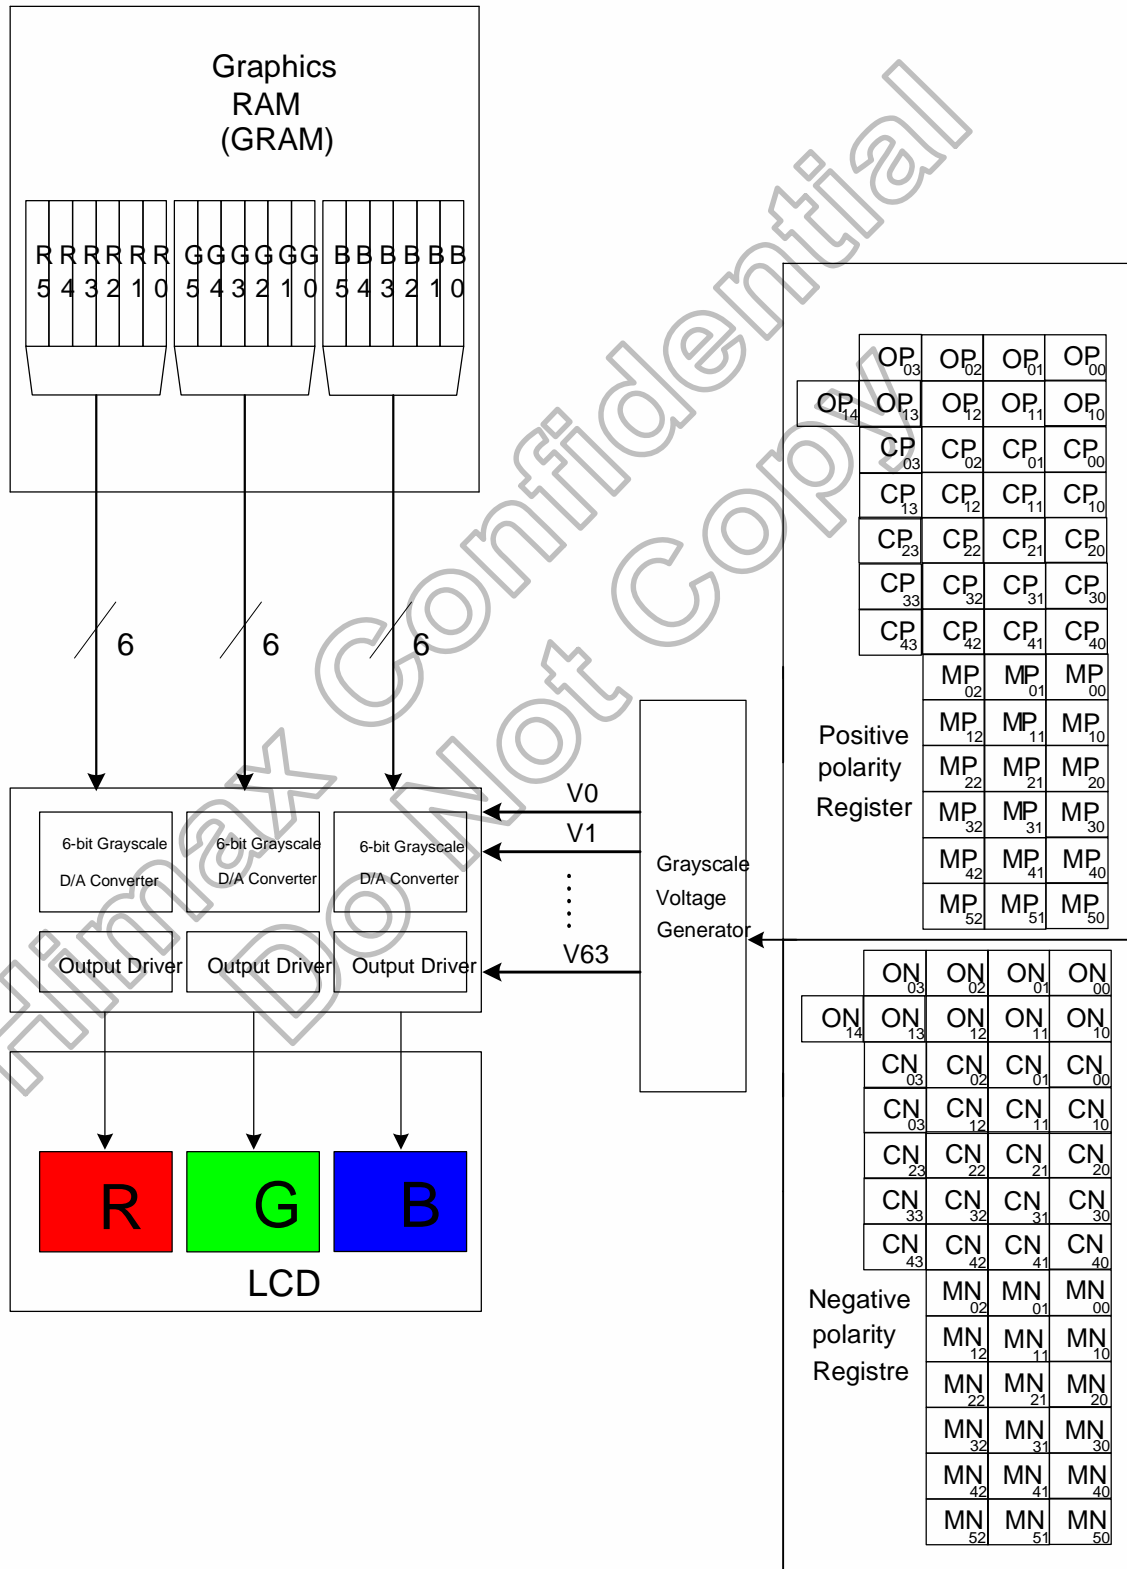

Figure 5. 55 Grayscale Control

5.11.1 Structure of Grayscale Voltage Generator

Eight reference gamma voltages $V_{gP/N}(0, 1, 8, 20, 43, 55, 62, 63)$ for positive and negative polarity are specified by the center adjustment, the micro adjustment and the offset adjustment registers firstly. With those eight voltage injected into specified node of grayscale voltage generator, totally 64 grayscale voltages (V_0-V_{63}) can be generated from grayscale amplifier for LCD panel.

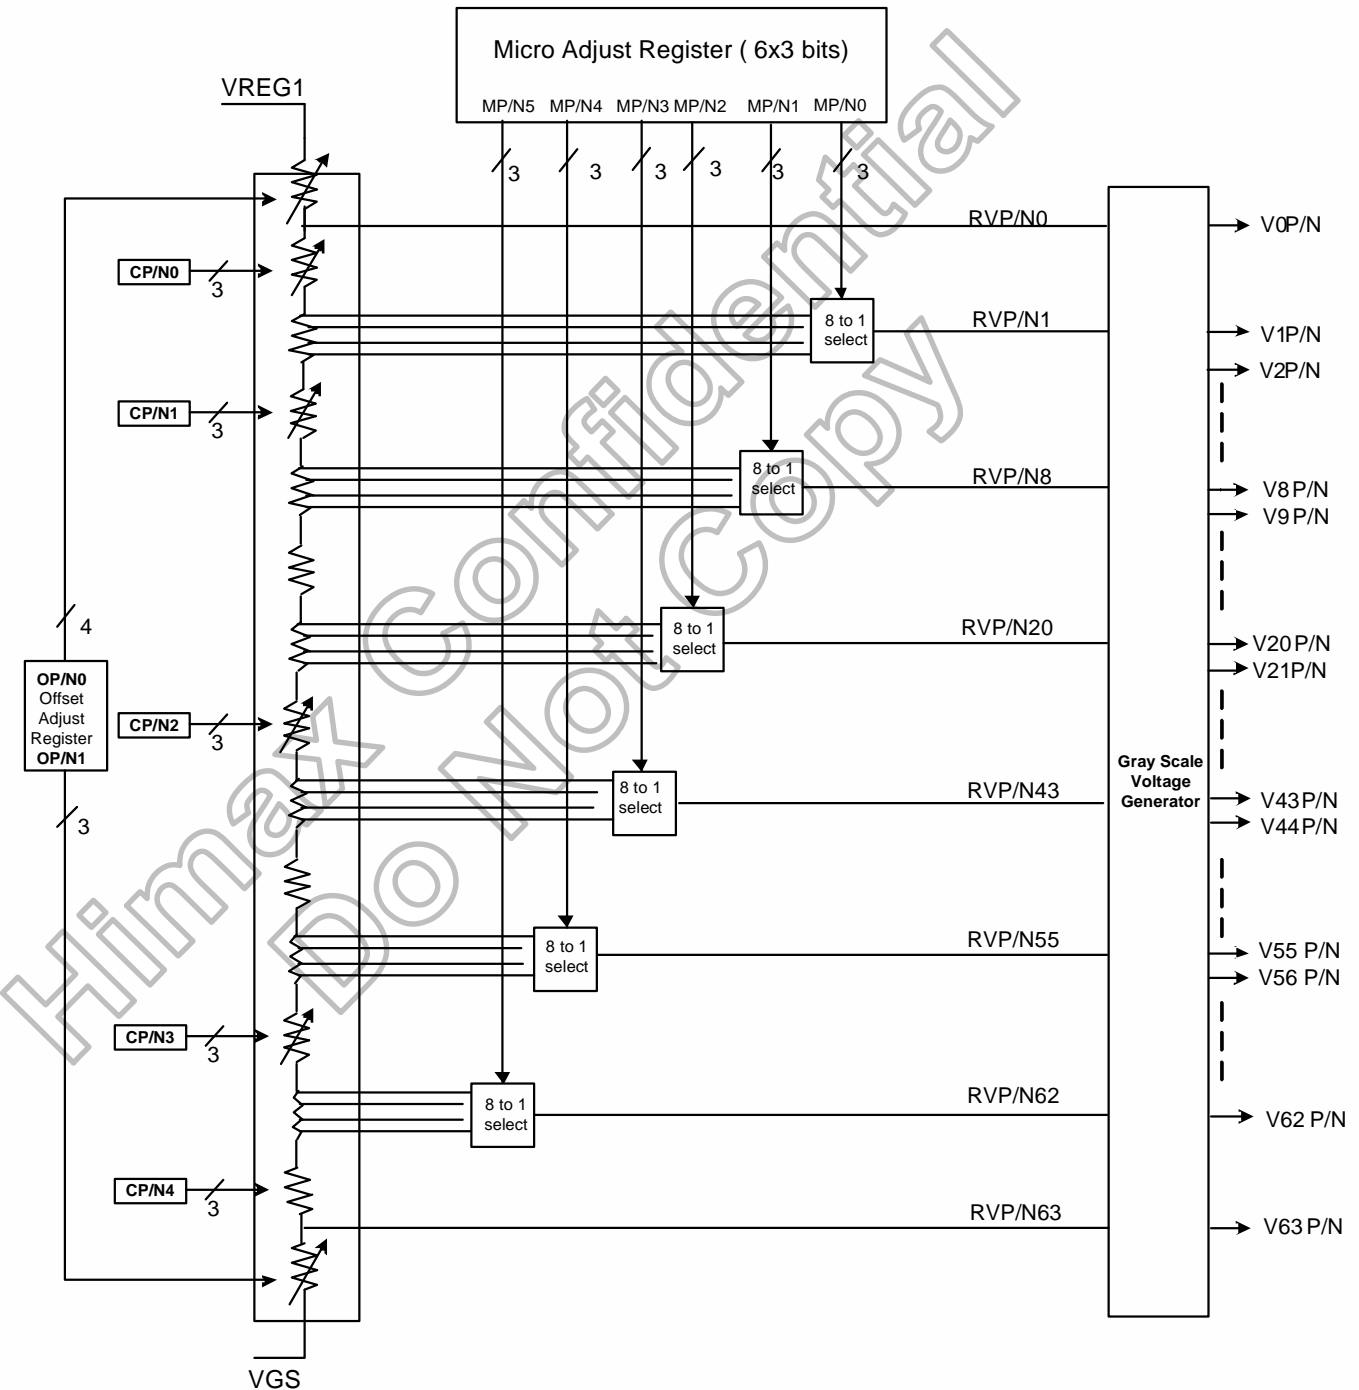

Figure 5. 56 Structure of Grayscale Voltage Generator

5.11.2 Gamma-Characteristics Adjustment Register

This HX8353-C has register groups for specifying a series grayscale voltage that meets the Gamma-characteristics for the LCD panel. These registers are divided into two groups, which correspond to the gradient, amplitude, and macro adjustment of the voltage for the grayscale characteristics. The polarity of each register can be specified independently. (R, G, and B are common.)

5.11.2.1 Offset Adjustment Registers 0/1

The offset adjustment variable registers are used to adjust the amplitude of the grayscale voltage. This function is implemented by controlling these variable resistors in the top and bottom of the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities.

5.11.2.2 Gamma Center Adjustment Registers

The gamma center adjustment registers are used to adjust the reference gamma voltage in the middle level of grayscale without changing the dynamic range. This function is implemented by choosing one input of 8 to 1 selector in the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities.

5.11.3 Gamma Macro Adjustment Registers

The gamma macro adjustment registers can be used for fine adjustment of the reference gamma voltage. This function is implemented by controlling the 8-to-1 selectors (MP/N0~5), each of which has 8 inputs and generate one reference voltage output (RVP/N 0, 1, 8, 20, 44, 56, 63, 64). These registers are available for both positive and negative polarities.

Register Groups	Positive Polarity	Description
Center Adjustment	CP/N0 3-0	Variable resistor (VRTP/N) for center adjustment
	CP/N1 3-0	Variable resistor (VRCP/N0)for center adjustment
	CP/N2 3-0	Variable resistor (VRMP/N) for center adjustment
	CP/N3 3-0	Variable resistor (VRCP/N1)for center adjustment
	CP/N4 3-0	Variable resistor (VRBP/N)for center adjustment
Macro Adjustment	MP/N0 2-0	8-to-1 selector (reference voltage level of grayscale 1)
	MP/N1 2-0	8-to-1 selector (reference voltage level of grayscale 8)
	MP/N2 2-0	8-to-1 selector (reference voltage level of grayscale 20)
	MP/N3 2-0	8-to-1 selector (reference voltage level of grayscale 43)
	MP/N4 2-0	8-to-1 selector (reference voltage level of grayscale 55)
Offset Adjustment	OP/N0 3-0	Variable resistor (VRP/N0)for offset adjustment
	OP/N1 4-0	Variable resistor (VRP/N1)for offset adjustment

Table 5. 21 Gamma-Adjustment Registers

5.11.4 Gamma Resister Stream and 8 to 1 Selector

The block consists of two gamma resister streams, one is for positive polarity and the other is for negative polarity, each one includes eight gamma reference voltages (Vg(P/N)0, 1, 8, 20, 43, 55, 62, 63). Furthermore, the block has a pin (VGS) to connect a variable resister outside the chip for the variation between panels, if needed.

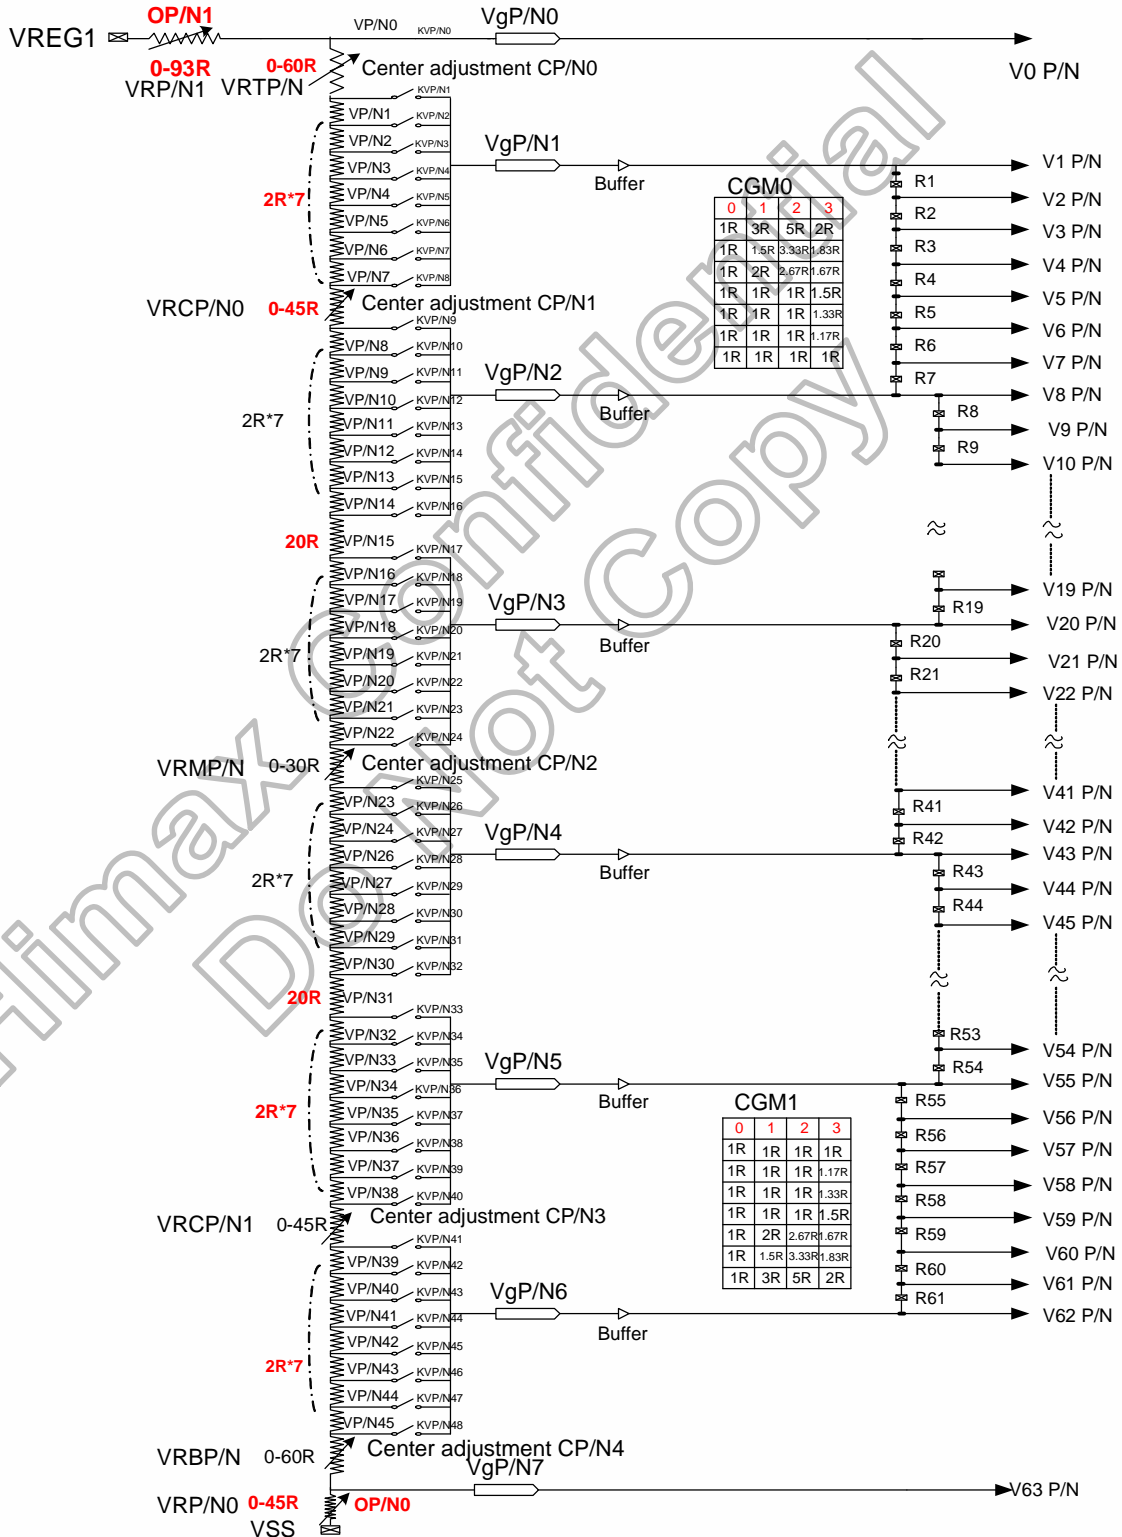

Figure 5. 57 Gamma Resister Stream and Gamma Reference Voltage

5.11.5 Variable Resister

There are two types of variable resistors, one is for center adjustment and the other is for offset adjustment. The resistances are decided by setting values in the center adjustment, offset adjustment registers. Their relationship is shown as below.

5.11.6 Gamma Curve Control

There are four kind of Gamma Curve is selected by GAMSET command. The parameter GC[7:0] is stored in internal register and used to select one set of gamma correction register.

GC_SEL= Low(VSSD):

Figure 5.60 Gamma Curve according to the GC0 to GC3 bit (GC_SEL=low)

GC_SEL= high (VDDI):

5.12 Oscillator

The HX8353-C can oscillate an internal R-C oscillator with an internal oscillation resistor (Rf). The oscillation frequency is changed according to the CADJ[3:0] and RADJ[2:0] internal register. Please refer to extended command set B0h. The default frequency is 1.5MHz.

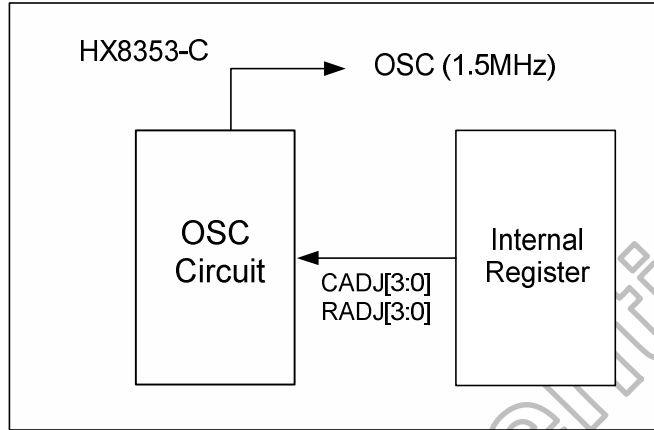

Figure 5. 61 Oscillation Circuit

5.13 Power On/Off Sequence

VDDI, VDD can be applied in any order. VDDI and VDD can be powered down in any order. During power off, if LCD is in the Sleep Out mode, VDDI and VDD must be powered down minimum 120msec after NRESET has been released. During power off, if LCD is in the Sleep In mode, VDDI or VDD can be powered down minimum 0msec after NRESET has been released. NCS can be applied at any timing or can be permanently grounded. NRESET has priority over NCS. There will be no damage to the display module if the power sequences are not met. There will be no abnormal visible effects on the display panel during the Power On/Off Sequences. There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence. If NRESET line is not held stable by host during Power On Sequence as defined in Sections 5.16.1 and 5.16.2, then it will be necessary to apply a Hardware Reset (NRESET) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed. The power on/off sequence is illustrated below:

Himax Confidential
Do Not Copy

5.13.1 Case 1 – NRESET line is hold High or Unstable by Host at Power On

If NRESET line is held high or unstable by the host during Power On, then a Hardware Reset must be applied after both VDD and VDDI have been applied - otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

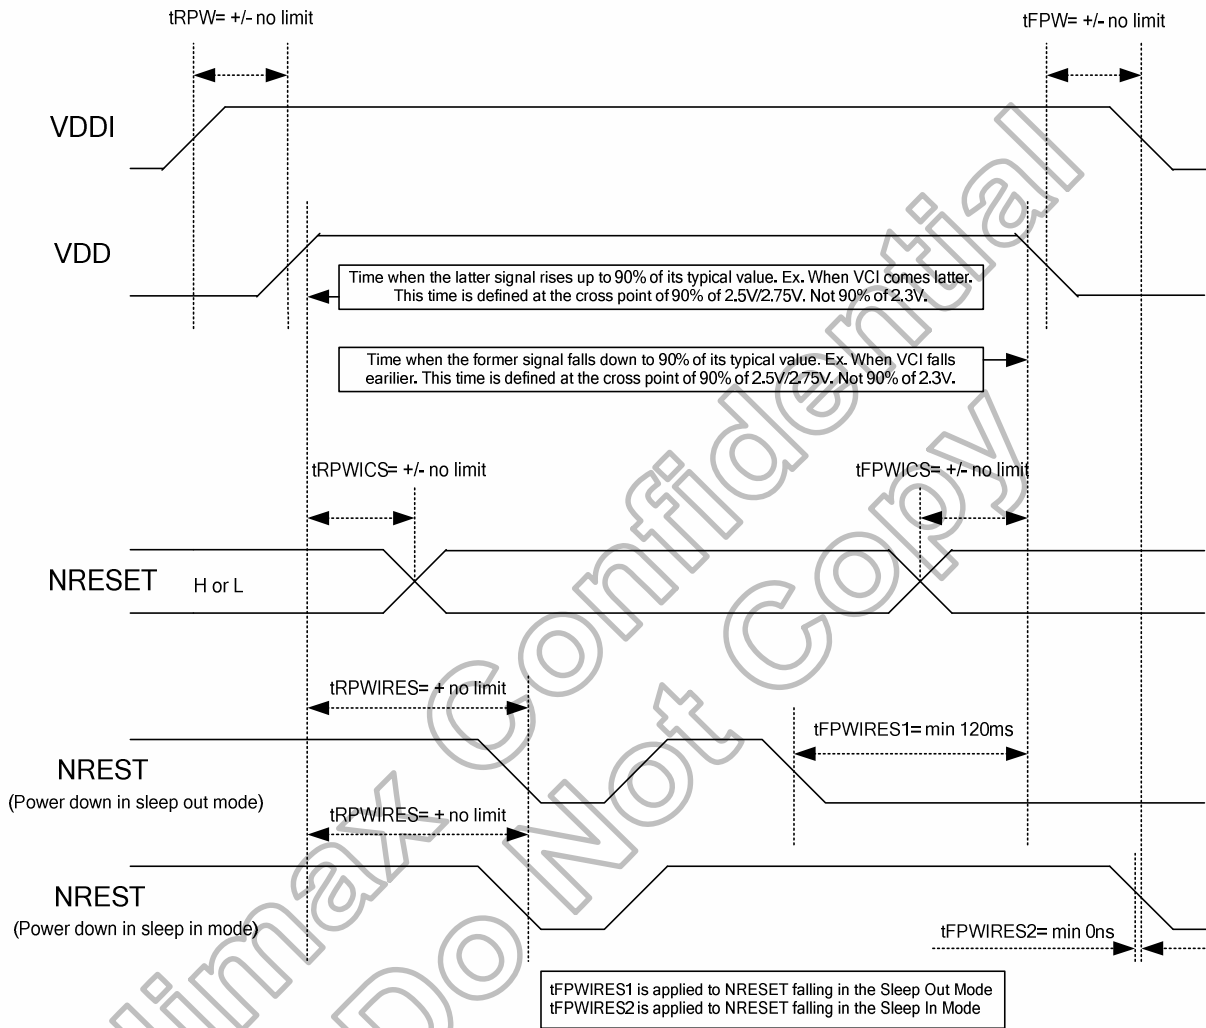

Figure 5. 62 Case 1 – NRESET line is hold High or Unstable by Host at Power On

5.13.2 Case 2 – NRESET line is held Low by host at Power On

If NRESET line is held Low (and stable) by the host during Power On, then the NRESET must be held low for minimum 10µsec after both VDD and VDDI have been applied.

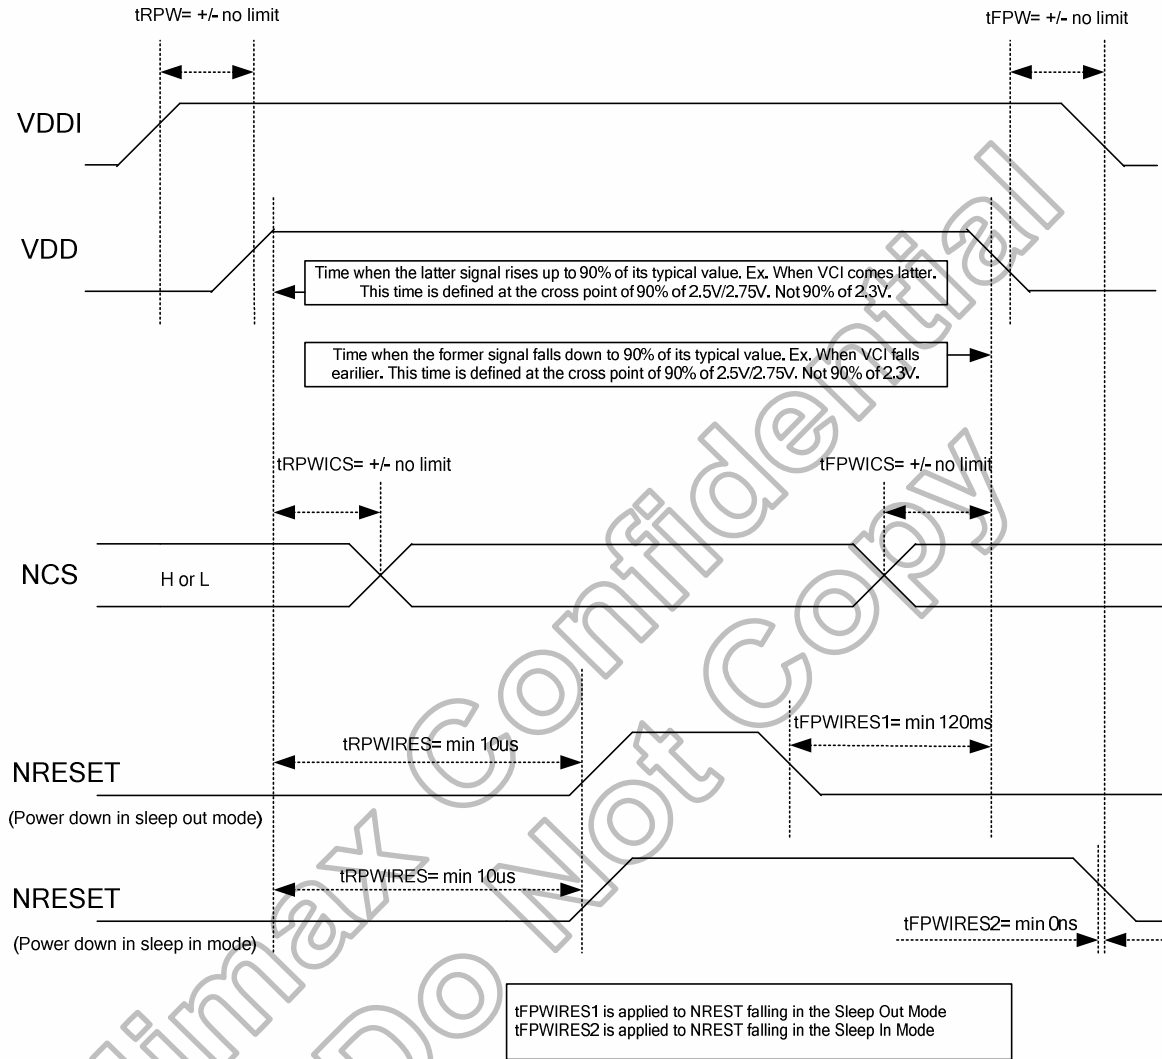

Figure 5. 63 NRESET line is held Low by host at Power On

5.14 Uncontrolled Power Off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. There will not be any damages for the display module or the display module will not cause any damages for the host or lines of the interface. At an uncontrolled power off the display will go blank and there will not be any visible effects within 1 second on the display (blank display) and remains blank until "Power On Sequence" powers it up.

5.17 Sleep Out – Command and Self-Diagnostic Functions of the Display Module

5.17.1 Register loading Detection

Sleep Out-command (See section 6.2.12 “Sleep Out (11h)”) is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP (or similar device) to registers of the display controller is working properly.

There are compared factory values of the OTP and register values of the display controller by the display controller. If those both values (OTP and register values) are same, there is inverted (=increased by 1) a bit, which is defined in command 6.2.10 “Read Display Self-Diagnostic Result (0Fh)” (=RDDSDR) (The used bit of this command is DB7). If those both values are not same, this bit (DB7) is not inverted (= increased by 1).

The flow chart for this internal function is following:

Note: There is not compared and loaded register values, which can be changed by User (User area commands: 00h to AFh and DAh to DDh), by the display module.

Figure 5. 65 Register loading Detection Flow

5.17.2 Functionality Detection

Sleep Out-command (See section 6.2.12 “Sleep Out (11h)”) is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (e.g. booster voltage levels, timings, etc.). If functionality requirement is met, there is inverted (= increased by 1) a bit, which defined in command 6.2.10 “Read Display Self- Diagnostic Result (0Fh)” (= RDDSDR) (The used bit of this command is DB6). If functionality requirement is not same, this bit (DB6) is not inverted (= increased by 1). The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In -mode to Sleep Out -mode, before there is possible to check if User's functionality requirements are met and a value of RDDSDR's DB6 is valid. Otherwise, there is 5msec delay for DB6's value, when Sleep Out -command is sent in Sleep Out -mode.

Figure 5. 66 Functionality Detection Flow

Table 5. 31 OTP memory table

	For OSC adjust and BGAP voltage adjust are valid only Himax provide)
	For Module supplier program
	For Module supplier program
	For Module supplier program
	For Module supplier program

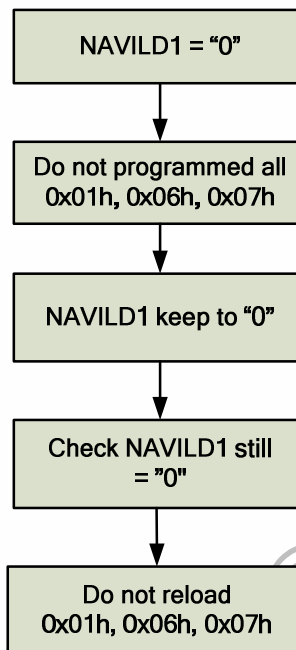

Note: (1) The default value of OTP memory bits are all "0".
 (2) NAVLIDB1, NVALID_VCM[2:0] bit decide the OPT reload Enable/Disable, the default value is "0". If the own OTP area of NAVILD bit had been programmed, the NAVILD bit will be changed to "1" automatically and execute the OTP reload.

For example:

Condition 1: Programmed all index of 0X01h, 0X06h and 0X07h

Condition 2: Do not program all index of 0X01h, 0X06h and 0X07h

(3) There are some conditions that HX8353-C can reload OTP.

1. Hardware reset
2. Software reset
3. SLPOUT command.

(4) User can use GETOTP command to read back the OTP values. Similarly, the user also can use GETOTP to read the index 0x02h, 0x03h and 0x04h that is defined the NVALID bit for VCM0, VCM1 and VCM2 (NVALID_VCM0, NAVLID_VCM1 and NAVLID_VCM2). User can read back the NVALID_VCM0, NAVLID_VCM1 and NAVLID_VCM2 (use GETOTP command to know how many times of VCM had programmed on OTP).

	NVALID_VCM2	NVALID_VCM1	NVALID_VCM0
Programed 0 time	0	0	0
Programed 1 time	0	0	1
Programed 2 times	0	1	1
Programed 3 times	1	1	1

11	Set OTP_EN=1, Internal register begin write to OTP according to OTP_index.																								
12	Wait 1 ms																								
13	Complete programming one parameter to OTP. If continue to programming other parameter, return to step (9). Otherwise, power off the module and remove the external power on VGH pin.																								

Programming circuitry

Note: (1) Connect external power at Step 7
 (2) C:1uF(built-in on the module)

5.19 Free Running Mode Specification

Burn-in of TFT displays consists of driving each module for 10hr at a temperature of 60°C. In order to drive the modules, it requires extra electronics. To reduce the burn-in cost, it is requested that the driver IC will generate the required display image without requiring extra electronics. We term this a free running mode (FR-mode). For burn-in, it is sufficient that the display is powered up with a plane saturated black or saturated white pattern. Black should be used for burn-in, since this result in a larger pixel voltage. White is used to verify if the free running mode is properly functioning. Please note that the black and the white pattern are reversed in case of a normally black display.

Parameter	Symbol	Description
Power supply pins	VDDI, VDD	All power supply pins
Free running mode	BURN	BURN=1, FR-mode is enabled.
Reset	NRESET	Active low pulse in order to start the FR-mode.
Chip select ⁽¹⁾	NCS	This pin will be left open during FRM mode.
Reads/not write ⁽¹⁾	NWR_RNW	This pin will be left open during FRM mode.
Data/not command ⁽¹⁾	DNC_SCL	This pin will be left open during FRM mode.
SPI I/F select ⁽¹⁾	SPI_SEL	This pin will be left open during FRM mode.
TE select	STE_SEL	This pin will be left open during FRM mode.
CPU I/F Data ⁽¹⁾	D[0..17]	This pin will be left open during FRM mode.
SPI I/F	SCL	This pin will be left open during FRM mode.

Note: (1) As a general rule, all control pins of the interfaces like chip-select, data-enable, etc, must be disabled, all modes select pins like data-not-command, interface-select etc and all data-bus pins must be set to either logic high or logic low during the FR-mode.

Table 5. 32 Pin Information

Power-on Sequence of Free Running Mode

The FR-mode starts automatically after the power supply is switched on and a reset pulse is applied to the Reset-pin, if the BURN pin is set to logical high. In case of separate supply pins for the analogue supply and digital supply, both supply pins will be connected together, if it is supported by the driver specification. Otherwise, each supply voltage will be switched on separately according to the requested power-on sequence. The BURN and all other digital I/F pins, which will be set to logic high during the free running mode, can be switched to logic high together with the digital supply pin. The FR-mode will be restarted if the reset pulse is applied a second time. The OTP starts to load when Reset leaves low to high.

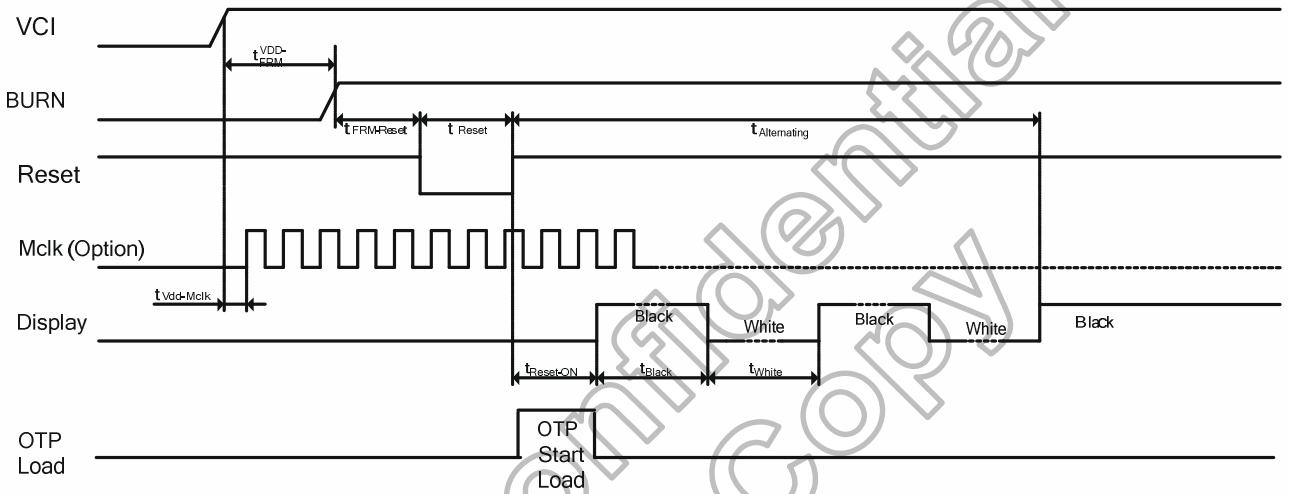

Figure 5. 68 Power On Sequence of FR-mode (for Normally-White Panel)

Power off Sequence of Free Running Mode

The power supply can be switched off any time.

Figure 5. 69 Power Off Sequence of FR-mode

Free Running Mode Display

The display will show an alternating black and white picture for about the first 5 minutes. The black to white ratio shall be 50%/50%. The time of the black and white pattern shall be around 1 second in order to avoid a too long waiting time to verify that the FR-mode is functioning properly. The display is switched to a static black pattern after the alternating mode is finished. Thus, most efficient burn-in stress is ensured. The display shall work in idle-mode. There is no special restriction for the frame frequency. The frame frequency will be set according to the parameter in the OTP.

Alternating Black and White Pattern	$t_{\text{Alternating}}$	-	5	-	min
Master Clock Frequency	f_{Mclk}	-	-	1.5	MHz

6.2 User Define Command List Table

User define command list is available only under “EXTC=1” or enable PASSWDEN command (even EXTC = low), if EXTC=0 (No enable PASSWDEN command)all user define write command is seen as “NOP”, of Hi-Z data bus if any user defined read command.

														TS[6:0]	It is for internal use, not open.

- Note:** (1) Undefined commands are treated as NOP (00H) command.
 (2) B0 to DB9 and DE to FF are for factory use of display module supplier. User can decide if these commands are available or they are treated as NOP (00H) commands before shipped to User. Default value is NOP(00H). If pin EXTC is tied to high, B0 to DB9 and DE to FF extended command sets are accepted, other extended command sets are discarded.
 (3) Commands 10H, 12H, 13H, 20H, 21H, 26H, 28H, 29H, 30H, 36H (Bit B4 only), 38H and 39H are updated during V-sync when Module is in Sleep Out Mode to avoid abnormal visual effects. During Sleep In mode, these commands are updated immediately. Read status (09H), Read Display Power Mode (0AH), Read Display MADCTL (0BH), Read Display Pixel Format (0CH), Read Display Image Mode (0DH), Read Display Signal Mode (0EH) and Read Display Self Diagnostic Result (0FH) of these commands is updated immediately both in Sleep In Mode and Sleep Out Mode.
 (4) SETGAMMA and GETGAMMA can't be set at the same time.

6.3 Command Description

6.3.1 NOP

00 H	NOP (No Operation)											
	DNC	NWR	NRD	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX
Command	0	↑	1	0	0	0	0	0	0	0	0	00
Parameter	NO PARAMETER											
	This command is an empty command; it does not have any effect on the display module.											
Description	However it can be used to terminate Frame Memory Write or Read as described in RAMWR (Memory Write) and RAMRD (Memory Read) Commands.											
Restriction												
Register Availability	Status						Availability					
	Normal Mode On, Idle Mode Off, Sleep Out						Yes					
	Normal Mode On, Idle Mode On, Sleep Out						Yes					
	Partial Mode On, Idle Mode Off, Sleep Out						Yes					
	Partial Mode On, Idle Mode On, Sleep Out						Yes					
Default	Sleep In or Booster Off						Yes					
	Status						Default Value					
	Power On Sequence						N/A					
	S/W Reset						N/A					
Flow Chart	H/W Reset						N/A

6.3.2 Software Reset (01h)

01 H	SWRESET (Software Reset)												
	DNC	NWR	NRD	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX	
Command	0	↑	1	0	0	0	0	0	0	0	0	1	01
Parameter	NO PARAMETER												
Description	When the Software Reset command is written, it causes a software reset. It resets the commands and parameters to their S/W Reset default values. (See default tables in each command description.) Note: The Frame Memory contents are unaffected by this command. It will be necessary to wait 5msec before sending new command following software reset.												
Restriction	The display module loads all display supplier's factory default values to the registers during this 5msec. If Software Reset is applied during Sleep Out mode, it will be necessary to wait 120msec before sending Sleep out command. Software Reset Command cannot be sent during Sleep Out sequence.												
Register Availability	Status						Availability						
	Normal Mode On, Idle Mode Off, Sleep Out						Yes						
	Normal Mode On, Idle Mode On, Sleep Out						Yes						
	Partial Mode On, Idle Mode Off, Sleep Out						Yes						
	Partial Mode On, Idle Mode On, Sleep Out						Yes						
	Sleep In or Booster Off						Yes						
Default	Status						Default Value						
	Power On Sequence						N/A						
	S/W Reset						N/A						
	H/W Reset						N/A						
Flow Chart	<pre> graph TD A[SWRESET] --> B[Display whole blank screen] B --> C[Set Commands to S/W Default Value] C --> D[Sleep In Mode] </pre>												

6.3.3 Read Display Identification Information (04h)

04 H	RDDIDIF (Read Display Identification Information)											
	DNC	NWR	NRD	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX
Command	0	↑	1	0	0	0	0	0	1	0	0	04
1st parameter	1	1	↑	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	-
2 nd parameter	1	1	↑	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	-
3 rd parameter	1	1	↑	ID37	ID36	ID35	ID34	ID33	ID32	ID31	ID30	-
Description	This read byte returns 24-bit display identification information. The 1st Parameter is dummy read. The 2nd Parameter identifies the LCD module's manufacturer. It is specified by Nokia and for xx is defined as xxHEX. The 3rd Parameter has 2 purposes. Bit7 (MSB) defines the type of panel. 0=Driver (STN B/W), 1=Module (Color). Bits 6...0 are used to track the LCD module/driver version. It is defined by display supplier (with Nokia's agreement) and it changes each time a revision is made to the display, material or construction specifications. See Table:											
	ID Byte Value V[7:0]			Version			Changes					
	80h											
	81h											
	82h											
	83h											
84h												
85h												
The 4th parameter identifies the LCD module/driver. It is specified by Nokia and for this LCD project module is defined as xxHEX.												
Restriction												
Register Availability	Status						Availability					
	Normal Mode On, Idle Mode Off, Sleep Out						Yes					
	Normal Mode On, Idle Mode On, Sleep Out						Yes					
	Partial Mode On, Idle Mode Off, Sleep Out						Yes					
	Partial Mode On, Idle Mode On, Sleep Out						Yes					
Default	Status						Default Value					
	Power On Sequence						See Description					
	S/W Reset						See Description					
Flow Chart	Serial I/F Mode						Parallel I/F Mode					
	RDDID (04h)						RDDID (09h)					
	Dummy Clock						Dummy Read					
	Send ID1[7:0]						Send ID1[7:0]					
	Send ID2[7:0]						Send ID2[7:0]					
	Send ID3[7:0]						Send ID3[7:0]					

6.3.4 Read Display Status (09h)

09 H	RDDST (Read Display Status)											
	DNC	NWR	NRD	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX
Command	0	↑	1	0	0	0	0	1	0	0	1	09
1 st parameter	1	1	↑	-	-	-	-	-	-	-	-	-
2 nd parameter	1	1	↑	D31	D30	D29	D28	D27	D26	D25	D24	-
3 rd parameter	1	1	↑	D23	D22	D21	D20	D19	D18	D17	D16	-
4 th parameter	1	1	↑	D15	D14	D13	D12	D11	D10	D9	D8	-
5 th parameter	1	1	↑	D7	D6	D5	D4	D3	D2	D1	D0	-

Description	This command indicates the current status of the display as described in the table below:		
	Bit	Description	Comment
	D31	Booster Voltage Status	
	D30	Page Address Order	
	D29	Column Address Order	
	D28	Page/Column Order	
	D27	Vertical Order	
	D26	RGB/BGR Order	
	D25	Horizontal Order	
	D24	Switching between Segment outputs and RAM	Set to '0'
	D23	Switching between Common outputs and RAM	Set to '0'
	D22	Interface Color Pixel Format Definition	Set to '1'
	D21		Set to '1'
	D20		Set to '0'
	D19	Idle Mode On/Off	
	D18	Partial Mode On/Off	
	D17	Sleep In/Out	
	D16	Display Normal Mode On/Off	
	D15	Vertical Scrolling Status	
	D14	Horizontal Scrolling Status	Set to '0'
	D13	Inversion Status	
	D12	All Pixels On	Set to '0'
	D11	All Pixels Off	Set to '0'
	D10	Display On/Off	
	D9	Tearing Effect Line On/Off	
	D8	Gamma Curve Selection	
	D7		
	D6		
	D5	Tearing Effect Output Line Mode	
	D4	For Future Use	Set to '0'
D3	For Future Use	Set to '0'	
D2	For Future Use	Set to '0'	
D1	For Future Use	Set to '0'	
D0	For Future Use	Set to '0'	

Bit Values are explained overleaf.

Bit D31 – Booster Voltage Status
 '0' = Booster Off.
 '1' = Booster On.

Bit D30 – Page Address Order
 '0' = Top to Bottom (When MADCTL DB7='0').
 '1' = Bottom to Top (When MADCTL DB7='1').

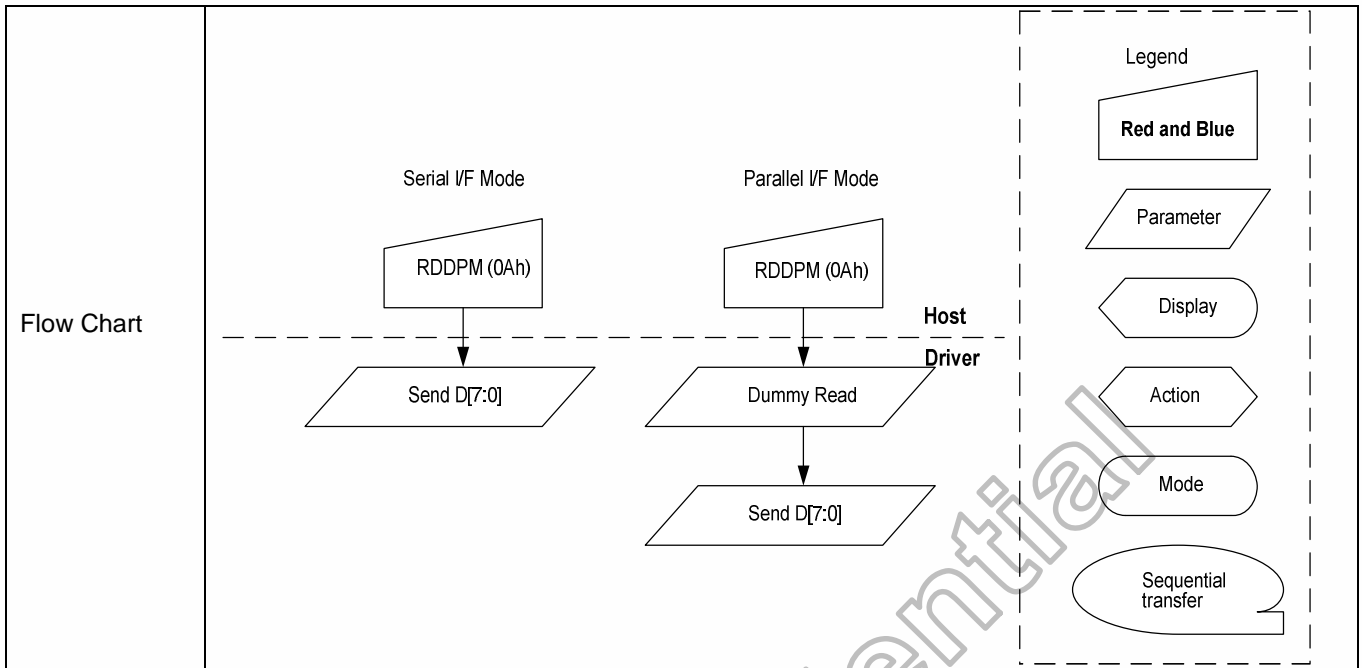

'0' = Left to Right (When MADCTL DB6='0').
 '1' = Right to Left (When MADCTL DB6='1').
 Bit D28 - Page/Column Order
 '0' = Normal Mode (When MADCTL B5='0').
 '1' = Reverse Mode (When MADCTL B5='1').
 Bit D27 - Line Address Order
 '0' = LCD Refresh Top to Bottom (When MADCTL B4='0').
 '1' = LCD Refresh Bottom to Top (When MADCTL B4='1').
 Bit D26 - RGB/BGR Order
 '0' = RGB (When MADCTL B3='0').
 '1' = BGR (When MADCTL B3='1').
 Note: For Bits DB27, DB26, also refer to Section 9.3.23.
 Bit D25 - Display Data Latch Data Order (if this bit is not available, so it is set to '0')
 '0' = LCD Refresh Left to Right (When MADCTL B2='0').
 '1' = LCD Refresh Right to Left (When MADCTL B2='1').
 Bit D24 - Switching Between Segment Outputs and RAM
 This bit is not applicable for this project, so it is set to '0'
 Bit D23 - Switching Between Common Outputs and RAM
 This bit is not applicable for this project, so it is set to '0'
 Bits D22, DB21, DB20 - Interface Color Pixel Format Definition
 Bit D19 - Idle Mode On/Off
 '0' = Idle Mode Off.
 '1' = Idle Mode On.
 Bit D18 - Partial Mode On/Off
 '0' = Partial Mode Off.
 '1' = Partial Mode On.
 Bit D17 - Sleep In/Out
 '0' = Sleep In Mode.
 '1' = Sleep Out Mode.
 Bit D16 - Display Normal Mode On/Off
 '0' = Display Normal Mode Off.
 '1' = Display Normal Mode On.
 Bit D15 - Vertical Scrolling On/Off
 '0' = Vertical Scrolling is Off.
 '1' = Vertical Scrolling is On.
 Bit D14 - Horizontal Scrolling Status
 This bit is not applicable for this project, so it is set to '0'
 Bit D13 - Inversion On/Off
 '0' = Inversion is Off.
 '1' = Inversion is On.
 Bit D12 - All Pixels On
 This bit is not applicable for this project, so it is set to '0'
 Bit D11 - All Pixels Off
 This bit is not applicable for this project, so it is set to '0'
 Bit D10 - Display On/Off
 '0' = Display is Off.
 '1' = Display is On.
 Bit D9 - Tearing Effect Line On/Off
 '0' = Tearing Effect Line Off.
 '1' = Tearing Effect On.
 Bits D8, D7, D6 - Gamma Curve Selection

Gamma Curve Selected	D8	D7	D6	Gamma Set (26h) Parameter
Gamma Curve 1	0	0	0	GC0
Gamma Curve 2	0	0	1	GC1
Gamma Curve 3	0	1	0	GC2
Gamma Curve 4	0	1	1	GC3
Not Defined	1	0	0	Not Defined
Not Defined	1	0	1	Not Defined
Not Defined	1	1	0	Not Defined
Not Defined	1	1	1	Not Defined

	Bit D5 – Tearing Effect Line Output Mode. '0' = Mode 1, V-Blanking only. '1' = Mode 2, both H-Blanking and V-Blanking. Bits D4, D3, D2, D1, D0 are for future use and are set to '0'.	
Restriction

2 nd parameter	1	1	↑	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	-
Description	This command indicates the current status of the display as described in the table below:											
	Bit		Description							Comment		
	DB7		Booster Voltage Status									
	DB6		Idle Mode On/Off									
	DB5		Partial Mode On/Off									
	DB4		Sleep In/Out									
	DB 3		Display Normal Mode On/Off									
	DB2		Display On/Off									
	DB1		Not Defined							Set to '0'		
	DB0		Not Defined							Set to '0'		
	Bit DB7 – Booster Voltage Status '0' = Booster Off or has a fault. '1' = Booster On and working OK (Meets Nokia's optical requirements).											
	Bit DB6 - Idle Mode On/Off '0' = Idle Mode Off. '1' = Idle Mode On.											
	Bit DB5 – Partial Mode On/Off '0' = Partial Mode Off. '1' = Partial Mode On.											
	Bit DB4 – Sleep In/Out '0' = Sleep In Mode. '1' = Sleep Out Mode.											
	Bit DB3 – Display Normal Mode On/Off '0' = Display Normal Mode Off. '1' = Display Normal Mode On.											
Bit DB2 – Display On/Off '0' = Display is Off. '1' = Display is On.

	DNC	NWR	NRD	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX												
Command	0	↑	1	0	0	0	1	0	0	0	1	11												
Parameter	NO PARAMETER																							
Description	<p>This command turns off sleep mode. In this mode the DC/DC converter is enabled, Internal oscillator is started, and panel scanning is started.</p>  <p>See also section 5.13</p>																							
Restriction	<p>This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be left by the Sleep In Command (10h). It will be necessary to wait 5msec before sending next command, this is to allow time for the supply voltages and clock circuits to stabilize. The display module loads all display supplier's factory default values to the registers during this 5msec and there cannot be any abnormal visual effect on the display image if factory default and register values are same when this load is done and when the display module is already Sleep Out –mode. The display module is doing self-diagnostic functions during this 5msec. See also section 8.10. It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.</p>

6.3.26 Vertical Scrolling Definition (33h)

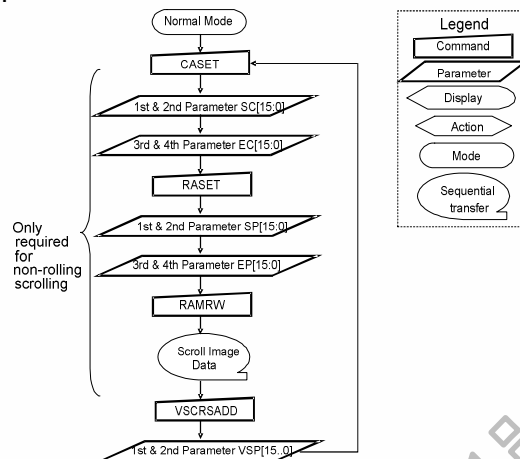

33 H	VSCRDEF (Vertical Scrolling Definition)											HEX
Command	DNC	NRD	NWR	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX
Command	0	1	↑	0	0	1	1	0	0	1	1	33
1st parameter	1	1	↑	TFA 15	TFA 14	TFA 13	TFA 12	TFA 11	TFA 10	TFA 9	TFA 8	00..A2
2nd parameter	1	1	↑	TFA 7	TFA 6	TFA 5	TFA 4	TFA 3	TFA 2	TFA 1	TFA 0	
3rd parameter	1	1	↑	VSA 15	VSA 14	VSA 13	VSA 12	VSA 11	VSA 10	VSA 9	VSA 8	00..A2
4th parameter	1	1	↑	VSA 7	VSA 6	VSA 5	VSA 4	VSA 3	VSA 2	VSA 1	VSA 0	
5th parameter	1	1	↑	BFA 15	BFA 14	BFA 13	BFA 12	BFA 11	BFA 10	BFA 9	BFA 8	00..A2
6th parameter	1	1	↑	BFA 7	BFA 6	BFA 5	BFA 4	BFA 3	BFA 2	BFA 1	BFA 0	
Description	<p>This command defines the Vertical Scrolling Area of the display. When MADCTL B4=0 The 1st & 2nd parameter TFA[15..0] describes the Top Fixed Area (in No. of lines from Top of the Frame Memory and Display). The 3rd & 4th parameter VSA[15..0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the bottom most line of the Top Fixed Area. The 5th & 6th parameter BFA[15..0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display). TFA, VSA and BFA refer to the Frame Memory Line Pointer.</p> <p>When MADCTL B4=1 The 1st & 2nd parameter TFA[15..0] describes the Top Fixed Area (in No. of lines from Bottom of the Frame Memory and Display). The 3rd & 4th parameter VSA[15..0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the top most line of the Top Fixed Area. The 5th & 6th parameter BFA[15..0] describes the Bottom Fixed Area (in No. of lines from Top of the Frame Memory and Display).</p> <p>See also Section 8.2.2.2 for details of the Memory to Display mappings.</p>											
Restriction	<p>The condition is (TFA+VSA+BFA)=162, otherwise Scrolling mode is undefined. In Vertical Scroll Mode, MADCTL B5 should be set to '0' – this only affects the Frame Memory Write.</p>

6.3.30 Vertical Scrolling Start Address (37h)

37 H	VSCRSADD (Vertical Scrolling Start Address)										HEX
	NRD DNC	NW R	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
Command	10	↑	0	0	1	1	0	1	1	1	37
1 st parameter	11	↑	VSP 15	VSP 14	VSP 13	VSP 12	VSP 11	VSP 10	VSP 9	VSP 8	00 .. A1
2 nd parameter	11	↑	VSP 7	VSP 6	VSP 5	VSP 4	VSP 3	VSP 2	VSP 1	VSP 0	
Description	<p>This command is used together with Vertical Scrolling Definition (33h). These two commands describe the scrolling area and the scrolling mode.</p> <p>The Vertical Scrolling Start Address command has one parameter which describes the address of the line in the Frame Memory that will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below:-</p> <p>When MADCTL B4=0</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 162 and VSP='3'</p> <p>(Example)</p> <p>When MADCTL B4=1</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 162 and VSP='3'</p> <p>(Example)</p> <p>When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect.</p> <p>VSP refers to the Frame Memory line Pointer.</p>										
	Restriction	<p>Since the value of the Vertical Scrolling Start Address is absolute (with reference to the Frame Memory), it must not enter the fixed area (defined by Vertical Scrolling Definition (33h) – otherwise undesirable image will be displayed on the Panel.</p>

1	1	0	1.5
1	1	1	Ignore

VC1(2-0):

Specify the ratio for VLCD voltage adjusting.

VC12	VC11	VC10	VLCD
0	0	0	5.47
0	0	1	5.29
0	1	0	5.12
0	1	1	4.95
1	0	0	4.76
1	0	1	4.59
1	1	0	4.46
1	1	1	4.23

VRH(3-0):

Set the magnification of amplification for VREG1 voltage for gamma voltage setting. It allows magnify the amplification of VREF from 2.8 to 4.8 times.

VRH3	VRH2	VRH1	VRH0	VREG1
0	0	0	0	VREF x 1.87
0	0	0	1	VREF x 2.00
0	0	1	0	VREF x 2.13
0	0	1	1	VREF x 2.20
0	1	0	0	VREF x 2.27
0	1	0	1	VREF x 2.33
0	1	1	0	VREF x 2.4
0	1	1	1	VREF x 2.47
1	0	0	0	VREF x 2.53
1	0	0	1	VREF x 2.6
1	0	1	0	VREF x 2.67
1	0	1	1	VREF x 2.8
1	1	0	0	VREF x 2.93
1	1	0	1	VREF x 3.07
1	1	1	0	VREF x 3.2
1	1	1	1	Inhibited

Note: VREF is the internal reference voltage equals to 1.8V.

BT(3-0):

Switch the output factor of step-up circuit 2 for VGH and VGL voltage generation. The LCD drive voltage level can be selected according to the characteristic of liquid crystal which panel used. Lower amplification of the step-up circuit consumes less current and then the power consumption can be reduced.

BT3	BT2	BT1	BT0	VCL	VGH	VGL		Capacitor Connection Pins

1	1	1	1		Inhibited			

Note: 1. The conditions of VLCD ≤ 6V, VCL ≤ -3.3V, VGH-VGL ≤ 32V must be satisfied.
 2. If VCOMG=0, VCL output is floating.
 3. C22 option : VGH and VGL can share the same pump capacitor when operate on special pumping condition →BT[3:0]=1XXX (On this condition, C22 can be removed).

FS0(1-0):

Set the operating frequency of the step-up circuit 1 and extra step-up circuit 1 for VLCD voltage generation. When using the higher frequency, the driving ability of the step-up circuit and the display quality are high, but the current consumption is increased. The tradeoff is between the display quality and the current consumption.

DCDCf = DC / DC converter operating frequency

FS01	FS0	Operation Frequency of Step-up Circuit 1 and Extra Step-up circuit 1
0	0	DCDCf / 1
0	1	DCDCf / 2
1	0	DCDCf / 4
1	1	DCDCf / 8

FS1(1-0):

Set the operating frequency of the step-up circuit 2 and 3 for VGH, VGL and VCL voltage generation. When using the higher frequency, the driving ability of the step-up circuit and the display quality are high, but the current consumption is increased. The tradeoff is between the display quality and the current consumption.

DCDCf = DC / DC converter operating frequency

FS11	FS10	Operation Frequency of Step-up Circuit 2 , Step-up Circuit 3
0	0	DCDCf / 1
0	1	DCDCf / 2
1	0	DCDCf / 4
1	1	DCDCf / 8

Note: Ensure that the operation frequency of step-up circuit 1 ≥ step-up circuit 2

N_DC: Normal mode

E_DC: Idle mode

DCCLK_SYNC: Internal use, not open.

This command is used to set display related register

DB1-0: When DB1 = 1, display is on; when DB1 = 0, display is off. When display is off, the display data is retained in the GRAM, and can be instantly displayed by setting DB1 = 1. When DB1 = 0, the display is off with the entire source outputs are set to the VSSD level. Because of this, the HX8353-C can control the charging current for the LCD with AC driving. Control the display on/off while control GON and DTE. When DB1-0 = 01, the internal display of the HX8353-C is performed although the actual display is off. When DB1-0 = 00, the internal display operation halts and the display is off.

DB 1	DB 0	Source Output	HX8353-C Internal Display Operations	Gate-Driver Control Signals (CPV, FLM, M)
0	0	VSSD	Halt	Halt
0	1	VSSD	Operate	Operate
1	0	Non-lit display	Operate	Operate
1	1	Display	Operate	Operate

Description

6.4.5 SETCYC: Set Display Waveform Cycles (B4h)

B4H	SETCYC(Set display waveform cycles)												
	DNC	NWR	NRD	DB15-8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX
Command	0	↑	1	--	1	0	1	1	0	1	1	1	B4
1 st parameter	1	↑	1	--	N_RTN[3:0]			--	N_NW[2:0]			--	
2 nd parameter	1	↑	1	--	E_RTN[3:0]			--	E_NW[2:0]			--	
3 rd parameter	1	↑	1	--	--	--	DIV_E[1:0]		--	--	--	--	--
4 th parameter	1	↑	1	--	SON[7:0]							--	
5 th parameter	1	↑	1	--	GDON[7:0]							--	
6 th parameter	1	↑	1	--	GDOF[7:0]							--	

This command is used to set display waveform cycles

NW[2:0]: Frame Inversion and N-line inversion control

NW[2:0]	Inversion Type
0	Frame inversion
1	1-line inversion
2	2-line inversion
3	3-line inversion
..	..
7	7-line inversion

RTN[3:0]: Set the 1-line period in a clock unit.
Clock cycles=1/internal operation clock frequency

RTN[3:0]	Clock Cycles per Line
4'b0000	138
4'b0001	139
4'b0010	140
4'b0011	141
....
4'b1110	153
4'b1111	154

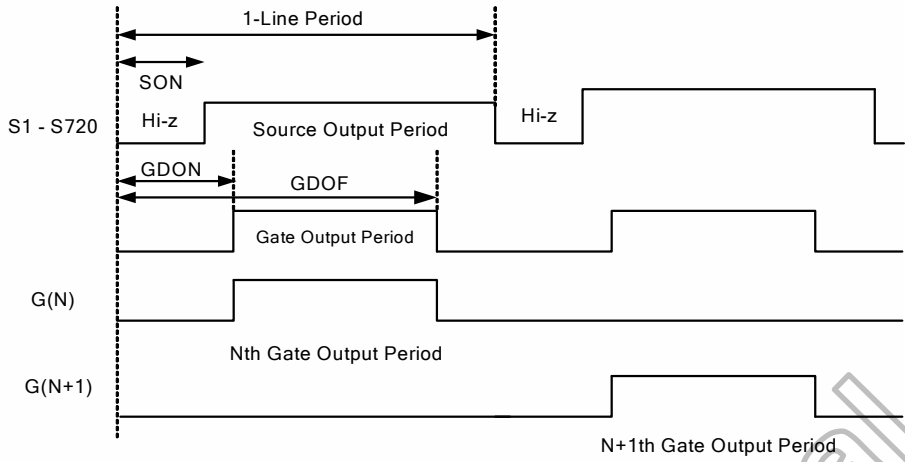

DIV_E: only use in Idle mode
DIV_E[1:0]:The division ratio of clocks for internal operation (DIV1-0). Internal operations are base on the clocks which are frequency divided according to the value of DIV1-0. Frame frequency can be adjusted along with the 1H period (RTN3-0). When the drive line count is changed, the frame frequency must be also adjusted.

fosc = R-C oscillation frequency

DIV_E1	DIV_E0	Division Ratio	Internal Operation Clock Frequency
0	0	1	fosc / 1
0	1	2	fosc / 2
1	0	4	fosc / 4
1	1	8	fosc / 8

Formula for the Frame Frequency:
 Frame frequency = fosc/(RTN × DIV × (NL+BP+FP)) [HZ]
 fosc: RC oscillation frequency
 RTN bit: Clocks per line
 DIV bit: Division ratio
 NL: The number of lines
 FP: Number of lines for front porch
 BP: Number of lines for back porch
 BP+FP ≤ 16

The HX8353-C can control the display operation period time for LCD panel driving as follow:

	 <p>SON7-0: Specify the valid source output start time in 1-line driving period. The period time is defined as SYSCLK clock number. (Please note that the setting "00h" and "01h" is inhibited).</p> <p>GDON7-0: Specify the valid gate output start time in 1-line driving period. The period time is defined as SYSCLK clock number in internal clock display mode. The period time is defined as setting value x 8 DOTCLK clock number in external clock display mode. (Please note that the setting "00h", "01h", "02h" is inhibited).</p> <p>GDOF7-0: Specify the gate output end time in 1-line driving period. The period time is defined as SYSCLK clock number in internal clock display mode. The period time is defined as setting value x 8 DOTCLK clock number in external clock display mode. (Please note that the $GDOF7-0 \leq HCK-1$).</p>												
Restrictions	If EXTC is high or enable PASSWDEN command (even EXTC = low) can enable this command

6.4.7 SETVCOM: Set VCOM Voltage (B6h)

B6 H	SETVCOM(Set VCOM Voltage)																																																																																																																																																																																																																								
	DNC	NWR	NRD	DB15-8	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	HEX																																																																																																																																																																																																												
Command	0	↑	1	--	1	0	1	1	0	1	1	0	B6																																																																																																																																																																																																												
1 st parameter	1	↑	1	--	VCOMG	--	--	--	--	--	--	--	--																																																																																																																																																																																																												
2 nd parameter	1	↑	1	--	--	VCMN[6:0]						--																																																																																																																																																																																																													
3 rd parameter	1	↑	1	--	--	--	--	VDV[4:0]				--																																																																																																																																																																																																													
Description	This command is used to set VCOM Voltage include VCOM Low and VCOM High Voltage																																																																																																																																																																																																																								
	<p>VCOMG: When VCOMG = 1, VCOML voltage can output to negative voltage (1.0V ~ -VDD +0.5V). When VCOMG = 0, VCOML voltage becomes VSSD and stops the amplifier of the negative voltage. Therefore, low power consumption is accomplished.</p> <p>VDV(4-0): Specify the VCOM amplitude factors for panel common driving (VCOML = VCOMH – VCOM amplitude). It is possible to setup from 0.6 to 1.23 times of VREG1. When VCOMG0 = 0, the VDV(4-0) setup is invalid and VCOML is output VSSA.</p>

Drive Supply Voltage	VGH-VGL	-	VGH, VGL ⁽³⁾	15.0	27.0	30		
Input / Output								
High level input voltage	VIH	-	Note ^{(1),(2)}	0.7VDDI	-	VDDI	V	
Low level input voltage	VIL	-	Note ^{(1),(2)}	VSSA	-	0.3VDDI		
High level output voltage	VOH	IOH = -1.0mA	DB17 to DB0	0.8VDDI	-	VDDI		
Low level output voltage	VOL	IOL = +1.0mA	TE, TEST1 ⁽²⁾	VSSA	-	0.2VDDI		
Input leakage current	IIL	VIN = VDDI or VSSA	Note ^{(1),(2)}	-1.0	-	+1.0		μA

Note: (1) OSC, P68, BS1, BS0, NRESET, DNC_SCL, NWR_RNW, NRD_E, and DB17 to DB0 pins

(2), (3) When the measurement are performed with LCD module, Measurement Points are like below

Table 7. 4 DC Characteristics 1

Parameter	Symbol	Conditions	Related Pins	Min.	Typ.	Max.	Unit
VCOM Generator							
VCOM amplitude	VCOMA	No load	VCOMH VCOML	2.5	--	5	V
VCOM output high resistance	RVCOMH	VCOM output = High I _{VCOM} = 1mA	VCOM	-	100	-	Ω
VCOM output low resistance	RVCOML	VCOM output = Low I _{VCOM} = 1mA	VCOM	-	100	-	
Source Driver							
Gray scale resistance	Rgray	Rap~Rjp, Ran~Rjn, R0~R62 of gray voltage generator	S1 to S396	0.7*Rx	Rx	1.3*Rx	Ω
Drive output current ^{(1),(2)}	I _{VOSH}	VS=4.25V, VSO=V0 at positive, VOUT=V0-2V	S1 to S396	-	-200	-100	μA
	I _{VOSL}	VS=4.25V, VSO=V0 at negative, VOUT=V0-2V	S1 to S396	100	200	-	μA
Output voltage deviation	DVOS	VSSD+1.0 ~ VS-1.0	S1 to 396	-	±10	±20	mV
		VSSD+0.1V ~ VSSD+1.0 VS-1.0 ~ VS-0.1V	S1 to 396	-	±30	±50	mV
Output voltage range	VOS	-	S1 to 396	0.1	-	VS-0.1	V
Gate Driver							
Output ON resistance ⁽³⁾	RONG	Ta = 25 °C	G1 to G162	-	2	3	kΩ

Note: (1) VSO is the output voltage of source output pins S1 to S396.

(2) VOUT is the applied voltage to source output pins S1 to S396.

(3) Resistance value when -0.1[mA] is applied during the ON status of the gate output pin G0 to G160.

RON [] = V [V] / 0.1[mA] (V: Voltage change when -0.1[mA] is applied in the on status.)

Table 7. 5 DC Characteristics 2

- (8) Absolute Worst Case Patterns and Sequences: Defined by Display Supplier
- (9) Absolute worst case VDD current is less than TBD mA in the case of CPU access is inactive, Normal Mode On, Partial Mode Off, Idle Mode Off, Sleep Out mode.
- (10) Absolute worst case VDDI current is less than TBD mA in the case of CPU access is inactive, Normal Mode On, Partial Mode Off, Idle Mode Off, Sleep Out mode.
- (11) Inrush currents are not included in current consumption values

Typical Case:

TA = 25oC
VDDB2 = 2.75V
VDDB1 = 1.8V

Worst Case:

TA = -30 to70oC
VDDB2 = 2.5V to 2.9V
VDDB1 = 1.65V to 2.5V
Includes Process Variance.

Data setup time (Write)	tSDS	SDA	10	-	-	ns
Data hold time (Write)	tSDH	SDA	10	-	-	
Serial clock cycle (Read)	tSCYCR		150	-	-	
SCL "H" pulse width (Read)	tSHR	SCL	60	-	-	ns
SCL "L" pulse width (Read)	tSLR	SCL	60	-	-	
Access Time	tACC	SDA For maximum CL=30pF For maximum CL=8pF	10	-	50	ns
Output disable time	toH	SDA For maximum CL=30pF For maximum CL=8pF	15	-	50	ns
NCS "H" pulse width	tCHW	NCS	40	-	-	ns
NCS-SCL time (write)	tCSS	NCS	15	-	-	ns
NCS-SCL time (write)	tCSH	NCS	15	-	-	
NCS-SCL time (Read)	tCSS	NCS	60	-	-	ns
NCS-SCL time (Read)	tCSH	NCS	65	-	-	

Note: The input signal rise time and fall time (tr, tf) is specified at 15 ns or less.

Logic high and low levels are specified as 30% and 70% of VDDI for Input signals. For output, see Section 7.7.6.2

Table 7. 8 Serial Interface Characteristics

7.5.3 Reset Input Timing

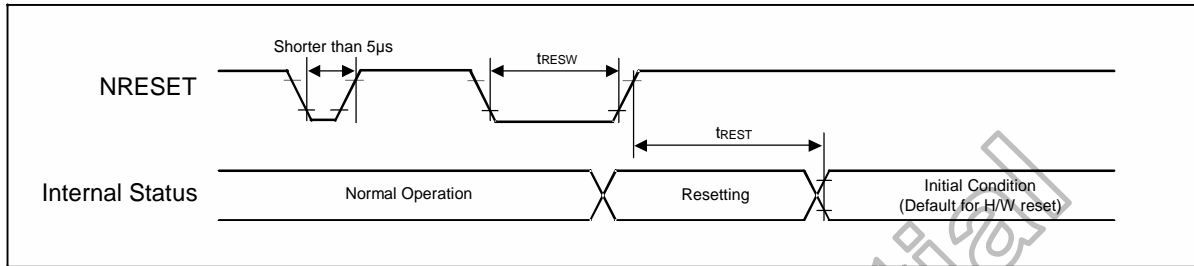

Figure 7. 5 Reset input timing

Symbol	Parameter	Related Pins	Min.	Typ.	Max.	Note	Unit
tRESW	Reset low pulse width ⁽¹⁾	NRESET	10	-	-	-	µs
tREST	Reset complete time ⁽²⁾	-	-	-	5	When reset applied during Sleep In mode	ms
		-	-	-	120	When reset applied during Sleep Out mode	ms

Note: (1) Spike due to an electrostatic discharge on NRESET line does not cause irregular system reset according to the table below.

NRESET Pulse	Action
Shorter than 5µs	Reset Rejected
Longer than 10µs	Reset
Between 5 µs and 10µs	Reset Start

- (2) During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for H/W reset.
- (3) During Reset Complete Time, IDB2 value in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (tREST) within 5ms after a rising edge of NRESET.
- (4) Spike Rejection also applies during a valid reset pulse as shown below:

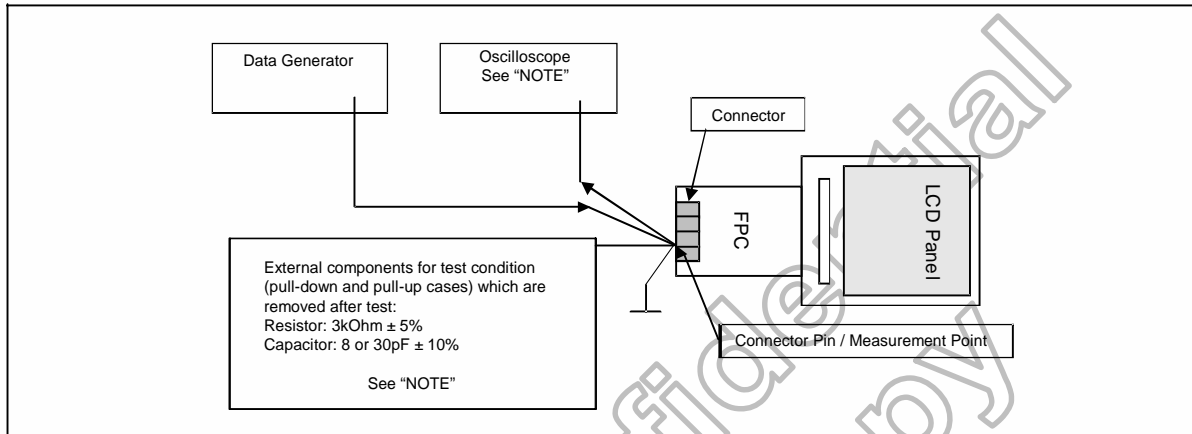

- (5) It is necessary to wait 5msec after releasing NRESET before sending commands. Also Sleep Out command cannot be sent for 120msec.

Table 7. 9

7.5.4 Measurement Conditions

8. Reference Application

8.1 Example Connection with Panel

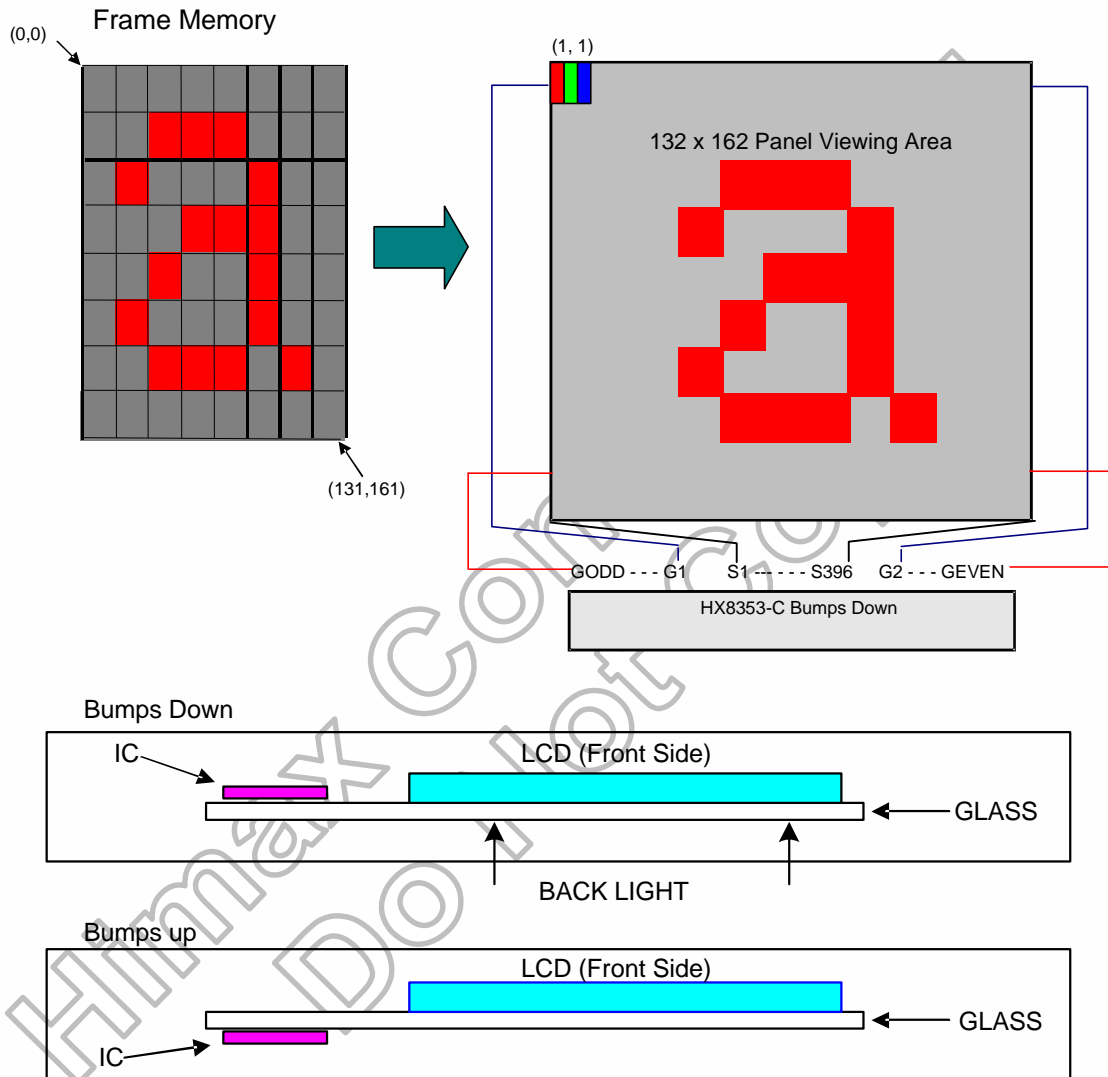

Figure 8. 1

8.2 Connection Example with External Components

Note1: C22 option : VGH and VGL can share the same pump capacitor when operate on special pumping condition → $VGH < 4 \times VDD$, $VGL > -3 \times VDD$ (On this condition, C22 can be removed).

Note2: If need to remove capacitor of VDDD connection : when $VDDI = 1.65 \sim 1.95v$, VDDD can connect to VDDI on FPC directly

Figure 8. 2 Example connection with external components

8.3 External Components

Pad Name	Connection	Typical capacitance value
VGL	Connect to Capacitor (Max 16V): VGL ---(-)---- --- (+)---- VSSA	1.0μF
VCL	Connect to Capacitor (Max 5V): VCL ---(-)---- --- (+)---- VSSA	1.0μF
VDDD	Connect to Capacitor (Max 5V): VDDD ---(+)- - - --- (-)---- VSSA	1.0μF
VGH	Connect to Capacitor (Max 21V): VGH ---(+)- - - --- (-)---- VSSA	1.0μF
C21A, C21B	Connect to Capacitor (Max 7V): C21A ---(+)- - - --- (-)---- C21B	1.0μF
C22A, C22B	Connect to Capacitor (Max 7V): C22A, ---(+)- - - --- (-)---- C22B	1.0μF
C11A, C11B	Connect to Capacitor (Max 5V): C11A ---(+)- - - --- (-)---- C11B	2.2μF
VLCD	Connect to Capacitor (Max 6V): VLCD ---(+)- - - --- (-)---- VSSA	1.0μF
VDD	VDD (Analogue Power)	Optional
VSSD	Connect to VSSD	-
VDDI	VDDI (Digital Power)	Optional
VSSD	VSSA (Ground)	-

Table 8. 1 Example capacitor connection

Pins connection	Recommended voltage	Capacity
VDD, VDDI, VCL, C11A/B, VDDD	6V	1 μFor 2.2uF (B characteristics)
VLCD, C21A/B, C22A/B,	10V	1 μF
VGH, VGL	25V	1 μF
