# 1 Structure and Features

FYH Ball Bearing Units are manufactured to exacting standards comprising of grease sealed deep groove ball bearings and housings in various forms.

Self-aligning units allow for easy installation and are supplied with grease fittings in order to facilitate quick and convenient re-lubrication.

## 1.1 Structure

FYH Ball Bearing Units are constructed of high carbon chromium bearing steel and have precision honed raceways and riveted steel cages (Fig. 1.1).

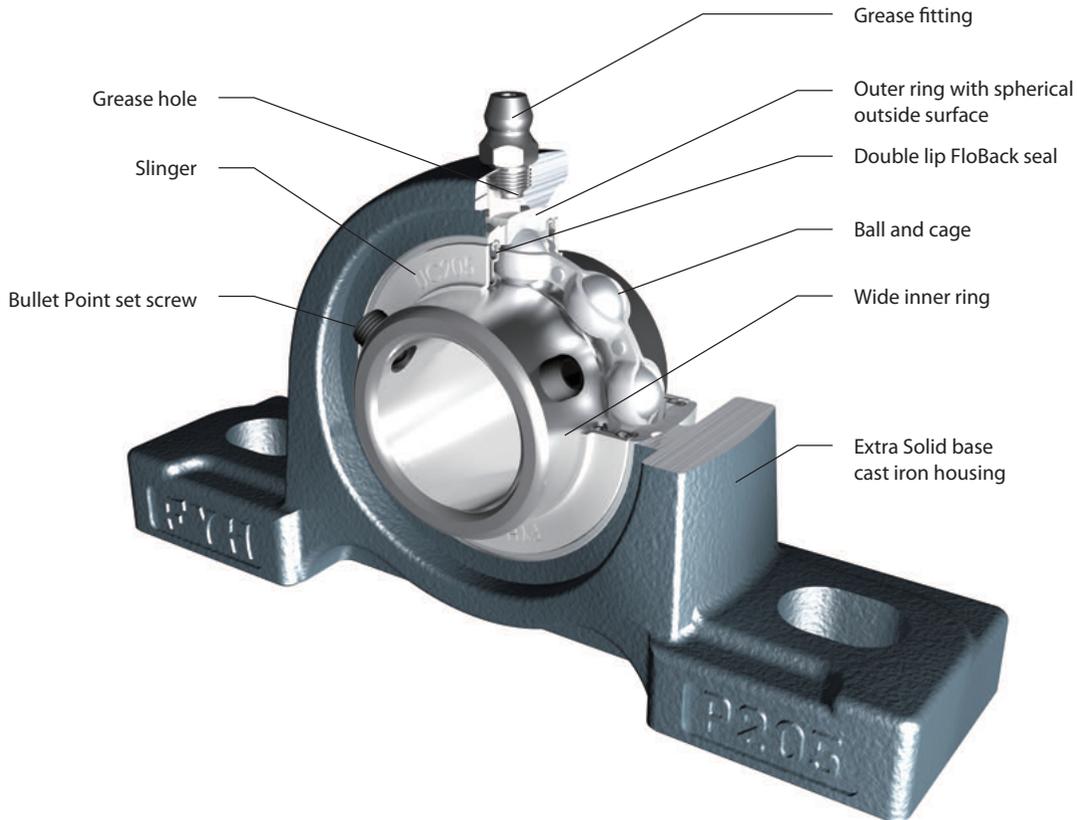

Fig. 1.1 Structure of ball bearing units (representative example)

## 1.2 Features

FYH Ball Bearing Units have many features and are available in various models. A wide selection of mounted units is offered to fit virtually any application.

### 1 Supreme load capacity and accuracy

FYH Ball Bearing Units feature an internal structure identical to single row deep groove ball bearings and can bear significant radial load, as well as a great deal of axial load in both directions. The hardened steel balls exhibit a high degree of "roundness" and the races are highly polished to accommodate a smooth ride at a wide range of speeds.

### 2 Rational self-aligning mechanism and optimal fit

FYH Ball Bearing Units have the special ability to self-align inside the housing because of the spherical shape of the outer diameter of the bearing insert and the concave shape of the inner diameter of the housing into which it fits.

This design allows the bearing unit to self-adjust for shaft deviation and reduce abnormal bearing load. Therefore, the original rated life of the bearing can be guaranteed. Since the spherical outside surface of the bearing is precision ground and the spherical bore of the housing is machined by a boring machine with great accuracy, optimal fitting of the bearing and the housing can be obtained, as well as superior aligning performance. The allowable aligning angle of standard ball bearing units is 3°, while units with covers is 1°.

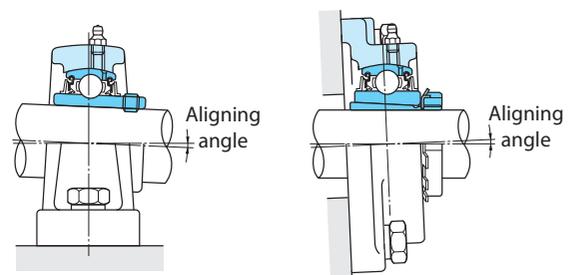

Fig. 1.2 Allowable aligning angle of ball bearing units

### 3 Superior sealing performance

FYH Ball Bearing Units efficiently prevent grease from leaking out of the interior of the bearing, and perform extremely well at keeping contaminants, such as dust and water, from entering. This is achieved by installing the seal to the outer ring of the bearing and installing the slinger to the inner ring of the bearing.

The FloBack seal to be used in the standard FYH Ball Bearing units will contribute to the long life of the bearing. It consists of a double-lip seal which is stamped into place in the outer ring of the bearing to reduce the possibility of being pushed out from over-lubrication. The first seal makes contact with the inside of the slinger which provides the first line of defense against contamination. The next seal makes contact with the inner ring to provide another level of contamination resistance. An additional level of protection exists in the extra non-contact inward facing lip which allows grease to flow back towards the balls and raceways during operation thereby improving lubrication performance and extending bearing life.

Allowable rotating speed is the same as the previous seal design while providing more than four times better protection.

### 4 Simple lubrication

FYH Ball Bearing Units are tapped to accept a grease fitting which is also supplied with every mounted unit. Bearings are pre-lubricated at the factory and do not require additional grease upon installation. When operating in excessively moist, dusty, or hot environments, it is recommended that grease be supplied at regular intervals. If appropriately maintained, the rated life of the bearing can be extended.

FYH Lithium Bearing Grease to be sealed in early bearing grease use are manufactured to accommodate a wide range of operating conditions.

FYH Lithium Bearing Grease can be mixed with former FYH Bearing grease as it will improve performance, corrosion resistance, loading capability, and promote longer bearing life.

The grease fittings that are supplied with FYH mounted units include 1/4-28 for smaller units and 1/8 PT for larger units. Additional styles are available upon request. FYH Lithium Bearing Grease is also available in automatic lubricators.

Fig. 1.3 Sealing mechanism of ball bearing units

## 5 Highly rigid and rugged cast iron housings

FYH Ball Bearing Unit housings are designed so that they are optimized for reduction of deformation due to centralization of stress and load. Only the best material is selected to be cast by a highly advanced technique or press working technique, depending on the housing. Since any abnormal load on the bearing is eliminated by the housing, the life of the bearing can be extended. A Granular material baking finish coating (powder coating) helps resist corrosion and protect the surface of the housing for an extended period of time.

FYH original solid base pillow block housings seat better and produce a more stable mounting configuration that significantly reduces vibration.

The support ribs have been eliminated to make more room for mounting bolts and washers, yet these housings are more than 30% stronger than before while also reducing housing weight. The new housing downward destruction strength means that the inserts break before the housings.

## 6 Simple installation and handling

FYH Ball Bearing Units interchange with many different models and can be bolted to machinery without any modification. The exact amount of clearance is allowed between the bore and the shaft to allow a perfect fit. Therefore, FYH Ball Bearing Units do not require any additional lubrication or seal installation. As a result, handling and downtime can be drastically reduced. Four different locking mechanisms are available:

- (1) Set Screw
- (2) Eccentric Locking Collar
- (3) Tapered Adapter
- (4) Concentric Collar

Mounting the bearing to the shaft can be executed easily and securely by adopting any of these methods.

## 7 Series and models

FYH Ball Bearing Units are available in various series and models. Reliability of machinery or equipment, used together with these units, can be improved by selecting and using units optimal for the application and operating conditions.

- High / Low Temperature Series

- Corrosion Resistant Series

Stainless Units  
Plastic Units  
Nickel plated Units

- Air Handling Series

## 2 Selection Guide

### 2.1 Selection Guide

1. Select the housing style that best suits your application.

**P** - PILLOW BLOCK **PA** - TAPPED-BASE **PH** - HIGH-BASE **LP** - LIGHT **IP** - THICK **PP** - STAMPED STEEL  
**F** - 4-BOLT FLANGE **FS** - SQUARE PILOTTED  
**FL** - 2-BOLT FLANGE **LF** - LIGHT **PFL** - STAMPED STEEL **FA** - ADJUSTABLE  
**FB** - 3-BOLT FLANGE  
**FC** - 4-BOLT FLANGE CARTRIDGE  
**T** - TAKE-UP  
**C** - CARTRIDGE  
**H** - HANGER

2. Select the shaft size and duty that is needed for your application.

**SU** - FROM 10 MM TO 30 MM BORE  
**SA & SB** - FROM 12 MM & 1/2" TO 40 MM & 1-9/16" BORE  
**UC** - FROM 12 MM & 1/2" TO 140 MM BORE  
**NA** - FROM 12 MM & 1/2" TO 75 MM & 3" BORE  
**NC** - FROM 20 MM & 3/4" TO 60 MM & 2-7/16" BORE  
**UK** - FROM 20 MM & 3/4" TO 120 MM BORE

### 3. Do you need to customize the bearing for your application? Select STANDARD as the default.

**TEMP** - **D2K2** -58°F TO 248°F (-50°C TO 120°C), **D1K2** -40°F TO 356°F (-40°C TO 180°C), **D9K2** -4°F TO 446°F (-20°C TO 230°C)  
**WASH DOWN** - STAINLESS STEEL UNITS, PLASTIC HOUSING UNITS,  
**AIR HANDLING** - **S3** AIR HANDLING FIT UNITS, **S5** NON CONTACT SEAL  
**DUST** - **L3** TRIPLE LIP SEAL, COVERS  
**DIRT** - **LT3** TIGHT TRIPLE LIP SEAL, COVERS

### 4. Select the locking style type for your insert.

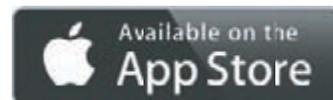

**UC** - SETSCREW LOCK  
**NA** - ECCENTRIC COLLAR LOCK  
**NC** - CONCENTRIC COLLAR LOCK  
**UK** - ADAPTER SLEEVE LOCK

### 5. YOUR UNIT

Selection application is available for download in the mobile device.

TEMP

### 2.2 High / Low Temperature Series

(suffix codes - High temperature: D1K2 & D9K2, Low temperature: D2K2)

For applications that require bearing units to be used at a higher or lower temperature range than our standard models FYH offers several options. For high temperature units that require lubrication please specify D1K2 as a suffix to the standard part number. For high temperature units that do not require lubrication specify D9K2.

The D9K2 insert uses a fluoro-grease that allows for excellent heat resistance and operation with minimal maintenance.

Specifications for the high temperature and low temperature units are shown in **Table 2.1**.

**Table 2.1 Specifications of High / Low Temperature Series**

Specifications of High / Low Temperature Series							
Category	Suffix code	Operating temperature range		Grease	Seal rubber material	Bearing internal clearance	
		(°C)	(°F)			UC type	UK type
Standard	-	-20 to 100	-4 to 212	FYH Lithium Bearing Grease (lithium complex)	Nitrile	CN	C3
Cold resistant	D2K2	-50 to 120	-58 to 248	SH33M (lithium)	Silicone	CN	C3
Heat resistant	D1K2	-40 to 180	-40 to 356	U-RET EDM-1 (diurea)	Silicone	C4	C5
Heat resistant	D9K2	-20 to 230	-4 to 446	Demnum L-200 (fluorinated grease)	Silicone	C4	C5

Specifications of Extreme High Temperature Series							
Category	Suffix code	Operating temperature range		Grease	Seal rubber material	Bearing internal clearance	
		(°C)	(°F)			UC type	UK type
Heat resistant	D9P4S6Y2	-20 to 260	-4 to 500	Demnum L-200 (fluorinated grease)	-	C4	-
Extreme heat resistant	S6Y3	300 to 450	572 to 842	Solid graphite lubricant	-	Special	-

**Table 2.2 Grease Schedule of Ball Bearing Units**

Grease schedule of ball bearing units						
Operating temperature °C		Grease Intervals			Bearing used	Grease supplied
Over	Incl.	Substantially clean	Excessive dust	Excessive dust and moisture		
	50	(3 months) not necessary	(2 months) 1 year	(1 month) 4 months	(Low temperature D2K2) <sup>1)</sup> Standard bearing	SH33M FYH Lithium - Bearing Grease
50 70	70 100	1 year 6 months	4 months 2 months	1 month 2 weeks		
100 120 150	120 150 180	2 months 2 weeks 1 week	2 weeks 5 days 2 days	5 days 2 days 1 day	High temperature D1K2	U-RET EDM-1

Note 1) Greasing intervals in parentheses are applicable to low temperature grease (D2K2).  
 Remark Greasing intervals shown in this table are applicable to a unit operated for 8 to 10 hours per day.  
 If the time of operation is greater than this range, then a more frequent greasing interval must be specified.  
 For example, if the unit is operated 16 to 20 hours per day, then the greasing interval must be twice as frequent.

### 2.2.1 Rotational speed adjustment due to shaft fit

A marginal degree of clearance is typically used to facilitate easy installation of a bearing to a shaft.

The amount of clearance between the bearing and shaft must be factored in to determine the maximum allowable rotational speed, and as rotational speed is increased, the amount of clearance must be decreased.

**Table 2.3** shows the factor that must be used to correct the allowable rotational speed. The maximum rotational speed is determined by multiplying the speed found in **Table 6.1** by the factors below.

**Table 2.3 Fitting factor of ball bearing units  $f_c$  (recommended)**

Type of ball bearing units	Fitting factor $f_c$					
	Shaft tolerance range class					
	h5, j5	j6	h6	h7	h8	h9
Heat resistant type (Suffix code: D1K2)	-	-	-	1	1	0.7
Cold resistant type (Suffix code: D2K2)	-	-	-	1	1	0.7

### 2.2.2 Correction of basic load rating due to temperature

If a ball bearing unit is used at a relatively high temperature the physical composition of the bearing material is changed leading to decreased hardness. This decreased hardness leads to the basic dynamic load rating being reduced. Once the structure of the bearing material has been changed, it will remain this way for the life of the unit, even when it returns to room temperature.

When using a ball bearing unit at 150 °C or more, the basic load rating must be corrected by multiplying the basic dynamic load rating shown in the dimensional table by the temperature factor shown in **Table 2.4**.

**Table 2.4 Temperature factor**

Bearing temperature, °C	125	150	175	200	250
Temperature factor	1	1	0.95	0.9	0.75

### 2.2.3 Operating temperature range

The operating temperature of a ball bearing unit depends on the type of grease, the material of the seal, and the internal clearance of the bearing. FYH Ball Bearing Units are available in high temperature (D1K2, D9K2) and low temperature (D2K2) series, in addition to the standard models, to allow selection of the correct bearing for your operational temperature (see **Table 2.1**). The correct unit must be chosen for the desired temperature range, and it is equally important to use the appropriate grease according to the specified schedule.

### 2.2.4 Operating temperature and internal clearance of bearings

When bearings are operated in a high ambient temperature environment, or when the operating temperature is high because of rotational speed, differential expansion rates occur within the bearing components. This causes higher friction, grease breakdown, and eventual seizure.

If the temperature difference between the inner and outer ring is known, or can be approximated, then the following **Formula (2.1)** may be applied.

Under these conditions, decrease in the internal clearance must be calculated, and the internal clearance of bearing needs to be selected properly.

$$S_{t1} = \alpha \cdot D_e \cdot \Delta t \dots\dots\dots (2.1)$$

Whereas,

$S_{t1}$ : Decrease in the internal clearance of bearings depending on the difference in the temperatures of the bearing inner ring and the bearing outer ring can be found by formula, mm

$\alpha$ : Line expansion factor of bearing steel,  $12.5 \times 10^{-6}$

$D_e$ : Raceway dia. of bearing outer ring, mm

Diameter series 2, X .....  $D_e \approx 0.92 D$

Diameter series 3 .....  $D_e \approx 0.9 D$

$D$ : Nominal bearing outer dia., mm

$\Delta t$ : Difference in temperatures of bearing inner ring and outer ring, °C

If a ball bearing unit is used in a high temperature environment, an abnormal load will result due to thermal expansion of the shaft. This must be compensated for by allowing free movement of one side of the shaft. (See "9 Design of shaft and base")

## CERAMIC BALL UNITS

**Y2: Ceramic balls with stainless units**

**Y3: Ceramic balls with a solid self-lubricating lubricant**

### Ceramic Ball Units features

- Reduced maintenance costs
- Green bearings
- Independent operation
- Low friction
- High stress resistance
- Non-conductive

### 2.3 Corrosion Resistant Series

The Corrosion Resistant Series is available in a wide array of sizes and styles, and units may be customized with a number of different specialized options to accommodate virtually any application. Federal compliance can be assured with FYH Bearing Units.

AIR HANDLING

### 2.4 Air Handling Series

Units for HVAC and air handling (suffix code: S3, S5)

Ball bearing units for blowers must meet the demands of high speed rotation, low vibration, low noise, and decreased temperature output.

To meet these performance needs FYH produces the S3 and S5 series with tighter bore tolerances.

S5 uses non-contact seals as well as an improved machining accuracy to cut down on heat, noise, and vibration.

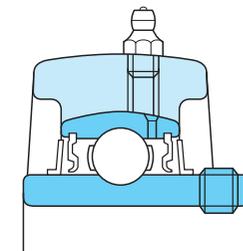

Table 2.5 Specifications of air handling units

Air Handling Fit	
100% Noise Check	
P11	The anti-rotation pin

Air Handling Fit	
100% Noise Check	
P11	The anti-rotation pin
C2	Internal bearing clearance is defined as the allowable space between the rolling elements and the raceways. <b>C2</b> is smaller clearance than the standard, and it reduces the noise and vibration in high speed applications.
P18	<b>P18</b> is the suffix code that designates smaller bore tolerance which allows for a tighter fit with the shaft. This, in turn, reduces vibration and noise and dramatically increases bearing life.
K3	Non contact lip seal is available for the lighter torque.

**2.4.1 Features of the air handling units**

The air handling unit is manufactured with original fitting called the air handling fit which exists in the middle with fitting "H" which can be assembled more easily than a standard fit "J." In addition, "J" fit the standard is fit that there is not the need for the anti-rotation pin, but can be very secure in high speed applications by adding the anti-rotation pin.

S3 and S5 bearings are sound tested in order to make sure the noise level is low enough to be suitable for high speed applications such as blowers.

**2.4.2 Feature of air handling S5 specification for blowers**

**(1) Dimensional tolerances of shafts for blowers (used with set screw bearings)**

For bearings used in blowers (suffix code: S5), a C2 internal ball clearance is recommended to reduce vibration and noise during operation.

Therefore, the shaft tolerance classes shown in **Table 2.6** are recommended for bearings with set screws.

Refer to ("**11.3 Internal bearing clearance**") Details of the internal C2 ball clearance.

**Table 2.6 Dimensional tolerance of shaft used for bearings (set screw type) for blowers**

unit:  $\mu\text{m}$

Shaft dia. (mm)		Dimensional tolerance of shaft			
		h5		j5	
Over	Incl.	Max.	Min.	Max.	Min.
<b>10</b>	<b>18</b>	0	- 8	+5	- 3
<b>18</b>	<b>30</b>	0	- 9	+5	- 4

DUST

DIRT

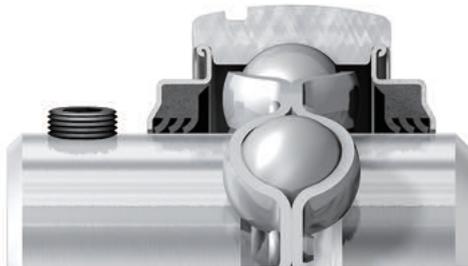

## 2.5 Dust Resistant Units

The FYH Dust Resistant Units consists of a variety of supplemental sealing options that function extremely well in the exclusion of foreign matter. These options can work well by themselves or in combination with each other. From food processing and agricultural to wash-down and mining and aggregate, the FYH Dust Resistant Units can stand up to the toughest contamination challenges.

### Triple-Lip Seals (suffix code: L3)

The L3 seal consists of a stamped steel shield with a molded NBR try-ply seal affixed to the inner portion of the shield, all of which is attached to the outer ring of the bearing. The triple-lip seal is excellent for resisting all types of contamination and is appropriate for low to moderate speeds.

### Tight Triple-Lip Seals (suffix code: LT3)

The LT3 Triple-Lip seal fits tighter than the standard L3 seal. The rotating torque of the LT3 seal is approximately double that of the standard L3 seal, and it is appropriate where contamination or moisture are very high and rotating speeds are very low.

Stamped steel and cast iron covers are available in open or closed versions in a complete range of sizes. They are easy to install and they offer great resistance to wet and dry contaminants, and shocks and heats. Covers protect the entire bearing insert from contamination and they also help to provide a safer working environment.

### Stamped Steel Open Covers

### Cast Iron Open Covers

### BACKSIDE GUARD

The nitrile rubber shields can be mounted on the backside of two and four bolt flange units and the equipment it is bolted onto. The backside guard protects your bearings from dust and moisture and help lead to longer bearing life in applications where this can be an issue.

The nitrile rubber on the steel plate come without a drain slot and is designed for dust protection. Some applications where this product could be used include: aggregate applications, fertilizer spreaders, salt spreaders and agricultural applications where dirt can reach the backside of bearing units.

The nitrile rubber on the 304 stainless steel plate with the drain slot is designed to protect your bearing units in applications that are exposed to moisture and where moisture or water build up can create issues. These backside guards can be utilized in food and beverage applications where they are being washed down as well as pharmaceutical applications. The stainless steel core is perfect for situations where regular steel can rust quickly.

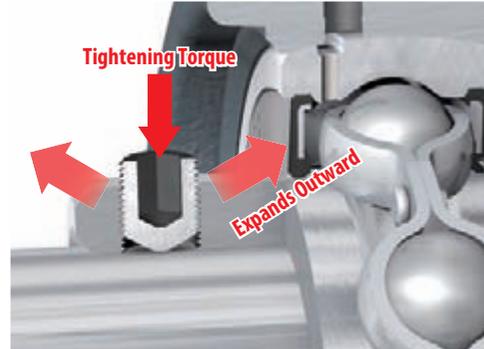

**ORIGINAL DESIGNED SET SCREW**

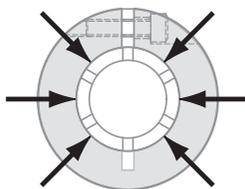

The innovative FYH Bullet Point set screw is a one piece ball point set screw which is designed to expand the threads of the screw as the point of the screw contacts the surface of the shaft. The resulting force creates superior holding power especially where vibration is present. Other set screws have larger contact areas with sharp edges at the point of the screw to bite into the shaft. However, these sharp edges damage more easily from vibration which creates a gap between the point of the set screw and the shaft. Once this gap is established, the set screw will begin to loosen.

When the Bullet Point set screw is tightened, the original shape of the point causes the threads of the screw to expand up to and beyond the elastic limit to achieve the maximum possible holding power. The thickness of the point is also designed to expand easily. This specialized design drastically reduces the potential for damage to both the set screw and shaft from normal use or for severe vibration, shock load, and high speed.

**360° SHAFT CONTACT TRUE Concentric-LOC**

The **FYH NU-LOC** bearing grips the shaft more uniformly, which allows for 360 degrees of equalized locking contact. Compared to set screw bearings, the roundness of the ball path on the NU-LOC bearings results in better operation and longer life.

NU-LOC concentric locking collars are designed to prevent shafting from becoming marred or burred. A single standard hex head cap screw can be tightened quickly and easily, and NU-LOC bearings can replace either setscrew or eccentric locking collar inserts.

NU-LOC concentric locking collar with a single cap screw provides excellent holding power. The collar is installed over the slotted inner ring on the shaft concentrically. Quick & Easy Installation with a single hex cap screw.

NU-LOC's standard tolerance specification is designed for air handling applications, and the greater roundness of the ball path enable the use of smaller internal ball clearance.

The bore tolerance is also smaller since NU-LOC has the 360 degrees of equalized locking contact. NU-LOC is not only good for the air handling applications, but great for the other applications as well.

### 3 Models

#### 3.1 Model List

Table 3.1 and Table 3.2 shows the models of FYH Ball Bearing Units and ball bearing inserts.

**Table 3.1 FYH Ball Bearing Units models**

Model	Type	Bearing bore dia. Surface (fixing to shaft)	Model code	Shaft dia.				Dimension table

**STANDARD**

**3.2 Models and Features**

FYH Ball Bearing Units are available in a variety of styles and sizes. Models and features of the Ball Bearing Units are shown below.

Note <sup>1)</sup> Descriptions of codes for units with covers are shown in the table below. (common to all the models)

Diameter series	Code	Descriptions
2	C, CD	Stamped steel plate cover type
	FC, FCD	Cast iron cover type
X	C, CD	From X05 to X17: Stamped steel plate cover type X18 and X20: Cast iron cover type
	3	C, CD

**1 Pillow Block Units**

**1 Pillow Block Units**

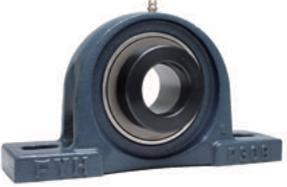

**UCP**

**NAP**

**UCP** is a pillow block unit with a rigid cast iron housing and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions.

Duty: Standard, Medium, Heavy

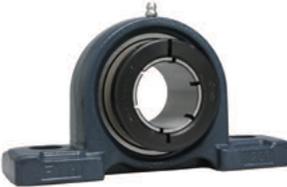

**NAP-E**

**NAPK**

**NAP** is a pillow block unit with an eccentric locking collar insert that provides a very secure grip to the shaft that becomes even more secure during continued operation. It is specifically used for single-direction/non-reversing rotation.

Duty: Standard, Heavy

**NCP**

**UKP+H**

**NCP** is a pillow block unit with a specially designed concentric locking collar that provides 360 degrees of shaft contact. It produces a more concentric lock on the shaft compared to other locking styles and it functions very well for high speed applications.

Duty: Standard

**UCP-C, CD  
UKP-C, CD**

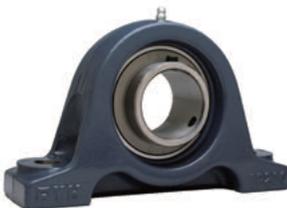

**UCP-FC, FCD  
UKP-FC, FCD**

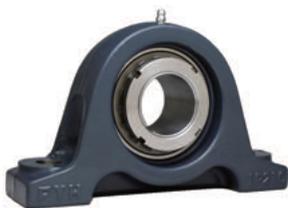

**UKP** is a pillow block unit with a tapered-bore bearing insert that utilizes an adapter sleeve assembly to produce a highly concentric and secure lock on the shaft to reduce slippage and fretting corrosion even under adverse conditions.

Duty: Standard, Medium, Heavy

**2 Thick Pillow Block Units**

**UCIP**

**UKIP+H**

**UCIP** is a pillow block unit with a highly rigid and rugged casting for particularly demanding applications. The two bolt holes are round for more accurate positioning and the strength ratings of the housing are substantially improved over standard pillow block housings. UK style is also available.

Duty: Standard, Heavy

3 Tapped-Base Pillow Block Units

UCPA

UCPAN

NCPA

NCPAN

**UCPA** and **UCPAN** are tapped-base pillow blocks with threaded bolt holes in the bottom of the housings. They are ideal for exact unit positioning and limited space applications. They are available in both inch and metric bolt-hole dimensions. NA, NC & UK style are also available.

Duty: Standard

4 High-Base Pillow Block Units

UCPH

**UCPH** is a pedestal pillow block unit with an exceptionally high mounting base. It is ideal for applications where a shouldered shaft could create interference with the mounting surface when using a standard pillow block unit.

Duty: Standard

5 Narrow Inner Ring Bearing Pillow Block Units

SBP-RKP8

SAP-FP9

SBPAN-RKP8

SAPAN-FP9

**SBP-RKP8** is a lightweight bearing mounted pillow block unit which is ideal for limited space applications and light to moderate duty applications.

**SAP-FP9** with SA eccentric locking collar style is also available.

**SBPAN-RKP8** is a lightweight bearing mounted tapped-base pillow block unit which is ideal for limited space applications and light to moderate duty applications.

**SAPAN-FP9** with SA eccentric locking collar style is also available.

Duty: Standard

### 3 Models

#### (1 Pillow Block Units)

##### 6 Light Pillow Block Units

BLP

ALP

**BLP** is a compact and lightweight pillow block unit which is ideal for limited space applications and light to moderate duty applications.

**ALP** with SA eccentric locking collar style is also available.

Duty: Light

##### 7 Compact Pillow Block Units

UP

UP-C, CD

**UP** is a light duty pillow block unit that is part of the Clean Series. It has a zinc-alloy housing for a high level of corrosion resistance and it is capable of accepting end covers to increase contamination resistance.

Duty: Light

##### 8 Corrosion Resistant Series Pillow Block Units

UCSP-H1S6

USP-S6

**UCSP** is a pillow block unit that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also pre-filled with food grade grease for food processing applications.

Duty: Standard

UCSPA-H1S6

UCVP-S6  
UCVP-ES7

**USP-S6** is a light duty stainless pillow block unit that is part of the Clean Series. It has a stainless housing for a high level of corrosion resistance and it is capable of accepting end covers to increase contamination resistance.

Duty: Light

**UCSPA** is a tapped-base pillow block unit with threaded bolt holes in the bottom of the housings. It is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is ideal for exact unit positioning and limited space applications. It is also pre-filled with food grade grease for food processing applications.

Duty: Standard

UCVPAN-ES7

**UCVP** and **UCVPAN** is a pillow block unit with a corrosion resistant thermoplastic housing and the option of either a stainless steel bearing insert or a zinc chromate plated bearing insert. Both bearing inserts offer a high level of corrosion resistance and they are factory lubricated with food grade grease.

Duty: Standard

##### 9 Stamped Steel Pillow Block Units

SBPP

SAPP

**SBPP** is a pillow block unit with a lightweight and compact stamped steel housing for light to moderate duty applications. **SAPP** with SA eccentric locking collar style is also available.

Duty: Light

2 4-Bolt Flange Units

1 4-Bolt Flange Units

UCF  
UCF-E

NANF

**UCF** is a four-bolt flange unit with a rigid cast iron housing and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions. UK style is also available.

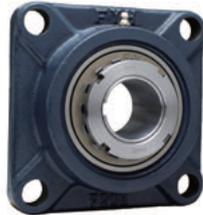

Duty: Standard, Medium, Heavy

**NANF** is a four-bolt flange unit with an eccentric locking collar insert that provides a very secure grip to the shaft that becomes even more secure during continued operation. It is specifically used for single-direction/non-reversing rotation.

Duty: Standard

NCF  
NCF-E

UKF+H

**NCF** is a four-bolt flange unit with a specially designed concentric locking collar that provides 360 degrees of shaft contact. It produces a more concentric lock on the shaft compared to other locking styles and it functions very well for high speed applications.

Duty: Standard

2 Square Piloted 4-Bolt Flange Units

UCFS

UKFS+H

**UCFS** is a piloted four-bolt flange unit available with a heavy duty bearing insert for a demanding operating environment. The pilot on the back of the housing allows for precise mounting where necessary. UK style is also available.

Duty: Heavy

3 Narrow Inner Ring Bearing 4-Bolt Flange Units

SBF-RKP8

SAF-FP9

**SBF-RKP8** is a lightweight bearing mounted four-bolt Flange units which is ideal for limited space applications and light to moderate duty applications.

**SAF-FP9** with SA eccentric locking collar style is also available.

Duty: Standard

4 Corrosion Resistant Series 4-Bolt Flange Units

UCSF-H1S6  
UCSF-EH1S6

UCVF-S6  
UCVF-ES7

**UCSF** is a four-bolt flange unit that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also pre-filled with food grade grease for food processing applications.

**UCVF** is a four-bolt flange unit with a corrosion resistant thermo-plastic housing and the option of either a stainless steel bearing insert or a zinc chromate plated bearing insert. Both bearing inserts offer a high level of corrosion resistance and they are factory lubricated with food grade grease.

Duty: Standard

#### 3 Oval Flange Units

##### 1 2-Bolt Flange Units

**UCFL**  
**UCFL-E**

**NANFL**

**NCFL**  
**NCFL-E**

**UKFL+H**

**UCFL** is a two-bolt flange unit with a rigid cast iron housing and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions. UK style is also available.

Duty: Standard, Medium, Heavy

**NANFL** is a two-bolt flange unit with an eccentric locking collar insert that provides a very secure grip to the shaft that becomes even more secure during continued operation. It is specifically used for single-direction/non-reversing rotation.

Duty: Standard

**NCFL** is a two-bolt flange unit with a specially designed concentric locking collar that provides 360 degrees of shaft contact. It produces a more concentric lock on the shaft compared to other locking styles and it functions very well for high speed applications.

Duty: Standard

##### 2 Adjustable 2-Bolt Flange Units

**UCFA**

**UCFA** is an adjustable two-bolt flange unit with a rigid cast iron housing and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions.

Duty: Standard

##### 3 3-Bolt Flange Units

**UCFB**

**UCFB** are three-bolt flange brackets with rigid cast iron housings and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions. They are available in both inch and metric bolt-hole dimensions.

Duty: Standard

##### 4 Narrow Inner Ring Bearing 2-Bolt Flange Units

**SBFL-RKP8**

**SAFL-FP9**

**SBFL-RKP8** is a lightweight bearing mounted two-bolt flange units which is ideal for limited space applications and light to moderate duty applications.

**SAFL-FP9** with SA eccentric locking collar style is also available.

Duty: Standard

5 Light 3-Bolt Flange Units

SBTFD-H4RKP8

SATFD-FH4P9

**SATFD** is a compact and lightweight three-bolt flange unit with square bolt holes for carriage bolts and a ductile iron housing for added strength. It is ideal for limited space applications and light to moderate duty applications.  
with ductile iron housing

Duty: Light

6 Light 2-Bolt Flange Units

BLF

ALF

**BLF** is a compact and lightweight two-bolt flange unit which is ideal for limited space applications and light to moderate duty applications.

**ALF** with SA eccentric locking collar style is also available.

Duty: Light

7 Compact 2-Bolt Flange Units

UFL

UFL-C, D

**UFL** is a light duty two-bolt flange unit that is part of the Clean Series. It has a zinc-alloy housing for a high level of corrosion resistance and it is capable of accepting end covers to increase contamination resistance.

Duty: Light

8 Corrosion Resistant Series 2-Bolt Flange Units

UCSFL-H1S6  
UCSFL-EH1S6

USFL-S6

**UCSFL** is a two-bolt flange unit that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also pre-filled with food grade grease for food processing applications.

Duty: Standard

**USFL-S6** is a light duty stainless two-bolt flange unit that is part of the Clean Series. It has a stainless housing for a high level of corrosion resistance and it is capable of accepting end covers to increase contamination resistance.

Duty: Light

UCVFL-S6  
UCVFL-E57

**UCVFL** is a two-bolt flange unit with a corrosion resistant thermo-plastic housing and the option of either a stainless steel bearing insert or a zinc chromate plated bearing insert. Both bearing inserts offer a high level of corrosion resistance and they are factory lubricated with food grade grease.

Duty: Standard

### 3 Models

#### (3 Oval Flange Units)

##### 9 Corrosion Resistant Series 3-Bolt Flange Units

UCVFB-ES7

**UCVFB** is a three-bolt flange unit that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also pre-filled with food grade grease for food processing applications.

Duty: Standard

#### 4 4-Bolt Flange Cartridge Units

##### 1 4-Bolt Flange Cartridge Units

UCFC  
UCFCX-E  
UCFCF

NCFC

**UCFC** is piloted flange cartridge units with rigid cast iron housings and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions. The pilot on the back of the housing allows for precise mounting where necessary. UK, NA styles are also available.

Duty: Standard, Medium

**NCFC** is a piloted flange cartridge unit with a specially designed concentric locking collar that provides 360 degrees of shaft contact. It produces a more concentric lock on the shaft compared to other locking styles and it functions very well for high speed.

Duty: Standard

UKFC+H

##### 2 Narrow Inner Ring Bearing 4-Bolt Flange Cartridge Units

SBFC-RKP8

SAFC-FP9

**SBFC-RKP8** is a lightweight bearing mounted 4-Bolt Flange Cartridge Units which is ideal for limited space applications and light to moderate duty applications.

**SAFC-FP9** with SA eccentric locking collar style is also available.

Duty: Standard

##### 3 Corrosion Resistant Series 4-Bolt Flange Cartridge Units

UCSFC-H1S6

**UCSFC** is a four-Bolt Flange Cartridge Units that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also pre-filled with food grade grease for food processing applications.

Duty: Standard

5 Stamped Steel Plate Flange Units

1 Stamped Steel 3-Bolt Flange Cartridge Units

SBPF

SAPF

**SBPF** is a round three-bolt flange unit with a lightweight and compact stamped steel housing for light to moderate duty applications.

**SAPF** with SA eccentric locking collar style is also available.

Duty: Light

2 Stamped Steel 2-Bolt Flange Units

SBPFL

SAPFL

**SBPFL** is a two-bolt flange unit with a lightweight and compact stamped steel housing for light to moderate duty applications.

**SAPFL** with SA eccentric locking collar style is also available.

Duty: Light

6 Take-Up Units

1 Take-Up Units

UCT  
UCT-E

NAT-E

**UCT** is a wide-slot take-up unit suitable for use in a side-mount take-up frame. It has a rigid cast iron housing and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions.

UK style is also available.

Duty: Standard, Medium, Heavy

**NAT** is a wide-slot take-up unit with an eccentric locking collar insert that provides a very secure grip to the shaft that becomes even more secure during continued operation. It is specifically used for single-direction/non-reversing rotation.

Duty: Standard

NCT  
NCT-E

UKT+H

**NCT** is a wide-slot take-up unit with a specially designed concentric locking collar that provides 360 degrees of shaft contact. It produces a more concentric lock on the shaft compared to other locking styles and it functions very well for high speed applications.

Duty: Standard

UCTRS

**UCTRS** is a narrow slot take up unit. It has a rigid cast iron housing and two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions.

Duty: Standard

### 3 Models

#### (6 Take-Up Units)

##### 2 Corrosion Resistant Series Take-Up Units

**UCST-H1S6**  
**UCST-EH1S6**

**UCST** is a wide-slot take-up unit that is made entirely out of stainless steel components for the highest level of corrosion resistance for a mounted bearing unit. It is also pre-filled with food grade grease for food processing applications.

Duty: Standard

##### 3 Section Steel Frame Take-Up Units

**UCTH**

**UCTH** is a Take-Up unit with section a steel frame.

Duty: Standard

##### 4 Channel Steel Frame Take-Up Units

**UCTL**

**UCTU**

**UCTL** is a Take-Up unit with a channel steel frame.

Duty: Standard

**UCTU** is a Take-Up unit with a channel steel frame.

Duty: Standard, Heavy

##### 5 Steel Plate Frame Take-Up Units

**SBPTH**

**SBNPTH**

**SBPTH** is a Take-Up unit with a steel plate frame.

Duty: Standard

**SBNPTH** is a Take-Up unit with a steel plate frame.

Duty: Standard

#### 7 Other Units

##### 1 Cartridge Units

**UCC**

**UKC+H**

**UCC** is a cartridge unit with two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions. The cartridge housing allows for precise shaft mounting and expansion capability where necessary. UK, NA, NC styles are also available.

Duty: Standard, Medium, Heavy

##### 2 Hanger Units

**UCHA**

**UCHA** is a hanger unit with a threaded-base for simple installation on a threaded pipe mounting configuration. It has two specially designed set screws in the inner-ring spaced at 120 degrees for maximum holding power and reliability for a wide variety of applications and operating conditions.

Duty: Standard

8 Ball Bearing Inserts

1 UC inserts

UC

UC-L3

UC-S6

with set screws

**UC2 (X, 3)**...Standard type      Duty: Standard, Medium, Heavy

**UC2 (X, 3) L3**...Triple-lip seal type

**UC2-S6**...Stainless steel series      Duty: Standard

This deep grooved ball bearing insert with rubber seal and metal slinger comes pre-lubricated with FYH grease. This insert incorporates a wide inner ring design with FYH Bullet Point setscrews as a standard, at 120 degrees apart to affix the insert to the shafting. The setscrew locking design with wide inner ring is the most common insert and can be used in a wide variety of applications. The spherical O.D. of the insert has both a grease groove as well as grease holes to re-lubricate the insert when needed. The UC insert can be ordered with a triple lip seal by using a L3 designation in the suffix.

The UC-S6 series incorporates the same design and dimensions as a standard UC insert but is constructed of 316 grade stainless steel for wash down and other corrosive environments. These inserts come with food grade grease as a standard, and a primary used in food, pharmaceutical, fertilizer and demanding applications.

2 UK inserts

UK

UK+H

UK-L3

UK-L3+H

with adapter

**UK2 (X, 3)**...Standard type      Duty: Standard, Medium, Heavy

**UK2 (3) L3**...Triple-lip seal type

This deep grooved ball bearing insert with rubber seal and metal slinger comes pre-lubricated with FYH grease. The UK series incorporates a tapered inner ring and uses corresponding adaptors to determine the bore size and affix it to the shaft. The UK series is perfect for applications where shock load can damage other locking devices. The tapered bore with adaptor provides true 360 degree shaft contact that runs the entire length of the inner ring. The spherical O.D. has a grease groove and grease holes for re-lubrication. The insert and adaptor come as two separate items and must be ordered separately. The insert is also available in a triple lip design by adding the L3 designation to the suffix.

3 NC inserts

NC

with concentric locking collar

**NC2**      Duty: Standard

The FYH NU-LOC bearing features a concentric locking collar that allows for 360 degrees of locking contact. This deep groove ball bearing insert uses a grooved inner ring with a collar that incorporates a hex screw that is tightened to squeeze equally against the inner ring. The NU-LOC insert has a spherical O.D. and has grease grooves and grease holes for re-lubricating.

The roundness of the ball path created by the NU-LOC bearing results in better operation and longer life. The collar is designed to prevent shaft marring and burring that can occur with other locking options.

### 3 Models

#### (8 Ball Bearing Inserts)

##### 4 NA inserts

NA

with eccentric locking collar

**NA2**

Duty: Standard, Heavy

This deep groove ball bearing insert with rubber seal and metal slinger comes pre-lubricated with FYH grease. This insert incorporates a wide inner ring design with an eccentric locking collar for securing the insert to the shafting. The insert has grease holes and a grease groove on the outer ring for re-lubrication.

The spherical O.D. allows this insert to be installed in a wide range of housings. When the insert is affixed to the shaft, the eccentric collars' elliptical shape meshes with the elliptical surface of the inner ring.

The turning of the inner ring locks the shafting in place and a setscrew is tightened to keep it from slipping.

##### 5 SB inserts

SB

SB-RKP8

with set screws

**SB2**

Duty: Light

This is a deep groove ball bearing insert with spherical O.D. comes from the factory pre-lubricated with FYH grease. This bearing can be ordered in either re-lube style or sealed for life. The re-lube style has a grease groove and grease holes on the O.D. while the lubed for life does not. The SB series has the same load ratings as a UC bearing but has a narrow inner ring, and uses a one piece seal and slinger design rather than a separate seal and slinger. This insert affixes to the shafting using two set screws at 120 degrees apart. To order this same bearing with a cylindrical O.D. use the designation SBB.

##### 6 SA inserts

SA

SA-F

with eccentric locking collar

**SA2, SA2-F**

Duty: Light

This deep groove ball bearing unit with spherical O.D. is the same as the SB type insert, but uses an eccentric locking collar for affixing to the shafting. This insert comes from the factory pre-lubricated with FYH grease. This bearing can be ordered in either re-lube style or sealed for life. The re-lube style has a grease groove and grease holes on the O.D. while the lubed for life does not. This series also has a re-lube backside style. The backside re-lube is designated by an F in the suffix to be compatible with others in the industry. When the insert is affixed to the shaft, the eccentric collars' elliptical shape meshes with the elliptical surface of the inner ring.

The turning of the inner ring locks the shafting in place and a setscrew is tightened to keep it from slipping. To order this same bearing with a cylindrical O.D. use the designation SAA.

SA-FP9

7 SU inserts (Small size)

SU

SU-S6

with set screws

**SU0...**Standard type

Duty: Light

**SU0-S6...**Stainless steel

This deep groove ball bearing insert is intended for very light loads and is used in light duty conveying applications as part of our Clean Series. This bearing has a spherical O.D. and comes pre-lubricated from the factory. These inserts have a spherical O.D. with a wider inner ring and have no grease groove or grease holes for re-lubrication. Two setscrews at 120 degrees apart affix this insert to the shafting. The SU-S6 bearing is constructed of stainless steel material and is used as part of our stainless Clean Series. The stainless material is superior in corrosion resistance compared to the normal clean series insert.

8 ER inserts

ER

ERC

with set screws, cylindrical O.D. lubricating mechanism, locating snap ring and snap ring groove

**ER2, ERC2**

Duty: Standard

This deep groove ball bearing insert with a rubber seal and metal slinger come pre-lubricated with FYH grease. The ER series has a cylindrical O.D. with grease groove and grease holes outer ring for re-lubrication. The ER series uses two FYH Bullet Point type setscrews at 120 degrees apart to affix it to the shafting. The ER bearings have a snap ring on the outer ring to help make locating the bearing a simple task during installation. ERC with NU-LOC concentric locking collar style is also available.

9 RB inserts

RB

with set screws, cylindrical O.D.

**RB2**

Duty: Standard

This deep groove ball bearing insert with a rubber seal and metal slinger come pre-lubricated with FYH grease. The RB series has a cylindrical O.D and has the same dimensions as the ER series but does not have a snap ring for locating or a grease groove and grease holes for re-lubrication. The RB series uses two FYH Bullet Point type setscrews at 120 degrees apart to affix it to the shafting.

### 3 Models

---

#### (8 Ball Bearing Inserts)

---

##### 10 SC inserts

---

SC

##### SC2

Duty: Light

The SC series is a non-extending inner ring insert with a spherical outer-diameter which allows it to be mounted in a traditional housing. The bore tolerance is more precise than typical mounted bearings so press-fit shaft mounting can be accomplished.

---

##### 11 SBB, SAA inserts

---

SBB-RK

SAA-F

with set screws, cylindrical O.D.

##### SBB2, SAA2-F

Duty: Light

The SBB and SAA insert series' both have a cylindrical outer diameter for press-fit mounting directly into component machinery. They are not self-aligning or capable of being mounted into traditional housings.

---

##### 12 Adapter

---

H2300X

Adapter

##### H2300X

The H2300X adapter series' are for use in the tapered-bore UK series. Proper assembly of adapter sleeves can create excellent holding power on the shaft.

## 4 Rating Life of Bearings

When ball bearing units are installed and operated on a piece of machinery eventually a failure will occur. The period of operation until the unit cannot be used due to failure is called the bearing life.

Bearing failure is caused by two main reasons. The first is fatigue of bearing material, and the second is lubricant degradation. The life is figured on whichever fails first.

Proper bearing lubrication will eliminate grease degradation and allow full bearing life to be achieved. If the bearing units are run without replenishment of the grease the bearing life will have to be factored by either the grease life or the bearing life. During installation, care must be taken not to damage the bearing. Proper bearing maintenance and lubrication will ensure long bearing life.

### 4.1 Basic Rating Life and Basic Load Rating

#### 4.1.1 Basic rating life

When a bearing is rotated under load the raceways and the rolling elements are continuously exposed to load. Damage, such as scaling (flaking or peeling), eventually appears on the material, and the total rotating frequency until the damage appears is called the “fatigue limit of the bearing”. Fatigue limit of the bearing can vary greatly even if the bearings have the same structure, dimensions, materials, machining methods, and are operated under the same conditions.

To account for this variation, a group of the same bearings operating under the same conditions are tested, and the total rotating frequency of 90% of the bearings operating with no damage due to rotating fatigue (90% reliability) is called the basic load rating.

#### 4.1.2 Basic load rating

Dynamic ratings are determined by placing a pure radial load on a radial bearing or by placing a central axial load on a thrust bearing. The dynamic rating is the load that the bearing will withstand for one million cycles before failure of the bearing.

These ratings are referred to as the **basic dynamic radial load rating** ( $C_r$ ) or the **basic dynamic axial load rating** ( $C_a$ ). These values are indicated in the catalog as the basic dynamic radial load rating ( $C_r$ ), and the value is shown in the dimensional table.

### 4.2 Calculation of Rating Life

The relationship between the basic rating life, the basic dynamic load rating, and the dynamic equivalent load of the ball bearing is indicated in **Formula (4.1)**. If the ball bearing unit is being used at a fixed rotating speed, the life is indicated as time. This is shown in **Formula (4.2)**.

$$\text{(Total rotating frequency)} \quad L_{10} = \left(\frac{C_r}{P_r}\right)^3 \dots\dots\dots (4.1)$$

$$\text{(Time)} \quad L_{10h} = \frac{10^6}{60n} \left(\frac{C_r}{P_r}\right)^3 \dots (4.2)$$

Whereas,

$L_{10}$ : Basic rating life,  $10^6$  rotations

$L_{10h}$ : Basic rating life, hr

$C_r$ : Basic dynamic load rating, N

$P_r$ : Dynamic equivalent load, N  
(see “5 Bearing load”)

$n$ : Rotating speed,  $\text{min}^{-1}$

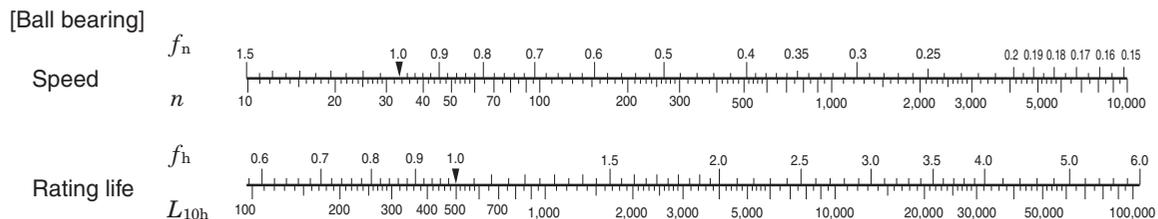

Calculation of the basic rating life using the life factor ( $f_h$ ) and the speed factor ( $f_n$ ) in **Formula (4.2)** are shown below.

$$L_{10h} = 500 f_h^3 \dots\dots\dots (4.3)$$

$$\text{Life factor} \quad f_h = f_n \cdot \frac{C_r}{P_r} \dots\dots\dots (4.4)$$

$$\begin{aligned} \text{Speed factor} \quad f_n &= \left(\frac{10^6}{500 \times 60n}\right)^{1/3} \\ &= (0.03n)^{-1/3} \dots\dots\dots (4.5) \end{aligned}$$

Values of  $f_n$ ,  $f_h$  and  $L_{10h}$  can be found using the nomogram of **Fig. 4.1**.

**Fig. 4.1 Relation between basic rating life ( $L_{10h}$ ) and rotating speed ( $n$ ), speed factor ( $f_n$ ), and life factor ( $f_h$ )**

**4.2.1 Correction of basic load rating due to temperature**

If a ball bearing unit is used at a relatively high temperature the physical composition of the bearing material is changed leading to decreased hardness. This decreased hardness leads to the basic dynamic load rating being reduced. Once the structure of the bearing material has been changed, it will remain this way for the life of the unit, even when it returns to room temperature.

When using a ball bearing unit at 150 °C or more, the basic load rating must be corrected by multiplying the basic dynamic load rating shown in the dimensional table by the temperature factor shown in **Table 4.1**.

**Table 4.1 Temperature factor**

Bearing temperature, °C	125	150	175	200	250
Temperature factor	1	1	0.95	0.9	0.75

**4.2.2 Corrected rating life**

The basic  $L_{10}$  rating life shown in **Formula (4.1)** is the fatigue life of a bearing with 90% reliability however; there are circumstances where bearings need greater reliability. The bearing life may be extended by using special materials.

Other conditions, including lubrication, may influence the bearing life.

The corrected rating life is found by taking the basic rating life and taking the factors in **Formula (4.6)** into consideration.

---

$$L_{na} = a_1 a_2 a_3 L_{10} \dots\dots\dots (4.6)$$

---

Whereas,

- $L_{na}$ : Corrected rating life,  $10^6$  rotations  
Bearing characteristics and operating conditions are taken into consideration with reliability 100– $n$ % (breakage probability)
  - $L_{10}$ : Basic load rating,  $10^6$  rotations  
Life with 90% reliability
  - $a_1$ : Reliability factor ..... see (1)
  - $a_2$ : Bearing characterization factor ..... see (2)
  - $a_3$ : Operating condition factor ..... see (3)
- 

**(1) Reliability factor  $a_1$**

**Table 4.2** shows the values used when a corrected bearing life that has less than a 10% breakage probability is necessary.

**Table 4.2 Reliability factor  $a_1$**

Reliability, %	$L_{na}$	$a_1$
90	$L_{10a}$	1
95	$L_{5a}$	0.62
96	$L_{4a}$	0.53
97	$L_{3a}$	0.44
98	$L_{2a}$	0.33
99	$L_{1a}$	0.21

**(2) Bearing characterization factor  $a_2$**

The material make-up of a bearing can have an affect on its basic rating life. Factors that can influence the bearing include bearing material (type of steel), production procedures, and bearing design. Bearing characterization is shown as factor  $a_2$ .

FYH ball bearing inserts use high quality vacuum degassed bearing steel as standard material, and this material allows for a longer rating life. For FYH ball bearing units, the bearing characterization factor  $a_2$  is 1 ( $a_2 = 1$ ). When bearings with special materials are used for a longer fatigue limit the characterization factor can be shown as  $a_2$  being greater than 1 ( $a_2 > 1$ ).

**(3) Operating condition factor  $a_3$**

Operating conditions may directly influence the life of the bearing (especially proper or improper lubrication). The basic rating life should be corrected using the operating condition factor  $a_3$ . If lubrication is being maintained the factor  $a_3 = 1$ . If excellent re-lubrication practices are being maintained the factor  $a_3 > 1$  should be applied.

If any of the following operating conditions are applicable the condition should be applied as  $a_3 < 1$ .

- (1) Kinematic viscosity of lubricant during operation is low:  
Ball bearing: 13 mm<sup>2</sup>/s or less,  
Roller bearing: 20 mm<sup>2</sup>/s or less
- (2) Rotating speed is low:  
 $d_{mn}$ : 10,000 or less
- Note:  $d_m$  (Pitch dia. of ball set in mm)  $\times n$  (Rotating speed)
- (3) Foreign matters are mixed in lubricant

Even if the bearing characterization factor is improved i.e.,  $a_2 > 1$ , the life of the bearing must still be down-rated if the combination,  $a_2 \times a_3 > 1$ .

### 4.2.3 Required lifetime of bearings

At some point, the economical nature of a ball bearing begins to decline. The operating conditions, type of bearing used, and type of machine the bearing is used on all influence the operational life of the bearing.

The required lifetime of the ball bearing is shown in **Table 4.3**.

**Table 4.3 Required life time of ball bearing units (reference)**

Operating conditions	Machines used	Required life time, hrs
Operated in short periods or intermittently	Home electric appliances, electric tools, agricultural machinery, hoist, etc.	4,000 – 8,000
Operated for several minutes or hours at a time, but less than 8 hours per day	Factory motor, ordinary gearing, etc.	12,000 – 20,000
Constantly operated for 8 hours or longer per day or operated continuously for long periods	General machinery, blowers, etc.	20,000 – 30,000
Operated continuously for 24 hours, no fault is allowed	Power plants, mine drainage facility, etc.	100,000 –200,000

### 4.3 Grease Life

The grease life for ball bearing units is influenced by: the level of the load, rotating speed of the bearing, and the operating temperature.

The grease life for ball bearing units being used under appropriate operating conditions can be found by the formula shown below.

$$\log L = 6.10 - 4.40 \times 10^{-6} d_m n - 2.50 \left( \frac{P_r}{C_r} - 0.05 \right) - (0.021 - 1.80 \times 10^{-8} d_m n) T \dots\dots\dots (4.7)$$

Whereas,

*L*: Grease life, hr

*d<sub>m</sub>*: Pitch dia. of ball set, mm

$$d_m = \frac{(D + d)}{2}$$

( *D*: Nominal bearing outer dia.,  
*d*: Nominal bearing bore dia. )

*n*: Rotating speed of bearing, min<sup>-1</sup>

*P<sub>r</sub>*: Dynamic equivalent radial load, N  
(see “5 Bearing load”)

*C<sub>r</sub>*: Basic dynamic radial load rating of bearing, N

*T*: Operating temperature of bearing, °C

Applicable conditions for the **Formula (4.7)** are shown below.

1) Operating temperature of bearing: *T* °C

To be applied if the following condition is satisfied:  
*T* ≤ 100

( If *T* is smaller than 50 (*T* < 50),  
following condition should be applied: *T* = 50.)

If *T* is larger than 100 (*T* > 100), contact FYH.

2) Rotating speed of bearing: *d<sub>m</sub>n*

To be applied if the following condition is satisfied:  
*d<sub>m</sub>n* ≤ 30 × 10<sup>4</sup>

( If *d<sub>m</sub>n* is smaller than 12.5 × 10<sup>4</sup> (*d<sub>m</sub>n* < 12.5 × 10<sup>4</sup>),  
following condition should be applied:  
*d<sub>m</sub>n* = 12.5 × 10<sup>4</sup> )

If *d<sub>m</sub>n* is larger than 30 × 10<sup>4</sup> (*d<sub>m</sub>n* > 30 × 10<sup>4</sup>),  
contact FYH.

3) Load condition of bearing:  $\frac{P_r}{C_r}$

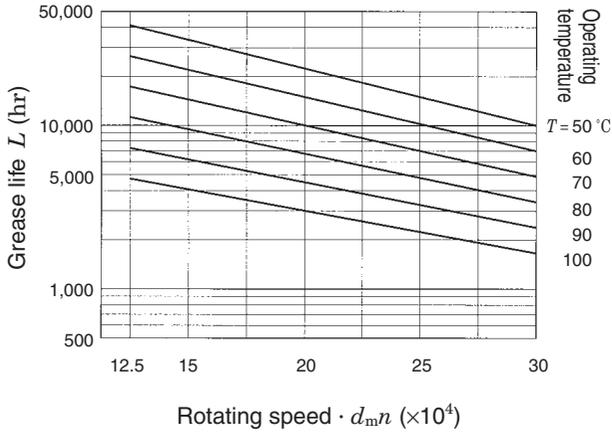

To be applied if the following condition is satisfied:  
 $\frac{P_r}{C_r} \leq 0.2$

( If  $\frac{P_r}{C_r}$  is smaller than 0.05 ( $\frac{P_r}{C_r} < 0.05$ ),  
following condition should be applied:  $\frac{P_r}{C_r} = 0.05$  )

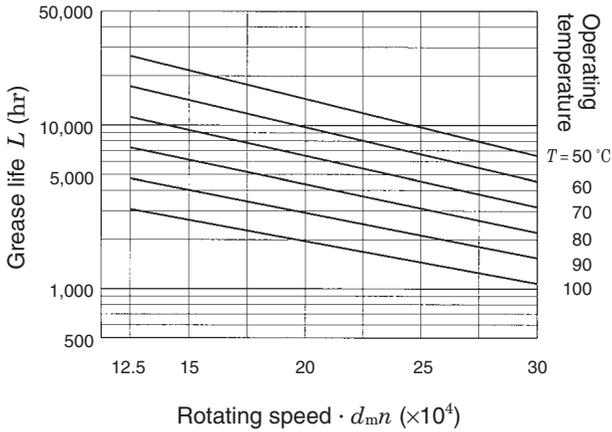

If  $\frac{P_r}{C_r}$  is larger than 0.2 ( $\frac{P_r}{C_r} > 0.2$ ), contact FYH.

Reference figure of grease life obtained by the **Formula (4.7)** is shown in **Fig. 4.2**.

(1) Bearing load  $\cdot \frac{P_r}{C_r} = 0.05$

(2) Bearing load  $\cdot \frac{P_r}{C_r} = 0.125$

(3) Bearing load  $\cdot \frac{P_r}{C_r} = 0.2$

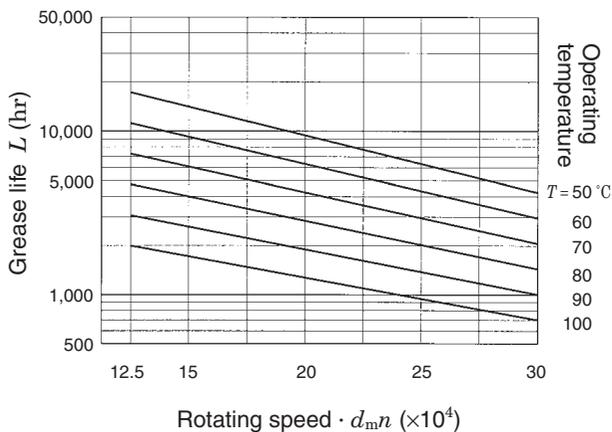

Fig. 4.2 Relation of grease life to bearing load, rotating speed, and operating temperature (reference)

## 5 Bearing Load

Loads that are applied to bearings come from a variety of sources.

In addition to the primary load, other resultant loads include the weight of complementary objects including shafting, gears, pulleys, torsion from chain and belts, and so on. Shock or dynamic load can also be derived from these sources.

In many cases, these loads cannot be determined by a simple or single calculation; and since these loads often fluctuate in intensity, it is difficult to determine the exact magnitude of them prior to actual lab or field measurements on the machinery in question.

However, in order to approximate the loads involved prior to putting a machine into operation, the technique shown below should be used. This technique uses multiplication factors that have been determined empirically from sample measurements taken on actual machines in operation.

### 5.1 Loads Applied to Bearings

#### 5.1.1 Load factor

Even if the static radial load and the axial load can be accurately calculated, the actual loads are generally greater than the calculated figures. This is due to the presence of vibration and shock load during actual machine operation.

To find the loads actually applied to a bearing, multiply the values determined for the static load by the following load factors.

$$F = f_w \cdot F_c \dots\dots\dots (5.1)$$

Whereas,

$F$ : Load actually applied to bearing, N

$F_c$ : Theoretically calculated load, N

$f_w$ : Load factor (see Table 5.1)

Table 5.1 Load factor  $f_w$

Operating conditions	Applications	$f_w$
Virtually no vibration or impact	Electric machines and instruments	1 –1.2
Ordinary operation (light impact)	Agricultural machines and blower	1.2–2
Great vibration and impact	Construction machines and grinders	2 –3

**5.1.2 Loads from belts or chain drives**

The load calculated for the bearing is equal to the tensile load of the belt. However, this load must be multiplied by the load factor ( $f_w$ ), which accounts for vibration and impact of the machine and a belt factor ( $f_b$ ), which accounts for the vibration and impact generated through the belt.

When calculating loads for a chain drive, use the same factor ( $f_b$ ) as used for belt drives.

$$F_b = \frac{2M}{D_p} \cdot f_w \cdot f_b$$

$$= \frac{19.1 \times 10^6 W}{D_p \cdot n} \cdot f_w \cdot f_b \dots\dots\dots (5.2)$$

Whereas,

- $F_b$ : Load actually applied to pulley shaft or sprocket shaft, N
- $M$ : Torque applied to pulley or sprocket, mN · m
- $W$ : Transmitted power, kW
- $D_p$ : Pitch circle dia. of pulley or sprocket, mm
- $n$ : Rotating speed, min<sup>-1</sup>
- $f_w$ : Load factor (see **Table 5.1**)
- $f_b$ : Belt factor (see **Table 5.2**)

**Table 5.2 Belt factor  $f_b$**

Belt type	$f_b$
Toothed belt	1.3–2
V belt	2 –2.5
Flat belt (with tension pulley)	2.5–3
Flat belt	4 –5
Chain	1.2–1.5

**5.1.3 Load of gear transmissions**

Gear transmissions have a load in the tangential direction ( $K_t$ ), a load in the radial direction ( $K_r$ ), and an axial load ( $K_a$ ). Different types of gears are calculated differently.

The following is a sample of a calculation for an ordinary spur gear arrangement. A flat spur gear will not support an axial load.

- (1) Load applied to gear in tangential direction (tangential line force)

$$K_t = \frac{2M}{D_p} = \frac{19.1 \times 10^6 W}{D_p n} \dots\dots\dots (5.3)$$

- (2) Load applied to gear in radius direction (separating force)

$$K_r = K_t \tan \alpha \dots\dots\dots (5.4)$$

- (3) Synthetic load applied to gear

$$K_g = \sqrt{K_t^2 + K_r^2} = K_t \sec \alpha \dots\dots\dots (5.5)$$

Whereas,

- $K_t$ : Load applied to gear in tangential direction (tangential line force), N
- $K_r$ : Load applied to gear in radius direction (separating force), N
- $K_g$ : Synthetic load applied to gear, N
- $M$ : Torque applied to gear, mN · m
- $D_p$ : Pitch circle dia. of gear, mm
- $W$ : Transmission power, kW
- $n$ : Rotating speed, min<sup>-1</sup>
- $\alpha$ : Pressure angle of gear, °

Note that the actual gear load must be found by multiplying the theoretical load by the load factor ( $f_w$ ) obtained by taking into consideration the vibration and impact loads generated while the machine is in operation. The gear factor ( $f_g$ ) is determined by taking into consideration the accuracy of machining and the finish of the gears.

$$F_g = f_w \cdot f_g \cdot K_g \dots\dots\dots (5.6)$$

Whereas,

- $F_g$ : Load actually applied to gear, N
- $K_g$ : Theoretical synthetic load applied to gear, N
- $f_w$ : Load factor (see **Table 5.1**)
- $f_g$ : Gear factor (see **Table 5.3**)

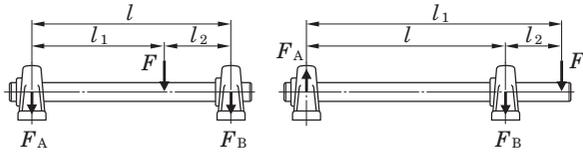

**Table 5.3 Gear factor  $f_g$**

Gear type	$f_g$
Precision gear (both pitch error and tooth profile error should be 0.02 mm or less)	1 –1.1
Ordinary gear (both pitch error and tooth profile error should be 0.1 mm or less)	1.1–1.3

5.2 Distribution of Bearing Load

In order to determine the radial load distribution to each bearing attached to a shaft, use the procedure shown below. Use the load factors shown in **Table 5.1** to account for vibration and impact.

A standard radial ball bearing bears an axial load component in addition to the radial component. The total vectored load can be calculated by taking the square root of the sum of the squares of each load as shown in the previous calculation.

$$F_A = \frac{l_2}{l} \cdot F \dots\dots\dots (5.7)$$

$$F_B = \frac{l_1}{l} \cdot F \dots\dots\dots (5.8)$$

Fig. 5.1 Distribution of load to bearings

5.3 Dynamic Equivalent Load

In many cases, a bearing is exposed to the combined vector load of both radial and axial load components. It may also be used under more severe conditions such as vibration and shock load. In this case, a direct comparison to the dynamic load rating is not appropriate.

In such a case, find the load equivalent to a direct radial load only and compare this with the basic dynamic load rating.

The converted virtual load is called dynamic equivalent load (*P*).

5.3.1 Calculation of dynamic equivalent load

The dynamic equivalent radial load (*P<sub>r</sub>*) of a bearing that bears radial and axial loads as well as vibration and impact is found by the following formula.

$$P_r = XF_r + YF_a \dots\dots\dots (5.9)$$

Whereas,

*P<sub>r</sub>*: Dynamic equivalent radial load, N

*F<sub>r</sub>*: Radial load, N

*F<sub>a</sub>*: Axial load, N

*X*: Radial load factor (see **Table 5.4**)

*Y*: Axial load factor (see **Table 5.4**)

Table 5.4 Radial load factor (*X*) and axial load factor (*Y*)

$\frac{f_0 F_a}{C_{0r}}$	<i>e</i>	$F_a / F_r \leq e$		$F_a / F_r > e$	
		<i>X</i>	<i>Y</i>	<i>X</i>	<i>Y</i>
0.172	0.19	1	0	0.56	2.30
0.345	0.22				1.99
0.689	0.26				1.71
1.03	0.28				1.55
1.38	0.30				1.45
2.07	0.34				1.31
3.45	0.38				1.15
5.17	0.42				1.04
6.89	0.44				1.00

Remarks 1. *C<sub>0r</sub>* (basic static radial load rating) and *f<sub>0</sub>* (factor) are shown in the dimensional tables.  
 2. If *f<sub>0</sub> F<sub>a</sub> / C<sub>0r</sub>* does not conform to the table above, find by interpolation.

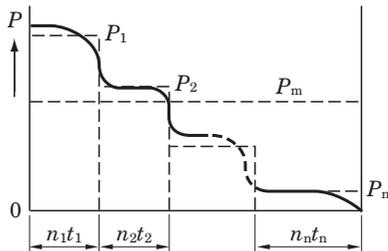

**5.3.2 Average dynamic equivalent load in the case of fluctuating loads**

If the level or direction of the load applied to a bearing is fluctuating, it is necessary to find the average dynamic equivalent load to calculate the bearing life.

**Table 5.5** shows the method of finding the average dynamic equivalent load under various types of fluctuating conditions.

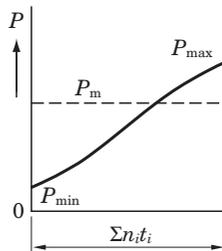

**Table 5.5 Calculation of average dynamic equivalent load in case of fluctuated load**

**(1) Graduated fluctuation**

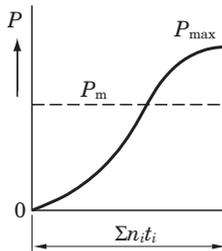

$$P_m = \sqrt[p]{\frac{P_1^p n_1 t_1 + P_2^p n_2 t_2 + \dots + P_n^p n_n t_n}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}} \quad \dots \dots \dots (5.10)$$

**(2) Monotone fluctuation**

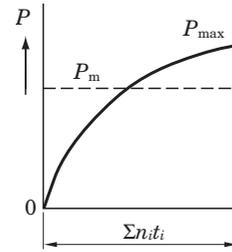

$$P_m = \frac{P_{min} + 2 P_{max}}{3} \quad \dots \dots \dots (5.11)$$

**(3) Sine curve fluctuation**

$$P_m = 0.68 P_{max} \quad \dots \dots \dots (5.12)$$

**(4) Sine curve fluctuation (upper half of sine curve)**

$$P_m = 0.75 P_{max} \quad \dots \dots \dots (5.13)$$

Whereas,

- $P_m$ : Average dynamic equivalent load, N
- $P_1$ : Dynamic equivalent load actuating for  $t_1$  hours at rotating speed of  $n_1$ , N
- $P_2$ : Dynamic equivalent load actuating for  $t_2$  hours at rotating speed of  $n_2$ , N
- ⋮
- $P_n$ : Dynamic equivalent load actuating for  $t_n$  hours at rotating speed of  $n_n$ , N
- $P_{min}$ : Minimum dynamic equivalent load, N
- $P_{max}$ : Maximum dynamic equivalent load, N
- $\Sigma n_i t_i$ : Total rotating frequency for  $t_1$  to  $t_i$  hours

**5.4 Basic Static Load Rating and Static Equivalent Load**

**5.4.1 Basic static load rating**

If a bearing is exposed to excessive static or impact load even when running at low rotational speed, partial permanent deformation occurs to the contact surface of the raceways of the bearing. The amount of permanent deformation increases with increased loads, and at some point, the bearing will no longer rotate smoothly.

The basic static load rating of a bearing is the static load that generates the calculated contact stresses shown below at the center of the contact surfaces of the raceways.

- (1) Self aligning ball bearings ..... 4,600 MPa
- (2) Other ball bearings  
(mounted ball bearings included) ..... 4,200 MPa
- (3) Roller bearings ..... 4,000 MPa

The total permanent deformation that occurs to the raceways and the balls under the above critical contact stresses is 0.0001 times the diameter of the ball.

In ball bearing units, this is indicated as the basic static radial load rating ( $C_{0r}$ ) and these values are shown in the dimensional tables.

5.4.2 Static equivalent loads

Static equivalent load is the equivalent of the combined (vectored) load converted to the equivalent direct radial load. The term “static” refers to no rotation or very little rotation.

Static equivalent radial load ( $P_{0r}$ ) can be calculated by using the formula below.

$$P_{0r} = 0.6 F_r + 0.5 F_a \dots\dots\dots (5.14)$$

$$P_{0r} = F_r \dots\dots\dots (5.15)$$

Whereas,

$P_{0r}$ : Static equivalent radial load, N

$F_r$ : Radial load, N

$F_a$ : Axial load, N

5.4.3 Safety factor

The static equivalent load that can be withstood by a bearing, in addition to the above considerations, is sometimes dependent upon unforeseen conditions in the operating environment. Therefore, a safety factor is always built in to insure success in the application.

$$f_s = \frac{C_{0r}}{P_{0r}} \dots\dots\dots (5.16)$$

Whereas,

$f_s$ : Safety factor (see **Table 5.6**)

$C_{0r}$ : Basic static radial load rating, N

$P_{0r}$ : Static equivalent radial load, N

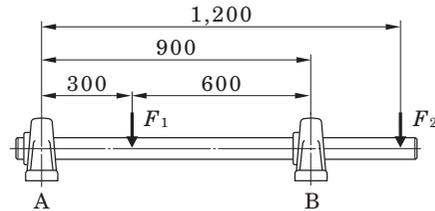

**Table 5.6 Safety factor  $f_s$  (recommended)**

Operating conditions		$f_s$ (Min.)
Being rotated	High rotating accuracy is required	2
	Ordinary operating conditions	1
	Impact	1.5
Not always being rotated (sometimes oscillated)	Ordinary operating conditions	0.5
	Impact, unevenly distributed load	1

5.5 Example of Applied Calculation

**Example 1 Distributing load**

Find the load applied to the bearing A and bearing B, if the radial load  $F_1$  ( $F_1 = 1.5$  kN) and  $F_2$  ( $F_2 = 4.5$  kN) are applied.

- (1) Find the radial load  $F_{1A}$  applied to the bearing A by  $F_1$ , with **Formula (5.7)** and **Formula (5.8)**.

$$F_{1A} = \frac{600}{900} \times 1.5 = 1.0 \text{ (kN)}$$

In a similar manner, find the radial load  $F_{2A}$  applied to the bearing A by  $F_2$ .

$$F_{2A} = - \frac{1,200 - 900}{900} \times 4.5 = -1.5 \text{ (kN)}$$

Remark: Negative load is the upward load.

Radial load  $F_A$  applied to the bearing A:

$$F_A = F_{1A} + F_{2A} = 1.0 + (-1.5) = -0.5 \text{ (kN)}$$

- (2) In a similar manner to (1), find the radial load  $F_B$  applied to the bearing B.

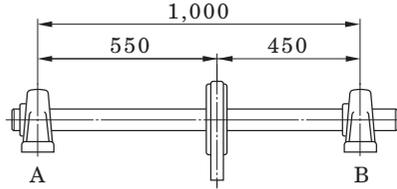

$$F_{1B} = \frac{300}{900} \times 1.5 = 0.5 \text{ (kN)}$$

$$F_{2B} = \frac{1,200}{900} \times 4.5 = 6.0 \text{ (kN)}$$

$$F_B = F_{1B} + F_{2B} = 0.5 + 6.0 = 6.5 \text{ (kN)}$$

**Example 2 Calculating load by V-belt transmission**

Find the load applied to the bearing A and bearing B when the shaft is driven by the V-belt, transmission power  $W$  is 7.5 kw ( $W = 7.5 \text{ kW}$ ), rotating speed  $n$  is  $300 \text{ min}^{-1}$  ( $n = 300 \text{ min}^{-1}$ ), effective diameter of pulley  $D_p$  is 300 mm ( $D_p = 300 \text{ mm}$ ).

- (1) Find the load actually applied to the pulley shaft  $F_b$  with **Formula (5.2)**.

From **Table 5.1**, load factor  $f_w$  is 1.2 ( $f_w = 1.2$ ), and the belt factor  $f_b$  is 2.5 ( $f_b = 2.5$ ), from **Table 5.2**.

$$F_b = \frac{19.1 \times 10^6 W}{D_p \cdot n} \cdot f_w \cdot f_b$$

$$= \frac{19.1 \times 10^6 \times 7.5}{300 \times 300} \times 1.2 \times 2.5 = 4.78 \text{ (kN)}$$

- (2) Find the load actually applied to the bearing A and bearing B ( $F_A$  and  $F_B$ ) with **Formulas (5.7) and (5.8)**.

$$F_A = \frac{450}{1,000} \times 4.78 = 2.15 \text{ (kN)}$$

$$F_B = \frac{550}{1,000} \times 4.78 = 2.63 \text{ (kN)}$$

**Example 3 Calculating dynamic equivalent radial load**

Find the dynamic equivalent radial load  $P_r$  when the radial load  $F_r$ , 1.5 kN ( $F_r = 1.5 \text{ kN}$ ), and the axial load  $F_a$ , 0.85 kN, ( $F_a = 0.85 \text{ kN}$ ) are applied to the pillow type unit UCP306J (bearing UC306).

- (1) Find the radial load factor ( $X$ ) and the axial load factor ( $Y$ ) with using the static radial load rating  $C_{0r}$  of UCP306J (bearing UC306), 15.0 kN ( $C_{0r} = 15.0 \text{ kN}$ ), and **Table 5.4**.

Find the solutions of the following formulas:

$$\frac{f_0 F_a}{C_{0r}} = \frac{13.3 \times 0.85}{15.0} = 0.754, e = 0.264$$

$$\frac{F_a}{F_r} = \frac{0.85}{1.5} = 0.567 > e (0.264)$$

Therefore,  $X = 0.56$ ,  $Y = 1.68$

- (2) Find the dynamic equivalent radial load  $P_r$  with **Formula (5.9)**.

$$P_r = XF_r + YF_a = 0.56 \times 1.5 + 1.68 \times 0.85$$

$$= 2.27 \text{ (kN)}$$

**Example 4 Calculating bearing life**

Under the conditions shown in **Example 3**, find the bearing life  $L_{10h}$  when a bearing is used for a blower with a rotating speed  $n$ ,  $1,000 \text{ min}^{-1}$ .

- (1) Select the load factor  $f_w$  is 1.2 ( $f_w = 1.2$ ) from **Table 5.1**, and find the bearing load  $P_r$ .

$$P_r = f_w \cdot F = 1.2 \times 2.27 = 2.72 \text{ (kN)}$$

- (2) The dynamic radial load rating of UCP306J (bearing UC306),  $C_r$ , is 26.7 kN ( $C_r = 26.7 \text{ kN}$ ), and calculate the bearing life  $L_{10h}$  with the **Formula (4.2)**.

$$L_{10h} = \frac{10^6}{60n} \cdot \left(\frac{C_r}{P_r}\right)^3 = \frac{10^6}{60 \times 1,000} \times \left(\frac{26.7}{2.72}\right)^3$$

$$\approx 15,800 \text{ (hr)}$$

- (3) Calculate bearing life  $L_{10h}$  with the nomogram shown in **Fig. 4.1**.

When the rotating speed  $n$  is  $1,000 \text{ min}^{-1}$  ( $n = 1,000 \text{ min}^{-1}$ ), rotating factor  $f_n$  is 0.32 ( $f_n = 0.32$ ). Next, find the life factor  $f_h$  by speed factor  $f_n$ , dynamic radial load rating of bearing  $C_r$ , and the bearing load  $P_r$ .

$$\text{Life factor } f_h = f_n \cdot \frac{C_r}{P_r} = 0.32 \times \frac{26.7}{2.72} = 3.14$$

From life factor  $f_h$ , bearing life  $L_{10h} \approx 16,000$  hours.

**Example 5 Selecting ball bearing units**

If a bearing is operated under the following conditions, select the flange type unit (UCF) with at least two years (5,000 hours) or longer rating life: rotating speed of shaft  $n$  is  $1,500 \text{ min}^{-1}$  ( $n = 1,500 \text{ min}^{-1}$ ), and radial load  $F_r$  is 5 kN ( $F_r = 5 \text{ kN}$ ). The radial load  $F_r$  includes the load factor and gear factor.

- (1) From the nomogram shown in **Fig. 4.1**, when life time  $L_h$  is 5,000 hr ( $L_h = 5,000 \text{ hr}$ ), life factor  $f_h$  can be found as 2.16 ( $f_h \approx 2.16$ ), and speed factor  $f_n$  can be found as 0.28 ( $f_n \approx 0.28$ ) when the rotating speed  $n$  is  $1,500 \text{ min}^{-1}$  ( $n = 1,500 \text{ min}^{-1}$ ).

$$\text{Dynamic radial load rating } C_r = F_r \cdot \frac{f_h}{f_n} = 5 \times \frac{2.16}{0.28}$$

$$\approx 38.6 \text{ (kN)}$$

- (2) Find the flange type unit that meets the following condition: dynamic radial load rating  $C_r$  is 38.6 kN ( $C_r = 38.6 \text{ kN}$ ). For the 200 series, UCF211J (dynamic radial load rating  $C_r$  is 43.4 kN ( $C_r = 43.4 \text{ kN}$ )) can be selected.

**Example 6 Selecting pillow type units for low speed**

If a bearing is used for a dolly under the following conditions, select the pillow type unit (UCP) with 10,000 hours rating life: radial load  $F_r$  is 12 kN ( $F_r = 12$  kN), and rotating speed is  $8 \text{ min}^{-1}$ .

- (1) Find the required dynamic radial load rating  $C_r$  with using **Formulas (4.4) and (4.5)**.

$$\text{Speed factor } f_n = (0.03n)^{-1/p} = (0.03 \times 8)^{-1/3} \approx 1.61$$

$$\text{Life factor } f_h = \left(\frac{L_{10h}}{500}\right)^{1/p} = \left(\frac{10,000}{500}\right)^{1/3} \approx 2.71$$

$$\begin{aligned} \text{Dynamic radial load rating } C_r &= P_r \cdot \frac{f_h}{f_n} = 12 \times \frac{2.71}{1.61} \\ &\approx 20.2 \text{ (kN)} \end{aligned}$$

- (2) From **Table 5.6**, define safe factor  $f_s$  as 2 ( $f_s = 2$ ), and find the static radial load rating of bearing required  $C_{0r}$ .

$$C_{0r} = f_s \cdot P_r = 2 \times 12 = 24 \text{ (kN)}$$

- (3) The unit is used for a dolly, and vibration or impact may occur. Thus, select UCP308J ( $C_r = 40.7$  kN,  $C_{0r} = 24.0$  kN).

**Example 7 Calculating bearing life in high temperature applications**

Find the bearing life if the heat resistant pillow type unit (UCP215D1K2) is operated under the following conditions: operating temperature is  $175^\circ\text{C}$ , radial load  $F_r$  is 4 kN ( $F_r = 4$  kN), and the rotating speed  $n$  is  $800 \text{ min}^{-1}$  ( $n = 800 \text{ min}^{-1}$ ). Note that the radial load  $F_r$  includes load factor and gear factor.

- (1) From **Table 4.1**, find the dynamic load rating  $C_r$  in the case that a bearing is used at  $175^\circ\text{C}$ .

$$C_r = 67.4 \times 0.95 = 64.0 \text{ (kN)}$$

Find the bearing life  $L_{10h}$  using **Formula (4.2)**.

$$\begin{aligned} L_{10h} &= \frac{10^6}{60n} \cdot \left(\frac{C_r}{P_r}\right)^3 = \frac{10^6}{60 \times 800} \times \left(\frac{64.0}{4}\right)^3 \\ &\approx 85,000 \text{ (hr)} \end{aligned}$$

- (2) If a bearing unit is operated at  $175^\circ\text{C}$ , grease is degraded faster, and it cannot be used without lubrication. Supply grease at intervals specified in **Table 14.4**.
- (3) If the shaft experiences axial expansion due to heat, install a fixed bearing unit on one end of the assembly and install floating bearing unit on the other side that allows the shaft to move freely through the bore of the bearing. More information is offered in **Section 9**. (see “**9 Design of shaft and base**”).

**Example 8 Calculating grease life**

Find the grease life for pillow type unit UCP204J (bearing UC204) under the following conditions: radial load  $F_r$  is 1 kN ( $F_r = 1$  kN), and rotating speed  $n$  is  $800 \text{ min}^{-1}$  ( $n = 800 \text{ min}^{-1}$ ). Note that the radial load  $F_r$  includes load factor and belt factor. Operating temperature of the bearing should be  $40^\circ\text{C}$ .

Find the grease life  $L$  using **Formula (4.7)**.

$$\begin{aligned} \log L &= 6.10 - 4.40 \times 10^{-6} d_m n - 2.50 \left(\frac{P_r}{C_r} - 0.05\right) \\ &\quad - (0.021 - 1.80 \times 10^{-8} d_m n) T \\ &= 6.10 - 4.40 \times 10^{-6} \times 12.5 \times 10^4 \\ &\quad - 2.50 \left(\frac{1}{12.8} - 0.05\right) \\ &\quad - (0.021 - 1.80 \times 10^{-8} \times 12.5 \times 10^4) \times 50 \\ &= 4.542 \\ L &\approx 34,800 \text{ (hr)} \end{aligned}$$

**Example 9 Calculating life of bearing units in case of non-lubrication**

Find the life of a bearing unit in the case that it is operated under the conditions shown in **Example 8**, but without lubrication.

- (1) Find the rating life of bearings  $L_{10h}$  using **Formula (4.2)**.

$$\begin{aligned} L_{10h} &= \frac{10^6}{60n} \cdot \left(\frac{C_r}{P_r}\right)^3 = \frac{10^6}{60 \times 800} \times \left(\frac{12.8}{1}\right)^3 \\ &\approx 43,700 \text{ (hr)} \end{aligned}$$

- (2) Compare the grease life  $L$  shown in **Example 8** to the rating life of bearings  $L_h$ . Then, grease life  $L$  is shorter than the bearing rating life. Therefore, life of a bearing unit should be the same as the grease life  $L$ , 34,800 hours ( $L = 34,800$  hours).

1. Shaded Area A non-contact seal is used.

If the bearing with set screws is exposed to a heavy load (Pr / Cr > 0.12), vibration, or heavy impact, use a tighter shaft tolerance than normal.

1. Shaded area A non-contact seal is used.

If the bearing with set screws is exposed to a heavy load (Pr / Cr > 0.12), vibration, or heavy impact, use a tighter shaft tolerance than normal.

**Ball Bearing Life Calculations**

The relationship between the basic rating life, the basic dynamic load rating, and the dynamic equivalent load of the ball bearing is indicated in Formula 1.

If the ball bearing unit is being used at a fixed rotating speed, the life is indicated as time. This is shown in Formula 2.

$$1. L_{10} = \left( \frac{C_r}{P_r} \right)^3$$

$$2. L_{10h} = \frac{10^6 L_{10}}{60n} = \frac{10^6}{60n} \cdot \left( \frac{C_r}{P_r} \right)^3$$

## 6 Allowable Rotating Speed

### 6.1 Allowable Rotating Speed

The rotational speed of a bearing is limited by the temperature increase, mainly due to friction. When the bearing reaches the speed limits shown below, it will seize if operated continuously at these levels.

The limiting rotational speed is the maximum speed at which the bearing can be safely operated continuously.

These allowable rotational speeds of a ball bearing unit are dependent upon the dimensions of the bearing, type of seal, and the fit of the bearing inner ring to the shaft.

**Table 6.1** shows the standard allowable rotating speeds of ball bearing units.

**Table 6.1 Allowable rotating speed of ball bearing units (standard value)**

Unit: min<sup>-1</sup>

Bore dia. code	UC type bearing, UC-S6 type bearing, UK type bearing, NC type bearing, NA type bearing, ER, RB type bearing									SA type bearing SB type bearing	SU type bearing SU-S6 type bearing

13	2,200	2,100	1,900	490	460	440	3,200	3,100	2,900		
14	2,100	2,000	1,800	460	440	410	3,100	2,900	2,700		
15	2,000	1,800	1,700	440	410	380	2,900	2,700	2,600		
16	1,800	1,700	1,600	410	380	360	2,700	2,600	2,400		
17	1,700	1,600	1,500	380	360	340	2,600	2,400	2,300		
18	1,600	1,500	1,400	360	340	320	2,400	2,300	2,100		
19	–	–	1,400	–	–	310	–	–	2,000		
20		1,300	1,300		300	280		2,000	1,900		
21		–	1,200		–	–		–	1,800		
22			1,100			250			1,700		
24			1,100			240			1,600		
26			1,000			220			1,500		
28			910			200			1,400		

Remarks 1. Allowable rotating speed of the units with covers is 80% of the value shown in the table above.

2. If a bearing unit is used with an excessively loose fit, allowable rotating speed must be corrected by multiplying it by the fitting factor  $f_c$  shown in **Table 6.2**.

3. The basic bearing size number consists of the duty code (2, X, or 3) followed by the inner ring size code (07, 10, 24, etc.)

## 6.2 Rotational Speed Adjustment Due to Shaft Fit

A marginal degree of clearance is typically used to facilitate easy installation of a bearing to a shaft. The amount of clearance between the bearing and shaft must be factored in to determine the maximum allowable rotational speed, and as rotational speed is increased, the amount of clearance must be decreased.

Table 6.2 shows the factor that must be used to correct the allowable rotational speed. The maximum rotational speed is determined by multiplying the speed found in Table 6.1 by the factors below. This table includes the multiplying factors for set screw bearings as well as bearings with adapters and eccentric locking collars. Due to the characteristics of bearings with adapters, a loose fit, h8 or h9, is acceptable. Bearings with eccentric locking collars function optimally with less clearance and therefore, an h5 or j5 fit is recommended to achieve the maximum allowable speed.

**Table 6.2 Fitting factor of ball bearing units  $f_c$  (recommended)**

Type of ball bearing units	Fitting factor $f_c$					
	Shaft tolerance range class					
	h5, j5	j6	h6	h7	h8	h9

## 7 Operating Temperature and Bearing Specifications

### 7.1 Operating Temperature Range

The operating temperature of a ball bearing unit depends on the type of grease, the material of the seal, and the internal clearance of the bearing.

FYH Ball Bearing Units are available in high temperature (D1K2, D9K2) and low temperature (D2K2) series, in addition to the standard models, to allow selection of the correct bearing for your operational temperature (see Table 2.1).

The correct unit must be chosen for the desired temperature range, and it is equally important to use the appropriate grease according to the specified schedule.

### 7.2 Operating Temperature and Internal Clearance of Bearings

When bearings are operated in a high ambient temperature environment, or when the operating temperature is high because of rotational speed, differential expansion rates occur within the bearing components. This causes higher friction, grease breakdown, and eventual seizure.

If the temperature difference between the inner and outer ring is known, or can be approximated, then the following **Formula (7.1)** may be applied.

Under these conditions, decrease in the internal clearance must be calculated, and the internal clearance of bearing needs to be selected properly.

$$S_{t1} = \alpha \cdot D_e \cdot \Delta_t \dots\dots\dots (7.1)$$

Whereas,

$S_{t1}$ : Decrease in the internal clearance of bearings depending on the difference in the temperatures of the bearing inner ring and the bearing outer ring can be found by formula, mm

$\alpha$ : Line expansion factor of bearing steel,  $12.5 \times 10^{-6}$

$D_e$ : Raceway dia. of bearing outer ring, mm  
 Diameter series 2, X.....  $D_e \approx 0.92 D$   
 Diameter series 3.....  $D_e \approx 0.9 D$

$D$ : Nominal bearing outer dia., mm

$\Delta_t$ : Difference in temperatures of bearing inner ring and outer ring, °C

If a ball bearing unit is used in a high temperature environment, an abnormal load will result due to thermal expansion of the shaft. This must be compensated for by allowing free movement of one side of the shaft.

(See “9 Design of Shaft and Base”)

## 8 Strength of Housings

FYH bearings can withstand very high loads due to the use of only high quality material and excellent design. However, when high static or impact loads are encountered, the load capacity of the bearing must be determined.

The housing design is such that it can withstand loads from any angle; however the bearing is strongest with a direct downward load through the base of the unit. For loads in other directions, the allowable load must be determined specifically for the direction in question.

Rigidity of the base and flatness of the mounting surface also influence the housing strength. The equipment designer or installer must examine and perform calculations for the complete supporting structure of the bearing.

### 8.1 Strength of Cast Iron Housings

Although gray cast iron has many superior characteristics, it may fail under impact loads, particularly in a low temperature environment.

Table 8.1 shows the applicable design safety factors for gray cast iron. Fig. 8.1 to 8.7 show the static rupture strength of the various housing types.

**Table 8.1 Safety factor of gray cast iron products (recommended)**

Property of load	Safety factor of gray cast iron
Static load	4
With vibration	10
With impact	15

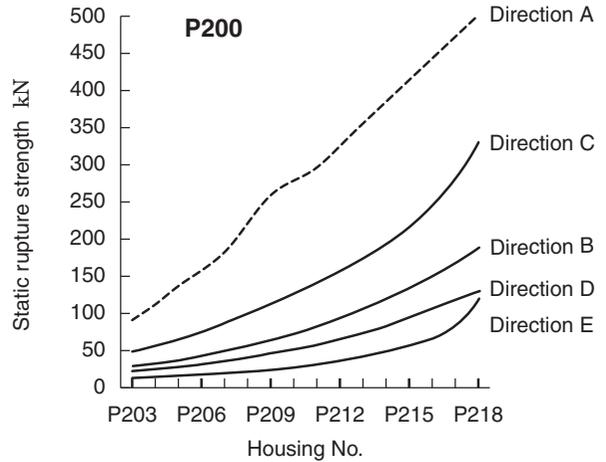

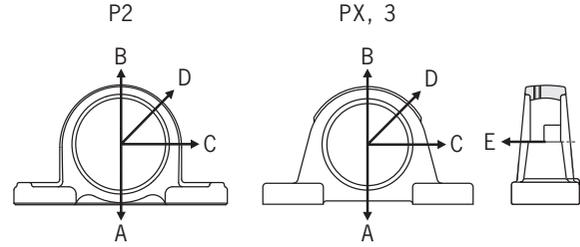

### 8.2 Strength of Ductile Cast Iron Housings

The high-strength ductile cast iron series has the same shape and dimensions as the standard gray cast iron series, but is acceptable in environments where high-strength is required.

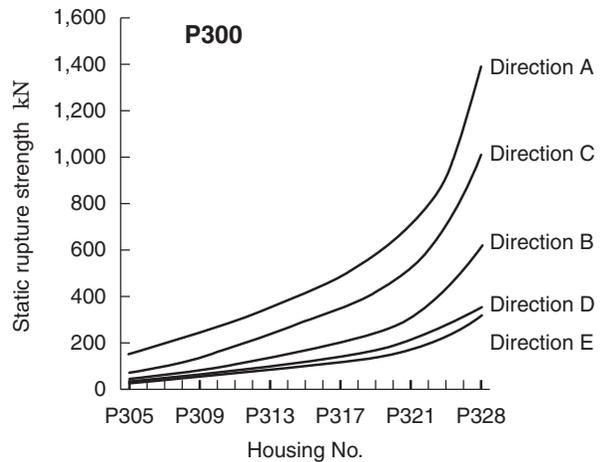

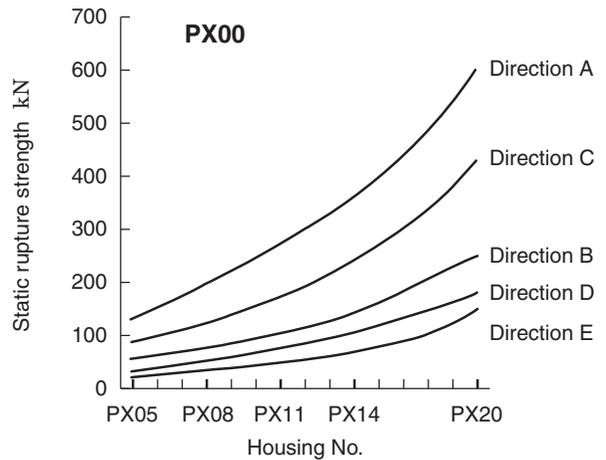

Table 8.2 shows safety factors of the load on ductile cast iron housings, and tables 8.8 to 8.11 show the approximate rupture strength of pillow type, flange type, and take-up type housings.

**Table 8.2 Safety factor of ductile cast iron (recommended)**

Property of load	Safety factor of ductile cast iron
Static load	3
With vibration	5
With impact	10

Remarks The graph value "Direction of A" is a reference value.

**Fig. 8.1 Static rupture strength of pillow type housing (P)**

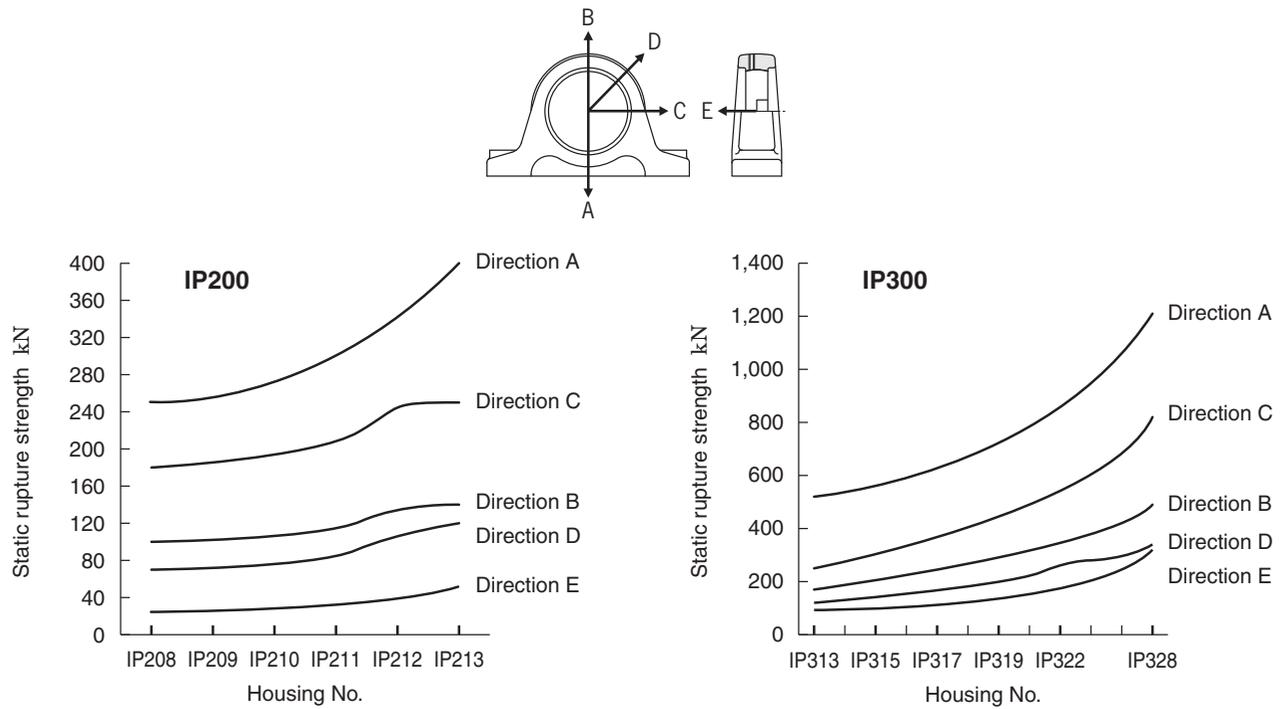

Fig. 8.2 Static rupture strength of thick pillow type housings (IP)

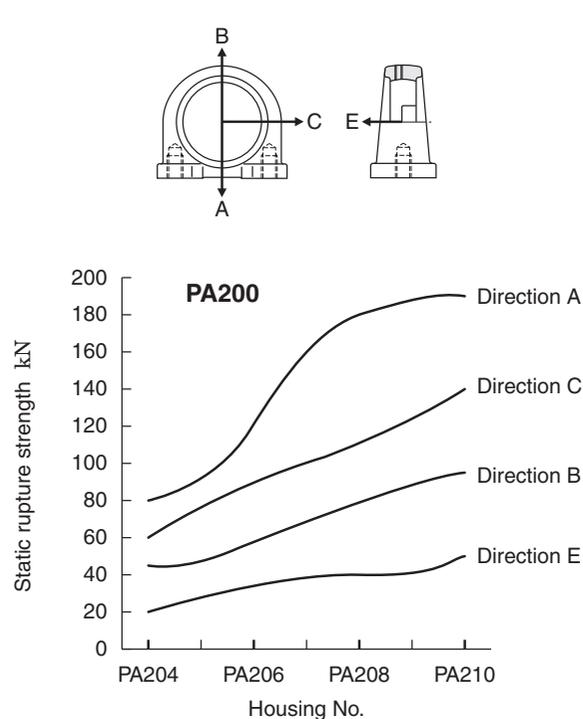

Fig. 8.3 Static rupture strength of tapped base pillow type housings (PA)

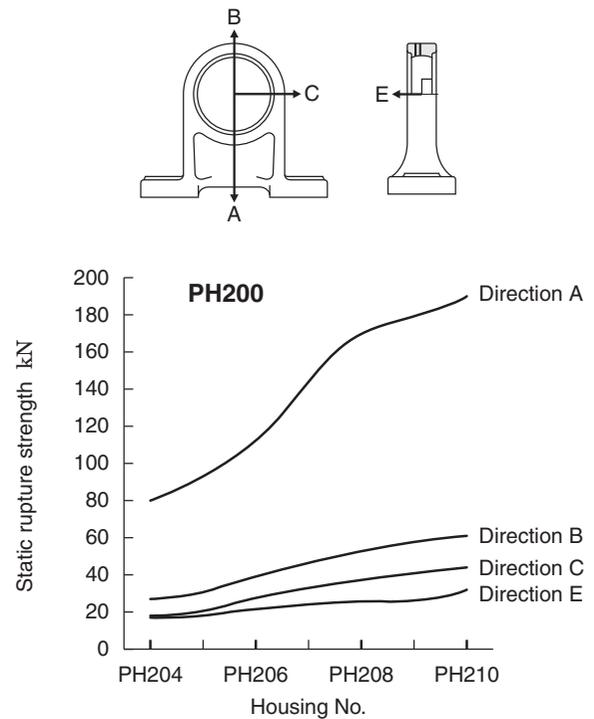

Fig. 8.4 Static rupture strength of High-Base pillow type housings (PH)

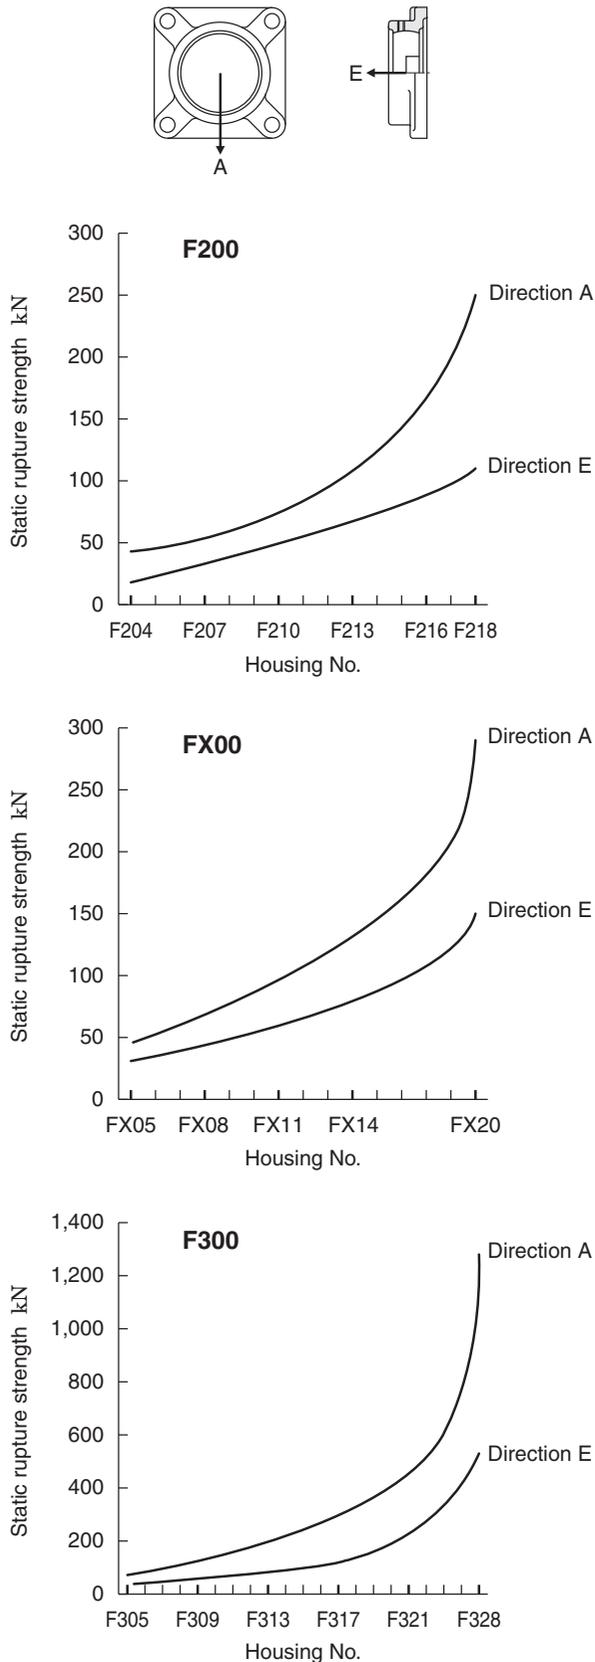

Fig. 8.5 Static rupture strength of square flange type housings (F)

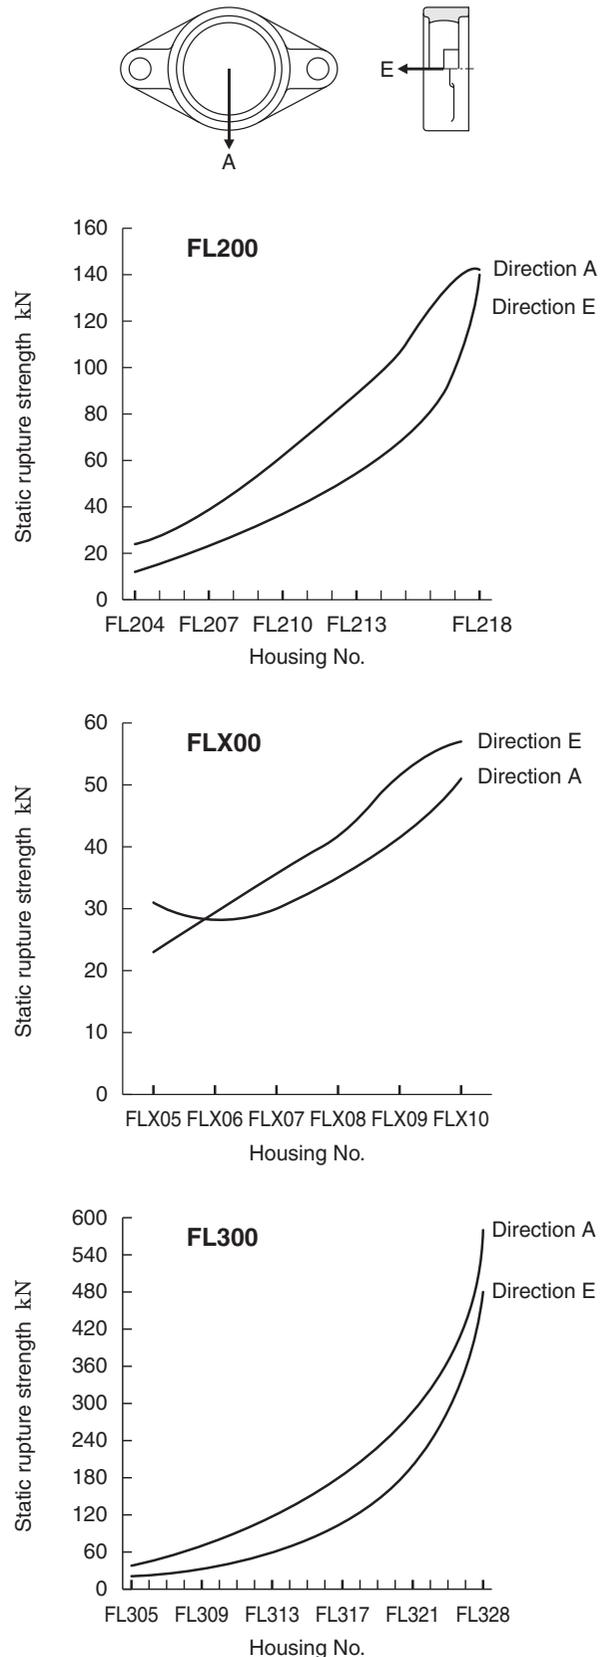

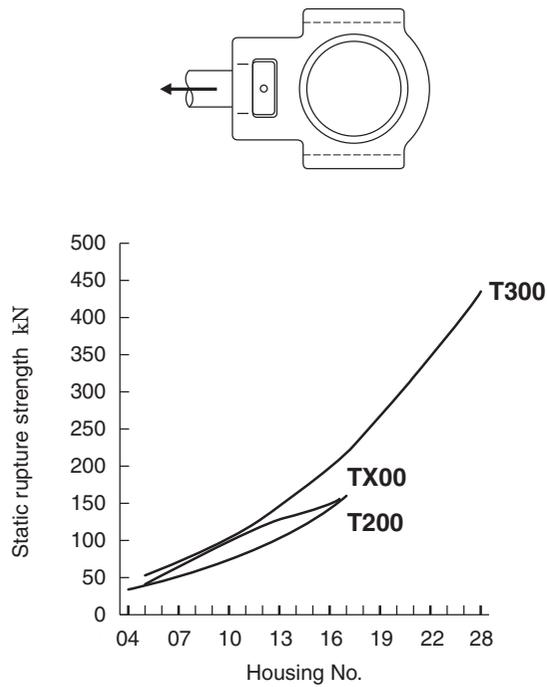

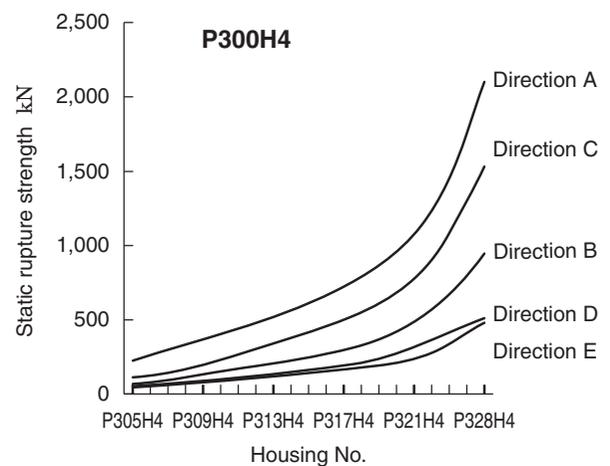

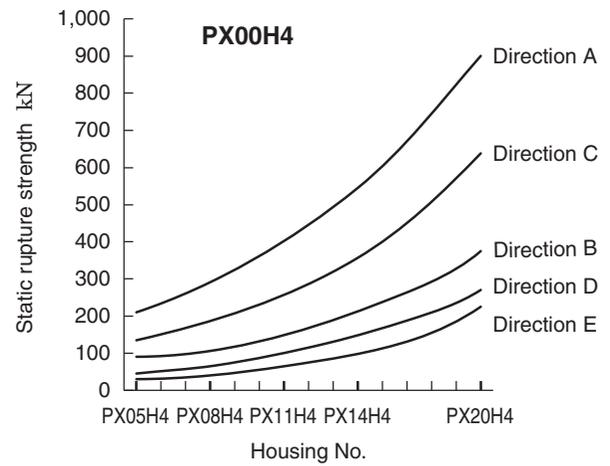

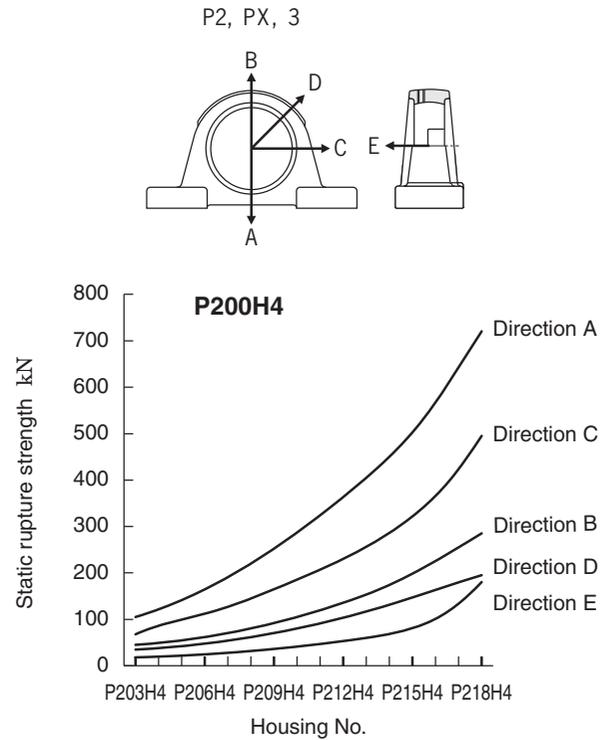

Fig. 8.6 Static rupture strength of oval flange type housings (FL)

**Fig. 8.7 Static rupture strength of take-up type housings (T)**

**Fig. 8.8 Static rupture strength of ductile cast iron pillow type housings (PH4)**

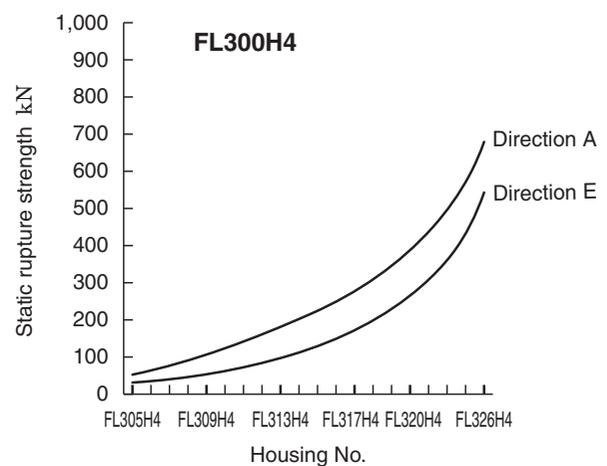

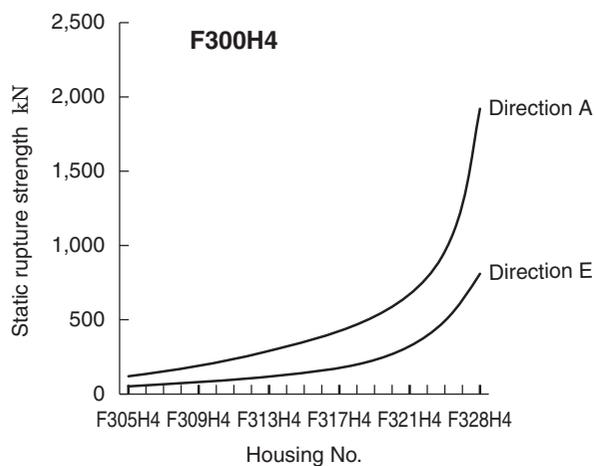

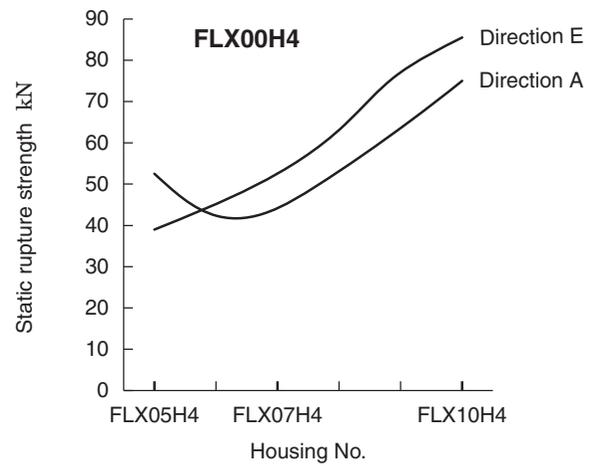

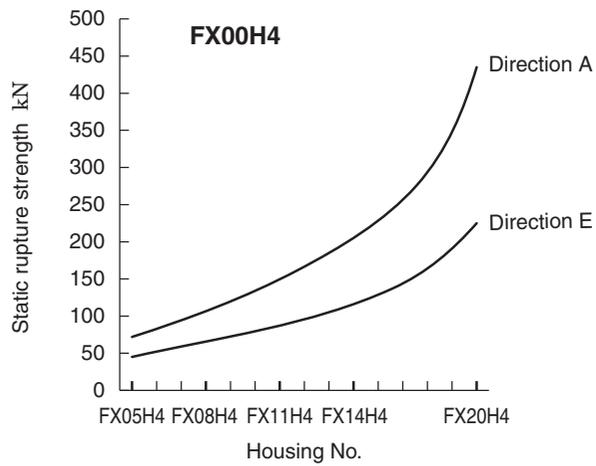

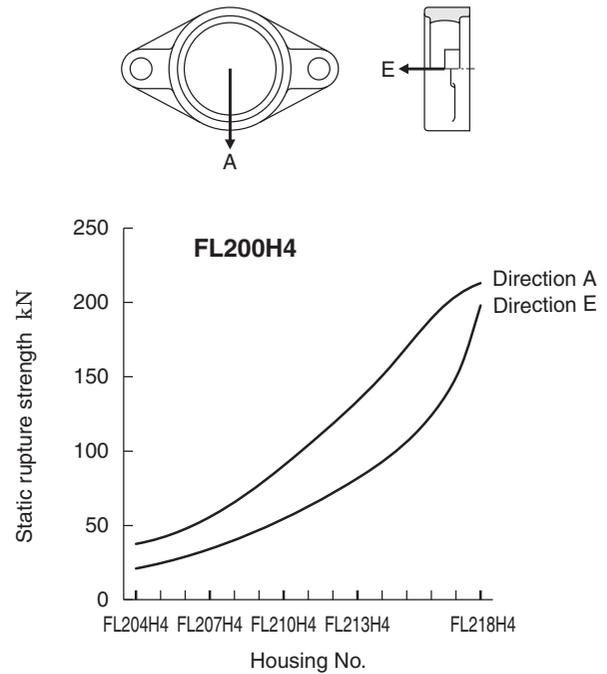

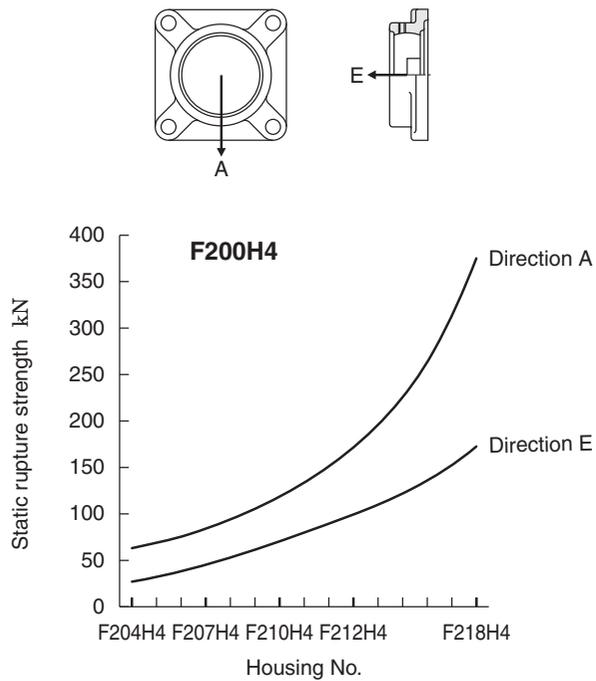

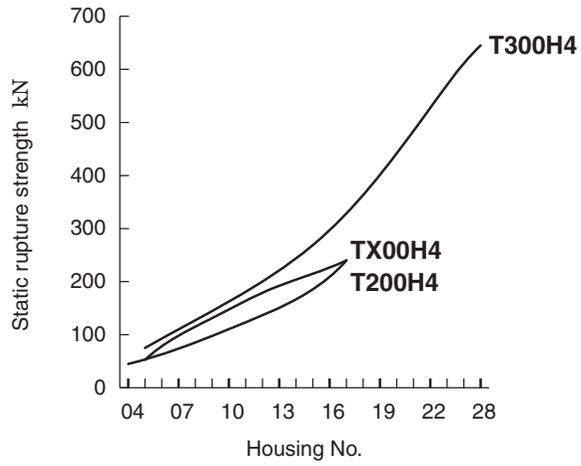

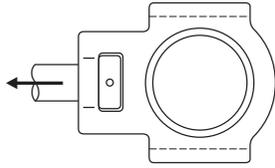

Fig. 8.9 Static rupture strength of ductile cast iron square flange type housings (FH4)

Fig. 8.10 Static rupture strength of ductile cast iron oval flange type housings (FLH4)

**Fig. 8.11** Static rupture strength of ductile cast iron take-up type housings (TH4)

### 8.3 Strength of Stamped Steel Housings

The precisely formed stamped steel housing is very rigid, but it is not as strong as cast iron or cast steel housings. Therefore, it will not support loads to the maximum rating of the bearing itself and must be down-rated per **Table 8.3**.

**Table 8.3 Allowable load of steel plate housings (recommended)**

Load direction	Allowable load of stamped steel housings
Radial	Approx. 1/6 of basic dynamic radial load rating of bearing ( $C_r$ )
Axial	Approx. 1/18 of basic dynamic radial load rating of bearing ( $C_r$ )

### 8.4 Strength of Stainless Steel Housings

FYH supplies stainless steel housings (SP-H1, SPA-H1, SF-H1, SFL-H1, ST-H1, SP, SFL).

**Table 8.4** shows the safety factors for stainless steel products. As for the basic values of the static rupture strength of SP-H1, SPA-H1, SF-H1, SFL-H1, ST-H1, SFC-H1 type housings, apply P200 of **Fig. 8.1**, PA200 of **Fig. 8.3**, F200 of **Fig. 8.5**, FL200 of **Fig. 8.6** and T200 of **Fig. 8.7**. As for the basic values of the static rupture strength of SFC-H1 housings, apply F200 of **Fig. 8.5**. For the basic values of the static rupture strength of the SP and SFL type housings, see P000~P006 of **Fig. 8.12** and FL000~FL006 of **Fig. 8.13** and multiply them by 1.5 respectively.

**Table 8.4 Safety factor of stainless steel products**

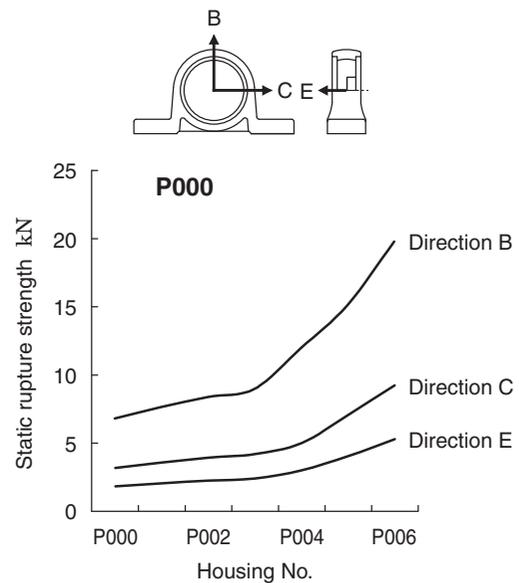

Property of load	Safety factor of stainless steel products
Static load	3
With vibration	5
With impact	10

### 8.5 Strength of Die-cast Housings

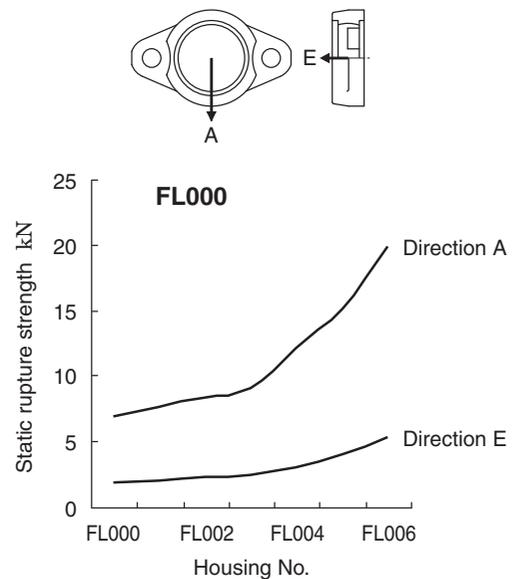

The clean series housing is made of die-cast zinc alloy, but the zinc alloy material is not as strong as cast iron or cast steel. **Table 8.5** shows safety factors for die-cast zinc alloy, and **Fig. 8.12** and **8.13** show the basic values of the static rupture strength of the die-cast zinc alloy housing.

**Table 8.5 Safety factor of zinc alloy die-cast products**

Property of load	Safety factor of die-cast products
Static load	8
With vibration	15
With impact	20

**Fig. 8.12 Static rupture strength of clean housings (P)**

**Fig. 8.13 Static rupture strength of clean housings (FL)**

### 8.6 Static Rupture Strength of Plastic Housings

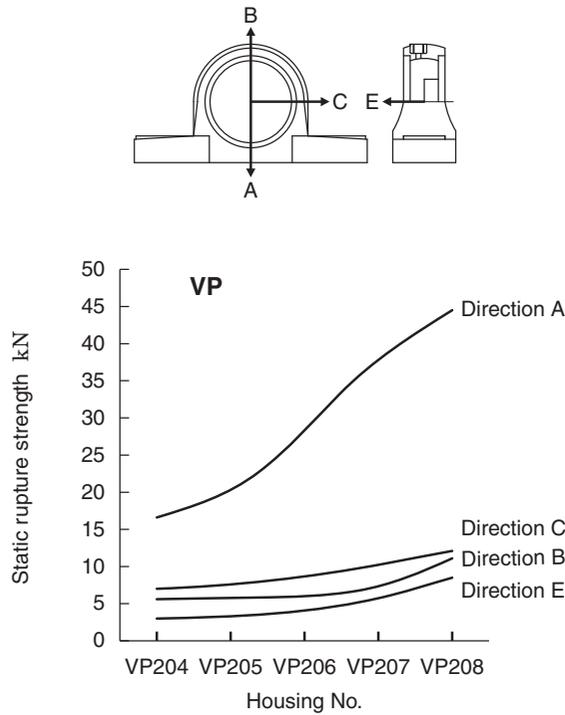

Fig. 8.14 Static rupture strength of plastic housings (VP)

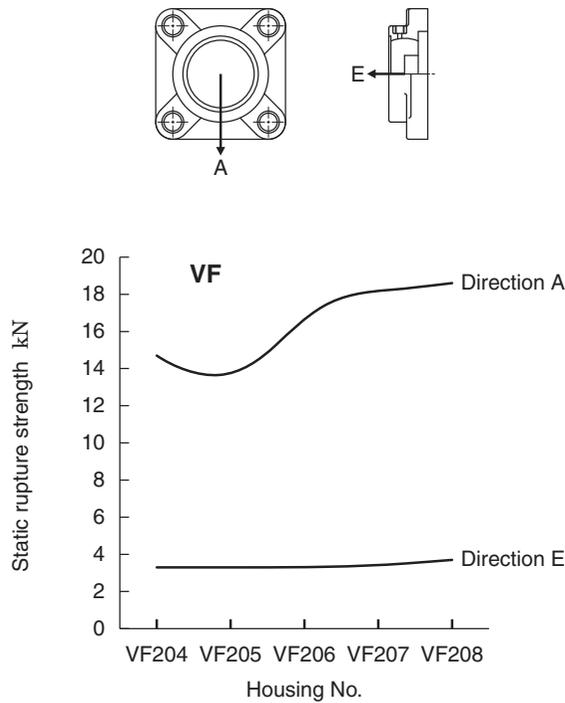

Fig. 8.15 Static rupture strength of plastic housings (VF)

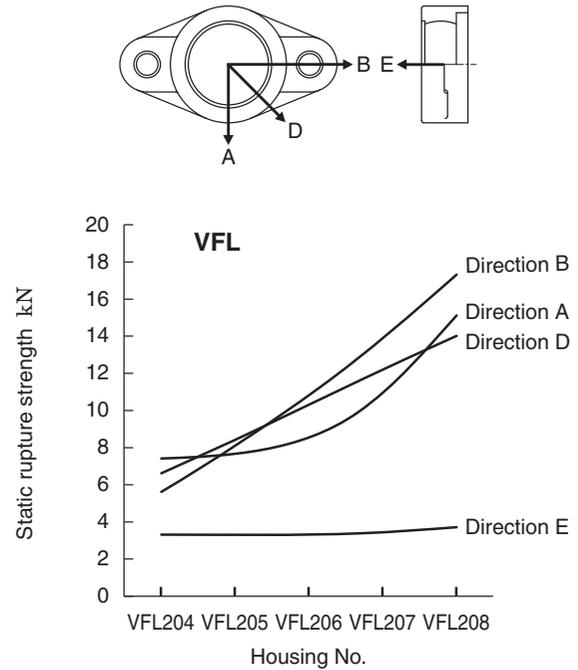

Fig 8.16 Static rupture strength of plastic housings (VFL)

Note:

The figure shows the average static rupture strength of housings.

The correct safety factor should be considered to properly account for combined load in various directions at room temperature (23 °C ±5 °C).

## 9 Design of Shaft and Base

### 9.1 Design of Shaft

For optimal performance of a ball bearing unit, and for maintenance-free operation for an extended period of time, proper shaft selection is very important. The shaft should be straight, of sufficient tensile strength, and free of burrs and scratches.

#### 9.1.1 Dimensional accuracy of shaft

##### (1) Dimensional tolerance of shaft used for set screw bearings

For bearings with set screws, a relatively looser class of fit makes assembly easier and is perfectly acceptable

at low operating speeds. The clearance between the bore of the bearing and the shaft must be decreased as the rotational speed is increased.

**Table 9.1** shows the guidelines for the tolerance class for the rotational speed of bearings with set screws.

If the bearing with set screws is exposed to a heavy load ( $P_r/C_r > 0.12$ ), vibration, or heavy impact, use a tighter shaft tolerance than normal.

**Table 9.2** shows the tolerances for tight fits.

**Table 9.3** shows the recommended roundness and cylindricity for shafting.

**Table 9.1 Dimensional tolerance of shaft used for cylindrical bore bearing with set screws (recommended) (clearance fit or intermediate fit)**

Unit:  $\mu\text{m}$

Shaft dia. (mm)		Dimensional tolerance of shaft							
		j6		h6		h7		h8	
Over	Incl.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.
6	10	+ 7	- 2	0	- 9	0	-15	0	-22
10	18	+ 8	- 3	0	-11	0	-18	0	-27
18	30	+ 9	- 4	0	-13	0	-21	0	-33

50	80	+12	- 7	0	-19	0	-30	0	-46
80	120	+13	- 9	0	-22	0	-35	0	-54
120	180	+14	-11	0	-25	0	-40	0	-63
Applicable rotating speed $dn^1$		Over 120,000		Over 100,000, incl. 120,000		Over 60,000, incl. 100,000		Incl. 60,000	

Note <sup>1</sup>  $dn = d$  (bearing bore dia., mm)  $\times n$  (rotating speed,  $\text{min}^{-1}$ )

**Table 9.2 Dimensional tolerance of shaft used for cylindrical bore bearing with set screws (recommended) (intermediate fitting or tight fitting)**

Unit:  $\mu\text{m}$

Shaft dia. (mm)		Dimensional tolerance of shaft					
		k6		k7		m6	
Over	Incl.	Max.	Min.	Max.	Min.	Max.	Min.
6	10	+10	+1	+16	+1	+15	+ 6
10	18	+12	+1	+19	+1	+18	+ 7
18	30	+15	+2	+23	+2	+21	+ 8
30	50	+18	+2	+27	+2	+25	+ 9
50	80	+21	+2	+32	+2	+30	+11
80	120	+25	+3	+38	+3	+35	+13
120	180	+28	+3	+43	+3	+40	+15

**Table 9.3 Recommended accuracy of shaft used for ball bearing units**

Unit:  $\mu\text{m}$

Shaft dia. (mm)		Tolerance of shaft roundness and cylindricity (max.)
Over	Incl.	
6	10	6
10	18	8
18	30	9
30	50	11
50	80	13
80	120	15
120	180	18

**(2) Dimensional tolerance of shaft used with tapered bore bearings**

Since tapered bore bearings are fixed to the shaft with an adapter, a looser fit is allowable since the adapter sleeve provides excellent concentricity. This makes mounting of the bearing to the shaft much easier.

Table 9.4 shows the dimensional tolerance of the shaft used with tapered bore bearings (with adapters).

**Table 9.4 Dimensional tolerance of shaft used for tapered bore bearings (with adapters) (recommended)**

Unit:  $\mu\text{m}$

Shaft dia. (mm)		Dimensional tolerance of shaft			
		h8		h9	
Over	Incl.	Max.	Min.	Max.	Min.
18	30	0	-33	0	- 52
30	50	0	-39	0	- 62
50	80	0	-46	0	- 74
80	120	0	-54	0	- 87
120	180	0	-63	0	-100

**(3) Dimensional tolerance of shaft with eccentric locking collar**

Eccentric locking collar bearings have greater clearance (more eccentricity) between the shaft and the bore of the bearing when installed. Therefore, the shaft tolerances must be tighter (h5 or j5) to reduce the clearance (eccentricity). The same clearance fits are recommended as with blower bearings as shown in Table 2.6.

**(4) Dimensional tolerance of shaft used for concentric locking collar**

Regarding the shaft used for concentric locking collar bearings, the same clearance (h5 or j5) fits are recommended as with air handling bearings as shown in Table 2.6.

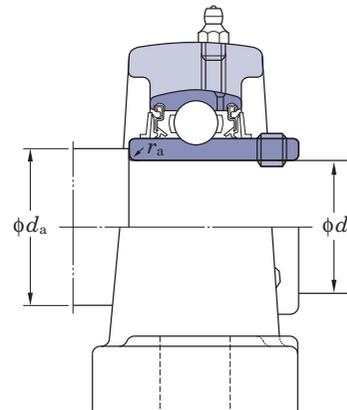

**9.1.2 Dimensions of shouldered shafts**

When using a set screw or eccentric locking collar bearing that is exposed to a high axial load, excessive vibration, or impact, a shouldered shaft may be used. The inner ring of the bearing is then tightened in place with a locknut, if the shaft is threaded, or with a locking ring otherwise.

However, if after mounted units used a shouldered shafts, between the inner ring end face and shouldered shafts, on clearances of 2 mm or more is recommended.

Table 9.5 shows the shoulder diameter and the fillet radius of the shouldered shaft.

**Table 9.5 Recommended shoulder diameter and fillet radius of a shouldered shaft**

Unit: mm

Bore dia. code	Nominal bearing bore dia. $d$	Diameter Series <sup>1)</sup>		Diameter Series <sup>1)</sup>

24	120			135	2.5
26	130			150	3
28	140			160	3

The basic bearing size number consists of the duty code (2, X, or 3) followed by the inner ring size code (07, 10, 24, etc.)

9.1.3 High temperature applications

In general, two bearing units are used per shaft. If the distance between the bearings is small, or if the temperature change of the shaft is small, both bearings may be fixed in position.

However, if the distance between the bearings is large and the shaft is exposed to heat, then only one bearing should be fixed and the opposing bearing must be free to float in the axial direction.

This is because shaft expansion due to temperature change of the shaft causes a high axial load and can cause failure of fixed bearings. The amount of shaft expansion due to temperature change may be calculated by using **Formula (9.1)**.

$$\Delta l = \alpha \cdot \Delta t \cdot l \quad (9.1)$$

Whereas,

- $\Delta l$ : Expansion of shaft, mm
- $\alpha$ : Linear expansion coefficient of shaft  
in the case of ordinary steel,  $11\sim 12 \times 10^{-6}$
- $\Delta t$ : Temperature increase, °C
- $l$ : Installation distance of unit, mm

Proper installation procedures for a shaft exposed to temperature changes are shown below.

(1) Installation with a dog point set screw on the free side

To accommodate shaft expansion in the axial direction, the bearing must be installed so that the shaft can move freely through the bore in either axial direction.

To accomplish this, the shaft must be grooved for a full dog point set screw (suffix code: G6). This should be done on the free side only. The dog point screw allows free movement in the axial direction and provides force to rotate the bearing in the radial direction.

**Fig. 9.1** shows an example of the structure of a bearing with a key groove on the shaft and a full dog point set screw. **Table 9.6** shows the dimensions of the key groove for the full dog point set screw. Note that the full dog point set screw in the image is also capped so that it may be tightened against the bearing, not the shaft. A full dog point set screw with a jam nut will also work to achieve this function.

The tolerance class of the shaft to be used is h7.

If the temperature of the shaft is higher than that of the bearing, then a looser fit tolerance class is specified.

When using this method to allow for free expansion, there is the possibility of fretting between the shaft and the inner race. In order to prevent fretting, a high temperature grease must be applied to the inner ring of the bearing and the shaft prior to installation.

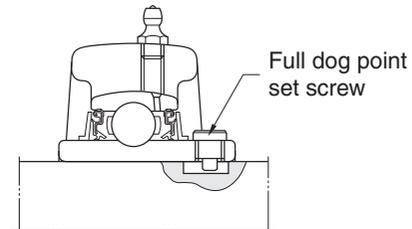

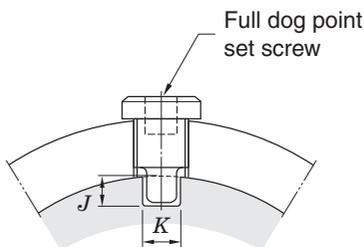

Fig. 9.1 Use on free side with full dog point set screw

Table 9.6 Dimensions of key groove for full dog point set screw (use on free side)

Nominal size of set screw	Dimensions of key groove (mm)		Applicable nominal bearing code		
	J	K	UC200	UCX00	UC300
M6 × 0.75	5	4	201–206	X05	305, 306
M8 × 1	6	6	207–209	X06–X08	307
M10 × 1.25	6.5	7	210–212	X09–X11	308, 309
M12 × 1.5	7	9	213–218	X12–X17	310–314
M14 × 1.5	7	10		X18	315, 316
M16 × 1.5	8	12		X20	317–319
M18 × 1.5	8	13			320–324
M20 × 1.5	8	15			326, 328

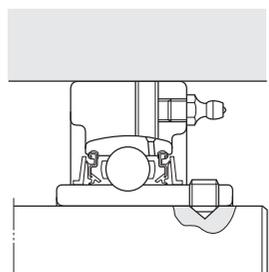

Allowable tolerance of key groove dimension “K” (Recommended value: 0~+0.2mm)

**(2) Installation of cartridge type units on the free side**

If the rotational speed is high or if the bearing is exposed to high vibration, the cartridge type unit is recommended on the free side. In this case, the housing of the cartridge unit is free to move axially within the mounting bore and the bearing insert is rigidly attached to the shaft.

Fig. 9.2 shows the required structure for the cartridge type unit on the free side.

**Fig. 9.2 Use of cartridge type units on free side**

If, in addition to the expansion of the shaft, the ball bearing itself is exposed to heat, then a calculation of the decrease in internal clearances of the bearing must be made. The appropriate bearing internal clearance must be specified. (see “7 Operating temperature and bearing specifications”).

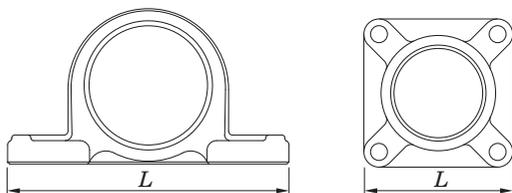

**9.2 Mounting Base Design**

**9.2.1 Rigidity of base and flatness of mounting Surface**

If rigidity of the base on which a ball bearing unit is to be mounted is not sufficient, or if the flatness of the mounting surface is poor, then vibration or abnormal noise may occur during operation. This may lead to premature bearing failure since the strength of the housing is diminished from improper support.

The mounting surface must be accurately machined to eliminate deformation of the housing.

Fig. 9.3 shows the recommended values for flatness of the mounting surface on which the ball bearing unit is to be installed.

Max.:  $L / 1,000$  mm

**Fig. 9.3 Flatness of mounting surface of base (recommended value)**

**9.2.2 Mounting cartridge type units in high temperature applications**

Cartridge units are designed to fit into an accurately bored cylindrical opening in the mounting base. Under ordinary operating conditions, H7 is an adequate choice for the tolerance class of the cylindrically bored hole.

In instances where both the bearing and the shaft are heated during operation, select G7 as the tolerance class of the cylindrical bore.

If the bearing is exposed to excessive vibration or impact, then an even tighter tolerance class must be specified.

Table 9.7 shows the dimensional requirements for the cylindrical bore.

**Table 9.7 Dimensional tolerance of cylindrical bore for mounting cartridge type units (recommended values)**

Unit:  $\mu\text{m}$

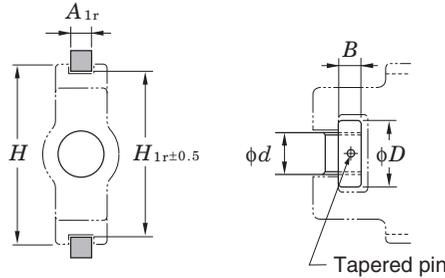

Nominal bore dia. of cylindrical bore (mm)		Dimensional tolerance of cylindrical bore			
		H7		G7	
Over	Incl.	Max.	Min.	Max.	Min.
50	80	+30	0	+40	+10
80	120	+35	0	+47	+12
120	180	+40	0	+54	+14
180	250	+46	0	+61	+15
250	315	+52	0	+69	+17
315	400	+57	0	+75	+18

**9.2.3 Installation of take-up units**

A take-up unit is positioned between two guide rails and enables linear adjustment by means of the threaded rod and bolt.

Table 9.8 shows the dimensions of the guide rail, adjuster bolt, and fixed nut.

Table 9.8 Dimensions relative to installation of take-up type units (recommended values)

Unit: mm

### 9.3 Dowel Pins for Accurate Unit Mounting

The pillow type, square flange type, and oval flange type housings all have a dowel pin seat on the mounting base. If accurate positioning of the housing is required, then the bottom of the housing may be drilled for dowel pins which fit into corresponding holes in the mounting surface. The dimensions for the hole and pin sizes can be found in **Appendix table 5** in the back of the catalog.

## 10 Nomenclature

Nomenclature of FYH Ball Bearing Units conform to JIS B 1557, and comprise the bearing unit model code (comprising bearing model code and housing model code),

diameter series code, bore diameter. code, accessory code, and special code.

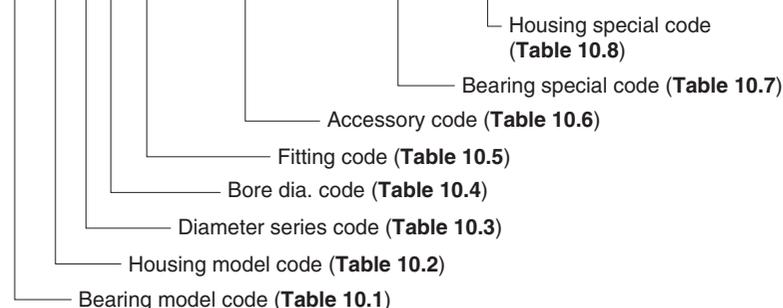

**UC P 207 J L3**

Bearing No.:	UC207L3
Housing No.:	P207J

**UK P 209 J CD + H2309X**

Bearing No.:	UK209+H2309X
Housing No.:	P209JE1
Steel plate cover No.:	(Open type) C-9x40 (Closed type) D-9

**UC F 209 J L3 FD D1K2 G6 A1**

Bearing No.:	UC209L3D1K2G6
Housing No.:	F209JA1E3
Cast iron cover No.:	(Closed type) 209FD

Remark The above code shows an example of nomenclature structure. It may depend on the bearing unit model.

## 11 Accuracy and Internal Clearance

Accuracy of a ball bearing unit is specified in JIS B 1558 (ball bearings for ball bearing units) and JIS B 1559 (housings for ball bearing units). FYH produces products conforming to these standards.

### 11.1 Accuracy of Bearings

Table 11.1 to Table 11.4 shows the accuracy of a ball bearings for ball bearing units.

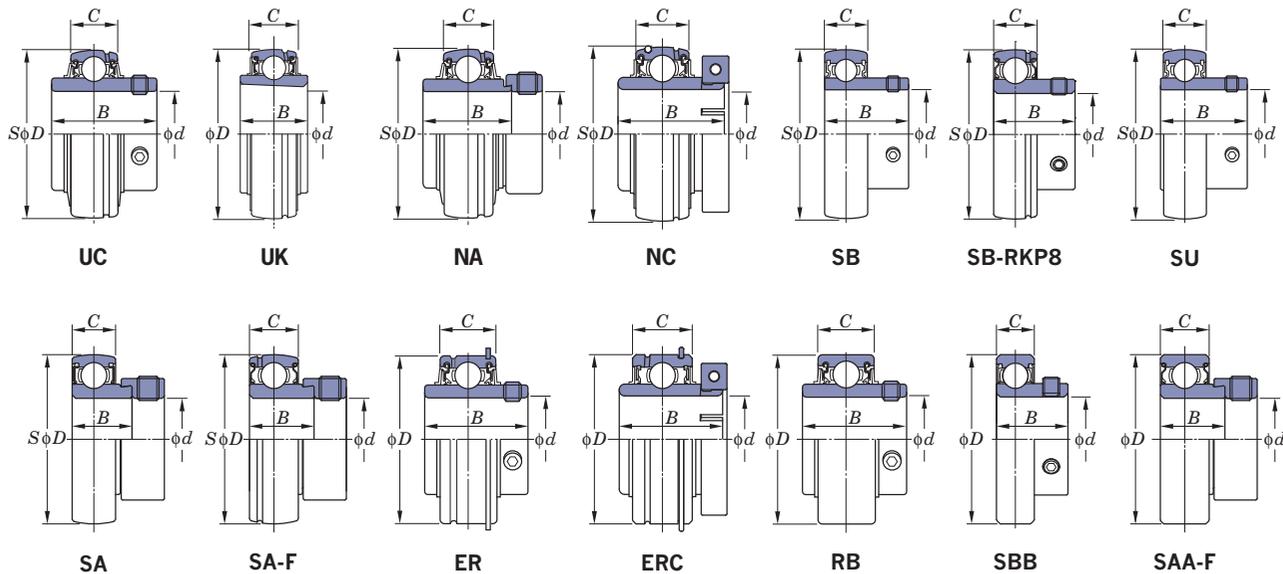

Ball bearings for blowers (special code: S3, S5) are produced with greater accuracy than standard models (see Table 11.3).

Table 11.5 shows the tolerance limitations of inner rings for cylindrical bore bearings.

**Table 11.2 Tolerances and tolerance values of outer rings of ball bearings inserts**

Unit:  $\mu\text{m}$

Nominal bearing outer dia. $D$ (mm)		Variation of tolerance of average outer dia. $\Delta D_m$		Radial runout of outer ring $K_{ea}$
Over	Incl.	Max.	Min.	Max.
18	30	0	-9	15
30	50	0	-11	20
50	80	0	-13	25
80	120	0	-15	35
120	150	0	-18	40

120	180	+33	0	22	+100	-100	0	-250	35

**Table 11.3** Variation of tolerances and tolerance values of tapered bore on bearing with tapered bore

Theoretical tapered bore

Tapered bore with variation of tolerance of average bore dia. in plane

Unit: μm

Nominal bearing bore dia. $d$ , mm		$\Delta d_{mp}$		$\Delta d_{1mp} - \Delta d_{mp}$		$V_{dsp}^{1)}$
Over	Incl.	Max.	Min.	Max.	Min.	Max.
18	30	+33	0	+21	0	13
30	50	+39	0	+25	0	16
50	80	+46	0	+30	0	19
80	120	+54	0	+35	0	22
120	180	+63	0	+40	0	40

Note <sup>1)</sup> To be applied to all the radial planes of tapered bore

Remarks 1. Applicable range

Applicable to tapered bore of inner ring of tapered bore radial bearing that standard value of taper ratio is 1/12.

2. Amount code

$d_1$ : Standard diameter at theoretical large end of tapered bore

$$\text{Standard diameter } d_1 = d + \frac{1}{12} B$$

$\Delta d_{mp}$ : Variation of tolerance of average bore diameter in plane at theoretical small end of tapered bore

$\Delta d_{1mp}$ : Variation of tolerance of average bore diameter in plane at theoretical large end of tapered bore

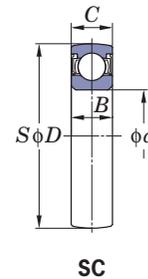

$V_{dsp}$ : Unequal bore diameter in plane

$B$ : Nominal inner ring width

$\alpha$ : 1/2 of nominal taper angle of tapered bore

$$\begin{aligned} \alpha &= 2^\circ 23' 9.4'' \\ &= 2.38594^\circ \\ &= 0.041643 \text{ rad} \end{aligned}$$

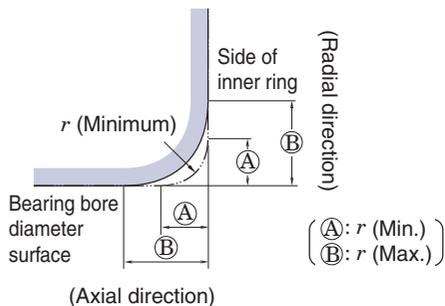

**Table 11.4** Tolerances and tolerance values of inner rings of SC ball bearings

Unit: μm

Nominal bearing bore dia. $d$ (mm)		Variation of tolerance of average bore dia. in plane $\Delta d_{mp}$		Unequal average bore dia. in plane $V_{dsp}$	Radial runout of inner ring $K_{ia}$
Over	Incl.	Max.	Min.	Max.	Max.
10	18	0	-8	6	7
18	31.75	0	-10	6	8
31.75	50.8	0	-12	10	10

**Table 11.5 Tolerance limitations for radius dimensions for the inner ring of cylindrical bore bearings**

Unit: mm

$r$ (Min.)	$r$ (Max.)	
	Radial direction	Axial direction
0.6	1	2
1	1.5	3
1.1	2	3.5
1.5	2.3	4
2	3	4.5
2.1	4	6.5
2.5	3.8	6
3	5	8
4	6.5	9

**Remark** Though accurate profile of chamfered surface is not specified, the profile on the axial plane should not exceed the virtual arc of radius  $r$  (minimum) that contacts with the side of inner ring and the bearing bore diameter surface.

## 11.2 Accuracy of Housings

This section details the tolerance specifications of the inner diameter of the spherical bore of FYH housings. These values determine how tight or how loose the bearing fits inside the housing.

**Table 11.6** shows the tolerance of the diameter of the spherical bore of housings.

Standard tolerance for mounted units, between the outer diameter of the bearing and the inner diameter of the housing, is a class J7 intermediate fit.

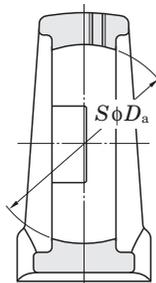

A class H7 tolerance allows greater clearance for applications where minor shaft alignment constantly occurs or in environments where higher temperatures can cause thermal expansion. An anti-rotation pin on the outer ring of the bearing is supplied with these units to prevent the outer ring of the bearing from spinning inside the housing.

A class K7 tolerance allows less clearance and is recommended to prevent the outer ring of the bearing from rotating inside the housing.

**Fig. 11.1** shows examples of housing dimensions relative to installation position with tolerance values.

**Table 11.6 Allowance of spherical bore diameter of housings**

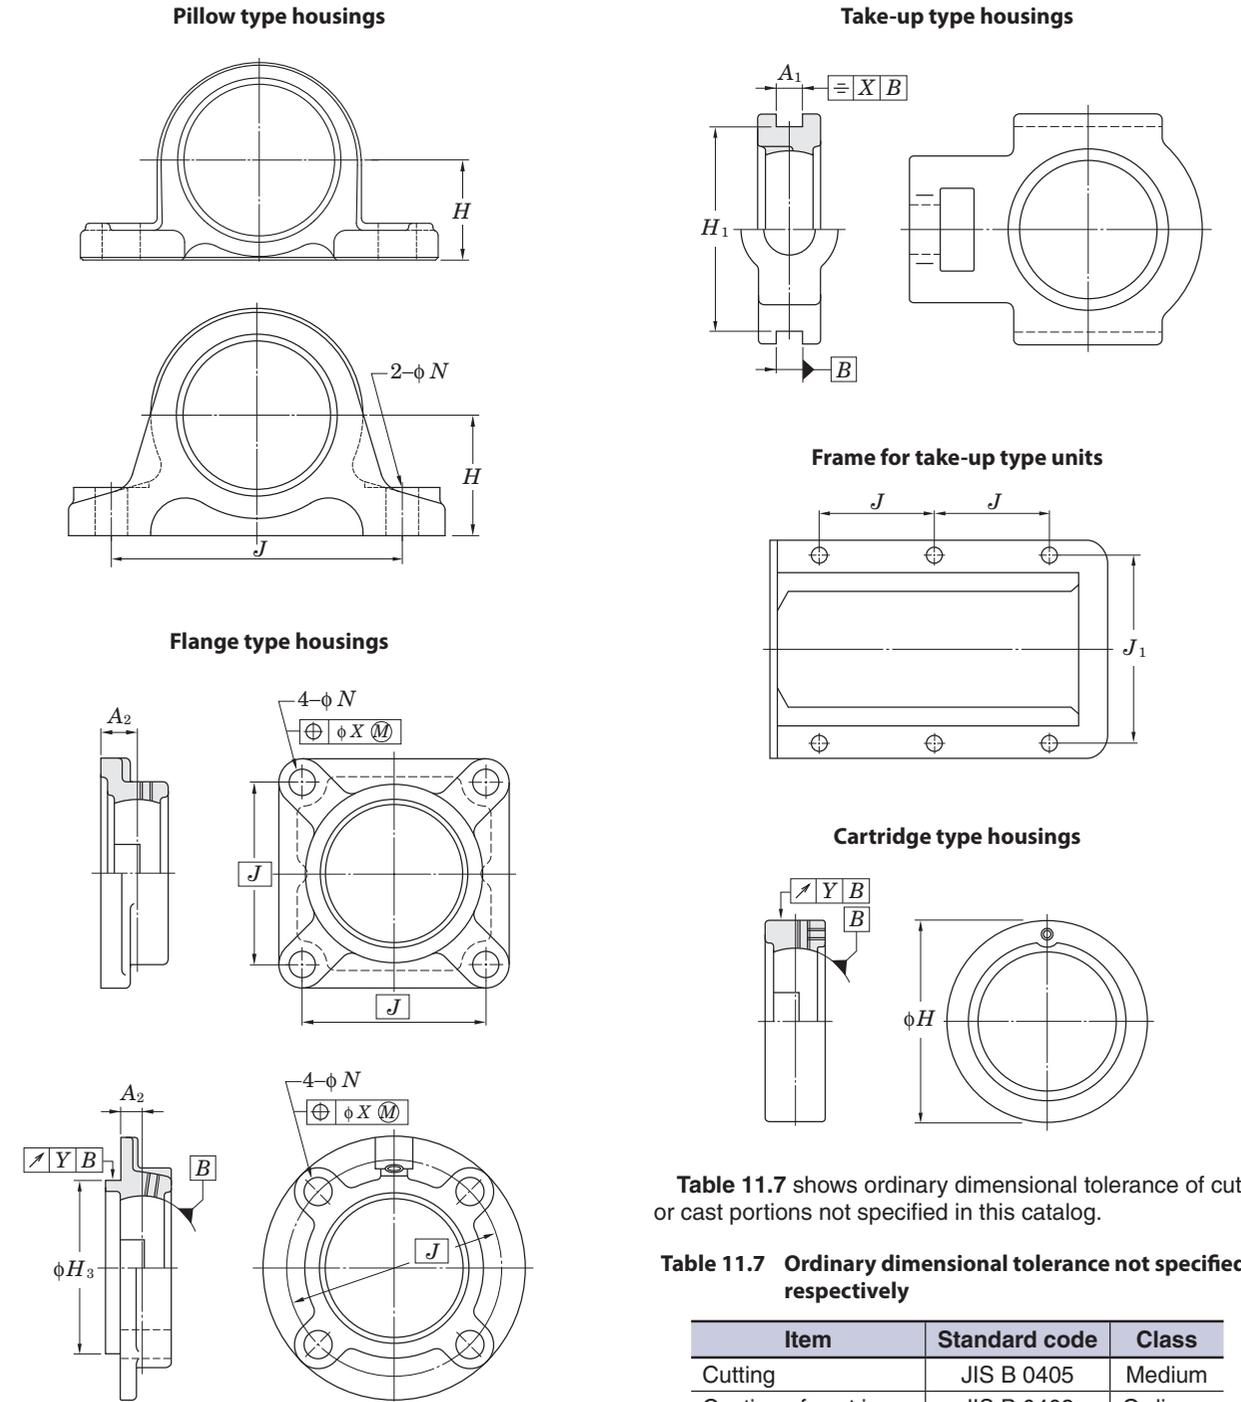

Unit:  $\mu\text{m}$

Nominal dia. of spherical bore $D_a$ (mm)		Tolerance class H7		Tolerance class J7		Tolerance class K7	
		Variation of tolerance of spherical bore dia. $\Delta D_{\text{dam}}$		Variation of tolerance of spherical bore dia. $\Delta D_{\text{dam}}$		Variation of tolerance of spherical bore dia. $\Delta D_{\text{dam}}$	
Over	Incl.	Max.	Min.	Max.	Min.	Max.	Min.
18	30	+21	0	+12	-9	+6	-15
30	50	+25	0	+14	-11	+7	-18
50	80	+30	0	+18	-12	+9	-21
80	120	+35	0	+22	-13	+10	-25
120	180	+40	0	+26	-14	+12	-28
180	250	+46	0	+30	-16	+13	-33
250	315	+52	0	+36	-16	+16	-36

**Remark** FYH selects J, H, or K depending on the applications.

Fig. 11.1 Dimensions relative to installation of housings with tolerances and tolerance values (representative example)

Remark Respective tolerances and tolerance values for housings are shown in dimensional tables.

Table 11.7 shows ordinary dimensional tolerance of cut or cast portions not specified in this catalog.

Table 11.7 Ordinary dimensional tolerance not specified respectively

Item	Standard code	Class
Cutting	JIS B 0405	Medium
Casting of cast iron	JIS B 0403	Ordinary
Casting of cast steel	JIS B 0403	Ordinary

### 11.3 Internal Bearing Clearance

Internal bearing clearance is defined as the allowable space between the bearing balls and the raceways. The degree of internal clearance, referred to as “operation clearance”, greatly influences operational life of the bearing as well as characteristics of heat, noise, and vibration.

If the clearance is exceptionally tight between the shaft and the inner ring of the bearing then expansion of the inner ring must be taken into consideration and the correct ball clearance should be selected. Transmission heat from the shaft is also a factor to consider when determining the correct amount of ball clearance (see “7 Operating temperature and bearing specifications”).

Table 11.8 shows the internal clearance applicable to specific operating conditions and Table 11.9 shows the available options for internal clearance.

**Table 11.8 Internal clearance applicable to specific operating conditions**

Type	Applicable internal clearance	
	Bearing with cylindrical bore	Bearing with tapered bore
Standard type	CN	C3
NC	CN	–
Stainless steel type	C3	–
Heat resistant type (suffix code: D1K2)	C4	C5
Heat resistant type (suffix code: D9K2)	C4	C5
Cold resistant type (suffix code: D2K2)	CN	C3
High speed type (suffix code: K3)	CN	C3
For blower (suffix code: S3)	CN	C3
For high speed blower (suffix code: S5)	C2	C3

Remark For bearings with suffix codes, as those indicated above, the clearance is implied and not indicated in the part number.

**Table 11.9 Available options for internal clearance**

Unit:  $\mu\text{m}$

Nominal bearing bore dia. $d$ (mm)		Internal clearance											
		C2		CN		GN		C3		C4		C5	
Over	Incl.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.

18	50	49	4 – 5	5		6	
50	280	147	6 – 8	8		9	

## 12 Materials

### 12.1 Bearing Material

Ball bearing inserts are comprised of inner and outer rings, balls, and steel ball cages all of which are made from the highest quality of bearing steel.

These bearings possess the following features.

- (1) High elastic limit to resist strong opposing force
- (2) High rolling fatigue strength to allow for heavy loads
- (3) Superior hardness
- (4) Superior wear resistance
- (5) Superior toughness against impact and shock loads
- (6) Superior precision of dimensional tolerances

High carbon chrome bearing steel is utilized for the bearing components as specified in JIS (Japanese Industrial Standards).

To increase reliability and reduce contamination within the material, a vacuum degassing process is executed to reduce non-metallic elements and any oxygen in the steel.

After the bearing is assembled it is heat tempered and quenched until the hardness reaches 60HRC.

**Table 12.1** shows the chemical components of high carbon chrome bearing steel. Stainless steel bearing inserts (suffix: S6) utilize superior corrosion resistant JIS certified stainless steel.

Riveted steel ball cages are made of JIS certified cold rolled steel which is shown in **Table 12.2**.

### 12.2 Housing Material

FYH housings are made primarily of gray cast iron, and stamped steel. Gray cast iron is the most popular choice for mounted units because of its optimal characteristics of vibration absorption, high strength, and excellent heat dissipation.

**Table 12.3** shows the mechanical properties of gray cast iron (FC200).

Nodular graphite cast iron, or ductile iron, (FCD450-10 of JIS G 5502) provides a good combination of rigidity and fracture resistance, and it is suitable where heavy vibration or impact forces are present.

Housings for units within the Clean Series are available in die-cast zinc alloy as well as stainless steel. Housing material for stamped steel units consists of thick gauge cold rolled sheet steel and steel strip.

**Table 12.4** to **12.8** show the mechanical properties of these housing materials.

**Table 12.1 Chemical components of high carbon chrome bearing steel (JIS G 4805)**

Code	Chemical components (%)						
	C	Si	Mn	P	S	Cr	Mo
SUJ 2	0.95– 1.10	0.15– 0.35	0.50 or less	0.025 or less	0.025 or less	1.30– 1.60	–

Grease fitting	Copper and copper alloy rod	SUM24L	JIS G 4804

## 13 Performance

### 13.1 Bearing Friction Torque

Bearing friction torque is the conglomeration of the rolling friction between the balls with the inner and outer rings, the sliding friction between the balls and the cage, the agitating resistance of lubricants, and the friction resistance of the seals.

The specific amount of friction torque is influenced by the particular bearing model, dimensions, bearing load, rotating speed, and lubricating conditions.

Bearings with triple-lip seals and open cover seals will have greater friction torque and overall greater friction resistance.

Friction torque for bearings can be found by the formulas below.

$$M = M_p + M_k \quad (13.1)$$

$$M_p = \mu \cdot P \cdot \frac{d}{2} \quad (13.2)$$

Whereas,

- $M$ : Friction torque of bearing,  $mN \cdot m$
- $M_p$ : Friction torque of sections changed by load,  $mN \cdot m$
- $M_k$ : Friction torque of sections changed by rotating speed,  $mN \cdot m$
- $\mu$ : Friction coefficient (0.0015 to 0.002)
- $P$ : Load applied to bearings,  $N$
- $d$ : Nominal bearing bore dia.,  $mm$

Note that the agitating resistance of lubricants and the friction resistance of the seals are difficult to calculate since the resistance fluctuates with speed.

Fig. 13.1 shows the result of measurement of friction torque of the typical ball bearing unit.

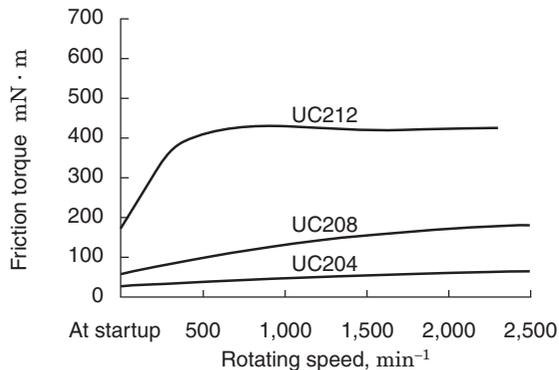

Fig. 13.1 Example of measurement result of ball bearing units

### 13.2 Bearing Temperature Increase

The increase in temperature of the bearing is represented as heat energy created from friction torque in the bearing during operation. The temperature of the bearing during operation increases in proportion to the amount of friction torque, and friction torque increases in proportion to the increase in bearing load.

The increase in temperature of the bearing depends on the heating value generated by friction in the bearing and the amount of heat discharged from the bearing and housing in which it is mounted. Therefore, the temperature level of the bearing is influenced by the environmental conditions of the location in which the bearing unit is installed (quality of heat radiation environment).

The operating temperature of the bearing unit increases gradually after startup of operation and reaches the maximum level after one or two hours if no abnormalities occur. Then it decreases slightly and enters a steady state (see Fig. 13.2).

If the operating conditions are not changed, bearing temperature will remain virtually constant, and measurement of the temperature and assumption of the bearing status are enabled.

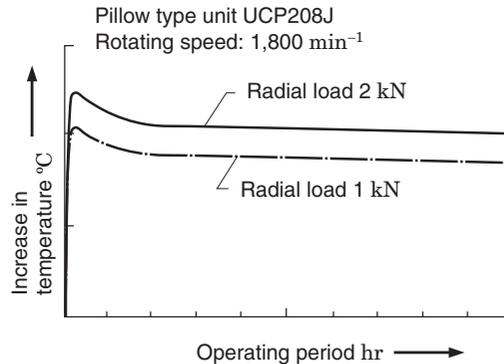

Fig. 13.2 Example of temperature measurement during operation of pillow type units

Increase in temperature during operation of the bearing depends on the type of seal used in the bearing as well as friction torque.

Increase in temperature of triple-lip bearings (suffix code: L3) is greater than that of the standard single lip model, and that of the non-contact seal (suffix code: K3, S5) is lower than the standard single lip model. Bearings for blowers and other high-speed applications are equipped with non-contact seals, with grease or oil, for high-speed operation as well as reduction of heat, vibration, and noise.

## 14 Handling

### 14.1 Installation

#### 14.1.1 Installation of setscrew units

When installing setscrew units, it is important to tighten the setscrews to the shaft with the specified torque.

When the clearance between the inner ring and the shaft is small, then grind the surface of the shaft where the setscrew contacts and make a flat base (Fig. 14.1). It helps you to take the shaft out of the inner ring.

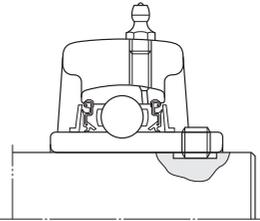

Fig. 14.1 Flat seat provided for shaft

If the unit is exposed to great load or excessive vibration, another option is to use a shouldered shaft and tighten the inner ring of the bearing with a shaft nut. (Fig. 14.2)

For dimensions of the shouldered shaft, see “9 Design of shaft and base”.

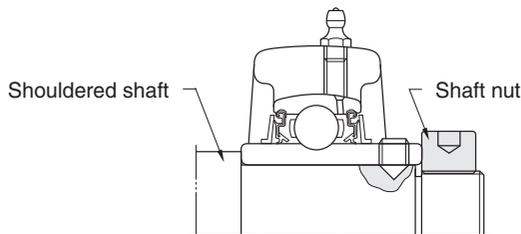

Fig. 14.2 Example of installation with a shouldered shaft and shaft nut

FYH Bearings are available with a variety of set screw options including **Double Point** and **Bullet Point** set screws which provide a secure fit to the shaft. Additional styles of setscrews are also available to meet a range of purposes and operating conditions (see Table 14.1).

Table 14.1 Set screws of ball bearings for units

Designations (code)	Details
Bullet Point  	The tip of the FYH Bullet Point setscrew has a ball shape, and it is designed to firmly grip the shaft by expanding its threads outward against the threads of the inner ring of the bearing as it is tightened. When shock or vibration are problems, the Bullet Point setscrew can remain affixed to the shaft longer than other set screw styles including double point, ball point, or others.
Double Point (G7) 	The cone point at the center of the screw, combined with the round point at the outer edge, provide excellent shaft contact and greatly reduced fitting error. This style is also available with a nylon film fused to the thread surface to prevent the screw from loosening during operation.
Cone Point (G4) 	The cone point setscrew has a 90° angle and fits a drilled cone seat in the shaft. It allows correct positioning on the shaft and prevents shaft movement in an axial direction. (Fig.14.3)
Capped Full Dog Point (G6) 	The capped full dog point setscrew fits into the keyed groove in the shaft and allows for expansion and contraction of the shaft. It tightens to the inner ring of the bearing (not the shaft) to allow the shaft to float within the bore of the bearing.

When correct positioning is required, make a drilled cone base on the shaft, and tighten the shaft, using a cone point set screw (Fig. 14.3).

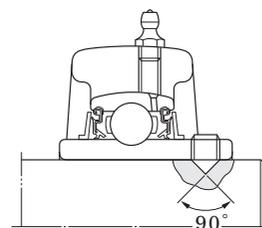

Fig. 14.3 Drilled seat provided for shaft

Contact FYH for additional set screw styles.

Shown below are installation procedures for bearing units with setscrews.

- (1) Inspect the unit to ensure that the rigidity of the base, flatness of the mounting surface, and tolerance of the shaft meet the required standards. Check the shaft for bends, burrs, and other flaws.
- (2) Make sure that the set screws are retracted far enough so that they do not contact the shaft as the bearing is installed.
- (3) Fit the bearing unit onto the shaft and slide it to the specified position. In order to secure a tight fit, press-fit the bearing unit to the shaft with a press, cold-fit by cooling the shaft, or shrink-fit the bearing unit by warming it with an air bath (100 °C or less). Avoid striking the bearing with a hammer to press-fit the bearing to the shaft. If you give a strong impact to the side surface of the inner ring, the both slinger moves, and it may cause a problem.
- (4) Align the bearing unit to the specified position on the base and affix it with washers and bolts. (Fig. 14.4). Use a torque wrench to tighten the bolts to the housing to the specified torque setting. For mounting bolt torque specifications, see **Appendix table 2** in the back of the catalog.

**Fig. 14.4** Installation of setscrew units

- (5) Tighten both of the setscrews on the inner ring to the specified torque setting (Fig. 14.5). For setscrew torque specifications, see **Appendix table 3** in the back of the catalog.

**Fig. 14.5** Tightening of set screws

- (6) Turn the shaft by hand and tighten the setscrews of all other bearings on the same shaft to the specified torque setting.

- (7) Finally, turn the shaft by hand and make sure that it rotates without any problems.

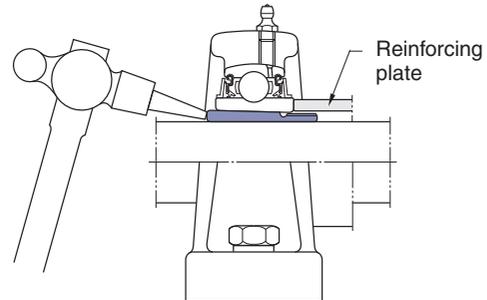

#### 14.1.2 Installation of adapter style units

Adapter units, comprised of an adapter sleeve, locknut, and washer, can be installed into environments where they are exposed to excessive vibration and impact.

It is of great importance that these units are properly mounted. If the locknut is not properly tightened, the sleeve may be loose which could lead to slippage and wear on the shaft or bearing. Conversely, if the locknut is over-tightened, the inner ring of the bearing can expand and reduce internal ball clearance which could cause excessive heat and premature failure.

Installation procedures for adapter style bearings are shown below.

- (1) Inspect the unit to ensure that the rigidity of the base, flatness of the mounting surface, and tolerance of the shaft meet the required standards. Check the shaft for bends, burrs, and other flaws.
- (2) Slide the adapter sleeve onto the shaft where the bearing unit will be installed.  
If the sleeve is too tight, place a screwdriver in the slotted portion of the sleeve and expand the slot to open the sleeve.
- (3) Slide the bearing unit over the shaft and onto the adapter sleeve, then place a cylindrical reinforcing ring against the inner ring of the front side of the bearing. Seat the adapter sleeve by lightly tapping all around the backside of the sleeve (Fig. 14.6).

**Fig. 14.6** Fitting adapter sleeve to bearing with tapered bore

- (4) Attach the lock washer so that the tab fits into the slot in the sleeve, and, making sure the tapered side is facing the bearing, tighten the locknut on the sleeve by hand.
- (5) Align the bearing unit to the specified position on the base and affix it with washers, and bolts. Use a torque wrench to tighten the bolts to the housing to the specified torque setting. For mounting bolt torque specifications, see **Appendix table 2** in the back of the catalog.
- (6) Use a torque wrench to tighten the locknut to the correct specification (Fig. 14.7). For locknut torque specifications, see **Appendix table 4** in the back of the catalog.

**Fig. 14.7 Tightening locknut**

- (7A) For pillow block housings, loosen the mounting bolts and adjust the unit axially while rotating the shaft by hand. Then re-tighten the mounting bolts to the correct specification.
- (7B) For flange block housings, the position of the unit must be in the correct axial position in relation to the shaft, so take extra care to properly align them before completing installation.
- (8) Bend one of the tabs on the washer so that it fits into one of the slots on the locknut (**Fig. 14.8**).

**Fig. 14.8 Bending claw of washer**  
(Locking locknut)

- (9) Finally, turn the shaft by hand and make sure that it rotates without any problems.

**14.1.3 Installation of units with eccentric locking collars**

Eccentric locking collar bearings provide another option for shaft locking. Since the rotating force of the shaft increases the tightening force of the eccentric ring to the shaft, this style of bearing allows a secure grip to the shaft.

Since the rotating force of the shaft increases the tightening force of the eccentric ring to the shaft, the unit with eccentric locking collar allows secure fixing of the bearing (**Fig. 14.9**).

**Fig. 14.9 Ball bearing units with eccentric locking collar**

Installation procedures for eccentric locking collar style bearings are shown below.

- (1) Inspect the unit to ensure that the rigidity of the base, flatness of the mounting surface, and tolerance of the shaft meet the required standards. Check the shaft for bends, burrs, and other flaws.
- (2) Slide the bearing unit onto the shaft, and place it at the specified mounting position.
- (3) Align the bearing unit to the specified position on the base and affix it with washers, and bolts. (**Fig. 14.4**). Use a torque wrench to tighten the bolts to the housing to the specified torque setting. For mounting bolt torque specifications, see **Appendix table 2** in the back of this catalog.
- (4A) Fit the eccentric section of the inner ring of the bearing to the eccentric recessed section of the eccentric locking collar, and rotate the collar in the direction of shaft rotation. Then, tighten the setscrew on the eccentric locking collar to the specified torque setting (**Fig. 14.10**).

**Fig. 14.10 Installing eccentric locking collar**

(4B) The NU-LOC collar is tightened by a hexagon head bolt to a specified torque setting in order to apply the correct amount of force to the inner ring of the bearing. (Fig. 14.11)

Regarding tightening torque for set screws or hexagon head bolts, see **Appendix Table 3** in the back of this catalog.

**Fig 14.11 Installation of NU-LOC units**

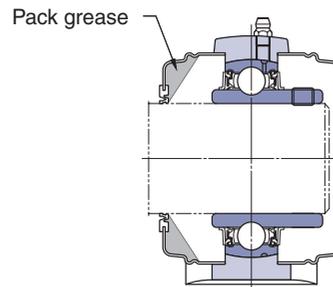

- (5) Rotate the shaft by hand and then install the next eccentric locking collar unit to the shaft.
- (6) Finally, turn the shaft by hand and make sure that it rotates without any problems.

**14.1.4 Installing units with covers**

Covers for ball bearing units are available in two types, steel plate and cast iron. Install both the covers at last after installation of the bearing and housing is complete.

Procedures for installation of the ball bearing units with covers are shown below.

- (1) Apply grease all around the seal lip of the cover, and pack the internal space of the cover with grease (approximately 1/3 to 1/2 of the space capacity) (Fig. 14.12).

**Fig. 14.12 Packing grease in internal space of seal lip of covers**

- (2) Make sure that the bearing unit is securely fixed to the shaft and mounting base.

- (3) Slide the cover over the shaft to the groove in the housing and lightly press it into place.

- (4A) For stamped steel covers, use a plastic mallet to prevent deformation, and evenly tap all around the periphery of the cover to install it to the housing (Fig. 14.13).

To remove the stamped steel cover, put a screwdriver into the groove on the periphery of the cover and slightly pry it.

**Fig. 14.13 Installing steel plate covers**

(4B) When installing a cast iron cover, fit the cover to the cover groove of the housing, and affix it with the supplied bolts.

For the tightening torque of the cast iron cover mounting bolts, see the **Appendix table 2** at the end of this catalog.

- (5) Install another cover to the housing in a similar manner.
- (6) Check for abnormality of the installed cover.
- (7) Finally, turn the shaft by hand, and check for abnormality in the bearing.

### 14.2 Test Run Inspection

After installation of the ball bearing unit is complete, execute the test run inspection to ensure that it was done properly.

The test run inspection should be executed by following the procedures below.

- (1) Turn the shaft by hand and make sure that the bearing rotates smoothly.

If there is any resistance, vibration, excessive rotational torque, or uneven rotation, the bearing is judged to be faulty.

- (2) Execute a powered run with no load and at low speed, and check for abnormal noise and vibration.
- (3) Execute a powered run under normal operating conditions and check for abnormal noise, vibration, and temperature increase.

**Table 14.2** shows the main faults that may occur during the test run inspection of the ball bearing unit and causes.

**Table 14.2 Main causes of bearing failure during test runs and their causes**

Faults	Causes
Excessive torque, uneven rotating torque	<ul style="list-style-type: none"> <li>(1) Faulty installation, causes preload on bearing</li> <li>(2) Inappropriate handling or installation, leading to interference of seal with slinger</li> <li>(3) Excessive tightening of locknut (adapter) causing too small internal clearance of bearing</li> </ul>
Abnormal noise, abnormal vibration	<ul style="list-style-type: none"> <li>(1) Improper tightening of set screws or of mounting bolts</li> <li>(2) Excessively large internal clearance of bearings</li> <li>(3) Bent shaft, or shouldered shaft may be machined eccentrically</li> <li>(4) Shaft tolerance chosen improperly</li> <li>(5) Mounting base not rigid or flat</li> </ul>
Abnormal temperature increase	<ul style="list-style-type: none"> <li>(1) Too small internal clearance of bearing</li> <li>(2) Faulty installation, causes preload on bearing</li> <li>(3) Load too great</li> <li>(4) Allowable rotational speed exceeded</li> <li>(5) Mounting base not rigid or flat</li> <li>(6) Inappropriate handling or installation, leading to interference of seal with slinger</li> </ul>

### 14.3 Periodic Inspection

FYH Ball Bearing Units do not need to be inspected as frequently as lower quality bearings. However, it is good practice to set up an inspection schedule for even these high quality bearings.

Since a ball bearing unit cannot be disassembled for inspection of the internal status of components, the external appearance of the bearing must be inspected to give tell-tale signs of the status and expected life of the bearing. The following characteristics must be checked per the inspection schedule that is established for a particular application.

- (1) Overall appearance
- (2) Loose set screws or mounting bolts
- (3) Noise from vibration
- (4) Temperature of the bearing housing or the inner ring
- (5) Grease supply interval and quantity of grease injected into the bearing (either too much or too little grease can be detrimental to the life of the bearing)

**Table 14.3** shows the main faults that are usually found during periodic inspections and their causes.

If any fault is found in a ball bearing unit during an inspection, then immediate action must be taken to correct the situation and prevent deterioration of the bearing components. If serious damage has already occurred to the bearing unit, then the bearing unit must be replaced immediately to prevent damage to other machine components.

**Table 14.3 Main faults found during periodic inspection and their causes**

Faults	Causes
Excessive torque	<ul style="list-style-type: none"> <li>(1) Degraded grease</li> <li>(2) Interference of seal with slinger due to excessive supply of grease</li> <li>(3) Deformation of slinger causing interference with seal</li> <li>(4) High load due to shaft expansion</li> </ul>
Abnormal noise, abnormal vibration	<ul style="list-style-type: none"> <li>(1) Improper tightening of set screws locknut (adapter) or of mounting bolts</li> <li>(2) Wear on inner ring of bearing or shaft due to creep or fretting</li> <li>(3) Ingress of foreign matter (dirt) into bearing</li> <li>(4) Damage to cage or ball surfaces due to rolling fatigue</li> <li>(5) Indentation on raceway surface or ball surface due to excessive load</li> <li>(6) Warped or bent shaft</li> </ul>
Abnormal temperature increase	<ul style="list-style-type: none"> <li>(1) Degraded grease</li> <li>(2) Interference of seal with slinger due to excessive supply of grease</li> <li>(3) Deformation of slinger causing interference with seal</li> <li>(4) Looseness of setscrew, eccentric locking collar or adapter lock nut for tapered bore bearings</li> <li>(5) Load due to shaft expansion</li> <li>(6) Damage to cage or ball surfaces due to rolling fatigue</li> </ul>

14.4 Supply of Grease

FYH Ball Bearing units are supplied with high quality FYH Lithium Bearing grease and seals. Therefore, under clean operating conditions, light loads, low speeds, and low temperatures the bearing may be used with no further lubrication.

However, under harsher operating conditions and environments, the grease will deteriorate much more rapidly.

This would include environments exposed to dust, moisture, or higher operating temperatures.

In such cases, a re-greasing schedule must be established to prevent premature failure of the bearing. The life of the bearing can be greatly extended by proper attention to the re-greasing schedule and by supplying the proper amount of grease. Please note that too much grease can be detrimental as well as too little grease.

14.4.1 Grease life and supply intervals

The grease life of a bearing unit can be found using **Formula (4.7)** in page 27.

The re-greasing schedule should be set at 1/4 to 1/3 of the grease life found by the calculation shown above; however this may be adjusted for particularly demanding environments or conditions.

In addition, some environments may be unusually dirty or wet, and these conditions may be exacerbated by higher temperatures. Under such harsh conditions, a more frequent re-greasing schedule will extend the life of the bearing.

Under normal operating conditions, adhere to the guidelines outlined in **Table 2.2** in page 10.

14.4.2 Amount of grease

The amount of grease initially supplied in a new FYH Ball Bearing Unit is approximately 30 to 35% of the internal space capacity of the bearing. If the bearing is over greased, the agitation of the grease causes internal friction and heating of the bearing. The first sign of failure will be excessive grease finding its way to the outside of the bearing. DO NOT exceed the initial greasing amount.

**Table 14.4** shows the recommended amount of grease to be used for re-greasing FYH bearings.

In a severely dusty or wet environments, the amount of grease may be as much as doubled if operating speeds are low.

Note:

1. **Table 14.4** applies to UK units as well.
2. For greasing triple-lip (L3) type bearings, use 1 1/2 times the amount of grease recommended in the table.
3. Values shown in the table are applicable to standard grease (density: 0.9 g/ml). If a compatible grease of another specific gravity is used, then the proper conversion must be made to insure that the recommended volume is put into the bearing.

Table 14.4 Amount of recommended grease for ball bearing units

Bore dia. code	Greasing amount, g		
	Diameter Series <sup>1)</sup>		
	UC200	UCX00	UC300
01	0.7		
02	0.7		
03	0.7		
04	0.7

13	6.8	7.7	17
14	7.7	9	21
15	9	11	25
16	11	14	29
17	14	17	34
18	17	21	40
19	–	–	47
20	–	29	61
21	–	–	69
22	–	–	84
24	–	–	98
26	–	–	126
28	–	–	151

The basic bearing size number consists of the duty code (2, X, or 3) followed by the inner ring size code (07, 10, 24, etc.)

### 14.4.3 Types of grease supplied

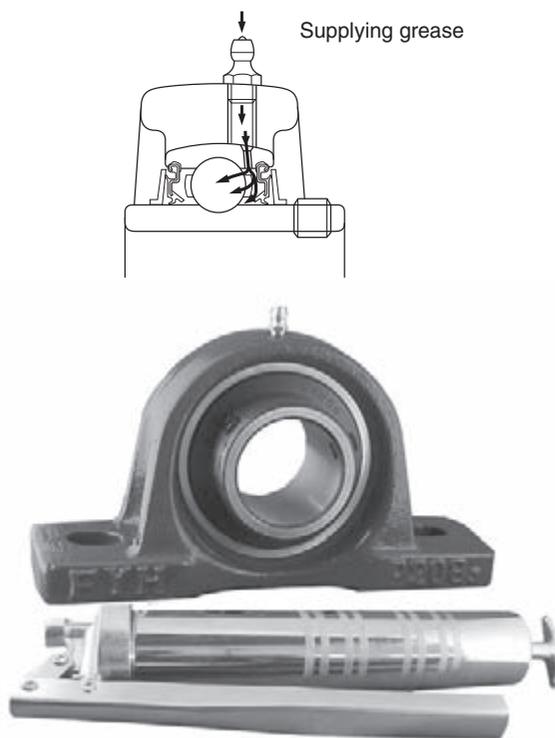

Many different types of grease are available for use in ball bearings. However, if a non-compatible grease is used, particularly a non-lithium based grease, then performance may be drastically reduced.

Only use the grease recommended in **Table 2.1** (page 10) to assure optimum performance of your bearings.

If another grease is used in an emergency situation, for instance, please assure that this grease is compatible, with a lithium base, at the minimum.

### 14.4.4 Relubricating the unit at the specified interval

Note **Fig. 14.14** which shows the grease fitting, grease groove and grease holes for relubrication of the unit.

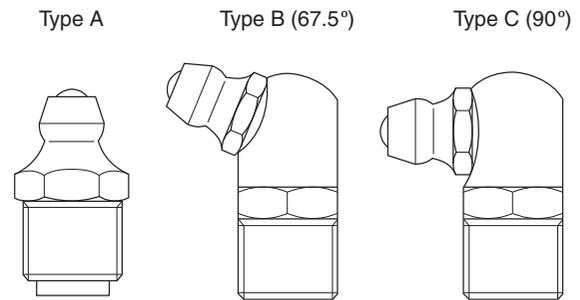

**Fig. 14.14** Supplying grease to ball bearing units

- (1) Clean the grease fitting and the area around it to prevent dirt and foreign material from entering the unit.
- (2) Clean the grease gun and pack clean grease.
- (3) Grease the unit with the recommended amount of grease.

**When lubricating the ball bearing unit, slowly turn the shaft with your hand.** This allows the fresh grease to be uniformly distributed inside the unit.

If it is difficult to access the standard straight type grease fitting with a grease gun, 67.5° and 90° angled fittings are available as an option. See the images below of these grease fittings. Contact FYH for more information.

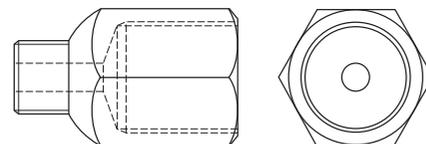

**Fig. 14.15** Types of grease fittings for ball bearing units

When using a centralized automatic lubrication system, with ball bearings, it is important to use softer grease than normal. The grease should be specified with a “worked penetration number” between 300 and 380. This is NLGI grade “0” or “1”. Piping from the lubricating system must be sized so that the specified volume of grease is supplied.

Piping must be connected to the threaded hole on the ball bearing unit. This is either 1/4-28 tapered threads for units up to and including 210 ring size, or 1/8 PT (BSPT) for ball bearing units with a 211 ring size and larger. If the piping size used is larger than the threaded hole in the ball bearing unit, then the appropriate reducing coupling (or street elbow) must be used to fit the threaded hole.

**Fig. 14.16** shows the body of a pipe reducer.

When using an automatic centralized lubrication system, it is imperative to assure that the correct volume of grease is supplied to each individual bearing as specified in **Table 14.4**. The total amount of grease is a multiple of the number of bearings being supplied by the central lubrication system.

**Fig. 14.16** Reducing coupling for centralized lubrication systems

### 14.5 Replacing Bearings

If a bearing insert needs to be replaced, it is not always necessary to replace the housing if the housing is intact.

After carefully inspecting the housing to ensure that it is not damaged, simply insert a new bearing into the old housing.

Replacement procedures for a bearing insert are listed below.

- (1) Remove the complete bearing unit from the shaft and mounting base.
- (2) Screw in the set screws so that the head of each set screw does not protrude outside the outer diameter of the inner ring. Otherwise, the head of the set screw may damage the bearing seat inside the housing.
- (3) Use a bar or pipe to rotate the bearing 90° until the bearing is horizontal.
- (4) Remove the bearing insert from the housing via the loading slot in the back of the housing.

Reverse the above procedure to put in a new bearing insert. Ensure that the set screws are screwed in before proceeding with the replacement.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~210, X05~X09, 305~308  
A-R1/8..... 211~218, X10~X20, 309~328

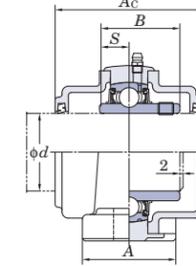

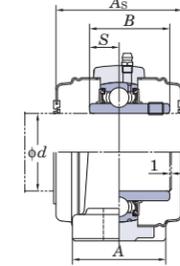

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No.: UCP206JL3, UC206L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Representative examples of the forms of housing are indicated.  
6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 201~210, X05~X09, 305~308  
 A-R1/8..... 211~218, X10~X20, 309~328

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No.: UCP206JL3, UC206L3)  
 4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
 5. Representative examples of the forms of housing are indicated.  
 6. Housings of nodular graphite cast iron are also available.

**UCP**  
Cylindrical bore (with set screws)  
 $d$  (75) ~ 140 mm

Variations of tolerance of distance from mounting bottom to center of spherical bore ( $\Delta H_{2c}$ )

Remarks 1. In Part No. of unit, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~210  
A-R1/8 ..... 211~215

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No.: NAP206JL3, NA206L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Representative examples of the forms of housing are indicated.  
6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 204~210  
 A-R1/8 ..... 211~212

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
 4. Representative examples of the forms of housing are indicated.

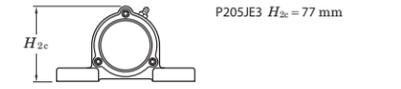

**UKP**

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 205~210, X05~X09, 305~308  
 A-R1/8 ..... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.  
 (Example of Part No.: UKP206J + H2306X, UK206 + H2306X)  
 4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing.  
 5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
 6. Representative examples of the forms of housing are indicated.  
 7. Housings of nodular graphite cast iron are also available.

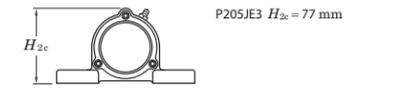

**UKP**  
**Tapered bore (with adapter)**

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 10.5** in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 205~210, X05~X09, 305~308  
 A-R1/8 ..... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.  
 (Example of Part No. : UKP206J + H2306X, UK206 + H2306X)  
 4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing.  
 5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
 6. Representative examples of the forms of housing are indicated.  
 7. Housings of nodular graphite cast iron are also available.

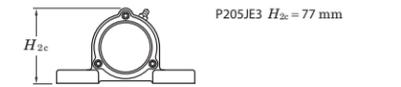

**UKP**  
Tapered bore (with adapter)  
 $d_1$  (90) ~ 125 mm

Variations of tolerance of distance from mounting bottom to center of spherical bore ( $\Delta H_{2c}$ )

Housing No.			Unit: mm

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 208~210  
A-R1/8..... 211~213, 313~328

3. As for the triple seal type product, suffix code L3 follows the Part No. of unit or bearing. (Example of Part No.: UCIP208JL3, UC208L3)  
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 208~210  
A-R1/8..... 211~213, 313~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.  
(Example of Part No. : UKIP208J + H2308X, UK208 + H2308X)  
4. As for the triple seal type product, suffix code L3 follows the Part No. of unit or bearing.  
(Example of Part No. : UKIP208JL3 + H2308X, UK208L3 + H2308X)  
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
2. Part No. of the applicable grease fitting is A-1/4-28UNF.  
3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows Part No. of unit or bearing. (Example of Part No.: UCPAN206L3, UC206L3)

4. As for the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Tapered bore (with adapter) type products are also available. (Example of Part No.: UKPAN205J + H2305X, UK205 + H2305X)  
6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 204~210  
A-R1/8..... 211

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
4. Representative examples of the forms of housing are indicated.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
 2. Allowable load to housing in radial direction is approximately half of basic load rating of bearing,  $C_r$  (when safety factor is 4).  
 3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of the applicable grease fitting is A-1/4-28UNFN12.  
3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~210, X05~X09, 305~308  
A-R1/8 ..... 211~218, X10~X20, 309~328

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No.: UCF206JL3, UC206L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~210, X05~X09, 305~308  
A-R1/8 ..... 211~218, X10~X20, 309~328

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No.: UCF206JL3, UC206L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 204~210  
A-R1/8..... 211~212

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
4. Representative examples of the forms of housing are indicated.

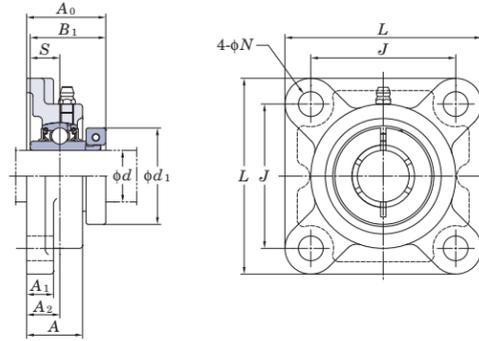

Variations of tolerance of distance from mounting surface to center of spherical bore ( $\Delta A_{2s}$ ) and tolerance of position of bolt hole ( $X$ )

Housing No.	$\Delta A_{2s}$	$X$
F204~F210	$\pm 0.5$	0.7
F211~F212	$\pm 0.8$	1

Variations of tolerance of bolt hole diameter ( $\Delta N_s$ )

Housing No.	$\Delta N_s$
F204~F212	$\pm 0.2$

**NCF-E**

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 205~210, X05~X09, 305~308  
A-R1/8 ..... 211~218, X10~X20, 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No.: UKF206J + H2306X, UK206 + H2306X)  
4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No.: UKF206JL3 + H2306X, UK206L3 + H2306X)  
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
6. Housings of nodular graphite cast iron are also available.

- Remarks
- In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)
  - Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 205~210, X05~X09, 305~308  
A-R1/8 ..... 211~218, X10~X20, 309~328
  - In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKF206J + H2306X, UK206 + H2306X)
  - As for the triple seal type product (205 is the double seal type product), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No. : UKF206JL3 + H2306X, UK206L3 + H2306X)
  - For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.
  - Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 305~308  
A-R1/8..... 309~328

3. As for the triple seal type product, suffix code L3 follows the Part No. of unit or bearing.  
(Example of Part No.: UCFS307JL3, UC307L3)  
4. The dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 305~308  
A-R1/8 ..... 309~328

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKFS307J + H2307X, UK307 + H2307X)  
4. As for the triple seal type product, suffix code L3 follows the Part No. of unit or bearing.  
(Example of Part No. : UKFS307JL3 + H2307X, UK307L3 + H2307X)  
5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~210, X05~X09, 305~308  
A-R1/8 ..... 211~218, X10, 309~324

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No.: UCFL206JL3, UC206L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

UCFL
Cylindrical bore (with set screws)
d (45) ~ (90) mm

With Pressed Steel Cover With Cast Iron Cover

Variations of tolerance of distance from mounting surface to center of spherical bore (ΔA2a) and tolerance of position of bolt hole (X)

Table with 4 columns: Housing No., ΔA2a, X, and Unit. mm. Rows include FL204~FL210, FLX05~FLX10, FL305~FL310, FL311~FL324.

Variations of tolerance of bolt hole diameter (ΔNs)

Table with 3 columns: Housing No., ΔNs, and Unit. mm. Rows include FL204~FL218, FLX05~FLX10, FL305~FL311, FL312~FL324.

Forms and dimensions of Lc of FL204JE3 and FL205JE3 (housing with cast iron cover) are shown below.

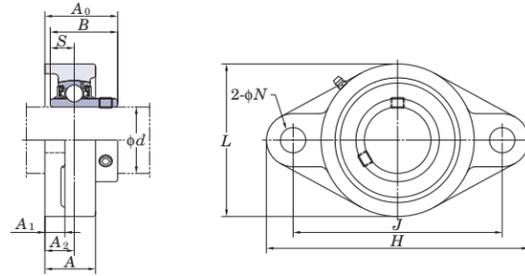

Main specification table with columns for Shaft Dia., Dimensions, Bolt Size, Standard (Unit No., Housing No., Bearing No.), Basic Load Ratings, Factor, and With Pressed Steel Cover / With Cast Iron Cover (Unit No., Dimension, Mass).

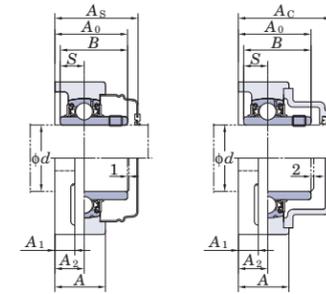

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.) 2. Part No. of applicable grease fittings are shown below.

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. 4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit. 5. Housings of nodular graphite cast iron are also available.

- Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 205~210, X05~X09, 305~308  
 A-R1/8 ..... 211~218, X10, 309~324  
 3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKFL206J + H2306X, UK206 + H2306X)  
 4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UKFL206JL3 + H2306X, UK206L3 + H2306X)  
 5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
 6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 204~210  
A-R1/8..... 211

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
4. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of the applicable grease fitting is A-1/4-28UNFN12.  
3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 201~210, X05~X09  
 A-R1/8 ..... 211~218, X10~X20  
 3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing.  
 (Example of Part No.: UCFC206JL3, UC206L3)  
 4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
 5. Housings of nodular graphite cast iron are also available.

**UCFC**  
Cylindrical bore (with set screws)  
 $d$  55 ~ 100 mm

Variations of tolerance of spigot joint outside diameter ( $\Delta H_{3s}$ ), variations of tolerance of distance from mounting surface to center of spherical bore ( $\Delta A_{2s}$ ), tolerance of position of bolt hole (X), and tolerance of circumferential runout of spigot joint (Y)

Variations of tolerance of bolt hole diameter ( $\Delta h_{1s}$ )

Variations of tolerance of spigot joint outside diameter ( $\Delta H_{3s}$ ), variations of tolerance of distance from mounting surface to center of spherical bore ( $\Delta A_{2s}$ ), tolerance of position of bolt hole (X), and tolerance of circumferential runout of spigot joint (Y)

Housing No.	$\Delta H_{3s}$	$\Delta A_{2s}$	Unit: mm	
			X	Y
FCX05E	0 -0.046	±0.5	0.7	0.2
FCX06E~FCX10E	0 -0.054			
FCX12E~FCX15E	0 -0.063	±0.8	1	0.3
FCX16E~FCX18E	0			
FCX20E	-0.072			

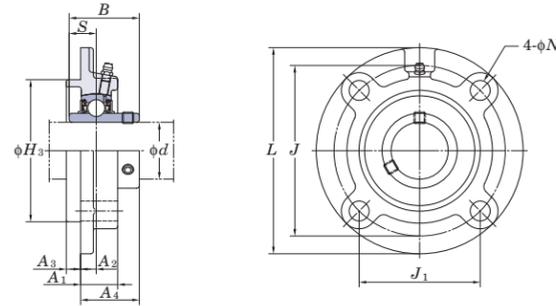

Variations of tolerance of bolt hole diameter ( $\Delta N_s$ )

Housing No.	Unit: mm
FCX05E~FCX20E	±0.2

Remarks 1. In Part No. of unit, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... X05~X09  
A-R1/8 ..... X10~X20

3. As for the triple seal type product, suffix code L3 follows the Part No. of unit or bearing. (Example of Part No. : UCFCX06EL3, UCX06L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 A-1/4-28UNF ..... 205~210, X05~X09  
 A-R1/8 ..... 211~218, X10~X20

3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables. (Example of Part No. : UKFC206J + H2306X, UK206 + H2306X)  
 4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UKFC206JL3 + H2306X, UK206L3 + H2306X)  
 5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
 6. Housings of nodular graphite cast iron are also available.

**UKFC**

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
B-1/4-28UNF ..... 201~210, X05~X09, 305~308  
B-R1/8 ..... 211~217, X10~X17, 309~328

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No.: UCT206JL3, UC206L3)  
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

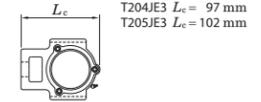

UCT Cylindrical bore (with set screws) d (45) ~ (75) mm

Variations of tolerance of groove width (ΔA1s), variations of tolerance of distance between both grooves (ΔH1s), and tolerance of symmetry of both groove sides (X)

Table with 5 columns: Housing No., ΔA1s, ΔH1s, X, Unit: mm. Rows include T204~T210, T211~T217, T305~T310, T311~T318, T319~T322, T324~T328.

Form and dimensions of Lc of T204JE3 and T205JE3 (housing with cast iron cover) are shown below.

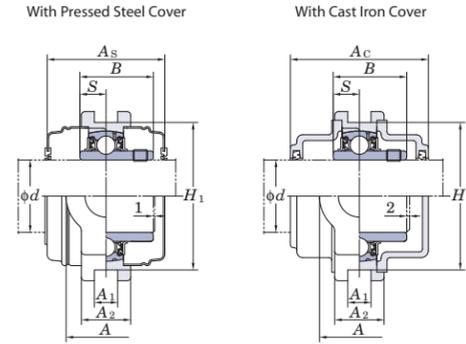

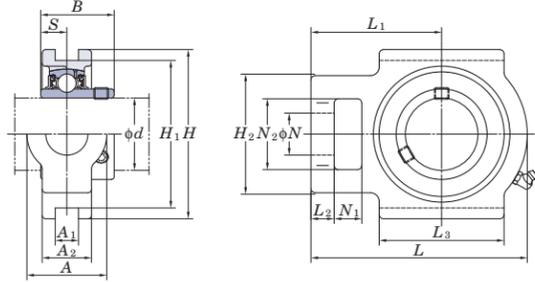

Main specification table with columns for Shaft Dia. (mm/inch), Dimensions (inch/mm), Standard (Unit No., Housing No.), Bearing No., Mass (kg), Basic Load Ratings (Cr, Cor, kN), Factor (fo), With Pressed Steel Cover (Unit No., Dimension mm/inch, Mass kg), and With Cast Iron Cover (Unit No., Dimension mm/inch, Mass kg).

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.) 2. Part No. of applicable grease fittings are shown below. B-1/4-28UNF.....201~210, X05~X09, 305~308 B-R1/8.....211~217, X10~X17, 309~328

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No.: UCT206JL3, UC206L3) 4. As for the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit. 5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
B-1/4-28UNF ..... 201~210, X05~X09, 305~308  
B-R1/8 ..... 211~217, X10~X17, 309~328

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing. (Example of Part No.: UCT206EL3, UC206L3)  
4. As for the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
5. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 B-1/4-28UNF.....204~210  
 B-R1/8.....211~215

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
 4. Representative examples of the forms of housing are indicated.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
B-1/4-28UNF ..... 204~210  
B-R1/8 ..... 211~212

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
4. Representative examples of the forms of housing are indicated.

Remarks 1. In Part No. of unit, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
B-1/4-28UNF ..... 204~210  
B-R1/8 ..... 211~212

3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
4. Representative examples of the forms of housing are indicated.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 B-1/4-28UNF..... 205~210, X05~X09, 305~308  
 B-R1/8..... 211~217, X10~X17, 309~328  
 3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.  
 (Example of Part No. : UKT206J + H2306X, UK206 + H2306X)

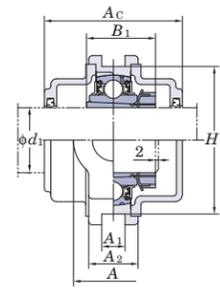

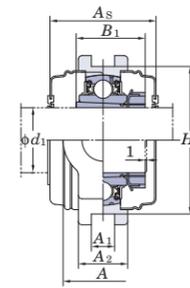

4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing.  
 (Example of Part No. : UKT206JL3 + H2306X, UK206L3 + H2306X)  
 5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
 6. Housings of nodular graphite cast iron are also available.

**UKT**  
**Tapered bore (with adapter)**  
 $d_1$  55 ~ 125 mm

With Pressed Steel Cover

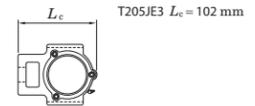

With Cast Iron Cover

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 B-1/4-28UNF ..... 205~210, X05~X09, 305~308  
 B-R1/8 ..... 211~217, X10~X17, 309~328  
 3. In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.  
 (Example of Part No. : UKT206J + H2306X, UK206 + H2306X)

4. As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing.  
 (Example of Part No. : UKT206JL3 + H2306X, UK206L3 + H2306X)  
 5. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
 6. Housings of nodular graphite cast iron are also available.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)  
2. Part No. of the applicable grease fitting is B-1/4-28UNFN12.  
3. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
 2. Part No. of applicable grease fittings are shown below.  
 B-1/4-28UNF..... 201~210  
 B-R1/8..... 211~213  
 3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing.  
 (Example of Part No. : UCTH206JL3-150, UC206L3)

4. If heavy load ( $P_r/C_r > 0.12$ ), vibration, or impact occurs, contact with FYH.  
 5. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.  
 6. Tapered bore (with adapter) type products are also available.  
 (Example of Part No. : UKTH205J-150 + H2305X, UK205 + H2305X)

- Remarks
- In Part No. of unit and units with covers, fitting codes follow bore diameter codes. (See Table 10.5 in P.62.)
  - Part No. of applicable grease fittings is C-1/4-28UNF.
  - As for the triple seal type product (204 and 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCTL206JL3-100, UC206L3)
  - The unit should be mounted so that load is applied to the frame mounting surface vertically and downward.

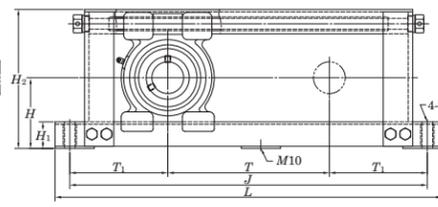

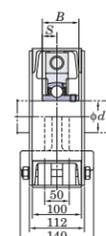

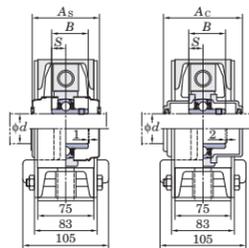

- If heavy load ( $P_r/C_r > 0.12$ ), vibration, or impact occurs, contact with FYH.
- Tapered bore (with adapter) type bearing units are also available. (Example of Part No. : UKTL206J-100 + H2306X, UK206 + H2306X)
- If frame parts need to be corrosion resistant, contact with FYH.
- For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

**UCTU**  
**Cylindrical bore (with set screws)**  
**d 40 ~ 80 mm**

- Remarks
1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See **Table 10.5** in P.62.)
  2. Part No. of applicable grease fittings are shown below.  
C-1/4-28UNF..... 208~210  
C-R1/8..... 211, 212, 313~318
  3. As for the triple seal type product, suffix code L3 follows the Part No. of unit or bearing. (Example of Part No. : UCTU208JL3-500, UC208L3)

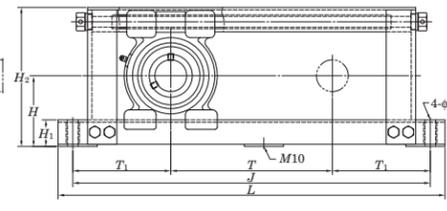

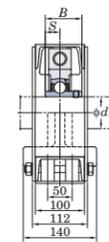

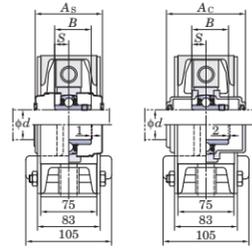

4. The unit should be mounted so that load is applied to the frame mounting surface vertically and downward.
5. If heavy load ( $P_r/C_r > 0.12$ ), vibration, or impact occurs, contact with FYH.
6. Tapered bore (with adapter) type bearing units are also available. (Example of Part No. : UKTU208J-500 + H2308X, UK208 + H2308X)
7. If frame parts need to be corrosion resistant, contact with FYH.
8. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~213, X05~X12, 305~308  
A-R1/8 ..... 309~328  
3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing.  
(Example of Part No. : UCC206JL3, UC206L3)  
4. For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

- Remarks
- In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)
  - Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~213, X05~X12, 305~308  
A-R1/8 ..... 309~328
  - As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (L2) follows the Part No. of unit or bearing.  
(Example of Part No. : UCC206L3, UC206L3)
  - For the dimensions and forms of applicable bearings, see the dimensional tables of ball bearing for unit.

- Remarks
- In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)
  - Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 205~213, X05~X12, 305~308  
A-R1/8 ..... 309~328
  - In Part No. of unit with adapters and bearing with adapters, Part No. of applicable adapter follow the Part No. shown in the dimensional tables.  
(Example of Part No. : UKC206J + H2306X, UK206 + H2306X)
  - As for the triple seal type product (205 is the double seal type product), suffix code L3 (or L2) follows the Part No. of unit or bearing.  
(Example of Part No. : UKC206JL3 + H2306X, UK206L3 + H2306X)
  - As for the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.

Cylindrical bore (with set screws)  
d 12 ~ 75 mm

Note 1) Dimensions N screw hole is apply JIS B0203 (Taper Pipe Threads) standards.  
It can not apply to the Parallel Pipe Male Thread.  
Also, below shown the dimensions of Parallel Pipe Female Thread.

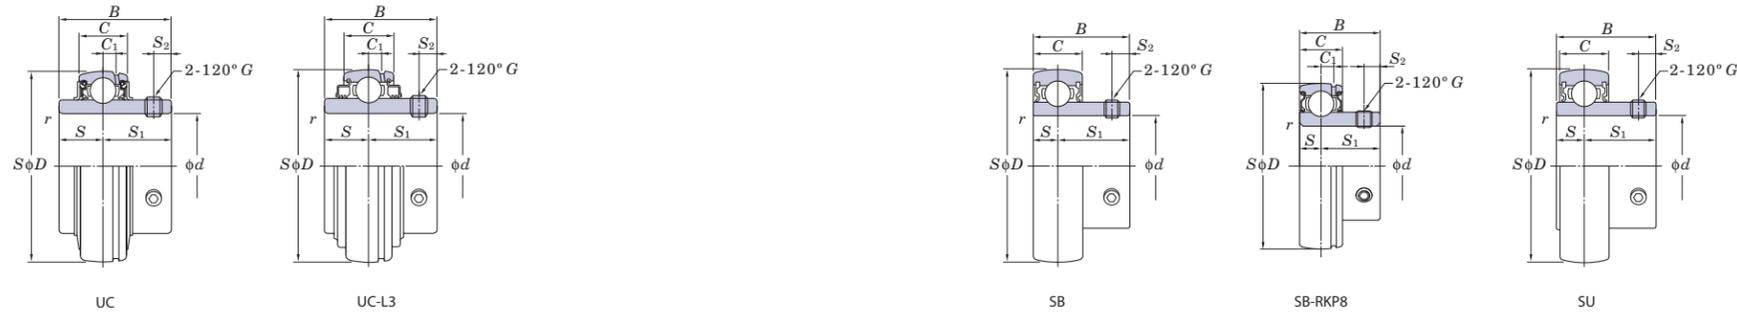

Nominal of Thread	Female Thread			Thread	Apply Male Thread
	Major Diameter	Pitch Diameter	Minor Diameter	Number of Threads (in 25.4 mm)

Remarks 1. In Part No. of unit and units with covers, fitting codes follow bore diameter numbers. (See Table 10.5 in P.62.)  
2. Part No. of applicable grease fittings are shown below.  
A-1/4-28UNF ..... 201~210  
A-R1/8..... 211~215

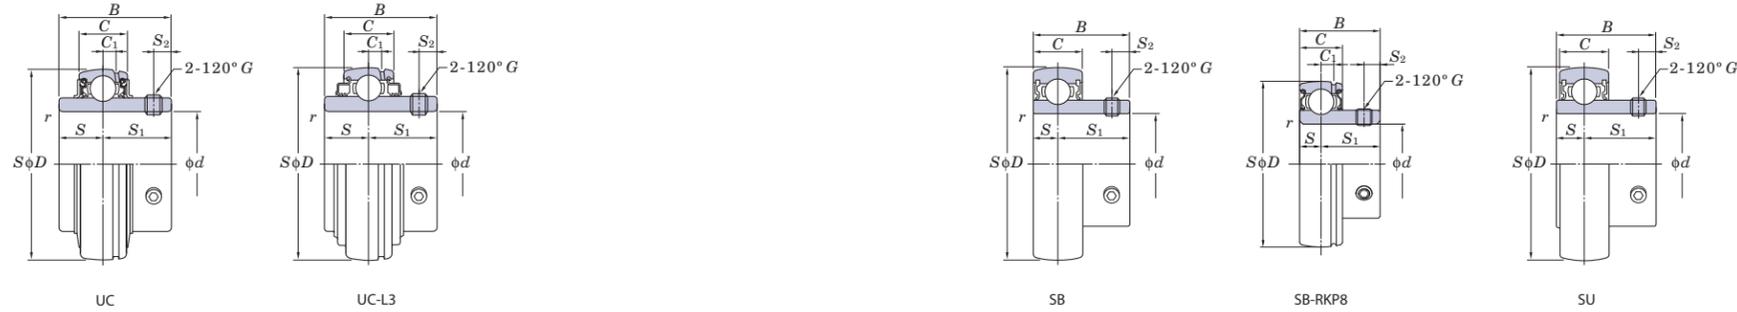

3. As for the triple seal type product (from 201 to 205 are the double seal type products), suffix code L3 (or L2) follows the Part No. of unit or bearing. (Example of Part No. : UCHA206JL3, UC206L3)  
4. For the dimensions and forms of applicable bearings and adapters, see the dimensional tables of ball bearing for unit and adapter.  
5. Tapered bore (with adapter) type products are also available. (Example of Part No. : UKHA205J + H2305X, UK205 + H2305X)

Remarks 1. SU type product is the clean series ball bearing for unit.  
2. From UC201 to 205 are the double seal type products (L2).

Remarks 1. In Part No. of unit with adapters, Part No. of applicable adapters follow the Part No. shown in the dimensional tables.  
(Example of Part No. : UK206 + H2306X, UK206L3 + H2306X)

2. Adapter series applicable to UK200 series  
UK200 ..... H2300X series  
UK200L3 (or L2)..... H2300X series  
3. UK205 is the double seal type product (L2).  
4. Inch bore diameter series adapters are also available (see the dimensional tables of adapters).

Remarks 1. In Part No. of unit with adapters, Part No. of applicable adapters follow the Part No. shown in the dimensional tables.  
 (Example of Part No. : UK206 + H2306X, UK206L3 + H2306X)

2. Adapter series applicable to UK200 series  
 UK200 ..... H2300X series  
 UK200L3 (or L2) ..... H2300X series  
 3. UK205 is the double seal type product (L2).  
 4. Inch bore diameter series adapters are also available (see the dimensional tables of adapters).

UK324	110	324C×110	324D	M5
UK326	115	326C×115	326D	M8
UK328	125	328C×125	328D	

Note <sup>1)</sup> Items in parentheses are applicable to the pillow type (P), square four-bolt flange type (F), oval flange type (FL), and the take-up type (T) bearings, and can be mounted to housings with three hexagon socket head cap screws (use four to mount other items).

<sup>2)</sup> Items in parentheses are applicable to the round flange cartridge type bearing (FC), and can be mounted to housings with three hexagon socket head cap screws (use four to mount other items).

Remark In the nominal codes of the cast iron covers for shouldered shaft, shaft diameter follows the basic code of the cover. For example, Part No. of the cover for a shaft with 60 mm diameter for UC210 is 210FC×60.

## 1 Structure and Features

### 1.1 Structure

More than sixty years of experience and innovation in the field of mounted ball bearing units has led to the production of mounted spherical roller units that cater to a wide range of applications and industries. Bearing and housing production are accomplished entirely by FYH while utilizing only the highest quality materials available. Through meticulous design enhancements and careful material selection this heavy duty mounted roller series attains the designation of "EXTRA TOUGH".

### 1.2 Features

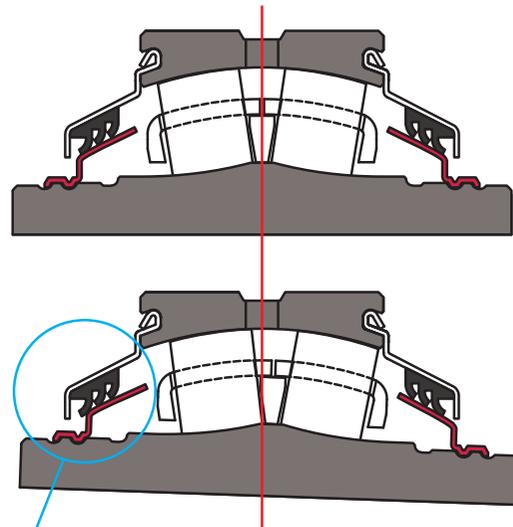

FYH spherical roller bearing units have many features and are available in various models. A wide selection of mounted units is offered to fit virtually any application.

### 1 Triple Lip Seal

*±2° Self Aligning capability*

The triple-lip seal maintains positive contact with a special sealing ring at virtually any angle of shaft mis-alignment. Our new patent pending sealing design protects the bearing against a variety of wet and dry contaminants and dramatically improves bearing life. The ability to accommodate shaft expansion is also available.

Positive seal contact is maintained during mis-alignment at any angle.

### 2 Semi Solid Base

*One piece ductile iron housings*

Ductile iron housings are approximately twice as strong as cast iron, and the semi-solid base design provides an excellent mounting foundation and superior rigidity over competitive offerings. The standard housing material from FYH is ductile iron, and additional material options may also be available.

### 3 Lubrication

FYH Roller Grease is a calcium sulfonate complex thickened lubricating grease formulated in 100% synthetic hydrocarbon base oil. FYH Roller Grease has excellent low temperature and high temperature performance, and it provides excellent extreme pressure and anti-wear protection. FYH Roller Grease also provides excellent corrosion protection and water wash-out resistance. Grease temperature range: -40 to 340°F (-40 to 170°C) FYH Roller Grease is also available in automatic lubricators.

### 4 Designed to Interchange with the Competition

Units are designed to interchange with most spherical roller unit footprints. Elongated bolt holes are dimensioned to allow for a shortened or extended mounting pitch to accommodate practically any competitive tapered roller or spherical roller design.

### 5 Convertible from Non-expansion to Expansion

By simply moving a snap ring on the back of the unit the bearing can easily be converted from non-expansion to expansion or vice versa.

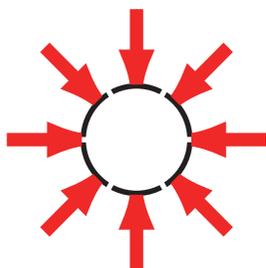

This procedure can be easily performed in the field even after the unit has been mounted.

### 6 Locking Style

The patent pending Z-Lock is the first ever tapered bore locking collar system. Just tighten the cap screws properly and the specialized tapered bore collar provides extreme holding power on the shaft without causing any damage. This is a true 360 degree locking mechanism.

Disassembly is easily accomplished with two threaded holes in the collar for standard withdrawal dismounting.

THE MOST REVOLUTIONARY  
LOCKING SYSTEM  
**TRUE 360° GRIP**

## 2 Models

### 2.1 Model List

## 2.2 Models and Features

### 1 SPHERICAL ROLLER BEARING UNITS

#### 1 2-Bolt Base Pillow Block Units

**XS2P**  
**XSE2P**

**ZS2P**  
**ZSE2P**

**XS2P** is a two-bolt pillow block unit with a setscrew locking insert system. This unit is equivalent to many of our competitors SRB style housings.

**XSE2P** is with Type E mounting dimensions which has a footprint that can accommodate both a tapered roller unit and a spherical roller unit for most shaft sizes.

**ZS2P** and **ZSE2P** have the same housing dimensions as the above styles but utilize our revolutionary Z-Lock concentric locking collar system.

#### 2 4-Bolt Flange Units

**XS4F**  
**XSE4F**

**ZS4F**  
**ZSE4F**

**XS4F** is a four-bolt flange unit with set screw locking system. It has standard spherical roller unit mounting dimensions and a compact footprint for areas with limited space.

**XSE4F** has Type E mounting dimensions with the same footprint as a tapered roller unit.

**ZS4F** and **ZSE4F** have the same housing dimensions as the above units but utilize our revolutionary Z-Lock concentric locking collar system.

#### 3 Flange Cartridge Units

**XS4FC**

**ZS4FC**

**XS4FC** is a piloted flange cartridge unit with a setscrew locking insert system. Its' pilot mounting dimensions are the same as the medium duty ball bearing units that allow for easy upgrades to a heavier duty series. The threaded withdrawal holes make for quick and easy dismounting.

**ZS4FC** carries as the same housing dimensions as the above unit but incorporate the revolutionary Z-Lock concentric locking collar system.

#### 4 Take-Up Units

**XST**

**ZST**

**XST** is a take-up unit with set screw locking system.

It has rail slots that are compatible with many industrial frame sizes. This unit can safely handle high belt tension and heavy shock loads.

**ZST** has the same housing dimensions as the XST units but incorporates the revolutionary Z-Lock concentric locking collar system.

#### 5 4-Bolt Base Pillow Block Units

**XS4P**

**ZS4P**

**XS4P** is a four-bolt base pillow block unit with standard spherical roller bearing mounting dimensions. Four mounting bolt-holes create a firm and secure fit to the mounting surface. The ends of the housing are flat to allow for mounting inside of a fixed frame assembly.

**ZS4P** is the Z-lock equivalent of the XS4P carrying the same housing dimensions but utilizing the revolutionary Z-Lock concentric locking collar system.

6 4-Bolt Base Pillow Block Units (Double Collar)

XDS4P

ZDS4P

**XDS4P** is the same as the XS4P above but utilizes a double lock. This insert has a setscrew locking mechanism on both the front and back of the inner ring.

This additional locking mechanism is helpful in applications where the bearing experiences some thrust loads on the inner ring that could cause a single locking unit to slip.

**ZDS4P** is the Z-lock equivalent of the XDS4P carrying the same housing dimensions but utilizing the revolutionary Z-Lock concentric locking collar system.

2 SPHERICAL ROLLER BEARING INSERTS

1 Spherical Roller Bearing Inserts (Single Collar)

XS

ZS

**XS** is a setscrew locking insert that utilizes the patented Bullet Point setscrews at 120 degrees apart to hold shafting firmly in place. This is the most economical type of SRB insert and can be utilized in a wide variety of industrial and agricultural applications.

**ZS** is a concentric locking insert that utilizes a tapered collar that allows for fast mounting while avoiding damage to shafting that a setscrew unit can cause. The tapered collar keeps the 100% true concentric holding power and does not remove any clearance in the insert by over tightening like the adaptor sleeve locking system can. The unit is tightened down using a hex wrench on the cap screws in a star pattern. The insert can be uninstalled by removing all cap screws and using two of them in the withdrawal holes to disengage the collar.

2 Spherical Roller Bearing Inserts (Double Collar)

XDS

ZDS

**XDS** is the same as the XS above but utilizes a double lock. This insert has a setscrew locking mechanism on both the front and back of the inner ring. This additional locking mechanism is helpful in applications where the bearing experiences some thrust loads on the inner ring that could cause a single locking unit to slip.

**ZDS** is the same as the ZS above but utilizes a double lock. This insert has a concentric tapered collar on both the front and back of the inner ring. This additional locking mechanism is helpful in applications where a bearing experiences some thrust loads on the inner ring that could cause a single locking unit to slip.

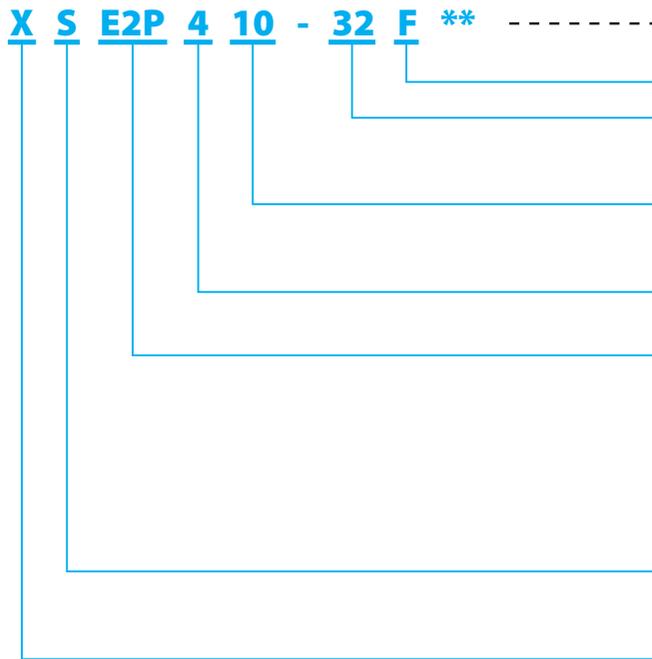

### 3 Nomenclature

The nomenclature of a FYH Spherical Roller Unit is comprised of the roller bearing unit model code which is made up using the bearing model code and the housing model code. This in combination with the diameter series code, bore diameter code, accessory code and any special

code for individual applications determines the FYH Spherical Roller Units part number.

### 4 Engineering Information

**Spherical Roller Bearing Life Calculations**

The relationship between the basic rating life, the basic dynamic load rating, and the dynamic equivalent load of the spherical roller bearing is indicated in Formula A. If the spherical roller bearing unit is being used at a fixed rotating speed, the life is indicated as time.

This is shown in Formula B.

$$A. L_{10} = \left( \frac{C_r}{P_r} \right)^{\frac{10}{3}}$$

$$B. L_{10h} = \frac{10^6 L_{10}}{60n} = \frac{10^6}{60n} \left( \frac{C_r}{P_r} \right)^{\frac{10}{3}}$$

$L_{10}$  : Basic Rating Life  $10^6$  rotations

$L_{10h}$  : Rated Life (hr)

$C_r$  : Basic Dynamic Load Rating (lbf)

$P_r$  : Dynamic equivalent Load (lbf)

$n$  : Speed ( $\text{min}^{-1}$ )

- Blue area: The Standard Triple Lip Seal is used.
- Green area: A non-contact seal is used.

## 5 Installation Guide

### 5.1 Precautions

- Read the entire installation guide prior to beginning.
- Bearings are precision instruments and they must always be handled carefully to prevent damage.
- Store bearings in a cool and dry location, and always leave bearings in original packaging until ready for installation.
- Bearing life calculations should be performed prior to installation to ensure that the selected unit is acceptable for the application.
- The use of more than two bearings on a single shaft is not recommended.
- To maximize the life of the bearing avoid mis-alignment and pre-loading by carefully following these instructions.
- Always lock out the power source and adhere closely to industry safety standards before performing any work on the equipment.

### 5.2 Preparation

The mounting surface and housing base must be clean, flat, and of sufficient thickness to support the weight of the entire assembly without deflecting or breaking. Make sure that the mounting surface is parallel to the plane of the shaft for pillow blocks, and perpendicular to the shaft for flanges and take-up units. FYH mounted bearings can accommodate up to  $\pm 2$  degrees of mis-alignment, however longer bearing life can be achieved if mis-alignment can be minimized during installation.

Check the shaft diameter and make sure that it is within tolerance as indicated in Table 1. Check that the shaft is straight, clean, and free of burrs or other imperfections. Use emery cloth or a fine file to smooth the surface as necessary. A small amount of lubricant may be applied to both the shaft and the bore of the bearing; however lubricant should not be applied to the areas where the bearing locking mechanism contacts the shaft. To ensure adequate locking power between the bearing and shaft the hardness of the shaft should not exceed Rc 45.

Table 1 - Shaft Tolerance					
Shaft Size (mm)		h6		h7	
		Shaft Speed Greater Than 50% of Max RPM Rating		Shaft Speed Less Than 50% of Max RPM Rating	
Over	Incl.	Max (mm)	Min (mm)	Max (mm)	Min (mm)
30	50	+0	-0.016	+0	-0.025
50	80	+0	-0.019	+0	-0.03
80	120	+0	-0.022	+0	-0.035
120	180	+0	-0.025	+0	-0.04

#### Converting units from fixed to expansion

FYH mounted roller units are capable of operating in both a fixed or expansion configuration.

#### Before bearing installation

On the back side of the unit (opposite the housing markings), remove the bearing retaining ring located on the inner diameter of the housing and move it back to the groove on the outer position of the housing. Slide the bearing insert rearward within the housing until it sits against the retaining ring that was just relocated. When ready for installation, slide the insert forward in the housing approximately one thirty-second of an inch ( $1/32$ " ) and alternately tighten the set screws onto the shaft to the specified torque setting as shown in Table 4.

#### After bearing installation

Before performing any work on the bearing, lock out the power source and allow the shaft and adjacent machinery to cool down to ambient temperature. Loosen the set screws or other locking mechanism to allow the shaft to move freely within the bore then follow the same procedures explained in the "Before bearing installation" section.

### 5.3 Installation

- Slide the unit onto the shaft while holding the inner ring of the bearing.

Position the unit on the mounting surface so that the plane of the shaft is perpendicular to the face of the housing, and alternately tighten the mounting bolts to the specified torque as shown in Table 2.

Make sure to use bolts, washers, and nuts of sufficient strength and grade rating for the application.

- Check the final position of the shaft and alternately tighten the set screws of the non-expansion unit onto the shaft to the specified torque setting as shown in Table 3. The set screws in the bearing on the opposite side of the shaft should line up

with the set screws of the bearing that was installed first (See Figure A). Expansion bearings should be installed only after the shaft and adjacent machinery has cooled down to the ambient temperature.

After positioning the expansion unit on the shaft slide the insert to the rearmost position within the housing until it seats against the retaining ring. Then slide the insert forward in the housing approximately one thirty second of an inch ( $\frac{1}{32}$ " ) and alternately tighten the set screws onto the shaft to the specified torque setting as shown in Table 3. Allowable shaft expansion and expansion calculation data can be found in Table 4 and Formula 1 respectively.

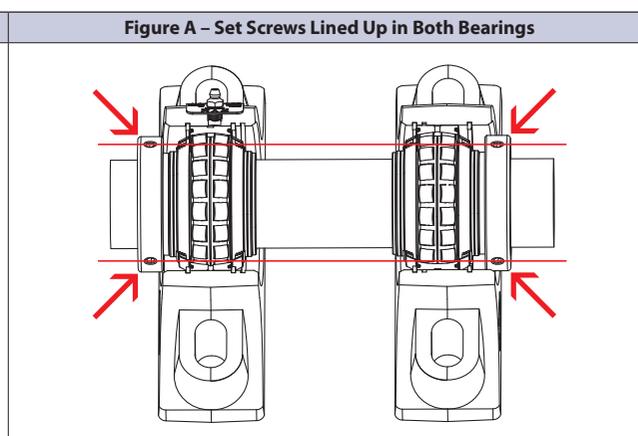

- Once installed, slowly rotate the bearing by hand to confirm that it turns smoothly and without resistance, vibration, or any other abnormalities.

### 5.4 Lubrication

Proper lubrication practices will greatly extend the life of the bearing.

Bearings are factory lubricated with the proper amount and type of lubricant for most general purpose applications as well as many highly demanding operating environments, and except as recommended by FYH, no further lubrication is required upon installation.

**Lubrication tips:**

- The factory standard lubricant is a **Calcium Sulfonate** grease. Always use the same type of lubricant to avoid compatibility issues and other potential problems.
- When adding lubricant do so slowly and while the bearing is rotating until a small amount of lubricant can be seen coming out of the seals.
- At low speeds (below 200 RPM) it is acceptable to completely fill the bearing with grease.
- At moderate to high speeds it is not advisable to completely fill the bearing with grease as it could lead to overheating and reduced bearing life.
- It is generally better to use less lubrication more frequently than more lubricant less often.
- If the unit will not be operated for an extended period of time extra lubricant should be added to prevent corrosion.
- If the unit has not been operated for an extended period of time fresh lubricant should be added prior to start-up.
- If the unit becomes too hot during operation from over-lubrication remove the grease fitting and operate the unit for approximately thirty minutes to allow excess grease to purge.

Appropriate lubrication intervals can be determined by referring to Table 5; however experience should largely determine the actual lubrication regimen for a particular application. Consult with an FYH representative for assistance.

If a suitable Calcium Sulfonate lubricant is not available for re-lubrication then the following compatible lubricants may also be used:

**Barium Complex, Calcium Stearate, Lithium Complex, Polyurea (Shear Stable)**

The use of any other type of lubricant should be avoided to prevent compatibility issues with the Calcium Sulfonate grease that is originally supplied.

To find the proper lubrication interval in Table 5 obtain the relevant percentage of max allowable RPM by referring to Table 6. Example: XS41 1 with positive contact seals has a max RPM rating of 2000. If the application has an RPM of 600 then the percentage of max RPM is 30% ( $600/2000 = .30$ ).

The amount of grease for replenishment can be found in Table 7.

Table 5 - Lubrication Schedule								
Environment	Clean to Moderately Dirty				Clean to Moderately Dirty			Dirty to Very Dirty
Temperature (°C)	Under 120 degrees				Over 120 degrees			From -20 to 200
% of max allowable RPM	0 - 25%	25 - 50%	50 - 75%	75 - 100%	0 - 25%	25 - 50%	50 - 100%	0 - 100%
Lubrication interval	From three to eight months	From one to three months	From one week to one month	Daily to once per week	From two to six weeks	From one week to one month	Daily to once per week	Daily to once per week

## Appendix Table 2 Tightening Torques of Housings and Cast Iron Cover Mounting Bolts

## (1) Tightening torques of housings mounting bolts (recommended)

Nominal size of screws	Tightening torques N · m
M 6	2.6– 4.7
M 8	6 – 10
M10	12 – 21
M12	21 – 37
M14	34 – 60
M16	53 – 93
M18	77 – 137
M20	104 – 186
M22	143 – 256
M27	266 – 478
M30	360 – 645
M33	494 – 886
M36	631 – 1,130

## (2) Tightening torques of plastic housings mounting bolts (recommended)

Nominal size of screws	Tightening torques N · m
M10	17.7–24.5
M12	29.4–44.1

## (3) Tightening torques of cast iron cover mounting bolts (recommended)

Nominal size of screws	Tightening torques, N · m	Part No. of applicable cast iron covers (reference)		
		200 series	X00 series	300 series
M3	0.3– 0.6	204, 205	–	–
M4	0.8– 1.4	204FC3 (FD3), 205FC3 (FD3), 206–215	–	305–307
M5	1.5– 2.8	216–218	X18, X20	308–324
M8	6 –10	–	–	326, 328

## Appendix Table 3 Tightening Torques of Inner Rings and Eccentric Locking Collar Set Screws

## (1) Tightening torques of inner rings and eccentric locking collar set screws (metric series) (recommended)

Nominal size of screws	Tightening torques, N · m	Part No. of applicable bearings						
		UC2, RB	UCX	UC3	NA	SB	SU	ER
M 3X0.35	0.7						08, 000, 001	
M 4X0.5	1.8	–				–	002, 003	
M 5X0.5	3	201X–203X	–	–		201–203	004–006	–
M 6X0.75	4	201–206	X05	305, 306	204, 205	204–207	–	201–206
M 8X1	8.5	207–209	X06–X08	307	206–210	208		207–209
M10X1.25	17.5	210–212	X09–X11	308, 309	211, 212	–		210–212
M12X1.5	28	213–218	X12–X17	310–314	–			–
M14X1.5	35	–	X18	315, 316				
M16X1.5	56		X20	317–319				
M18X1.5	62		–	320–324				
M20X1.5	83			326, 328				

Remarks 1) Tightening torques of set screws for UC2-S6 are identical to that of UC2. As for UC210S6, tightening torque of the set screw M8 × 1 should be applied.

2) When the application will be exposed to vibration and shock load additional tightening will be required. The maximum torque tightening should not exceed 1.5 times the normal torque tightening specifications.

**(2) Tightening torques of inner rings and eccentric locking collar set screws (inch series) (recommended)**

Nominal size of screws	Tightening torques, N · m	Part No. of applicable bearings		
		UC2-, ER2-, RB2-	UCX-	SB-
10-32UNF	3	–	–	201, 202
1/4-28UNF	4	201–206	X05	204–207
5/16-24UNF	8.5	207–209	X06–X08	208
3/8-24UNF	17.5	210–212	X09–X11	–
1/2-20UNF	28	213–218	X12–X18	
5/8-18UNF	56	–	X20	

Remark When the application will be exposed to vibration and shock load additional tightening will be required. The maximum torque tightening should not exceed 1.5 times the normal torque tightening specifications.

**(3) NC concentric cap screw tightening torque**

Nominal size of screws	Tightening torques, N · m
M4	7.4– 8.2
M5	10.2–11.2
M6	17.6–19.4
M8	41.6–46
No.8-32UNC	7.4– 8.2
No.10-24UNC	10.2–11.2
1/4-20UNC	17.6–19.4
5/16-18UNC	41.6–46

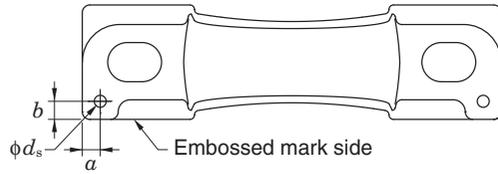

Remark When the application will be exposed to vibration and shock load additional tightening will be required. The maximum torque tightening should not exceed 1.5 times the normal torque tightening specifications.

Note <sup>1)</sup> Tolerance classes from IT14 to IT18 can not be applied to basic size 1 mm or less.

## Appendix Table 9 SI Unit Conversion Charts

### Force

N	dyn	kgf
1	$1 \times 10^5$	$1.019\ 72 \times 10^{-1}$
$1 \times 10^{-5}$	1	$1.019\ 72 \times 10^{-6}$
9.806 65	$9.806\ 65 \times 10^5$	1

### Moment of force (torque)

N · m	mN · m	$\mu\text{N} \cdot \text{m}$	kgf · m	kgf · cm	gf · cm
1	$1 \times 10^3$	$1 \times 10^6$	$1.019\ 72 \times 10^{-1}$	$1.019\ 72 \times 10$	$1.019\ 72 \times 10^4$
$1 \times 10^{-3}$	1	$1 \times 10^3$	$1.019\ 72 \times 10^{-4}$	$1.019\ 72 \times 10^{-2}$	$1.019\ 72 \times 10$
$1 \times 10^{-6}$	$1 \times 10^{-3}$	1	$1.019\ 72 \times 10^{-7}$	$1.019\ 72 \times 10^{-5}$	$1.019\ 72 \times 10^{-2}$
9.806 65	$9.806\ 65 \times 10^3$	$9.806\ 65 \times 10^6$	1	$1 \times 10^2$	$1 \times 10^5$
$9.806\ 65 \times 10^{-2}$	$9.806\ 65 \times 10$	$9.806\ 65 \times 10^4$	$1 \times 10^{-2}$	1	$1 \times 10^3$
$9.806\ 65 \times 10^{-5}$	$9.806\ 65 \times 10^{-2}$	$9.806\ 65 \times 10$	$1 \times 10^{-5}$	$1 \times 10^{-3}$	1

### Stress

Pa or N/m <sup>2</sup>	MPa or N/mm <sup>2</sup>	kgf/mm <sup>2</sup>	kgf/cm <sup>2</sup>
1	$1 \times 10^{-6}$	$1.019\ 72 \times 10^{-7}$	$1.019\ 72 \times 10^{-5}$
$1 \times 10^6$	1	$1.019\ 72 \times 10^{-1}$	$1.019\ 72 \times 10$
$9.806\ 65 \times 10^6$	9.806 65	1	$1 \times 10^2$
$9.806\ 65 \times 10^4$	$9.806\ 65 \times 10^{-2}$	$1 \times 10^{-2}$	1

Remark 1 Pa = 1 N/m<sup>2</sup>, 1 MPa = 1 N/mm<sup>2</sup>

### Pressure

Pa	kPa	MPa	bar	kgf/cm <sup>2</sup>	atm	mmH <sub>2</sub> O	mmHg or Torr
1	$1 \times 10^{-3}$	$1 \times 10^{-6}$	$1 \times 10^{-5}$	$1.019\ 72 \times 10^{-5}$	$9.869\ 23 \times 10^{-6}$	$1.019\ 72 \times 10^{-1}$	$7.500\ 62 \times 10^{-3}$
$1 \times 10^3$	1	$1 \times 10^{-3}$	$1 \times 10^{-2}$	$1.019\ 72 \times 10^{-2}$	$9.869\ 23 \times 10^{-3}$	$1.019\ 72 \times 10^2$	7.500 62
$1 \times 10^6$	$1 \times 10^3$	1	$1 \times 10$	$1.019\ 72 \times 10$	9.869 23	$1.019\ 72 \times 10^5$	$7.500\ 62 \times 10^3$
$1 \times 10^5$	$1 \times 10^2$	$1 \times 10^{-1}$	1	1.019 72	$9.869\ 23 \times 10^{-1}$	$1.019\ 72 \times 10^4$	$7.500\ 62 \times 10^2$
$9.806\ 65 \times 10^4$	$9.806\ 65 \times 10$	$9.806\ 65 \times 10^{-2}$	$9.806\ 65 \times 10^{-1}$	1	$9.678\ 41 \times 10^{-1}$	$1 \times 10^4$	$7.355\ 59 \times 10^2$
$1.013\ 25 \times 10^5$	$1.013\ 25 \times 10^2$	$1.013\ 25 \times 10^{-1}$	1.013 25	1.033 23	1	$1.033\ 23 \times 10^4$	$7.600\ 00 \times 10^2$
9.806 65	$9.806\ 65 \times 10^{-3}$	$9.806\ 65 \times 10^{-6}$	$9.806\ 65 \times 10^{-5}$	$1 \times 10^{-4}$	$9.678\ 41 \times 10^{-5}$	1	$7.355\ 59 \times 10^{-2}$
$1.333\ 22 \times 10^2$	$1.333\ 22 \times 10^{-1}$	$1.333\ 22 \times 10^{-4}$	$1.333\ 22 \times 10^{-3}$	$1.359\ 51 \times 10^{-3}$	$1.315\ 79 \times 10^{-3}$	$1.359\ 51 \times 10$	1

Remark 1 Pa = 1 N/m<sup>2</sup>

### Kinematic viscosity

m <sup>2</sup> /s	cSt	St
1	$1 \times 10^6$	$1 \times 10^4$
$1 \times 10^{-6}$	1	$1 \times 10^{-2}$
$1 \times 10^{-4}$	$1 \times 10^2$	1

Remark 1 cSt = 1 mm<sup>2</sup>/s, 1 St = 1 cm<sup>2</sup>/s

## Appendix Table 13 Mechanical Properties of Metal Materials (reference)

### (1) Modulus of longitudinal elasticity, elastic limit, and ultimate strength

Material	Main components and others	Specific gravity	Modulus of longitudinal elasticity (GPa)	Elastic limit $\sigma_e$ (MPa)	Ultimate strength (MPa)		
					Tensile $K_t$	Compression $K_c$	Shear $K_s$
Gray cast iron (FC150)		7.1–7.3	69	29	118	590	108
(FC200)		7.1–7.3	98	88	137– 216	740	206
(FC250)		7.1–7.3	103	88	176– 314	880	206
White heart malleable cast iron	Residual carbon: 1.6% or less	7.1–7.3	158	196	314– 392	820	382
Black heart malleable cast iron		7.2–7.6	158	196	274– 392	820	382
Carbon steel	General	7.7–7.8	196–216	176–245	314– 830	–	–
Extra mild steel	C 0.05–0.15%	7.8	196	118	Over 372	Virtually identical to tensile strength, provided buckling can be ignored	0.8 $K_t$
Mild steel	C 0.15–0.25%	7.8	204	157	372– 392		0.75 $K_t$
Middle hard steel	C 0.25–0.40%	7.8	206	245–294	490– 590		0.75 $K_t$
Hard steel	C 0.40–0.50%	7.8	216	343	590– 690		0.7 $K_t$
Maximum hard steel	C 0.50–0.65%	7.8	216	372	690– 830		0.65 $K_t$
Mild steel	C 0.18% hot rolling	7.8	206	176	421		314
Hard steel	Oil hardening, tempering at 700 °C	7.8	206	343	590		461
Tool steel	C 0.60–1.50% hardening	7.8	216	441	660	820	
Cast steel	General	7.8–7.9	206–211	176–245	343– 600	343–600	284–382
Cast steel (mild)	C 0.15–0.22%	7.8–7.9	206	196	363– 431	363–431	284
Cast steel (middle hard)	C 0.22–0.30%	7.8–7.9	211	225	392– 490	392–490	333
Cast steel (hard)	C 0.30–0.40%	7.9	211	245	490– 590	490–590	382
Nickel steel	C 0.25–0.35% Ni 2–5%	7.85	206–216	333	640– 830	640	401
Chrome steel	C 0.13–0.48% Cr 0.9–1.2%	7.85	206–216	–	780– 980	–	–
Nickel chrome steel	C, Ni, Cr included	7.85	206–216	–	740– 980	–	382–500
Chromium molybdenum steel	C, Cr, Mo included	7.85	206–216	–	830– 980	–	–
Manganese steel	C 0.2–0.46% Mn 1–1.4%	7.85	206–216	–	440–1,080	–	–
Spring steel		7.86	216	735	1,080–1,670	1,670	–
Stainless steel	C, Cr, Ni included	7.75	206–216	–	620	–	410
Brass casting	Cu 60% Zn 40%	8.5	69	–	176– 216	108	147
Brass (forged plate)	Cu 60% Zn 40%	8.4	78– 98	–	274– 392	314	206
Brass (forged rod)	Cu 60% Zn 40%	8.4	82	–	520	314	314
Phosphor bronze casting	Cu 90% Sn 10% P 0.1%	8.8	93–103	–	196– 294	137	176
Phosphor bronze (forging)	Cu 90% Sn 10% P 0.1%	8.8	132	–	294– 980	206	382
Tin		7.28	39– 54	–	27	–	–
Lead		11.34	15– 17	–	20	–	–
Zinc		7.1	78–127	–	78– 176	–	–

### (2) Allowable stress

Unit: MPa

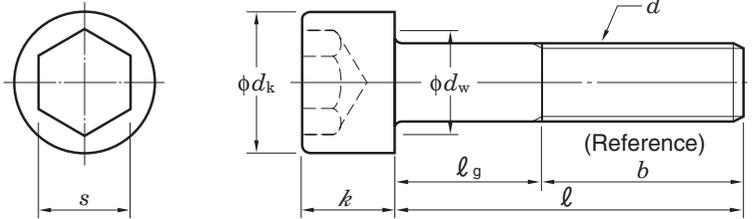

Material	Tensile $K_t$			Compression $K_c$		Bending $K_b$			Shear $K_s$			Torsion $K_d$

- Remarks
1. Priority is given to the nominal sizes of screws without parentheses.
  2. Nominal lengths ( $\ell$ ) to be recommended for the nominal sizes of screw are within the range enclosed by bold lines in the column of "Body length  $\ell_g$ ". In the column of "Body length  $\ell_g$ ", thread of the screw with length shorter than that indicated under dotted lines should be continuous. For the continuous thread stud screw, the incomplete thread portion length under the neck of the screw should be approximately three times of the thread pitch.
  3. The sides of the head of screw should be single or double knurled. The  $d_k$  values in the table are the maximum values without knurls.
  4. Roundness or chamfers on the bearing surface should be provided between the diameter of the head ( $d_k$ ) and the diameter of bearing surface ( $d_w$ ), and the surface should be free from burrs.

As for the bolts with nominal length within this area, standards of continuous thread stud hexagon head bolt (parts class A) should be observed.

- Remarks 1. Priority is given to the nominal sizes of screws without parentheses.
- 2. Nominal lengths ( $\ell$ ) to be recommended for the nominal sizes of screw are within the range enclosed by bold lines.
- 3. Body length  $\ell_g$  (maximum) should be found by the following formula :  $\ell_g$  (maximum) = Nominal length ( $\ell$ ) – Thread length ( $b$ )

- Remarks 1. Priority is given to the nominal sizes of screws without parentheses.  
 2. Nominal lengths ( $\ell$ ) to be recommended for the nominal sizes of screw are within the range enclosed by bold lines.  
 3. Body length  $\ell_g$  (maximum) should be found by the following formula :  $\ell_g$  (maximum) = Nominal length ( $\ell$ ) – Thread length ( $b$ )

Appendix Table 16 Hexagon Head Nuts (abstract from JIS B 1181: 1993)

Parts class A M 1.6 – 16  
 Parts class B M 18 – 64

(1) Parts class A M 1.6–16

Unit: mm

Nominal size of screw <i>d</i>	Coarse screw thread pitch	M 1.6	M 2	M 2.5	M 3	(M 3.5)	M 4	M 5	M 6	M 8	M 10	M 12	(M 14)	M 16
	Fine thread	–	–	–	–	–	–	–	–	–	M 8 × 1	M 10 × 1	M 12 × 1.5	–
		–	–	–	–	–	–	–	–	–	(M 10 × 1.25)	(M 12 × 1.25)	(M 14 × 1.5)	–
Bearing surface dia. <i>d<sub>w</sub></i> (min.)		2.27	3.07	4.07	4.57	5.07	5.88	6.88	8.88	11.63	14.63	16.63	19.64	22.49
Width across flats <i>s</i> (max.)		3.2	4	5	5.5	6	7	8	10	13	16	18	21	24
Width across corners <i>e</i> (min.)		3.41	4.32	5.45	6.01	6.58	7.66	8.79	11.05	14.38	17.77	20.03	23.36	26.75
