RadNet Deployables Capabilities.doc
RadNet Deployables Capabilities.doc

Here is what we know after talking to EPA/NAREL contact. Note that spelling of his name was incorrect in task tracker. It should be Fraass.

## Capabilities of EPA RadNet Deployable Monitoring Stations

- Discussed briefly with Ron Fraass, EPA, NAREL in Alabama (fraass.ron@epa.gov, 334-270-3400) 04/01/2011. Ron is the best contact. (pronounce his name like Frost, without the T.)
- Deployable RadNet Unit Capabilites/Limitations
- Near-real-time (satellite telemetry) data is limited to exposure rate only (compensated GM detector). Spectral data is not available.
- Also have low-volume and high-volume air sampling units. Filters must be manually changed out daily, transported to a laboratory, and analyzed.
- Require ac power, so usually set up at police stations or other public buildings.
- Deployed on a $4 \mathrm{ft} x 4 \mathrm{ft}$ pallet.
- EPA would want an EPA staffer to deploy to setup units and initiate local staff to continue operation.
- EPA staff thinks they may have approximately a dozen units that could be deployed.
- At this time (04/01/2011, 10:00 EDT), NRC has not asked EPA to deploy monitors.

Source Terms for Liquid Effluent from Fukushima Plants
MEXT Ocean Samples_0331.pdf

Lt. Commander O'Neill:

While NRC does produce source term estimates for airborne released from the Fukushima plants, we do not generate source terms for liquid effluents. We were able to confirm that MEXT of Japan has been collecting samples at various sampling points at sea, including at varying depths, and posting the results at the following website:
http://www.mext.go.jp/english/radioactivity level/detail/1304192.htm

The most recent data file, dated March 31, is attached. Hope this information is useful for your modeling needs.

RE: TEPCO Press Release detection of radioactive materials in the water.

Thanks a lot. The J2 was excited to see this. The J5 actually had me brief this during our Principal Update Brief at 1430 hr .

Cheers,
Vince

Yes, some difficulty getting to emails. Sounds like the NRC PMT has been dialing into the regular calls.

Subject: Request NRC representative on Advisory Team Conference Calls
Importance: High
Hi, Lou!
I am sure you are very busy but I wanted to ask if you could find someone to represent the NRC on the Advisory Team conference calls. Although the Advisory Team is NOT activated, we are having these calls to stay connected and aware of what our parent agencies are doing. We really would appreciate having an NRC representative on these calls.

The Advisory Team conference call will be at 1:00 PM (EDT) on March 17, 2011.
Please use the following call-in numbers:
Phone number: 866-561-4509
Pass code: (b)(6)
We hope NRC can be on this call.
Thanks!
Lynn

## SUMMARY:

This report descibes the health effect consequences associated with a hypothetical unknown release to the atmosphere from a raciological source. This is an inital, automated NARAC product, not a final recommendation. Initial predicions are for a limited time period and areas affected may change at later times. Please consult NARAC staff ( $925-222$-7627) for refined, quality assured predictions. Predicioions should be confimed and refired using measurements.

## PRODUCTS:

## Early Phase Dose (0-4d): (Total Effective Dose)

 XE-133

This product idenififes areas that could exceed doses of 5 and 1 rem over a 4 -day exposure period, which begins at the start of the release. If sed to project doses from a potential future release, these levels corespond to the EPADHS guidelines for the Early Phase based on the dose that may be avoided if shelter and evacuation guidance can be implemented prior to the beginning of the release. These Protective Action Guideline (PAG) linits are based on an assessment of the long-tem risk of developing cancer in exposed individuals over their lifetime or producing genetic disorders in subsequent generations. These isks resull from the projecied combined dose caused by radiaion from the material deposited onto the surface, radiation from the material as it is carried in the air, and radiation from the mateial that has been inhaled and retained by the body. Upon request, estimates of the total number of people exposed, and (after accounting for estimated deaths from acute, shor-term effects) the number of expected subsequent fatal cancers and combined number of expecied subsequent fatal and non-fatal cancers may be displayed. These are computer model estimates assuming unprotected exposure and no mitigating action (such as evacuation or shetteing) for the eniire time period of this predicion, and therefore may be overestimates of the actual effects.

## Early Phase Dose (4-8d): (Total Effective Dose)

 XE-133

This product idenififies areas that could exceed doses of 5 and 1 rem over a 4 -day exposure period, which begins at the star of the release. If used to project doses from a potential future release, these levels corespond to the EPADHS guideines for the Early Phase based on the dose that may be avoided if shelter and evacuation guidance can be implemented prior to the beginning of the release. These Protective Aclion Guideline (PAG) limits are based on an assessment of the long-term risk of developing cancer in exposed individuals over their liftime or producing genetic disorders in subsequent generations. These risks resull from the projected combined dose caused by radiation from the maierial deposited onto the surface, radiation from the material as it is carried in the air, and raciation from the mateial that has been inhaled and retained by the body. Upon request, estimaies of the total number of people exposed, and (after accounting for estimated deaths from acule, shor-t-emm effects) the number of expected subsequent fatal cancers and combined number of expected subsequent fatal and non-fatal carcers may be displayed. These are compuler model estimates assuming unprotected expossure and no mitigating action (such as evacuation or shelteing) for the enifre ime period of this prediction, and therefore may be overestimates of the actual effects.

## Early Phase Dose (8-12d) : (Total Effective Dose)

NARAC Contact Information email: anarac@llhl.gov or phone (925) 424.6465

## Offficial Use Onlly-Not Approwed for Further Distribution

 XE-133

This product identifies areas that could exceed doses of 5 and 1 rem over a 4 -day exposure period, which begins at the start of the release. If used to project doses from a potential future release, these evels correspond to the EPADHS guidelines for the Early Phase based on the dose that may be avoided if shelter and evacuation guidance can be implemented prior to the beginning of the release. These Protective Action Guideline (PAG) limits are based on an assessment of the long-term isk of developing cancer in exposed individuals over their lifetime or producing genetic disorders in subsequent generations. These risks resull from the projected combined dose caused by radiation from the material deposited onto the surface, radiation from the material asi is carried in the air, and radiation from the materia that has been inhaled and retained by the body. Upon request, estimates of the total number of people exposed, and (after accounting for estimated deaths from acute, shor-term effects) the number of expected subsequenf fatal cancers and combined number of expected subsequent fatal and non-fatal cancers may be displayed. These are computer model estimates assuming unprotected exposure and no mitigating action (such as evacuation or shettering) for the entire time period of this predicion, and therefore may be overestimates of the actual effects.

## Early Phase Dose ( $0-14 \mathrm{~d}$ ) : (Total Effective Dose)

Materia: : BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + $-131+\mathrm{I}-132+\mathrm{TE}-132+1-133+\mathrm{PU}-241+\mathrm{RE}-86+\mathrm{RU}-103+\mathrm{RU}-106+\mathrm{SB}-127+\mathrm{TE}-127 \mathrm{M}+\mathrm{SR}-89+\mathrm{SR}-90+\mathrm{TE}-129 \mathrm{M}+$ XE-133
This product identifies areas that could exceed doses of 5 and 1 rem over a 4 -day exposure period, which begins at the star of the release. If used to project doses from a potential future release, these levels correspond to the EPADHS guidelines for the Early Phase based on the dose that may be avoided if shetter and evacuation guidance can be implemented prior to the beginning of the release. These Protective Acion Guideline (PAG) linits are based on an assessment of the long-term isk of developing cancer in exposed individuals over their lifeime or producing genetic disorders in subsequent generations. These risks result from the projected combined dose caused by radiation from the material deposited onto the surface, radiation from the material as it is carried in the air, and raciation from the material that has been inhaled and retained by the body. Upon request, estimates of the total number of people exposed, and (ater accounting for estimated deaths from acule, shor-term effects) the number of expected subsequent fatal cancers and combined number of expected subsequent fatal and non-fatal cancers may be displayed. These are computer model estimates assuming unprotected exposure and no mitigating action (such as evacuation or sheltering) for the entire time period of this prediction, and therefore may be overestimates of the actual effects.

## Early Phase Guidance (Radioiodine) ( 0.14 d d : (K1 Administration based on Thyroid Radioiodine Dose)

Materia: : $-131+1-132+T E-132+1-133+T E-129 M$
The U.S. Environmental Protection Agency (EPA) and Department of Homeland Security (DHS) have proposed or accepted similar sets of Protective Action Guides (PAGs) to indicate when protective actions should be considered/implemented to protect the population. These Guides correspond to specific dose levels and are primarily based on an assessment of the risk in developing cancer over an exposed individual's lifelime. Thus the heath effectis produced by these doses may develop over a period of years. In the event radioiodines are released into the atmosphere, the PAG level is based on the projected dose to a child's thyroid which may be avoided by the administering of potassium iodide. Additional levels based on guidance from the U.S. Food and Drug Administration for adults may also be shown. (Note that the PAG level for potassium iodide administration to pregnant women is 5 rem to the adult thyroid.) These model predictions are based on the effects of radiaion from the material inhaled and retained by the body, and use the consevative assumption that individuals are unsheltered and remain in the area during the time period specified in the figure's legend. Health effects could be significanty different for sheltered individuals of for those exposed in these areas for different time periods. Estimates of the number of exposed individuals expected to experience these effects may be given in the legend. If $s 0$, the counts given for all illnesses include those leading to pre-mature death. Note that the counts and area covered by each contour are cumulative such that outer contours indude the counts and areas of all inner contours.

## Worker Protection Dose Rate al 4 d : (Groundshine Dose Rate at 03116/2011 15:25:00 JST)

Materia: : AA-140 + CE-144 + CM-242 +CS-134 + CS-136 + CS-137 + +-131 + $-132+$ TE-132 $+1-133+P U-241+R B-86+R U-103+R U-106+S B-127+T E-127 M+S R-89+S R-90+T E-129 M$ This product identifies the locations where the Federal Radiation Protection Guidance occupational upper limit dose may be exceeded for various exposure periods by unprotected workers performing emergency senvices. These limits are based on the risk of workers developing cancer over thei iffetimes, and ensure that exposures will not result in detimental acute or eaty health

## Official Use Onlly-Not Approved for Fuwther Distribution

effects. Althought these doses may be expressed in terms of the EPA Response Worker Guidelines, these contours may also be used to estimate the ongoing dose received by the unshettered general population. NCRP and NRC administrative control areas are also shown. Note: EPA and NRC guidelines are based on a total dose limit. These contoured dose rate values, if constant over the indicated exposure period, will deliver the equivalent limiting dose. For rapidly-decaying dose rates, these precicions will be consevvative. The dose associated with potential inhalation of resuspended material is not included in these estimates. The relative importance of any committed inhalation dose from resuspended material is dependent on a variety of factors (e.g. weather, radionucides, etc.). Note that the population count and area covered by each contour are cumulative such that outer contours include the counts and areas of all inner contours.

## Worker Protection Dose Rate at 8d: (Groundshine Dose Rate a 0312012011 15:25:00 JST)

 This product identifies the locations where the Federal Radiaion Protection Guidance occupational upper limit dose may be exceeded for various exposure periods by unprotected workers periorming emergency sevices. These limits are based on the risk of workers developing cancer over their liftetimes, and ensure that exposures will not result in detrimental acuite or early headth effects. Although these doses may be expressed in terms of the EPA Response Worker Guidelines, these contours may also be used to estimate the ongoing dose received by the unsheltered general population. NCRP and NRC administrative control areas are also shown. Note: EPA and NRC guidelines are based on a total dose limit. These contoured dose rate values, if constant over the indicated exposure period, will deliver the equivalent limiting dose. For rapidly-decaying dose rates, these predicions will be consevvative. The dose associated with potential inhalation of resuspended material is not included in these estimates. The realive importance of any committed inhalation dose from resuspended material is dependent on a variety of factors (e.g. weather, radionucides, etc.). Note that the population count and area covered by each contour are cumulafive such that outer contours include the counts and areas of all inner contours.

## Worker Protection Dose Rate at $12 \mathrm{~d}:$ :(Groundshine Dose Rate at 03/2412011 15:25:00 JST)

Materia: : $\mathrm{BA}-140+$ CE-144 + CM-242 + CS-134 + CS-136 + CS-137 $+1-131+1-132+\mathrm{TE}-132+\mathrm{H}-133+\mathrm{PU}-241+\mathrm{RB}-86+\mathrm{RU}-103+\mathrm{RU}-106+\mathrm{SB}-127+\mathrm{TE}-127 \mathrm{M}+\mathrm{SR}-89+\mathrm{SR}-90+\mathrm{TE}-129 \mathrm{M}$ This product identifies the locations where the Federal Radiation Protection Guidance occupational upper limit dose may be exceeded for various exposure periods by unprotected workers performing emergency senvices. These limits are based on the risk of workers developing cancer over their lifetimes, and ensure that exposures will not result in detrimental acule or earify health effects. Allhought these doses may be expressed in terms of the EPA Response Worker Guidelines, these contours may also be used to estimate the ongoing dose received by the unsheltered general population. NCRP and NRC administrative control areas are also shown. Note: EPA and NRC guidelines are based on a total dose limit. These contoured dose rate values, if constant over the indicated exposure period, will deliver the equivalent limiting dose. For rapidly-decaying dose rates, these predictions will be consevative. The dose associated with potential inhalation of resuspended material is not included in these estimates. The relative importance of any committed inhalation dose from resuspended material is dependent on a variety of factors (e.g. weather, radionucides, etc.). Note that the population count and area covered by each contour are cumulative such that outer contours include the counts and areas of all inner contours.

## Deposition at 14 d : (Surface Contamination from Deposited Radionuclides)

 This product identifies the more highly contaminated areas due to fallout and deposition of the radioactive material. This material, depending upon the type of radiation emitted, may continue to give significant doses to individuals in these areas through inhalation of resuspended radioactive material o o from direct extemal raciation. These levels of deposited radioactivity should be confirmed by monitoring surverys.

Classification: Officialluse Only - Not Approved for Futher Distribution

## DISCLAMMER:

These model predictions are intended to be guidance, and are not final recommendations. The accuracy of any prediction will be linited by the accuracy of the input data, such as estimates of the amount of material that becomes airbome and the available meteorological data for the area and time of the incident. Plume predicions may be for a linited time peiod, and may change at later times if new input data becomes available. Predictions should be conffrmed and refined using field measurements: Air and ground concentration may be higher than predicted by his plume model simulation due the limied resolution of this particular simulation. For actual incidents or exercises, consult incident command and subject matter experts from the appropriate coordinating agency before making any decisions based on this model prediction.

This document was prepared as an account of work sponsored by an agency of the United States government. Consequence Report
Issued: March 30, 2011 00:30 UTC
Japan Impacts - NRC PRC V3 - Relocation
NARAC Report - Potential Release

## SUMMARY:

This report describes the heath effect consequences associated with a hypothetical unknown release to the ammosphere from a radiological source. This is an initial, automated NARAC product, not a final recommendation. Initial predicions are for a linited time period and areas affected may change al later times. Please consuil NARAC slaf (925-422-7627) for refined, quality assured predictions. Predicitions should be confirmed and refined using measurements.

## PRODUCTS:

Intermediate Phase Relocation PAGs : (Relocation based on Avoidable Groundshine and Resuspension Dose)
 The following figure illustrates the model-predicted regions in which individuals are projected to have an elevated risk of developing fatal and non-fatal cancers due to radiation exposure over a period of many years from the radioactive material that has been deposited on the surface. There are two primary pathways by which individuals will continue to receive a radiological dose while they remain in these areas. Individuals in these regions will be exposed to radiation by direct exposure from radioactive material on surfaces and by exposure from material that has been resuspended into the air and subsequenty inhaled. The U.S. Environmental Protection Agency (EPA) and Deparment of Homeland Security (DHS) have proposed or accepted similar sels of Protective Action Guides (PAGs) to indicate when relocation (long-term removal) of individuals should be considered. These Guides are primaily based on an assessment of the risk in developing cancer over an exposed individuals lifetime, and thus the heath effects produced by the doses may develop over a period of several years. Note that the PAGs were developed based on avoidable dose (i.e. the dose that will be avoided once protective actions have been implemented). These model predicions are based on the conservalive assumplion that individuals are unshellered and remain in the area during the time period specified in the figure's legend. If protective actions have not been implemented by the beginning of this exposure period, the avoidable dose will be less than that shown for the unsheltered population, and accumulated dose will continue to ise at an undiminished rate. Heath effects could be significantly different for sheltered individuals of for those exposed in these areas for different time periods. The contours that may be displayed include the first-year relocation contour where individuals are projected to receive a dose in excess of 2 rem over the remainder of the first year following the release, and the second-year relocation contour where individuals are projected to receive a dose in excess of 0.5 rem during the second year following the release. (Doses received over each of the subsequent years are normally less than those received during the second-year.)

## DISCLAMER:

These model predictions are intended to be guidance, and are not final recommendations. The accuracy of any prediction will be limited by the accuracy of the input data, such as estimates of the amount of material that becomes airbome and the available meteorological data for the area and time of the incident. Plume predictions may be for a limited time period, and may change at later times if new input data becomes available. Predictions should be confirmed and refined using field measurements. Air and ground concentration may be higher than predicted by this plume model simulation due the limited resolution of this particular simulation. For actual incidents or exercises, consult incident command and subject matter experts from the appropriate coordinating agency before making any decisions based on this model prediction.

Here is the rest of the data that was requested.

Nuclear Incident Team (NIT)
Office of Emergency Response (NA-42)
National Nuclear Security Administration U.S. Department of Energy nitops@nnsa.doe.gov nit@doe.sgov.gov 202-5868100

## SUMMARY:

This report describes the health effect consequences associated with a hypothetical unknown release to the atmosphere from a radiological source. This is an initial, automated NARAC product, not a final recommendation. Initial predictions are for a limited time period and areas affected may change at later times. Please consult NARAC staff (925-422-7627) for refined, quality assured predictions. Predictions should be confirmed and refined using measurements.

## PRODUCTS:

## Early Phase Dose ( $0-96 \mathrm{Hrs}$ ) : (Total Effective Dose Including Plume Passage)

Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + PU-241 + RB-86 + $R \mathrm{U}-103+\mathrm{RU}-106+\mathrm{SB}-127+\mathrm{TE}-127 \mathrm{M}+\mathrm{SR}-89+\mathrm{SR}-90+\mathrm{TE}-129 \mathrm{M}+\mathrm{XE}-133$
This product identifies areas that could exceed doses of 5 and 1 rem over a 4-day exposure period, which begins at the start of the release. If used to project doses from a potential future release, these levels correspond to the EPA/DHS guidelines for the Early Phase based on the dose that may be avoided if shelter and evacuation guidance can be implemented prior to the beginning of the release. These Protective Action Guideline (PAG) limits are based on an assessment of the long-term risk of developing cancer in exposed individuals over their lifetime or producing genetic disorders in subsequent generations. These risks result from the projected combined dose caused by radiation from the material deposited onto the surface, radiation from the material as it is carried in the air, and radiation from the material that has been inhaled and retained by the body. Upon request, estimates of the total number of people exposed, and (after accounting for estimated deaths from acute, short-term effects) the number of expected subsequent fatal cancers and combined number of expected subsequent fatal and non-fatal cancers may be displayed. These are computer model estimates assuming unprotected exposure and no mitigating action (such as evacuation or sheltering) for the entire time period of this prediction, and therefore may be over-estimates of the actual effects.

## Early Phase Guidance (Radioiodine) : (KI Administration based on Thyroid Radioiodine Dose)

 Material: l-131 + I-132 + TE-132 + TE-129MThe U.S. Environmental Protection Agency (EPA) and Department of Homeland Security (DHS) have proposed or accepted similar sets of Protective Action Guides (PAGs) to indicate when protective actions should be considered/implemented to protect the population. These Guides correspond to specific dose levels and are primarily based on an assessment of the risk in developing cancer over an exposed individual's lifetime. Thus the health effects produced by these doses may develop over a period of years. In the event radioiodines are released into the atmosphere, the PAG level is based on the projected dose to a child's thyroid which may be avoided by the administering of potassium iodide. Additional levels based on guidance from the U.S. Food and Drug Administration for adults may also be shown. (Note that the PAG level for potassium iodide administration to pregnant women is 5 rem to the adult thyroid.) These model predictions are based on the effects of radiation from the material inhaled and retained by the body, and use the conservative assumption that individuals are unsheltered and remain in the area during the time period specified in the figure's legend. Health effects could be significantly different for sheltered individuals or for those exposed in these areas for different time periods. Estimates of the number of exposed individuals expected to experience these effects may be given in the legend. If so, the counts given for all illnesses include those leading to pre-mature death. Note that the counts and area covered by each contour are cumulative such that outer contours include the counts and areas of all inner contours. NOTE: This release scenario has not produced radiation doses which reach the originally requested threshold levels.

Worker Protection Dose Rate at 96 hrs (Far Field) : (Groundshine Dose Rate at 03/19/2011 03:00:00 JST)
Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + 1-131 + I-132 + TE-132 + PU-241 + RB-86 + $R \mathrm{RU}-103+\mathrm{RU}-106+\mathrm{SB}-127+\mathrm{TE}-127 \mathrm{M}+\mathrm{SR}-89+\mathrm{SR}-90+\mathrm{TE}-129 \mathrm{M}$
This product identifies the locations where the Federal Radiation Protection Guidance occupational upper limit dose

## - Drat Offeinl もse Only Nor Approd for Futher Distribution

are based on the risk of workers developing cancer over their lifetimes, and ensure that exposures will not result in detrimental acute or early health effects. Although these doses may be expressed in terms of the EPA Response Worker Guidelines, these contours may also be used to estimate the ongoing dose received by the unsheltered general population. NCRP and NRC administrative control areas are also shown. Note: EPA and NRC guidelines are based on a total dose limit. These contoured dose rate values, if constant over the indicated exposure period, will deliver the equivalent limiting dose. For rapidly-decaying dose rates, these predictions will be conservative. The dose associated with potential inhalation of resuspended material is not included in these estimates. The relative importance of any committed inhalation dose from resuspended material is dependent on a variety of factors (e.g. weather, radionuclides, etc.). Note that the population count and area covered by each contour are cumulative such that outer contours include the counts and areas of all inner contours.

## Deposition at 96 hrs : (Surface Contamination from Deposited Radionuclides)

Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + PU-241 + RB-86 + RU-103 + RU-106 + SB-127 + TE-127M + SR-89 + SR-90 + TE-129M
This product identifies the more highly contaminated areas due to fallout and deposition of the radioactive material. This material, depending upon the type of radiation emitted, may continue to give significant doses to individuals in these areas through inhalation of resuspended radioactive material or from direct external radiation. These levels of deposited radioactivity should be confirmed by monitoring surverys.

## DISCLAIMER:

These model predictions are intended to be guidance, and are not final recommendations. The accuracy of any prediction will be limited by the accuracy of the input data, such as estimates of the amount of material that becomes airborne and the available meteorological data for the area and time of the incident. Plume predictions may be for a limited time period, and may change at later times if new input data becomes available. Predictions should be confirmed and refined using field measurements. Air and ground concentration may be higher than predicted by this plume model simulation due the limited resolution of this particular simulation. For actual incidents or exercises, consult incident command and subject matter experts from the appropriate coordinating agency degregekingapyectigs

## PRODUCTS:

## Second Year Intermediate Phase Relocation PAG : (Relocation based on Avoidable Groundshine and

 Resuspension Dose)Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + I-133 + PU-241 + RB-$86+\mathrm{RU}-103+\mathrm{RU}-106+\mathrm{SB}-127+\mathrm{TE}-127 \mathrm{M}+\mathrm{SR}-89+\mathrm{SR}-90+\mathrm{TE}-129 \mathrm{M}$
The following figure illustrates the model-predicted regions in which individuals are projected to have an elevated risk of developing fatal and non-fatal cancers due to radiation exposure over a period of many years from the radioactive material that has been deposited on the surface. There are two primary pathways by which individuals will continue to receive a radiological dose while they remain in these areas. Individuals in these regions will be exposed to radiation by direct exposure from radioactive material on surfaces and by exposure from material that has been resuspended into the air and subsequently inhaled. The U.S. Environmental Protection Agency (EPA) and Department of Homeland Security (DHS) have proposed or accepted similar sets of Protective Action Guides (PAGs) to indicate when relocation (long-term removal) of individuals should be considered. These Guides are primarily based on an assessment of the risk in developing cancer over an exposed individual's lifetime, and thus the health effects produced by the doses may develop over a period of several years. Note that the PAGs were developed based on avoidable dose (i.e. the dose that will be avoided once protective actions have been implemented). These model predictions are based on the conservative assumption that individuals are unsheltered and remain in the area during the time period specified in the figure's legend. If protective actions have not been implemented by the beginning of this exposure period, the avoidable dose will be less than that shown for the unsheltered population, and accumulated dose will continue to rise at an undiminished rate. Health effects could be significantly different for sheltered individuals or for those exposed in these areas for different time periods. The contours that may be displayed include the first-year relocation contour where individuals are projected to receive a dose in excess of 2 rem over the remainder of the first year following the release, and the second-year relocation contour where individuals are projected to receive a dose in excess of 0.5 rem during the second year following the release. (Doses received over each of the subsequent years are normally less than those received during the second-year.)

## DISCLAIMER:

These model predictions are intended to be guidance, and are not final recommendations. The accuracy of any prediction will be limited by the accuracy of the input data, such as estimates of the amount of material that becomes airborne and the available meteorological data for the area and time of the incident. Plume predictions may be for a limited time period, and may change at later times if new input data becomes available. Predictions should be confirmed and refined using field measurements. Air and ground concentration may be higher than predicted by this plume model simulation due the limited resolution of this particular simulation. For actual incidents or exercises, consult incident command and subject matter experts from the appropriate coordinating agency before making any decisions based on this model prediction.

Consequence Report
Issued: March 29, 2011 13:12 UTC

## SUMMARY:

This report describes the health effect consequences associated with a hypothetical unknown release to the atmosphere from a radiological source. This is an initial, automated NARAC product, not a final recommendation. Initial predictions are for a limited time period and areas affected may change at later times. Please consult NARAC staff (925-422-7627) for refined, quality assured predictions. Predictions should be confirmed and refined using measurements.

## PRODUCTS:

## First Year Intermediate Phase Relocation PAGs: (Relocation based on Avoidable Groundshine and Resuspension Dose)

Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + PU-241 + RB-86 + RU-103 + RU-106 + SB-127 + TE-127M + SR-89 + SR-90 + TE-129M
The following figure illustrates the model-predicted regions in which individuals are projected to have an elevated risk of developing fatal and non-fatal cancers due to radiation exposure over a period of many years from the radioactive material that has been deposited on the surface. There are two primary pathways by which individuals will continue to receive a radiological dose while they remain in these areas. Individuals in these regions will be exposed to radiation by direct exposure from radioactive material on surfaces and by exposure from material that has been resuspended into the air and subsequently inhaled. The U.S. Environmental Protection Agency (EPA) and Department of Homeland Security (DHS) have proposed or accepted similar sets of Protective Action Guides (PAGs) to indicate when relocation (long-term removal) of individuals should be considered. These Guides are primarily based on an assessment of the risk in developing cancer over an exposed individual's lifetime, and thus the health effects produced by the doses may develop over a period of several years. Note that the PAGs were developed based on avoidable dose (i.e. the dose that will be avoided once protective actions have been implemented). These model predictions are based on the conservative assumption that individuals are unsheltered and remain in the area during the time period specified in the figure's legend. If protective actions have not been implemented by the beginning of this exposure period, the avoidable dose will be less than that shown for the unsheltered population, and accumulated dose will continue to rise at an undiminished rate. Health effects could be significantly different for sheltered individuals or for those exposed in these areas for different time periods. The contours that may be displayed include the first-year relocation contour where individuals are projected to receive a dose in excess of 2 rem over the remainder of the first year following the release, and the second-year relocation contour where individuals are projected to receive a dose in excess of 0.5 rem during the second year following the release. (Doses received over each of the subsequent years are normally less than those received during the second-year.)

Consequence Report

## SUMMARY:

This report describes the health effect consequences associated with a hypothetical unknown release to the atmosphere from a radiological source. This is an initial, automated NARAC product, not a final recommendation. Initial predictions are for a limited time period and areas affected may change at later times. Please consult NARAC staff (925-422-7627) for refined, quality assured predictions. Predictions should be confirmed and refined using measurements.

## PRODUCTS:

First Year Intermediate Phase Relocation PAG: (Relocation based on Avoidable Groundshine and Resuspension Dose)
Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + I-133 + PU-241 + RB$86+$ RU-103 + RU-106 + SB-127 + TE-127M + SR-89 + SR-90 + TE-129M

The following figure illustrates the model-predicted regions in which individuals are projected to have an elevated risk of developing fatal and non-fatal cancers due to radiation exposure over a period of many years from the radioactive material that has been deposited on the surface. There are two primary pathways by which individuals will continue to receive a radiological dose while they remain in these areas. Individuals in these regions will be exposed to radiation by direct exposure from radioactive material on surfaces and by exposure from material that has been resuspended into the air and subsequently inhaled. The U.S. Environmental Protection Agency (EPA) and Department of Homeland Security (DHS) have proposed or accepted similar sets of Protective Action Guides (PAGs) to indicate when relocation (long-term removal) of individuals should be considered. These Guides are primarily based on an assessment of the risk in developing cancer over an exposed individual's lifetime, and thus the health effects produced by the doses may develop over a period of several years. Note that the PAGs were developed based on avoidable dose (i.e. the dose that will be avoided once protective actions have been implemented). These model predictions are based on the conservative assumption that individuals are unsheltered and remain in the area during the time period specified in the figure's legend. If protective actions have not been implemented by the beginning of this exposure period, the avoidable dose will be less than that shown for the unsheltered population, and accumulated dose will continue to rise at an undiminished rate. Health effects could be significantly different for sheltered individuals or for those exposed in these areas for different time periods. The contours that may be displayed include the first-year relocation contour where individuals are projected to receive a dose in excess of 2 rem over the remainder of the first year following the release, and the second-year relocation contour where individuals are projected to receive a dose in excess of 0.5 rem during the second year following the release. (Doses received over each of the subsequent years are normally less than those received during the second-year.)

## DISCLAIMER:

These model predictions are intended to be guidance, and are not final recommendations. The accuracy of any prediction will be limited by the accuracy of the input data, such as estimates of the amount of material that becomes airborne and the available meteorological data for the area and time of the incident. Plume predictions may be for a limited time period, and may change at later times if new input data becomes available. Predictions should be confirmed and refined using field measurements. Air and ground concentration may be higher than predicted by this plume model simulation due the limited resolution of this particular simulation. For actual incidents or exercises, consult incident command and subject matter experts from the appropriate coordinating agency before making any decisions based on this model prediction.

## SUMMARY:

This report describes the health effect consequences associated with a hypothetical unknown release to the atmosphere from a radiological source. This is an initial, automated NARAC product, not a final recommendation. Initial predictions are for a limited time period and areas affected may change at later times. Please consult NARAC staff (925-422-7627) for refined, quality assured predictions. Predictions should be confirmed and refined using measurements.

## PRODUCTS:

Early Phase Dose ( $0-96 \mathrm{Hrs}$ ) : (Total Effective Dose Including Plume Passage) Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + I-133 + PU-241 + RB-$86+\mathrm{RU}-103+\mathrm{RU}-106+\mathrm{SB}-127+\mathrm{TE}-127 \mathrm{M}+\mathrm{SR}-89+\mathrm{SR}-90+\mathrm{TE}-129 \mathrm{M}+\mathrm{XE}-133$
This product identifies areas that could exceed doses of 5 and 1 rem over a 4-day exposure period, which begins at the start of the release. If used to project doses from a potential future release, these levels correspond to the EPANDHS guidelines for the Early Phase based on the dose that may be avoided if shelter and evacuation guidance can be implemented prior to the beginning of the release. These Protective Action Guideline (PAG) limits are based on an assessment of the long-term risk of developing cancer in exposed individuals over their lifetime or producing genetic disorders in subsequent generations. These risks result from the projected combined dose caused by radiation from the material deposited onto the surface, radiation from the material as it is carried in the air, and radiation from the material that has been inhaled and retained by the body. Upon request, estimates of the total number of people exposed, and (after accounting for estimated deaths from acute, short-term effects) the number of expected subsequent fatal cancers and combined number of expected subsequent fatal and non-fatal cancers may be displayed. These are computer model estimates assuming unprotected exposure and no mitigating action (such as evacuation or sheltering) for the entire time period of this prediction, and therefore may be over-estimates of the actual effects.

## Early Phase Guidance (Radioiodine) : (KI Administration based on Thyroid Radioiodine Dose)

Material: I-131 + I-132 + TE-132 + I-133 + TE-129M
The U.S. Environmental Protection Agency (EPA) and Department of Homeland Security (DHS) have proposed or accepted similar sets of Protective Action Guides (PAGs) to indicate when protective actions should be considered/implemented to protect the population. These Guides correspond to specific dose levels and are primarily based on an assessment of the risk in developing cancer over an exposed individual's lifetime. Thus the health effects produced by these doses may develop over a period of years. In the event radioiodines are released into the atmosphere, the PAG level is based on the projected dose to a child's thyroid which may be avoided by the administering of potassium iodide. Additional levels based on guidance from the U:S. Food and Drug Administration for adults may also be shown. (Note that the PAG level for potassium iodide administration to pregnant women is 5 rem to the adult thyroid.) These model predictions are based on the effects of radiation from the material inhaled and retained by the body, and use the conservative assumption that individuals are unsheltered and remain in the area during the time period specified in the figure's legend. Health effects could be significantly different for sheltered individuals or for those exposed in these areas for different time periods. Estimates of the number of exposed individuals expected to experience these effects may be given in the legend. If so, the counts given for all illnesses include those leading to pre-mature death. Note that the counts and area covered by each contour are cumulative such that outer contours include the counts and areas of all inner contours.

Worker Protection Dose Rate at 96 hrs (Far Field) : (Groundshine Dose Rate at 03/19/2011 03:00:00 JST)
Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + I-133 + PU-241 + RB-
$86+$ RU-103 + RU-106 + SB-127 + TE-127M + SR-89 + SR-90 + TE-129M
This product identifies the locations where the Federal Radiation Protection Guidance occupational upper limit dose may be exceeded for various exposure periods by unprotected workers performing emeg\&ygicegfibeqyis

## PRAFT-Official Use Only-Not Approved for Futher Distribution

are based on the risk of workers developing cancer over their lifetimes, and ensure that exposures will not result in detrimental acute or early health effects. Although these doses may be expressed in terms of the EPA Response Worker Guidelines, these contours may also be used to estimate the ongoing dose received by the unsheltered general population. NCRP and NRC administrative control areas are also shown. Note: EPA and NRC guidelines are based on a total dose limit. These contoured dose rate values, if constant over the indicated exposure period, will deliver the equivalent limiting dose. For rapidly-decaying dose rates, these predictions will be conservative. The dose associated with potential inhalation of resuspended material is not included in these estimates. The relative importance of any committed inhalation dose from resuspended material is dependent on a variety of factors (e.g. weather, radionuclides, etc.). Note that the population count and area covered by each contour are cumulative such that outer contours include the counts and areas of all inner contours.

## Deposition at 96 hrs : (Surface Contamination from Deposited Radionuclides)

Material: BA-140 + CE-144 + CM-242 + CS-134 + CS-136 + CS-137 + I-131 + I-132 + TE-132 + I-133 + PU-241 + RB$86+$ RU-103 + RU-106 + SB-127 + TE-127M + SR-89 + SR-90 + TE-129M

This product identifies the more highly contaminated areas due to fallout and deposition of the radioactive material. This material, depending upon the type of radiation emitted, may continue to give significant doses to individuals in these areas through inhalation of resuspended radioactive material or from direct external radiation. These levels of deposited radioactivity should be confirmed by monitoring surverys.

Plutonium Detected In Fukushima 'Not Significant': U.S. Official WASHINGTON (Kyodo)--A senior U.S. Energy Department official said Tuesday the level of plutonium detected in soil at the crippled Fukushima Daiichi nuclear power plant in Japan is "not significant."
"Certainly it would be a concern if it were in significant levels ... It was not significant at this point," Peter Lyons, acting assistant secretary of the department's Office of Nuclear Energy, said in a hearing of the Senate Energy and Natural Resources Committee.

He also noted finding plutonium that was derived from either the operating reactors or the spent fuel pools "would not be regarded as a major surprise."

Tokyo Electric Power Co., the operator of the stricken reactors, said Monday that plutonium has been detected in soil at five locations at the Fukushima Daiichi nuclear power plant.

In the Senate panel, Lyons said, "Current information suggests that the plants are in a slow recovery from the accident."

Although long-term cooling of the troubled reactors at Fukushima Daiichi Nuclear Power Station is essential, "it has not been adequately restored to date," he added.

Lyons revealed the United States plans to provide Japan with radiation-hardened robotics to assist the country's efforts to deal with the nuclear crisis.

The official also suggested that the nuclear accident in Japan will not alter U.S. energy policy, saying, "We view nuclear energy as a very important component to the overall portfolio we are trying to build a clean-energy future:"

President Barack Obama is scheduled to deliver a speech on U.S. energy security in Washington on Wednesday and may touch on the Japan's nuclear disaster and its implications for the U.S. policy.

Anthropogenic plutonium in japaneese soil
japanplu.pdf

# 4.31 Isotope ratios of ${ }^{240} \mathrm{Pu}{ }^{239} \mathbf{P u}$ in soil samples from different areas 

Yasuyuki Muramatsu ${ }^{1}$, Satoshi Yoshida ${ }^{1}$ and Shinnosuke Yamazaki ${ }^{2}$<br>${ }^{1}$ National Institute of Radiological Sciences: Anagawa 4-9-1, Inage, Chiba, 263-8555 Japan<br>${ }^{2}$ Tokyo Nuclear Service Inc.: Ueno 7-6-5, Taito-ku, Tokyo, 110-0005 Japan

#### Abstract

Plutonium concentrations and ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ atom ratios in soil samples from Japan and other areas in the world (including IAEA standard reference materials) were determined by ICP-MS. The range of ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ atom ratios observed in 21 Japanese soil samples was $0.155-0.194$ and the average was $0.180 \pm 0.011$, which is comparable to the global fallout value. A low ratio of about 0.05 , which is derived from Pu-bomb, was found in samples from Nishiyama (Nagasaki) and Mururoa Atoll (IAEA-368), while a high ratio of about 0.31 was found in a sample from Bikini Atoll (Marshall Islands). The ratio for Irish Sea sediment (IAEA-135) was 0.21 , which was higher than the global fallout value, suggesting the influence by the contamination from the Sellafield facility. The ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratios in soils from the Chernobyl area were determined, and the ratio was found to be very high (about 0.4), indicating the high burn-up grade of the reactor fuel. These results show that the ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio can be used as a finger print to identify the source of the contamination.

## Keywords

Plutonium, ICP-MS analysis, isotope ratio, soil, different areas

## 1. INTRODUCTION

Plutonium is one of the most important radionuclides in the field of radioecology. There are different anthropogenic sources of Pu in the environment [1]. Atomic weapons testing introduced the major deposited fraction of Pu to the global environment. High Pu levels are known for the nuclear weapons testing sites such as in the Marshall Islands, Mururoa Atoll, Nevada and Semipalatinsk. In the Nishiyama area (Nagasaki/Japan) elevated Pu concentrations were observed [2]. Plutonium has also been released into the environment through operation or accidents at nuclear facilities such as Sellafield/UK, Kyshtym/Russia, Chemobyl/Ukraine, etc. The deep-sea disposal of packaged waste around the Farallon Islands (California/USA) and in the North Atlantic would be potential contamination sources in the marine environment. Accidental burn-up of the SNAP9A satellite in 1964 also released Pu, which was used for the battery, into the atmosphere.

However, there is only a limited volume of quality data available on the isotope compositions of Pu (specifically, ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio). This is mainly due to the fact that ${ }^{239} \mathrm{Pu}$ and ${ }^{240} \mathrm{Pu}$ have similar alpha energies and cannot be easily resolved by alpha spectrometry. We have developed a reliable method
for the determination of ${ }^{239} \mathrm{Pu}$ and ${ }^{240} \mathrm{Pu}$ by ICP-MS (Inductively Coupled Plasma Mass Spectrometry) [3].

In this paper, we report the analytical methods for Pu by ICP-MS, ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio in soil (or sediments) samples from different areas (e.g. Japan, Chernobyl, the Marshall Islands) and the differences in the ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ ratios according to the soil profile.

## 2. MATERIALS AND METHOD

Analytical procedures used were based on the method reported previously [3, 4]. Only a brief description is given here. Samples ( $1-10 \mathrm{~g}$, depending on the concentration level) were mixed with a known amount of ${ }^{242} \mathrm{Pu}$ tracer (CRM 130, New Brunswick Laboratory) in a Pyrex beaker and treated with $8 \mathrm{M} \mathrm{HNO}_{3}$ (more than 8 times the sample weight). Special attention should be paid to the high production of $\mathrm{CO}_{2}$ bubbles during the acid dissolution step to avoid loss of sample. The beaker was covered with a watchglass and boiled on a hot plate $\left(180-200^{\circ} \mathrm{C}\right)$ for about 5 hours. The warm supernatant (leachate) was then filtered through a glass fiber filter. The residue in the beaker was treated again with $8 \mathrm{M} \mathrm{HNO}_{3}$ for about 30 minutes, then filtered. This leaching procedure was usually repeated at least twice. The filtrates were collected in a beaker, and heated on a hot plate until a thick wet paste was obtained. The paste was then dissolved in $\mathrm{HNO}_{3}$, and diluted with deionized water to adjust the solution to $8 \mathrm{M} \mathrm{HNO}_{3}$. Chemical form of plutonium was converted to tetravalent Pu (IV), which is the only retainable form in the chromatography column, with $\mathrm{NaNO}_{2}$. Sample solution was loaded onto the column containing 2 mL of Dowex 1 X 8 at a speed $<2 \mathrm{~mL} \mathrm{~min}^{-1}$. The resin was washed with 40 mL of $8 \mathrm{M} \mathrm{HNO}_{3}$, then with 40 mL of 10 M HCl . Finally, plutonium was eluted from the column using 40 mL of $\mathrm{NH}_{4} \mathrm{I}(5 \%)-10 \mathrm{M} \mathrm{HCl}$ solution which reducing Pu (IV) to Pu (III). In order to remove iodine, the eluant was treated with 4 mL of $\mathrm{HNO}_{3}$ and 1 mL of $\mathrm{H}_{2} \mathrm{O}_{2}$, and the solution heated to dryness. The residue was then dissolved in $4 \% \mathrm{HNO}_{3}$ and plutonium isotopes measured by ICP-MS using a quadrupole-type mass spectrometer (Q-ICP-MS; Yokogawa PMS-2000) and also high resolution-type (HR-ICP-MS; Finnigan Element).

Concentrations of ${ }^{239} \mathrm{Pu}$ and ${ }^{240} \mathrm{Pu}$ were calculated from the results using isotope dilution methods. Three separate measurements of each solution digest were performed-normally the internal precision of these measurements was around $\pm 5 \%$. A plutonium isotopic standard (NIST-947) with a known ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio was also used to check the accuracy of the isotopic ratio measurements, and to correct for any mass bias.

## 3. RESULTS AND DISCUSSIONS

## $3.1{ }^{2+0} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ ratios in Japanese soil samples

Analytical results for 21 Japanese soil samples collected from different places showed that the concentrations of $\mathrm{Pu}\left({ }^{239+260} \mathrm{Pu}\right)$ ranged from $0.15-4.3 \mathrm{~Bq} / \mathrm{kg}$ (dry weight basis). The concentrations in surface soils collected from forests were higher than those from agricultural fields. The range of ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ atom ratios observed in the Japanese soil samples was $0.155-0.194$ (excluding

Nishiyama/Nagasaki sample) and the average was $0.180 \pm 0.011$. These values were comparable to the global fallout value of $0.176 \pm 0.014$ reported by Krey [5], which was based on the mass-spectrometric measurements of various soils (about 60) collected world-wide. Variation between the lowest to highest ratio might be due to the influence of different fallout events, since a variety of nuclear weapons has been tested world-wide. Differentiation of the ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ ratio might also occur during the migration of Pu in the environment (e.g. in soil), because chemical species of Pu would depend on individual fallout.

In order to know the vertical distribution of Pu in soil, samples were collected at 4 different depths $(0-2 \mathrm{~cm}, 2-5 \mathrm{~cm}, 10-20 \mathrm{~cm}$ and $20-30 \mathrm{~cm}$ ) at the same point in a pine forest in Aomori Prefecture. It was observed that Pu concentration was markedly higher in the surface soil layer (specifically in the $0-5 \mathrm{~cm}$ depth) than in deeper layers (see Table 1). This suggested that the migration of Pu into lower soil layers was very slow and most of Pu is still retained in the surface soil for more than 30 years after the fallout peak (around 1963). A tendency was observed for the ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio to increase with depth, although the differences were not so large. If these differences had been statistically significant, there could be a possibility that species having a higher ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio migrated in the soil faster than those having a lower ratio. However, it is necessary to analyze more samples from different areas, before we can confirm this hypothesis. There was also a possibility that the difference of the isotope ratios and the Pu chemical forms were related to the different origin of the fallout, which were influenced by the type and scale of the explosion.

Table 1 Concentrations of ${ }^{239} \mathrm{Pu}$ and ${ }^{240} \mathrm{Pu}$ and their atom ratios in soils from a forest in Aomori Prefecture (on a dry weight basis).

### 3.2 Comparison of the ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ ratios from different areas

The ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratios analyzed by us for samples originating from several different areas (including IAEA standard reference materials) are summarized in Figure 1. Details on the samples from the Chernobyl area and from the Marshall Islands were published elsewhere [6, 7].

The value for surface soil collected from Austria (IAEA-SOIL-6) was $0.191 \pm 0.005$, which was somewhat larger than the Japanese soil, but within the range of the global fallout value of $0.176 \pm$ 0.014 reported by Krey [5].

Ocean sediment from Mururoa Atoll (IAEA-368) had a value of $0.04 \pm 0.008$. This suggested that Pu was derived from the testing of a Pu-bomb in which ${ }^{239} \mathrm{Pu}$ was enriched. However, the ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$
atom ratio for samples from the Marshall Islands (IAEA-367) showed a high value of about 0.30 , although the concentration of ${ }^{239+240} \mathrm{Pu}$ in these two marine sediments was similar. The high ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratio for samples found for the Marshall Islands sample was similar to the ratio reported by Komura et al. [8] measured in two samples of Hemp-palm leaves ( $0.338 \pm 0.051$ and $0.318 \pm 0.033$ ) used in the Japanese fishing boat, No. 5 Fukuryu-Maru (Lucky Dragon), which was directly contaminated in a thermonuclear bomb test at Bikini Atoll. The difference of the atom ratio observed in Mururoa Atoll and the Marshall Islands may be due to the type of the weapons tested. Since several different tests were probably carried out in both islands, we could not conclude that the values mentioned here were representative for these areas; they are just for examples based on our analytical results in standard reference materials.

The ratio obtained for the Irish Sea sediment sample (IAEA-135) of 0.211 was higher than the global fallout value. The higher value would be influenced by the contamination from the Sellafield facility. Our value was comparable to the ratio (0.20) reported by Yamamoto et al. [9] in a sediment sample originating from the Sellafield area. Fish flesh from the Irish Sea (IAEA-134) showed a similar value of 0.200 to the Irish Sea sediment sample, suggesting that the origin of the contamination seemed to be the same.

Fig. $1{ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ atom ratio in samples from different areas

The very low value of the ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratio ( 0.04 ) observed in the sample collected from Nishiyama/Nagasaki indicated the influence of Pu from the bomb dropped in August 1945. The low ratio observed in a sample from Kyshtym of about 0.07 indicated the Pu was related to the contamination due to the release of nuclear materials from the nearby military facility.

Analytical results for surface soil samples collected from the 30 Km zone of the Chernobyl reactor showed very high ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratios of about 0.41 [6]. There were almost no differences in the ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratios between the samples analyzed in our study, although the ${ }^{239+240} \mathrm{Pu}$ levels varied very widely, i.e. $6.3-1430 \mathrm{~Bq} \mathrm{~kg}$, depending on the distances from the reactor and also on the soil layers. The ratio observed in the Chernobyl area was much higher than that attributed to weapons fallout. This high ratio should be related to the high burn-up grade of the reactor fuel. The ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio observed might be used in identifying the distribution of the Chernobyl-derived Pu in the environment.

As already mentioned that the average ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratio in global fallout was around 0.18 ; it is interesting to consider which significant sources (nuclear weapons types, etc.) contributed to this ratio. In our previous study [7] on Pu analysis in soil samples from the Marshall Islands, we saw there was a large variation of ${ }^{240} \mathrm{Pu} /{ }^{239} \mathrm{Pu}$ ratios, depending on the type of devices having tested. For example, samples from Bikini Island (Bikini Atoll) had a high ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio of 0.302-0.306. This Island received direct contamination from the fallout originating from the Castle-BRAVO thermonuclear test ( 15 Mt ) at Namu Island (Bikini Atoll) in March 1954. On the other hand, the very low ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratio of 0.065 with a high Pu concentration ( $1420 \mathrm{~Bq} \mathrm{~kg}{ }^{-1}$ ) was observed in a sample from Runit Island (Enewetak Atoll), in which Pu bombs were tested. As mentioned above, one $\left.{ }^{240} \mathrm{Pu}\right)^{239} \mathrm{Pu}$ ratio found in Nishiyama/Nagasaki was also very low, 0.037 , due to the influence of Pu bomb fallout. If we consider the mixture of Pu isotopes from the above-mentioned two major sources, Pu bombs and thermonuclear bombs, the mean ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ atom ratio might be similar to the average ratio found in global fallout. However, data are still lacking on source specific ${ }^{240} \mathrm{Pu}{ }^{239} \mathrm{Pu}$ ratios from different nuclear weapons tests, including thermonuclear tests other than the BRAVO bomb.

The determination of the Pu isotope ratio is important in understanding the source of the nuclide and the ratio can be used as a finger print in the environmental monitoring of Pu .

Hi Cyndi, Casper, et al.,
Thanks for your comments on my report, Cyndi. I have worked through them and now have the report in good shape. I'll be in touch if I have further questions, but for now I think I'm ok. I've attached the report. You will notice that I acknowledge assistance from NRC, which I greatly appreciate. I will update the report from time to time, so let me know if you have any thoughts, esp. things to add.
Best,
Jon

Hi Jonathan-
I have been working in the Ops Center on swing shift the past week and got your phone message regarding the comments that NRC provided on your draft CRS document. I did not see the comments that NRC passed on to
you, however, I am ccing the Protective Measures Team Director and Dr. Casper Sun, who was in the PMT that provided the mark-ups on your document.

PMT and/or Casper- Can you please call Jonathan back at 202-707-7632 to go over the comments provided?
Thanks
Cyndi

Here's a somewhat technical explanation of what happened at the Japanese Nuclear powerplant. May be too deep for some -- but it's interesting reading.

These slides came from the Nuclear Safety Monitoring at Lawrence Livermore National Laboratory. They explain how the plant is constructed, what they believe happened and what they don't yet know. Also provided are URL's to websites for more up to date information.

Like an hour from now. I'm assuming you're not going to make it. My fault for just getting this to you.
I've been told by a number of experts now that the NRC is concerned that a sudden change to metric could create confusion and raise the risk of an accident. I feel reasonably confident that this must be correct. If you find out otherwise, please let me know.

Thanks.

Hi Scott,

I have to bug you with yet another question for my Slate Explainer column, although this one is relatively straightforward (I think).

Why does the NRC make facilities report radiation quantities in old units (curies, rad, and rem) rather than in the new ones (becquerel, gray, and sieverts)?

Any thoughts?

Thanks again.

Brian

Brian - the file titled "Description for the NIT.doc" explains the FDA Derived intervention levels (page 1-2) and the milk pathway DRL calculation specifically (page 3-4). The other word document contains the answers to several questions that were posed to the FDA regarding produce/milk/feed/etc.etc. for various locations of interest in the Trans_Pacific runs.

No questions, and therefore no answers are included regarding Wake Island. I know nothing about it, but will see what I can find out before the Melcor trans-pacific memo is done.

## Explanation of FRMAC's Ingestion Pathway Analysis

The Derived Intervention Levels (DILs) are established by the U.S. Food and Drug Administration (FDA) or are derived using the FDA's methodology. The DIL represents the amount of contamination (e.g., $\mu \mathrm{Ci} / \mathrm{kg}$ ) that is expected to produce a dose equal to the FDA's protective action guide (PAG) for food consumption over a period of one year. The default FDA PAGs are 500 mrem effective (whole body) dose and 5,000 mrem equivalent dose to the most restrictive organ.

The FDA has precalculated the DIL values for the radionuclides listed in Table 4.1-1 (from the FRMAC Assessment Manual. These values must be used when evaluating the radionuclides (and groups of radionuclides) in the table unless an alternate DIL is requested by the Advisory Team or local decision makers. DIL values for radionuclides not listed in table 4.1-1 are calculated using the steps in FRMAC Assessment Method Method 4.1.2.

I-131 and Cs-137 are listed in Table 4.1-1, and therefore, FRMAC did not calculated DIL values for these radionuclides.

Table 4.1-1 FDA-Listed Ingestion DILs (FDA 1998)

| Radionuclide Group | $\begin{aligned} & \text { FDA DIL } \\ & \left(\mathrm{Bq} / \mathrm{kg}_{\mathrm{wet}}\right) \end{aligned}$ | $\begin{aligned} & \text { FDA DIL }{ }^{\mathrm{a}} \\ & \left(\mu \mathrm{Ci} / \mathrm{kg}_{\text {wet }}\right) \end{aligned}$ |

| ${ }^{244} \mathrm{Cm}$ | 2 | $5.4 \mathrm{E}-05$ |

${ }^{\text {a }}$ A food sample is considered to exceed the DIL if it meets or exceeds the DIL for any individual nuclide. Analysis results are not summed across nuclides except the combinations specifically stated (i.e., ${ }^{134} \mathrm{Cs}+{ }^{137} \mathrm{Cs},{ }^{238} \mathrm{Pu}+{ }^{239} \mathrm{Pu}+{ }^{241} \mathrm{Am}$, and ${ }^{103} \mathrm{Ru}+{ }^{106} \mathrm{Ru}$ ).

The Ingestion DRL (Ing_DRL) represents the amount of contamination on food or forage that is projected to result in the food to grown in the contaminated area to equal the FDA's contamination limits (DIL). The example below shows how the Milk_DRL is calculated. The calculation

## Method 4.3.1 Ingestion DRL for Milk based on areal activity ( $\mu \mathrm{Ci} / \mathrm{m}^{\mathbf{2}}$ ) on forage

This method calculates the areal activity level ( $\mu \mathrm{Ci} / \mathrm{m}^{2}$ ) of a radionuclide deposited over a grazing area that would result in a grazing animal's milk exceeding the DIL for the radionuclide.

## Calculation

Equation 4.3-1 shows this Milk_DRL area calculation.

$$
\begin{aligned}
& \text { Milk_DRL } L_{\text {area }, A, i}=\frac{D I L_{\text {organ }, \text { age. } i} * \rho_{\text {milk }}}{\left[\frac{(C R F * A F D I R)}{Y}+\frac{A S D I R}{\rho_{\text {soili }} * d_{m}}\right] * F D C_{F} * T F_{\text {Mikk } A . i i} * e^{-\lambda_{t, m}}} \text { (Eq. 4.3-1) } \\
& \frac{\mu \mathrm{Ci}}{\mathrm{~m}^{2}}=\frac{\frac{\mu \mathrm{Ci}}{\mathrm{~kg}_{\text {we }}} * \frac{\mathrm{~kg}_{\text {wet }}}{1}}{\left[\frac{\left(\text { unitless } * \frac{\mathrm{~kg}_{\text {wet }}}{\mathrm{d}}\right)}{\frac{\mathrm{kg}_{\text {wer }}}{\mathrm{m}^{2}}}+\frac{\frac{\mathrm{kg}_{\text {siil }}}{\mathrm{d}}}{\left.\frac{\mathrm{~kg}_{\text {siil }} * \mathrm{~m}}{\mathrm{~m}^{3}}\right] * \text { unitless } * \frac{\mu \mathrm{Ci} / 1}{\mu \mathrm{Ci} / /} * \text { unitless }}\right.}
\end{aligned}
$$

where:

> Milk_DRL $L_{\text {area, }, i, i}=$ Ingestion Derived Response Level for Milk, the ground concentration, or areal activity, of radionuclide $i$ that will be expected to cause the milk produced by grazing animals $(A)$ to exceed the Derived Intervention Level (DIL) for that radionuclide, $\mu \mathrm{Ci} / \mathrm{m}^{2}$;
> $D I L_{\text {organ, age, } i}=$ Derived Intervention Level, the activity concentration level of radionuclide $i$ at which the ingestion dose to the most sensitive population (age group) and target organ has the potential to exceed the applicable ingestion PAG, $\mu \mathrm{Ci} / \mathrm{kg}_{\text {wet }}$;
> $\rho_{\text {milk }}=$ Milk density (default 1.04), $\mathrm{kg}_{\text {wet }} / \mathrm{l}$;
> $C R F=$ Crop Retention Factor, the fraction of deposited material that is retained by the edible portion of the crop ( 1.0 for iodine, 0.5 for other radionuclides), unitless;
> $A F D I R=$ Animal Feed Daily Ingestion Rate, the daily rate at which an animal consumes feed (default 50 ), $\mathrm{kg}_{\text {wel }} / \mathrm{d}$;
> $Y=$ Crop Yield, the mass of crop grown per area of land, (default 0.7 ); $\mathrm{kg}_{\text {wet }} / \mathrm{m}^{2}$
> ASDIR = Animal Soil Daily Ingestion Rate, the daily rate at which an animal consumes soil (default 0.5 ), $\mathrm{kg}_{\text {soil }} / \mathrm{d}$;
> $\rho_{\text {soil }}=$ Soil density (default 1600 ), $\mathrm{kg}_{\text {soil }} / \mathrm{m}^{3}$;
> $d_{m}=$ Mixing Depth (default 1.0E-03), m;
> $F D C_{F}=$ Fraction of Diet Contaminated (feed), the fraction of the animal's diet that is from contaminated feed (default 1.0), unitless;

NOTE: If there is convincing local information that the actual $F D C$ is considerably different, local authorities may decide to use a different $F D C$.
$T F_{\text {Milk,A.i }}=$ Transfer Factor for Milk, the fraction of radionuclide $i$ consumed by an animal $(A)$ that is transferred to the milk produced by the animal, $\mu \mathrm{Ci} / 1$ per $\mu \mathrm{Ci} / \mathrm{d}$;
$\lambda_{i}=$ Decay constant for the radionuclide $i, \mathrm{~d}^{-1}$;
$t_{m}=$ Time to Market, the number of days from harvest to consumption (default 2), d; and
$e^{- \text {-itm }}=$ Radioactive Decay adjustment for radionuclide $i$ over time $t_{m}$, unitless.

## EXAMPLE 1

## Problem: Calculate the Cow Milk Ingestion DRL for ${ }^{60} \mathrm{Co}$ in units of areal activity ( $\mu \mathrm{Ci} / \mathrm{m}^{\mathbf{2}}$ )

The most conservative DIL for ${ }^{60} \mathrm{Co}$ is $0.02 \mu \mathrm{Ci} / \mathrm{kg}_{\text {wet }}$ ( 3 month old, whole body).
Equation 4.3-1 can be used to calculate the DRL.

$$
\text { Milk_ } D R L_{\text {area }, A, i}=\frac{D I L_{\text {orgal, age. } i} * \rho_{\text {milk }}}{\left[\frac{(C R F * A F D I R)}{Y}+\frac{A S D I R}{\rho_{\text {soil }} * d_{m}}\right] * F D C_{F} * T F_{\text {Milk, }, i, i} * e^{-\lambda_{i, m}}}
$$

Assuming:

$$
\begin{aligned}
\rho_{\text {milk }} & =1.0 \mathrm{~kg}_{\text {wet }} / \mathrm{l}, \\
C R F & =1.0 \text { for iodine }, \\
A F D I R_{\text {cow }} & =50 \mathrm{~kg}_{\text {wet }} / \mathrm{d}, \\
Y & =0.7 \mathrm{~kg}_{\text {wet }} / \mathrm{m}^{2}, \\
A S D I R_{\text {cow }} & =0.5 \mathrm{~kg}_{\text {soil }} / \mathrm{d}, \\
\rho_{\text {soil }} & =1600 \mathrm{~kg}_{\text {soi }} / \mathrm{m}^{3}, \\
d_{m} & =1.0 \mathrm{E}-03 \mathrm{~m}, \\
F D C_{F} & =1.0, \\
T F_{\text {Milk,cow. } 60 \mathrm{Co}} & =9 \mathrm{E}-3 \mu \mathrm{Ci} / \mathrm{l} \text { per } \mu \mathrm{Ci} / \mathrm{d} \text { for } \mathrm{I}-131, \\
\lambda_{I-13 l} & =8.62 \mathrm{E}-2 \mathrm{~d}^{-1}, \text { and } \\
t_{m} & =2 \text { days. }
\end{aligned}
$$

The Milk_DRL area for ${ }^{60}$ Co for cow milk equals:

Therefore cows grazing in areas with ${ }^{60} \mathrm{Co}$ contamination on the ground greater than $1.85 \mu \mathrm{Ci} / \mathrm{m}^{2}$ have the potential to produce milk that would exceed the DIL. Milk that exceeds the DIL could produce a dose that exceeds the PAG when consumed by a 3 month old.

The FRMAC's CMHT is evaluating the ingestion pathway for areas that may be impacted by the plume from the Fukushima Reactor Facility. The regions that we are interested in are:
Southern Alaska

- Hawaii
- Midway Island
- Northern California
- Southern California
- Oregon, and
- Washington State

In order to accurately evaluate the crops/foods that may become contaminated and enter the human food chain we need to know the following information for each of the areas listed above.

## MILK PATHWAY:

Are dairy cows in the area which supply milk?
Are the cows feeding on pasture grass, and if so, what percent of their diet is the pasture grass.

## CROPS AND PRODUCE PATHWWAY:

Are produce crops grown in the area?
Are any crops mature and ready to be harvested.
If crops are in the field and are not mature and ready for harvest, how long are they expected to continue to grow before they are ready to be harvested?

## MEAT PATHWAY:

Are meat-producing animals (e.g., beef cattle, and more importantly daily or weekly $\%$ of spent dairy cattle) raised in the area that are intended to be a source of meat.
If meat-producing animals are grown in the area, how long will they continue to mature before they will be harvested.
What fraction of the meat-producing animal's diet is comprised of pasture grass?

|  | Subje | Request for information by Dept. of Energy FRMAC |

Greetings All,
As a member of the Radiological Advisory Team for Environment Food and Health, USDA works closely with the radiological subject matter experts at the DOE Federal Radiological Monitoring and Assessment Center to provide them agricultural information that helps calculate potential risk of contamination to the food chain. We have been sent a series of questions by the FRMAC Consequence Management Home Team and have been asked to reach out to all appropriate APHIS/PPQ/State resources to try to fill in some of the blanks before a potential plume reaches the US today or tomorrow. Please ask everyone to continue to update even past that time as the more information we have the better the FRMAC can inform the Advisory Team so they can make Protective Action Recommendations to Federal, State, local and tribal responders. Any help you can provide involving your state counterparts and in general, pushing this forward, would be greatly appreciated by all. This is a great opportunity for USDA (and Veterinary Services in particular) to come to the table in real time of need. For once, ***THIS IS NOT AN EXERCISE***
Thanks, and best regards,
Gordon

Obviously some of these questions are unanswerable in any detail. Please use your experiential calculus to give the best SWAG you can. The Dairy issues, including 'spent' dairy cows to slaughter, are of the highest priority.

The FRMAC's CMHT is evaluating the ingestion pathway for areas that may be impacted by the plume from the Fukushima Reactor Facility. The regions that we are interested in are:

## Southern Alaska

- Hawaii
- Midway Island
- Northern California
- Southern California
- Oregon, and
- Washington State

General information RE: dairy cow culls to slaughter: Industry average is $36 \%$ per year or $0.69 \%$ per week.

## Washington State

In order to accurately evaluate the crops/foods that may become contaminated and enter the human food chain we need to know the following information for each of the areas listed above.

## MILK PATHWAY:

Are dairy cows in the area which supply milk? WA Yes. HI Yes
Are the cows feeding on pasture grass, and if so, what percent of their diet is the pasture grass. WA Yes. HI Yes. 50\% of diet is grasses. Grasses not consumed on pasture. Stored grasses fed.

## CROPS AND PRODUCE PATHWWAY:

Are produce crops grown in the area? WA Yes. HI Yes
Are any crops mature and ready to be harvested. WA No. HI Yes
If crops are in the field and are not mature and ready for harvest, how long are they expected to continue to grow before they are ready to be harvested? WA 3 months, HI: Currently harvesting

## MEAT PATHWAY:

Are meat-producing animals (e.g., beef cattle) raised in the area that are intended to be a source of meat. WA Yes. HI Yes
If meat-producing animals are grown in the area, how long will they continue to mature before they will be harvested. WA and HI. This is a continuous production cycle. Animals are harvested throughout the year.
What fraction of the meat-producing animal's diet is comprised of pasture grass? 50\%. Varies depending on production stage of animal.

HAWAII

## MILK PATHWAY:

Are dairy cows in the area which supply milk? Yes.
Are the cows feeding on pasture grass, and if so, what percent of their diet is the pasture grass. Yes, the cows feed on grass; $100 \%$ with the exception of supplemental feed for periods of
drought. One dairy produces corn silage on-site to feed its cows, in addition to grass feed. The county with dairy production is currently experiencing drought conditions.

## CROPS AND PRODUCE PATHWWAY:

Are produce crops grown in the area? Yes.
Are any crops mature and ready to be harvested. Yes. Year-round production and harvest. If crops are in the field and are not mature and ready for harvest, how long are they expected to continue to grow before they are ready to be harvested? Year-round production and harvest.

## MEAT PATHWAY:

Are meat-producing animals (e.g., beef cattle) raised in the area that are intended to be a source of meat. Yes.
If meat-producing animals are grown in the area, how long will they continue to mature before they will be harvested. Year-round production and harvest.
What fraction of the meat-producing animal's diet is comprised of pasture grass? $100 \%$ with the exception of supplemental feed for periods of drought, with two counties experiencing drought conditions now.

MIDWAY ISLAND - No production of any kind is carried out.

## OREGON AREA RESPONSE--18MAR11

## MILK PATHWAY:

Are dairy cows in the area which supplies milk?
YES. Oregon state dairy cow inventory total: 114,000

Are the cows feeding on pasture grass, and if so, what percent of their diet is the pasture grass.
YES. Approximately 50\% graze pasture at some point in the production cycle.

## CROPS AND PRODUCE PATHWWAY:

Are produce crops grown in the area?
YES

Are any crops mature and ready to be harvested?

## YES. Mainly greenhouse grown tomatoes and lettuce/greens at this time.

If crops are in the field and are not mature and ready for harvest, how long are they expected to continue to grow before they are ready to be harvested?
Spring produce: Harvest begins in April
Produce and vegetables: May-October
Grass hay: Late June-July
Grass seed: Late June
Alfalfa: $\quad$ First cutting in June
Oats, wheat, barley: Late July-August
Sweet Corn: August-September
Corn silage: September-October
Cherries: June
Strawberries: May-June
Raspberry, blueberry, marionberry, blackberry: June-August
Orchard Fruit (apple, peach, pear): August-September
Grapes (wine industry): September-October

## MEAT PATHWAY:

Are meat-producing animals (e.g., beef cattle) raised in the areas that are intended to be a source of meat?

YES. Oregon state beef cow inventory total: 546,000

If meat-producing animals are grown in the area, how long will they continue to mature before they will be harvested?

Mother cows spend almost their entire lives on pasture or being fed hay in winter.

Market animals are commonly grazed until the last 50-60 days where they are finished in a feedlot.

Cull dairy cows commonly go directly to slaughter.

What fraction of the meat-producing animal's diet is comprised of pasture grass?
About 90\%

What percentage of 'spent' dairy cattle go to slaughter on a daily or weekly basis?
About 0.5-1\% on a weekly basis.

Miscellaneous information for Oregon:

Free Range Chickens. Both for meat and egg production. Grazing makes up a significant part (probably 50-60\%) of their diet. Inventory is about 10,000

Total Sheep and lambs. 225,000. Grazing (and hay) makes up about 90-95\% of breeding ewes. Market lambs are harvested in September.

Hogs and pigs. 17,000 Not many hogs in OR. Very few on grass.

Honey bees. $\mathbf{1 0 0 \%}$ grazing. 55,000 colonies; 1,870,000 lbs of honey/yr.

## California

CROPS AND PRODUCE PATHWWAY:
Are produce crops grown in the area? Yes.
Are any crops mature and ready to be harvested. Yes. Year-round production and harvest.
If crops are in the field and are not mature and ready for harvest, how long are they expected to continue to grow before they are ready to be harvested? Year-round production and harvest.

## ALASKA

There are 5 remaining commercial herds in AK. Due to the nature of the climate, stored feed is fed most of the year. Some of the smaller herds turn cows out for grazing during the summer months, but still the major portion of feed is stored and probably purchased from Canada.

## MILK PATHWAY:

Are dairy cows in the area which supply milk? Yes. 5 herds.
Are the cows feeding on pasture grass, and if so, what percent of their diet is the pasture grass. Perhaps 20\% pasture grass in summer, stored feed and forage in winter.

## CROPS AND PRODUCE PATHWWAY:

Are produce crops grown in the area? Very limited.
Are any crops mature and ready to be harvested. Not at this time of year.
If crops are in the field and are not mature and ready for harvest, how long are they expected to continue to grow before they are ready to be harvested? Grass can be cut in July. Other forage crops in August at earliest.

## MEAT PATHWAY:

Are meat-producing animals (e.g., beef cattle) raised in the area that are intended to be a source of meat. Yes. Limited numbers.
If meat-producing animals are grown in the area, how long will they continue to mature before they will be harvested. Beef animals harvested year round. Peak harvest in late summer and fall.
What fraction of the meat-producing animal's diet is comprised of pasture grass? Estimate of 20\%

| State Name | Crop Name | Estimated amount of crop | Planting timeframe | Havest timeframe |

FW: Speedi Plots

## All, FYI.

From: Brandon, Lou
Sent: Saturday, March 26, 2011 7:16 AM
To: Dorman, Dan
Cc: PMT02 Hoc; PMTERDS Hoc
Subject: Speedi Plots
Dan,
l've been attempting to interpret the Speedi Plots, to help address your question. The plots come in three forms, a wind flow chart valid for one hour, an air emersion dose rate, and an iodine concentration. The activity released appears to be 1 Bq in one hour.

The lodine Concentration in air plot appears to start with a maximum concentration of $6.76 \times 10^{-10} \mathrm{~Bq} / \mathrm{m} 3$ which seems to be 1 Bq dispersed through a hemisphere, of 1 km radius. The plot then highlights 5 contours of decreasing concentrations from $5 \times 10^{-10} \mathrm{~Bq} / \mathrm{m} 3$ to $5 \times 10^{-12} \mathrm{~Bq} / \mathrm{m} 3$. In essence the plot is like a smoke plot. If we were to artificially construct a RASCAL run with the same meteorological data (wind direction and speed for 1 hr ) and set up some reasonable source term, then we could scale the Speedi plot to obtain a concentration downwind and compare. In Speedi, the concentration drops off by a factor of 5 from 9 km to 15 km . Setting up a similar met situation in RASCAL (F stability), we see the iodine concentration drops off from $1.5 \mathrm{E} 6 \mathrm{~Bq} / \mathrm{m} 3 \mathrm{at}$ 11 km to about $6.7 \mathrm{~Bq} / \mathrm{m} 3$ at 16 km , roughly maybe a factor of 2.5 over the same distances. That's the kind of analysis we can do.

The Air Emersion Dose Rate plot works similarly, where the maximum dose rates starts at $2.835 \mathrm{E}-15 \mathrm{uGy} / \mathrm{h}$. I can't quite see how that number is arrived at, but it must be related to a Bq to dose rate conversion. The radionuclide is translated as rare gas (noble gas?) but a specific radionuclide is not identified. The dose rate drops off by a factor of 5 from about 6 km to 13 km . In RASCAL, the cloud shine drops off from $5.4 \mathrm{E}-3 \mathrm{~Sv} / \mathrm{h}$ at 4.8 km to $2.9 \mathrm{E}-3 \mathrm{~Sv} / \mathrm{h}$ at 11.3 km , roughly less than a factor of 2 over a doubling of the distance.

With the release of RASCAL 4.1, and it's new atmospheric dispersion model, we would expect greater dispersion than in the old model. With these initial comparisons, it would appear that the Speedi model has greater dispersion. My RASCAL run used one windspeed in one direction. In the Speedi runs, particularly the far reaching air immersion plot, turbulence is quite evident in the higher resolution model, so I think the greater dispersion is as expected.

This example just uses one set of Speedi data and a hypothetical RASCAL run. We're limited to how we can compare and contrast, but this case will hopefully give you perspective on what is possible and how one case compares.

Lou

Julie and Cyndi,
Please find our agency comments on the Draft Re-entry Guidance. These have been cleared through our senior leadership.

We hope that you find this to be helpful. Please contact us in the EOC Environmentalunit@epa.gov mailbox or by phone at 202-564-3850 if you require any further clarification.

Thank you for reaching out on this important guidance.

Cyndi,

I'd recommend that Lee Veal (EPA) who is leading the interagency reentry working group, be your POC. She can help coordinate this guidance with the appropriate people. I've cc'd her and a couple of others from EPA for quick turn around on this document (with a heads up to EPA, DOS and DOE ops center that coordination will be happening today).

Julie

Subject: Request for interagency comments on DRAFT Reentry guidance

Julie-

Attached please find our request for interagency comments on DRAFT Reentry guidance. We would like to send out to the pertinent interagency staff to get their comments on this draft by Sunday night.

My Q to you is: Would you like to coordinate the comments for USG agencies, or would you like us to coordinate? If you would like us to coordinate, can you please let me know who should receive at DOS, EPA \& DOE? And then I'll send out straight away

Thanks a bunch!

Cyndi Jones
PMT Director, NRC Ops Center

In a quiet moment tonight, I was thinking about the shift last night, and I now suspect that the skin dose spreadsheet I prepared has an error that wasn't caught in peer checking. I believe that my conversion of $\mathrm{Bq} / \mathrm{cc}$ to $\mathrm{Bq} / \mathrm{M}^{\wedge} 3$ was off by a factor of $10^{\wedge} 6-1$ recall multiplying by only 1000 when it should have been $10^{\wedge} 9$

This may have already caught and corrected. I think the sheet is on the $M$ drive as skin dose calculation.XLSX.

Subject: Update of forecast wind conditions for Fukushima Daiichi 1

A spreadsheet is attached containing the latest forecast wind conditions at the Fukushima Power Plant.
The forecast time series is derived from the latest NARAC WRF simulation with 5 km horizontal grid spacing.

NOTE: Onshore winds during forecast period.

Fukushima Power Plant Forecast Summary:
28 March 01:00 Z to 28 March 08:00 Z:
Southeasterly (onshore) winds around 3-4 m/s.
28 March 08:00 Z to 29 March 07:00 Z:
speeds from $1-5 \mathrm{~m} / \mathrm{s}$.
29 March 07:00 Z to end of forecast period: Westerly winds around 5-7 m/s.

Matthew Simpson
NARAC Atmospheric Scientist

CV 149 of 3058

Forecast Model: WRF

RE: re-entry guide- suggest you do the following
hi Tim-

We got some comments form Japan NR Team last night (Sandi documented). whatever you incorporate is fine with me-
Did we get comments from OSTP \& DOE ? Suggest we ask, if we haven't heard from them...

Cyndi,
Some PMT staff have additional comments. Would you be available to look at these comments (tomorrow) before moving to ET - or are you OK with us moving forward without your review?

I haven't seen any comments other than EPA's. Were we expecting additional commentors? Was there a comments due by date?

Tim

Hi there-

Gather the comments from the interagency (incl Japan) and "finalize" the document, telling the ET that the document is ready for the interagency if needed. Also cc COL Julie Bentz at the white house NSS (her email is on the PMT12) making her aware of the comments compiled on the document and the NRC Japan team.

Cyndi,

We got the EPA's comments. They look minor.

What are the next steps for the PMT?

Tim

## --- THIS IS A MONITORING OPERATION FOR THE FUKUSHIMA REACTOR IN JAPAN ---

## This is a MONITORING OPERATION FOR THE JAPAN EARTHQUAKE TSUNAMI AFTERMATH.

Attached is a spreadsheet that summarizes the projected doses from the three reactors for various downwind distances.

The following are the release durations for the three reactor sources:
Unit $1-3 / 1215: 25$ to $3 / 1415: 25$
Unit $2-3 / 1507: 00$ to $3 / 17$ 07:00
Unit $3-3 / 1411: 00$ to $3 / 16$ 11:00

NRC suggests running the total case from 3/12 15:25 to 3/17 07:00, all times Japan Standard Time.

Please call if more clarification is needed at: 301-816-5419 (Protective Measures Team)
Please reply to this email to acknowledge receipt.
This information should not be released at this time.

Here is a copy of the NRC Information Digest 2010-2011. Starting on page 98, Appendix A, you will find a listing of nuclear power plants in the US.

This is general information. We also have this information already available in GIS form. If you want that, I will need to find someone who can extract it and send it to you.

Jan,
I've added the NRC POCs to this email string and would ask that they contact you directly. If you don't hear back, call them at 301-816-5100

Hi Julie - do you know a good POC at NRC for the locations of nuclear plants in the US? Our Transportation GIS people would like to add that layer to our transportation system maps. Thanks, Jan

Comaprison of Speedi Run Source Term to NARAC Source Term

Per your request, we have developed the ST comparison as follows:

We understand Speedi used 1 E $14 \mathrm{~Bq} / \mathrm{hr}$ for their projection. However, the projection appears to be a short duration calculation as the wind direction does not vary.

In any case, the latest NARAC run used 2.4 E 18 Bq or $\sim 9 \mathrm{E} 15 \mathrm{~Bq} / \mathrm{hr}$ over the 12 day release we asked NARAC to run.

This suggests the STs are similar in magnitude.

We would be happy to talk to the Speedi operator to compare notes. Please note we do not do the NARAC runs, just supply the source term. If discussion with NARAC is desired, they should be contacted directly. We would be happy to help with coordination, etc, or to discuss RASCAL runs and capabilities.

PMT SITREP update 03 25.doc

## Insert A:

PMT has completed work with NARAC on the source term for Plausible Realistic Case model based on plant conditions as of 03/24/2011. Run was completed at 1400 EDT on 03/25/2011, and results have been verified by the PMT. The Plausible Realistic Case assumed partial melting of Unit 1 ( $70 \%$ core melt; 10\%/day release), Unit 2 ( $33 \%$ core melt; a 5 -inch sq. hole in containment), and Unit 3 ( $33 \%$ core melt; 100\%/day release. The case did not assume any release from the spent fuel pools. Actual meteorological data and forecasts were used. Releases were assumed to occur over 12 days, and dose results were calculated for 14 days for locations in Japan. TEDE was greater than 5 rem out to around 2 miles, and greater than 1 rem (TEDE PAG) out to around 8 miles from the plant. Adult thyroid dose was greater than 10 rem out to around 5.25 miles from the plant. Child thyroid dose was greater than the 5 rem out to around 11 miles from the plant.

Isotopic analysis received 03/25 from TEPCO indicates contaminated water (l-131 and other isotopes) in the U3 turbine building at levels indicating damaged fuel from the core. Workers entering turbine building on 03/24 encountered a few feet of water with surface radiation dose of $40 \mathrm{R} / \mathrm{h}$ which may have resulted in skin burns estimated to be 18 rem (beta).

Refer to highlighted question below. Is this something the PMT is working, or is this an FDA (or other Federal agency's) responsibility to response?

Subject: FW: Potassium Iodide - Action needed by Emb Tokyo

Readout of Embassy Tokyo (DOS, FCS, CDC) 3/25 17:30 meeting with GOJ regarding possible USG donation of liquid potassium iodide ("liquid KI") (drafted by Robert Gabor, ECON, ext. 5024):

GOJ Agencies Present:

- Ministry of Foreign Affairs (MOFA), First North Americas Division
- Ministry of Economy, Trade, and Industry (METI), Nuclear and Industrial Safety Agency (NISA), International Office
- Ministry of Health, Labor, and Welfare (MHLW), Pharmaceutical and Food Safety Bureau, Office of Chemical Safety

Meeting outcome:

- GOJ agencies will consider specifics of our proposed donation, including the issue of expiration dates, and will reply as soon as possible with a definite request.
- DCM, in his nightly 3/25 20:00 meeting with Special Advisor Hosono, will note the constructive meeting and that ball is in the GOJ court to reply affirmatively regarding its preferences for the donation.
- Please see GOJ questions below, followed by Embassy Tokyo replies in blue to the two sets of USG questions we received today.

## GOJ questions:

1. Would the shipment arrive by military or commercial air?

- We said we expected it would be by commercial charter flight. Action: Please confirm.

2. Requested USG information, if any, about expected duration of efficacy past indicated expiration date.

- We will request from NRC and or FDA and convey to GOJ if available.

3. Requested quantities and any other details regarding the inactive ingredients (note this to further help GOJ assess possible efficacy beyond expiration)

- Please advise (note MHLW has a bilateral agreement with the US FDA under which it could receive this otherwise possibly proprietary information)

## Question set received in Tokyo on 3/25 afternoon:

1. Has the GOJ decided how much KI it wants and from which expiration date lots?

- No decision yet, will consider and let us know.

2. Has the GOJ decided who (which agency) will be receiving the KI shipment and where the GOJ prefers the shipment be delivered?

- No decision yet, will consider and let us know.

3. Will there be any customs, taxation or regulatory issues surrounding the shipments? If the GOJ confirms that it is willing to receive the shipment under the IAEA Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency, most of these issues would be resolved.

- No intention to receive the shipment under the IAEA convention. No specifics regarding customs, tax, or regulatory issues, but GOJ understands our preference for GOJ to be the consignee in order to likely make such issues moot.

## Question set received in Tokyo on 3/25 <br> morning:

## Action requested by Washington:

$>$ Clarification on below questions.
$>$ Status update on whether IAEA Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency is in effect.
$\square$ (b)(4)

- Ask GOJ to transmit a letter to DOS requesting the number of doses of KI including expiration dates and acknowledge receipt of the shipment will be taken immediately upon arrival.

1. Conveyed this request.
2. Explained our strong preference for the GOJ to take immediate receipt of the shipment, i.e. be the consignee.
3. Explained that this can be a simpler letter if GOJ will be the consignee; or would be more complicated if GOJ cannot be the consignee.
4. Offered to provide suggested text of letter when they decide specifics of their request.
$>$ State/USAID lawyers will draft a grant document that GOJ will need to sign [whether this is necessary before shipment is to be determined].
5. Conveyed this intention.
6. GOJ asked who would sign on the USG side.
$>$ HHS will load and USAID will ship to GOJ to receive the doses.

## Outstanding questions:

1) How many doses of liquid (pediatric) KI and of which expiration date do the Japanese want? Items to consider:

- If GOJ intends to dispense these doses directly to the public, requesting the entire portion of a single expiration date may be preferable to ensure that the public and health officials are able to manage who has available, un-expired countermeasures. The largest allotment of 691,383 doses has an expiration date of 9/31/11.
- If GOJ intends to dispense the KI immediately from health facilities, the doses that expire soonest would be sufficient. If so, they could request the balance of their 1 million doses [ 308,617 ] from the soon-to-expire doses.
- HHS is prepared to transfer up to 1 million doses from any of the attached listed doses based on GOJ preferences.

1. Posed this question and provided the list of doses. METI/NISA and MHLW will evaluate and respond as soon as they can.
2) Who in the GOJ will be receiving the KI doses and where?

- 1 million doses have a significant "foot print." USAID has agreed to transfer but will not have storage capability in Japan.

1. GOJ asked exact size of footprint. CDC/Bowman will convey that when he gets the answer, likely evening of $3 / 25$ Tokyo time.
2. We would like to confirm the shipment would be on pallets with shrink wrapping, not stackable.

- USG is assuming transfer to GOJ at the airport of arrival. No internal transport has been anticipated.

1. Explained this.
2. Added that we could of course discuss if GOJ were to request, as a separate issue, USG assistance with internal distribution as part of our continuing relief support.
3) Will there be any customs, taxation or regulatory issues surrounding the importation of the doses?

- We are working under the assumption that the GOJ will take possession of the doses when they arrive making these issues moot for the USG.

1. Reiterated our strong preference for the GOJ to take immediate receipt of the shipment, i.e. be the consignee.

Sirs -
Please find below and attached a status update on the HHS's donation of potassium iodine to GOJ. Action is needed by Embassy Tokyo. Please let us know if we can answer any questions. Also attached is a PDF with product information for your reference.

## Potassium Iodide (KI) Donation

HHS has offered GOJ up to 1 million doses of ThyroShield - a liquid pediatric formulation of potassium iodide in multi-use bottles at no cost to GOJ. The GOJ may select which doses it needs from the attached list of available HHS stocks that expire at different times. HHS will transfer the KI doses to DOS/USAID to be airlifted by USAID and delivered to the appropriate GOJ representative in Japan. DOS/USAID will generate a grant document to legally transfer the KI to the GOJ. To note, the KI doses have a substantial footprint ("one and a half MD11s").

## Action needed:

$>$ Clarification on below questions.
> Status update on whether IAEA Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency is in effect.

Ask GOJ to transmit a letter to DOS requesting the number of doses of KI including expiration dates and acknowledge receipt of the shipment will be taken immediately upon arrival.
$>$ State/USAID lawyers will draft a grant document that GOJ will need to sign [whether this is necessary before shipment is to be determined].
> HHS will load and USAID will ship to GOJ to receive the doses.

## Outstanding question:

1) How many doses of liquid (pediatric) KI and of which expiration date do the Japanese want? Items to consider:

- If GOJ intends to dispense these doses directly to the public, requesting the entire portion of a single expiration date may be preferable to ensure that the public and health officials are able to manage who has available, un-expired countermeasures. The largest allotment of 691,383 doses has an expiration date of $9 / 31 / 11$.
- If GOJ intends to dispense the KI immediately from health facilities, the doses that expire soonest would be sufficient. If so, they could request the balance of their 1 million doses $[308,617]$ from the soon-toexpire doses.
- HHS is prepared to transfer up to 1 million doses from any of the attached listed doses based on GOJ preferences.

2) Who in the GOJ will be receiving the KI doses and where?

- 1 million doses have a significant "foot print." USAID has agreed to transfer but will not have storage capability in Japan.
- USG is assuming transfer to GOJ at the airport of arrival. No internal transport has been anticipated.

3) Will there be any customs, taxation or regulatory issues surrounding the importation of the doses?

- We are working under the assumption that the GOJ will take possession of the doses when they arrive making these issues moot for the USG.

All: Attached are gamma isotopic analysis results obtained by the Navy.

The first file (RARCR.PDF) contains isotopic analysis of data (three separate rag wipe samples) from surfaces of aircraft operating off USS RONALD REAGAN on 3/13/11.

The second file (North Advance Team DOC1) contains two filtered air sample results (labeled Team One PAS 1 of 1 and Team One PAS 1 of 2) from the North Advance Team taken on 3/21 (JST).

The third file (North Advance Team DOC2) contains two filtered air sample results from Yokosuka labeled Nanaba Tower (onsite 1 and onsite 2) taken on 3/21.

The fourth file (Gamma Counting Results) contains one filtered air sample result from USS GEORGE WASHINGTON inport in Yokosuka on 3/21.

The fifth file (KAPL RARCR.PDF) contains one composite sample of five wipes taken from aircraft at Atsugi on 3/18.

The six file (Sample Gamma Analysis Report - Japan) Gamma Counting Results.pdf) contains one sample from a wipe of surface contamination on a barge in Yokosuka taken on 3/15.

The seventh file (Compilation of Navy Data) is the summary of survey data forwarded previously in order to keep all the Navy data in one e-mail.

Any questions, please call the NR ECC at 202-781-6397/8/9.

We will update this e-mail as additional data becomes available so that you alcon have a complete set of available Navy data.
C. W. Burrows

Subject: Site team ?

We are developing a regimen for the US Ambassador to allow temporary reentry to evacuated areas (beyond the area evacuated by Japanese direction) for US citizens to recover personnel items from home. The regimen requires radiological coverage for the reentry in order to minimize contamination spread and maintain doses to citizens within limits.

We would like to ask DOE assets in country whether they have radiation control personnel and equipment that could/would support the effort.

MELCOR worst case assumptions and (separate) Plausible Realistic Case assumptions Plausible Realistic Case source term summary.doc; MELCOR based worst case source term information.doc

See attached. These are two separate runs. NARAC has finished the MELCOR worst case, and will be starting the Plausible Realistic Case run soon.

PMT
"M:IPMTMELCOR based worst case source term information.doc"

\section*{Plausible Realistic Case assumptions}

Per a conference call with OSTP, DOE, NARAC and NRC, NARAC is running a new case on a plausible realistic case for Tokyo. Once agreed upon by the inter-agency group, this analysis will be provided to the Japanese government. The attendees agreed that the source term would include:
- No spent fuel pool fires
- Core damage in Units 1, 2 and 3, assumed as \(33 \%\) each
- Design containment leakage rate ( \(0.5 \%\) per day)
- Release period starts at 21:15Z on March 15.
- Release is assumed to occur at a constant rate for 12 days.
- NARAC will use actual and forecast meteorological conditions.

The basis for the source term is the "SuperCore" reactor source term, which was 33\% damage to Unit 2.

Estimates of TEDE, Thyroid dose, worker protection dose rate and total deposition in Japan will be calculated.

\section*{ACCIDENTAL RADIOACTIVE CONTAMINATION OF HUMAN FOOD AND ANIMAL FEEDS: RECOMMENDATIONS FOR STATE AND LOCAL AGENCIES \({ }^{1}\)}

\section*{INTRODUCTION}

Recommendations on accidental radioactive contamination of human food and animal feeds were issued in 1982 by the Food and Drug Administration (FDA) (FDA 1982, Shleien et al 1982). Since then, there have been enough significant advancements related to emergency planning to warrant updating the recommendations. New scientific information and radiation protection philosophy are incorporated, experience gained since 1982 is included, and guidance developed by international organizations is taken into account (Schmidt 1988a, 1988b, 1990, Burnett and Rosenstein 1989).

These recommendations provide guidance applicable to accidents at nuclear power plants and many other types of accidents where a significant radiation dose \({ }^{2}\) could be received as a result of consumption of contaminated food. These recommendations rescind and replace the 1982 FDA recommendations.

\section*{GENERAL PROVISIONS}
(a) Applicability.

The recommendations provide guidance to State and local agencies to aid in emergency response planning and execution of protective actions associated with production, processing, distribution, and use of human food and animal feeds accidentally contaminated with radionuclides. The recommendations do not authorize or apply to deliberate releases of radionuclides which are permitted and limited by general controls and/or terms and conditions stipulated by a regulatory agency.

1 This document is intended to provide guidance. It represents the Agency's current thinking on the above. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. An alternative approach may be used if such approach satisfies the requirements of the applicable statute, regulations, or both.
2 The term "radiation dose" is used when the intended meaning is general or refers to more than one specific dose quantity.
(b) Scope.

The recommendations advise that health risk to the public be averted by limiting the radiation dose received as a result of consumption of accidentally contaminated food. This will be accomplished by: (1) setting limits, called Derived Intervention Levels (DILs) on the radionuclide activity concentration (concentration) permitted in human food, and (2) taking protective actions to reduce the amount of contamination.

DILs are limits on the concentrations permitted in human food distributed in commerce. They are established to prevent consumption of undesirable amounts of radionuclides and have units of radionuclide activity per kilogram of food, i.e. becquerels per kilogram, \(\mathrm{Bq} / \mathrm{kg}\) (previously used units - picocuries per kilogram, \(\mathrm{pCi} / \mathrm{kg})^{3}\). Comparable limits were not provided in the 1982 FDA recommendations. DILs apply during the first year after an accident. If there is concern that food will continue to be significantly contaminated beyond the first year, the long-term circumstances need to be evaluated to determine whether the DILs should be continued or if other guidance may be more applicable.

Protective actions would be initiated subject to evaluation of the situation and would continue until, in the absence of the actions, the concentrations remain below the DILs. Protective actions can be taken to:
- avoid or limit, through precautionary measures, the amount of contamination that could become incorporated in human food and animal feeds, or
- delay or limit consumption of human food and animal feeds suspected of being contaminated until the concentration of contamination has been determined, or
- reduce the amount of contamination in human food and animal feeds.

3 The International System of Units is used throughout this document. Units that were used in previous FDA guidance are shown in parenthesis in the main text of this document as reference points for the reader.

Limits on concentrations permitted in animal feeds are not given in these recommendations. However, protective actions for animal feeds are included as measures to reduce or prevent subsequent contamination of human food.

\section*{PROTECTIVE ACTION GUIDES}

The 1982 FDA recommendations established two levels of Protective Action Guides (PAGs).
PAGs were defined as "projected dose commitment values to individuals in the general population that warrant protective action following a release of radioactive material." The lower level, called the Preventive PAG, was a projected dose commitment of 5 mSv ( 0.5 rem ) to the whole body, active bone marrow, or any other organ except the thyroid, or a projected dose commitment of 15 mSv ( 1.5 rem ) to the thyroid. The Preventive PAG was associated with lowimpact protective actions (e.g. placing dairy cows on stored feed). The upper level, called the Emergency PAG, was a projected dose commitment of 50 mSv ( 5 rem ) to the whole body, active bone marrow, or any other organ except the thyroid, or a projected dose commitment of 150 mSv ( 15 rem ) to the thyroid. The Emergency PAG was associated with higher-impact protective actions (e.g., diversion of fresh milk to cheese or milk powder).

The 1982 FDA recommendations were developed from the prevailing scientific understanding of the relative risks associated with radiation as described in the 1960 and 1961 reports of the Federal Radiation Council (FRC 1960, 1961). Since 1982, FDA and the other federal agencies in the United States have adopted the methodology and terminology for expressing radiation doses provided by the International Commission on Radiological Protection (ICRP) in 1977 (ICRP 1977, ICRP 1984a, EPA 1987). The ICRP's dose quantities for radiation protection purposes include effective dose equivalent, committed effective dose equivalent, dose equivalent for a specific tissue, and committed dose equivalent for a specific tissue \({ }^{4,5}\).

\footnotetext{
See Appendix A (Glossary) for explanation of these dose quantities and their use in this document.
5 The ICRP adopted new recommendations in 1990, which include revisions in its methodology and terminology for expressing radiation doses and the relative risks associated with irradiation of specific organs (ICRP 1991a). There is not yet consensus among the federal agencies on the use of these changes.
}

These current recommendations replace the Preventive and Emergency PAGs with one set of PAGs for the ingestion pathway. The PAGs are \(5 \mathrm{mSv}(0.5 \mathrm{rem})\) for committed effective dose equivalent or 50 mSv ( 5 rem ) committed dose equivalent to an individual tissue or organ, whichever is more limiting. These correspond to the "intervention levels of dose" consensus values set by international organizations (see Appendix B). Intervention levels of dose are radiation doses at which introduction of protective actions should be considered (ICRP 1984b). The FDA guidance retains use of the term Protection Action Guide (PAG) for consistency with U.S. federal and state needs.

The current nominal estimate for the general population for lifetime total cancer mortality for low-LET (linear energy transfer) ionizing radiation, delivered at low doses and low dose rates, is \(4.5 \times 10^{-3}\) for a reference dose equivalent in the whole body of \(100 \mathrm{mSv}(10 \mathrm{rem})\) (CIRRPC 1992). For 5 mSv ( 0.5 rem ) committed effective dose equivalent (the recommended PAG) the associated lifetime total cancer mortality would be \(2.25 \times 10^{-4}\) or approximately 1 in \(4400 .{ }^{6}\) For comparison, the estimate of the normal lifetime total cancer mortality in the United States for the general population, not associated with additional radiation dose from ingestion of contaminated food from an accident, is 0.19 or approximately 1 in 5 (CIRRPC 1992). For example, in a general population of 10,000 individuals, each receiving a committed effective dose equivalent of \(5 \mathrm{mSv}(0.5 \mathrm{rem})\), the number of cancer deaths over the lifetimes of the individuals could increase in theory by about 2 cancer deaths, that is from the normal number of 1900 to 1902.

The numerical estimate of cancer deaths presented above for the recommended PAG of 5 mSv ( 0.5 rem ) was obtained by the practice of linear extrapolation from the nominal risk estimate for lifetime total cancer mortality for the general population at 100 mSv ( 10 rem ) dose equivalent in the whole body. Other methods of extrapolation to the low-dose region could yield higher or

\footnotetext{
\({ }^{6}\) The alternate PAG of 50 mSv ( 5 rem ) committed dose equivalent to a specific tissue or organ is always associated with a lifetime cancer mortality for the specific tissue that is as limiting or in some cases more limiting than the lifetime total cancer mortality associated with the PAG of 5 \(\mathrm{mSv}(0.5 \mathrm{rem})\) for committed effective dose equivalent.
}
lower numerical estimates of cancer deaths. Studies of human populations exposed at low doses are inadequate to demonstrate the actual magnitude of risk. There is scientific uncertainty about cancer risk in the low-dose region below the range of epidemiological observation, and the possibility of no risk cannot be excluded (CIRRPC 1992).

\section*{DERIVED INTERVENTION LEVELS}

A DIL corresponds to the concentration in food present throughout the relevant period of time that, in the absence of any intervention, could lead to an individual receiving a radiation dose equal to the PAG, or in international terms, the intervention level of dose. The equation given below is the basic formula for computing DILs. \({ }^{7}\)

Where:
DC \(\quad=\) Dose coefficient; the radiation dose received per unit of activity ingested ( \(\mathrm{mSv} / \mathrm{Bq}\) ).
\(\mathrm{f} \quad=\) Fraction of the food intake assumed to be contaminated.
Food Intake \(=\) Quantity of food consumed in an appropriate period of time (kg).

The FDA DILs provide a large margin of safety for the public because each DIL is set according to a conservatively safe scenario for the most vulnerable group of individuals (see Appendix D). In addition, protective action would be taken if radionuclide concentrations were to reach or exceed a DIL at any point in time, even though such concentrations would need to be sustained throughout the relevant extended period of time for the radiation dose to actually reach the PAG. In practice, when FDA DILs are used, radiation doses to the vast majority of the affected public would be very small fractions of the PAG. As a result, future adjustments in the absolute values

\footnotetext{
7 In the previous system of units DIL would be in units of \(\mathrm{pCi} / \mathrm{kg}\), intervention level of dose in
} units of mrem and DCs in units of mrem \(/ \mathrm{pCi}\).
of the PAGs would not necessarily require proportionate modifications in the DILs. Any modification of the DILs would depend on a review of all aspects of the conservatively safe scenario and how the DILs are applied.

Food with concentrations below the DILs is permitted to move in commerce without restriction. Food with concentrations at or above the DILs is not normally permitted into commerce. However, State and local officials have flexibility in whether or not to apply restrictions in special circumstances, such as permitting use of food by a population group with a unique dependency on certain food types.
(a) Use of Derived Intervention Levels for Food Monitoring after the Chernobyl Accident Developments in the U.S.

Following the Chernobyl accident in 1986, a task group of representatives from FDA and the Food Safety and Inspection Service (FSIS) of the United States Department of Agriculture established DILs for application to imported foods under their respective regulatory control. The FDA DILs were called "Levels of Concern" (LOCs) (FDA 1986a, 1986b) and the FSIS DILs were called "Screening Values." Food containing concentrations below the LOCs and Screening Values was allowed to be imported into the U.S.

FDA LOCs were derived from the 1982 Preventive PAGs and used the following assumptions:
- the entire intake of food would be contaminated,
- I-131 could be a major source of radiation dose for only 60 days following the accident
- Cs-134 + Cs-137 could be a major source of radiation dose for up to one year.

The LOCs provided such a large margin of safety that derivation of LOCs for other radionuclides, judged to be of less health significance, was considered unnecessary.

The FSIS Screening Value for I-131 was the same as the FDA LOC for I-131 in infant foods. The FSIS Screening Value for Cs-134 + Cs-137 initially differed from the FDA LOC because the

FSIS assumed that only meat and poultry (not \(100 \%\) of the diet) would be contaminated (USDA 1986a). In November 1986, the FSIS changed the Screening Value for Cs-134 + Cs-137 to be the same as the FDA LOC (USDA 1986b, Engel et al 1989). The FDA and FSIS DILs for the Chernobyl accident contamination in imported food after November 1986 are given in Table 1.

Table 1

The food monitoring results from FDA and others following the Chernobyl accident support the conclusion that I-131, Cs-134 and Cs-137 are the principal radionuclides that contribute to radiation dose by ingestion following a nuclear reactor accident, but that \(\mathrm{Ru}-103\) and Ru-106 also should be included (see Appendix C). Also, use of DILs was shown to be a practical way to control the radiation dose from ingestion of food that has been contaminated as a result of a nuclear reactor accident.

\section*{International Activities}

Efforts by international organizations to develop DILs have been extensive. Derivations have been based on the consensus value for the intervention level of dose, and have been for application within individual countries and in international trade. Each of the various international organizations selected values for the components in the basic formula for computing DILs, and each introduced additional judgments to arrive at its recommended DILs. As a result, the DILs recommended by the various organizations differed. The DILs adopted by the Commission of European Communities (CEC) for use in future accidents and those adopted
by the Codex Alimentarius (CODEX) for use in international trade \({ }^{8}\) are presented in Appendix F.
(b) Recommended Derived Intervention Levels

In these recommendations, FDA uses the term Derived Intervention Level (DIL), which is consistent with international usage. DIL is equivalent to, and replaces the previous FDA term Level of Concern (LOC).

The recommended DILs are for radionuclides expected to deliver the major portion of the radiation dose from ingestion during the first year following an accident. The DILs are for accidental releases of radionuclides from large nuclear reactors and for other radiological emergencies where there is a possibility of accidental radioactive contamination of human food. The approach provides the flexibility necessary to respond to special circumstances that may be unique to a particular accident. A summary of the considerations in selecting DILs is given in this section, with a more detailed explanation available in Appendix D.

The types of accidents and the principal radionuclides for which the DILs were developed are:
- nuclear reactors (I-131; Cs-134 + Cs-137; Ru-103 + Ru-106),
- nuclear fuel reprocessing plants ( \(\mathrm{Sr}-90 ; \mathrm{Cs}-137 ; \mathrm{Pu}-239+\mathrm{Am}-241\) ),
- nuclear waste storage facilities (Sr-90; Cs-137; Pu-239 + Am-241),
- nuclear weapons (i.e., dispersal of nuclear material without nuclear detonation) (Pu-239)
- radioisotope thermoelectric generators (RTGs) and radioisotope heater units (RHUs) used in space vehicles ( \(\mathrm{Pu}-238\) )

The radionuclides listed are expected to be the predominant contributors to radiation dose through ingestion. \({ }^{9}\) Several radionuclides could be released by an accident at a nuclear

\footnotetext{
\({ }^{8}\) An application of the CODEX DILs can be found in the International Atomic Energy Agency's (IAEA) interim edition of its basic safety standards for protection against ionizing radiation (IAEA 1994). IAEA based its "generic action levels for foodstuffs," found in Schedule V of IAEA 1994, on CODEX DILs.
\({ }^{9}\) A discussion of the principal radionuclides for an accident at a nuclear reactor is given in Appendix C.
}
reactor, a nuclear fuel processing plant or a nuclear waste storage facility, while only the specific radionuclide used in a nuclear weapon or a space vehicle would be released in that type of accident. When more than one radionuclide is released, the relative contribution that a radionuclide makes to radiation dose from ingestion of subsequently contaminated food depends on the specifics of the accident and the mode of release (NRC 1975, DOE 1989, EPA 1977).

In unique circumstances, such as transportation accidents, other radionuclides may contribute radiation doses through the food ingestion pathway. These situations are not specifically treated in these recommendations. An evaluation of the radiation dose from ingestion of these other radionuclides should be performed, however, to determine if the PAGs would be exceeded. FDA should be notified during such an evaluation.

DILs were calculated for the nine radionuclides noted above. For each radionuclide, DILs were calculated for six age groups using Protective Action Guides, dose coefficients, and dietary intakes relevant to each radionuclide and age group. The age groups included 3 months, 1 year, 5 years, 10 years, 15 years and adult ( \(>17\) years). The dose coefficients used were from ICRP Publication 56 (ICRP 1989).

The DILs were based on the entire diet \({ }^{10}\) for each age group, not for individual foods or food groups. The calculation presumed that contamination would occur in thirty percent of the dietary intake. The value of thirty percent was based on the expectation that normally less than ten percent of the annual dietary intake of most members of the population would consist of contaminated food. An additional factor of three was applied to account for limited subpopulations that might be more dependent on local food supplies. An exception was made for I131 in the diets of the 3-month and 1-year age groups, where the entire intake over a sixty-day period was assumed to be contaminated.

\footnotetext{
\({ }^{10}\) The "entire diet" includes tap water used for drinking.
}

The nine radionuclides comprised five radionuclide groups, each having common characteristics. The five groups are: Sr-90; I-131; Cs-134 + Cs-137; Ru-103 + Ru-106; and Pu-238 + Pu-239 + Am-241. An accident could involve more than one of the five groups.

Protection of the more vulnerable segments of the population and the practicality of implementation were major considerations in the selection of the recommendations. These considerations lead to the single DIL or the single criterion for each radionuclide group that is presented in Table 2, based on the most limiting Protective Action Guide (PAG) and age group for the radionuclide group. \({ }^{11}\)

The recommended DILs may be applied immediately following an accident. Early identification of other radionuclides that may be present in food is not required. However, the recommended DILs should be evaluated as soon as possible after an accident to ensure that they are appropriate for the situation. Appendix E presents a discussion on DILs for a number of other radionuclides that could be released from the reactor core of a nuclear power plant.
(c) Imported or Exported Food

The LOCs that applied to radioactive contamination from the Chernobyl accident in imported foods subject to FDA authority were given in an FDA Compliance Policy Guide (FDA 1986b). This guidance remains in effect and would be reviewed and modified as necessary to respond to any future accident resulting in radioactive contamination of imported food.

Food exported from the United States is controlled by standards, regulations and guidance in the importing countries. Two examples of guidance applicable to accidentally contaminated foods exported from the United States are the guidelines issued by the CODEX Alimentarius Commission of the Joint FAO/WHO Food Standards Program and the regulations adopted by the
\({ }^{11}\) The PAG of \(5 \mathrm{mSv}(0.5 \mathrm{rem})\) for committed effective dose equivalent was most limiting for Cs-134 + Cs-137 and Ru-103 + Ru-106; the PAG of 50 mSv ( 5 rem ) for committed dose equivalent to a single specific tissue or organ was most limiting for \(\mathrm{Sr}-90, \mathrm{I}-131\) and \(\mathrm{Pu}-238+\mathrm{Pu}\) \(239+\) Am-241.

Commission of the European Communities (CEC). The DILs adopted by these two organizations (presented in Appendix F) differ from each other and from the FDA LOCs.

Table 2

\author{
Recommended Derived Intervention Level (DIL) or Criterion for Each Radionuclide Group \({ }^{(a),(b)}\)
}

All Components of the Diet
\begin{tabular}{lcc}
\hline Radionuclide Group & \((\mathrm{Bq} / \mathrm{kg})\) & \((\mathrm{pCi} / \mathrm{kg})\) \\
Sr-90 & 160 & 4300 \\
I-131 & 170 & 4600 \\
Cs-134 + Cs-137 & 1200 & 32,000 \\

& \(\mathrm{C}_{3}\) & \(\mathrm{C}_{6}\) \\
\(\mathrm{Ru}-103+\mathrm{Ru}-106^{(\mathrm{c})}\) & \(\frac{6800}{450}\) & \(<1\) \\
\hline
\end{tabular}

Notes:
(a) The DIL for each radionuclide group is applied independently (see discussion in Appendix D). Each DIL applies to the sum of the concentrations of the radionuclides in the group at the time of measurement.
(b) Applicable to foods as prepared for consumption. For dried or concentrated products such as powdered milk or concentrated juices, adjust by a factor appropriate to reconstitution, and assume the reconstitution water is not contaminated. For spices, which are consumed in very small quantities, use a dilution factor of 10.
(C) Due to the large difference in DILs for Ru-103 and Ru-106, the individual concentrations of Ru-103 and Ru106 are divided by their respective DILs and then summed. The sum must be less than one. C3 and C6 are the concentrations, at the time of measurement, for Ru-103 and Ru-106, respectively (see discussion in Appendix D).

\section*{PROTECTIVE ACTIONS}

Protective actions are steps taken to limit the radiation dose from ingestion by avoiding or reducing the contamination that could occur on the surface of, or be incorporated into, human food and animal feeds. Such actions can be taken prior to and/or after confirmation of contamination. The protective actions for a specific accident are determined by the particulars of
the situation and once initiated they continue at least until the concentrations are expected to remain below the DILs.

For contamination events not effectively managed using DILs, protective actions appropriate to the situation would still be established and applied by the responsible officials. For example, in 1988 FDA developed guidance for use in responding to a contamination event that could have occurred from an uncontrolled reentry of the Russian satellite Cosmos 1900. FDA issued an advisory which specified protective actions against contamination in the form of widely but sparsely distributed discrete radioactive particulates and large pieces of radioactive debris (FDA 1988). The uncontrolled reentry of Cosmos 1900 did not occur.
(a) Protective Actions Prior to Confirmation of Contamination

Protective actions which can be taken within the area likely to be affected and prior to confirmation of contamination consist of:
- simple precautionary actions to avoid or reduce the potential for contamination of food and animal feeds, and
- temporary embargoes to prevent the introduction into commerce of food which is likely to be contaminated.

Protective actions can be taken before the release or arrival of contamination if there is advance knowledge that radionuclides may accidentally contaminate the environment.

For some types of accidents, determination of when and what protective actions would be taken may be facilitated by associating them with the accident classifications designated by the Nuclear Regulatory Commission (NRC) or the Department of Energy (DOE). For accidents involving commercial nuclear power reactors, the NRC has established four emergency classes: Notification of Unusual Event, Alert, Site Area Emergency, and General Emergency. Criteria for declaring these classes were published by the NRC (NRC 1980, 1991).

For accidents at DOE facilities, the DOE has established three emergency classes: Alert, Site Area Emergency, and General Emergency. These classes are comparable to those established by NRC. Incidents considered as Unusual Events by NRC licensees are covered as Unusual Occurrences by DOE (DOE 1992)

Simple precautionary actions include modest adjustment of normal operations prior to arrival of contamination. These will not guarantee contamination in food will be below the DILS but the severity of the forthcoming problem would be significantly reduced. Typical precautionary actions include covering exposed products, moving animals to shelter, corralling livestock and providing protected feed and water.

Precautionary actions should be implemented so as to avoid placing in jeopardy persons implementing the action. For example, in the case of an accident involving a commercial nuclear power plant, if the predictions of the magnitude of future off-site contamination are persuasive, precautionary actions that could be taken and completed before a declaration of Site Area Emergency or General Emergency could be considered. However, precautionary actions that would involve persons either not seeking shelter or leaving the immediate vicinity of shelter should not be taken after declaration of a Site Area Emergency or General Emergency. A temporary embargo on food and agricultural products (including animal feeds) prevents the consumption of food that is likely to be contaminated. Distribution and use of possibly contaminated food and animal feeds is halted until the situation can be evaluated and monitoring and control actions instituted. Temporary embargoes are applied when the concentrations are not yet known. Because there is potential for negative impact on the community, justification for this action must be significant. The embargo should remain in effect at least until results are obtained. For nuclear power plants, a temporary embargo should be issued only upon declaration of a General Emergency and if predictions of the extent and magnitude of the off-site contamination are persuasive. The geographical area under control by the embargo would depend on the accident sequence, the meteorological conditions, and the food affected.

\section*{(b) Protective Actions for Foods Confirmed to be Contaminated}

Protective actions which should be implemented when the contamination in food equals or exceeds the DILs consist of:
- temporary embargoes to prevent the contaminated food from being introduced into commerce,
- normal food production and processing actions that reduce the amount of contamination in or on food to below the DILs.

A temporary embargo to prevent the introduction into commerce of food from a contaminated area should be considered when the amount of contamination equals or exceeds the DILs or when the presence of contamination is confirmed, but the concentrations are not yet known. The temporary embargo would continue until measurements confirm that concentrations are below the DILs.

Normal food production and processing procedures that could reduce the amount of radioactive contamination in or on the food could be simple, (such as holding to allow for radioactive decay, or removal of surface contamination by brushing, washing, or peeling) or could be complex (Grauby and Luykx 1990, FDA 1982, USDA 1989). The blending of contaminated food with uncontaminated food is not permitted because this is a violation of the Federal Food, Drug and Cosmetic Act (FDA 1991).

Protective actions focus on the specific foods having the greatest sources of radiation dose to the population. Factors that determine which foods are most significant include the agricultural practices in the area of contamination and the stage of the growing or harvest season at the time of the accident. In general, foods consumed fresh, such as milk, leafy vegetables, and fruit, are initially most important. Grains, root crops, other produce, and animal-derived food products are significant later as they come to market.

Specific protective actions to be implemented following an accident are not provided in these recommendations because there is such a wide variety of actions that could be taken. The protective actions would be determined by state and local officials with assistance from the growers, producers, and manufacturers.
(c) Protective Actions for Animal Feeds Confirmed as Contaminated

Protective actions to reduce the impact of contamination in or on animal feeds, including pasture and water, should also be taken on a case-by-case basis. Accurately forecasting the transfer of radioactive contamination through the agricultural pathway, from animal feed to human food, is problematic. The forecast is influenced by many factors, such as: the type of feed (e.g., fresh pasture, grain), other intakes (e.g., other feeds, supplements), the chemical form of the radionuclide, medications being administered, the animal species, and the type of resulting human food (e.g., milk, meat, eggs).

Protective actions that could be taken when animal feeds are contaminated include the substitution of uncontaminated water for contaminated water and the removal of lactating dairy animals and meat animals from contaminated feeds and pasture with substitution of uncontaminated feed. Corralling livestock in an uncontaminated area could also be effective. The protective actions would be determined by State and local officials, with assistance from growers, producers, and manufacturers.

\section*{APPENDIX A - GLOSSARY}
absorbed dose - the quotient of the mean energy imparted by ionizing radiation, \(\mathrm{d} \varepsilon\), to matter of mass dm, unit: Gy (ICRU 1993)
averted dose - the radiation dose saved by implementing a protective action. It may be expressed in any of the relevant dose quantities. (ICRP 1991b)

Becquerel \((\mathrm{Bq})\) - the unit of radionuclide activity or expectation value of the number of spontaneous nuclear transitions per unit of time. \(\mathrm{Bq}=1\) transition per second. Unit: \(1 / \mathrm{s}\) (ICRU 1980) The unit of radionuclide activity used in the previous FDA guidance was the curie \((\mathrm{Ci})^{12} .1 \mathrm{~Bq}=27 \times 10^{-12} \mathrm{Ci}=27\) picocuries \((\mathrm{pCi})\).
committed dose equivalent \(\left(\mathrm{H}_{\mathrm{T}}\right)\) - the dose equivalent accruing in an organ or tissue up to a specified number of years after the intake of a radionuclide into the body. In this document, committed dose equivalent is always computed to age 70 years. Unit: Sv (ICRP 1984a)
committed effective dose equivalent \(\left(\mathrm{H}_{\mathrm{E}}\right)\) - committed dose equivalents to individual organs or tissues, multiplied by weighting factors, then summed. In this document, committed effective dose equivalent is always computed to age 70 years. Unit: Sv (ICRP 1984a)
contamination - radionuclides on or in food or animal feed as a result of an accidental release.
concentration - radionuclide activity concentration. Unit: \(\mathrm{Bq} / \mathrm{kg} ; 1 \mathrm{~Bq} / \mathrm{kg}=27 \mathrm{pCi} / \mathrm{kg}\).

Derived Intervention Level (DIL) - concentration derived from the intervention level of dose at which introduction of protective measures should be considered. Unit: \(\mathrm{Bq} / \mathrm{kg}\) (IAEA 1985)
\({ }^{12}\) The International System of Units is used throughout the document. In this Glossary, the units that were used in previous FDA guidance are given as reference points for the reader in the definitions of the units "Becquerel" and "sievert".
dose coefficient (DC) - the conversion coefficient for committed dose equivalent or committed effective dose equivalent per unit intake of radionuclide activity. Unit: \(\mathrm{Sv} / \mathrm{Bq}\) (ICRP 1989)
dose equivalent \({ }^{13}\left(\mathrm{H}_{\mathrm{T}}\right)\) - the product of the absorbed dose in an organ or tissue and the quality factor. Unit: Sv (ICRU 1993)
effective dose equivalent \(\left(\mathrm{H}_{\mathrm{E}}\right)\) - sum of weighted dose equivalents for irradiated tissues or organs.
\[
\mathrm{H}_{\mathrm{E}}=\mathrm{W}_{\mathrm{T}} \mathrm{H}_{\mathrm{T}}
\]
where \(\mathrm{W}_{\mathrm{T}}\) is a weighting factor representing the proportionate stochastic risk for tissue T , and \(\mathrm{H}_{\mathrm{T}}\) is the mean dose equivalent received by tissue \(T\). A list of tissues and their weighting factors is given by ICRP (ICRP 1984a). Unit: Sv
gray (Gy) - unit of absorbed dose. \(1 \mathrm{~Gy}=1 \mathrm{~J} / \mathrm{kg}\); 1 milligray ( mGy ) \(=10^{-3} \mathrm{~Gy}\). (ICRU 1993) The unit of absorbed dose in previous FDA publications was the rad. \(1 \mathrm{~Gy}=100 \mathrm{rad} ; 1 \mathrm{mGy}=\) 0.1 rad .
intervention level of dose - reference level of dose equivalent to an individual at which introduction of protective actions should be considered. Unit: Sv (ICRP 1977, ICRP 1984b)

Level of Concern (LOC) - concentration in an imported food, set by FDA after the Chernobyl accident, below which unrestricted distribution in U.S. commerce is permitted.
precautionary action - action taken, prior to confirmation of contamination, to avoid or reduce the potential for contamination of food and animal feed.

\footnotetext{
\({ }^{13}\) In this document, dose equivalent and committed dose equivalent are synonymous, and effective dose equivalent and committed effective dose equivalent are synonymous, because they
}
always refer to the general public, to radionuclides deposited in the body, and to values computed to age 70 years.
protective action - action taken to limit the radiation dose from ingestion by avoiding or reducing the contamination in or on human food and animal feeds.

Protective Action Guide (PAG) - committed effective dose equivalent or committed dose equivalent to an individual organ or tissue that warrants protective action following a release of radionuclides.
quality factor - modifying factor that weights the absorbed dose for the biological effectiveness of the charged particles producing the absorbed dose. (ICRU 1993)
sievert ( Sv ) - unit of dose equivalent. \(1 \mathrm{~Sv}=1 \mathrm{~J} / \mathrm{kg}\); 1 millisievert \((\mathrm{mSv})=10^{-3} \mathrm{~Sv}\). (ICRU 1993) The unit of dose equivalent used in previous FDA guidance was the rem. \(1 \mathrm{~Sv}=100 \mathrm{rem} ; 1\) \(\mathrm{mSv}=0.1 \mathrm{rem}\).

\section*{APPENDIX B - INTERNATIONAL CONSENSUS ON INTERVENTION LEVELS OF DOSE}

In 1984, the International Commission on Radiological Protection (ICRP) recommended basic principles for planning intervention in the event of major radiation accidents and provided general guidance on radiation dose levels for the implementation of countermeasures (ICRP 1984b). The term "intervention level of dose" is used by ICRP for these dose levels. The ICRP guidance indicated that for any countermeasure there is a lower level of radiation dose below which the introduction of the countermeasure is unlikely to be warranted, an upper level of radiation dose above which the countermeasure should almost certainly be implemented, and when between these levels, the specifics of the situation determine which actions (if any) would be taken. For the control of food, ICRP indicated lower and upper levels of \(5 \mathrm{mSv}^{14}\) and 50 mSv , respectively, for committed effective dose equivalent and 50 mSv and 500 mSv , respectively, for committed dose equivalent to an individual organ or tissue (ICRP 1984b, ICRP 1977).

Since 1984, a number of international organizations have provided guidance dealing with the ingestion of radionuclides that was consistent with the ICRP guidance. These organizations included the Commission of the European Communities (CEC), the Codex Alimentarius Commission (CODEX), the Food and Agricultural Organization of the United Nations (FAO), the International Atomic Energy Agency (IAEA), the Nuclear Energy Agency of the Organization for Economic Cooperation and Development (NEA), and the World Health Organization (WHO). All have adopted 5 mSv committed effective dose equivalent as the radiation dose level above which intervention was recommended (CODEX 1989, FAO 1987, IAEA 1986, Luykx 1989, NEA 1989, Waight 1988, WHO 1988). All except CODEX also adopted 50 mSv committed dose equivalent to an individual tissue or organ when that value is more limiting.

\footnotetext{
\({ }^{14}\) The International System of Units is used throughout this document. See Appendix A, Glossary, for equivalence to units used in previous FDA guidance.
}

The ICRP has updated its general concepts on intervention in its Publication 60 (ICRP 1991a). Additional advice for intervention for protection of the public was provided in its Publication 63 (ICRP 1991b). The additional advice included an intervention level of averted dose ( 10 mSv effective dose \({ }^{15}\) in a year) for restriction of a single foodstuff. ICRP considered this level appropriate for almost all cases, excepting when alternative food supplies are not available or population groups might suffer serious disruption of their food supply.

The ICRP approach recommended that in application of this intervention level of averted dose, the net benefit of withdrawing a particular foodstuff be made optimum, based on knowledge of the local situation and other assumptions about the monetary value assigned to the effective dose. The ICRP provided an example of how to evaluate the optimum. Such a procedure requires information that would not be available during the early phases of an accident.

The FDA uses the principles in the general guidance provided by ICRP in 1984 for the immediate response to a major radiation accident, recognizing that at later stages, after the local situation is stabilized and more clearly defined, the longer-term intervention for food can be modified based on more detailed evaluation of local conditions by local authorities. Therefore, the PAGs for the ingestion pathway at the onset of an accident are 5 mSv committed effective dose equivalent or 50 mSv committed dose equivalent to an individual tissue or organ, whichever is more limiting.

\footnotetext{
\({ }^{15}\) Effective dose is the ICRP's revised formulation of effective dose equivalent, as described in its 1990 recommendations (ICRP 1991a)
}

\title{
APPENDIX C - RADIONUCLIDES DETECTED IN FOOD FOLLOWING THE CHERNOBYL NUCLEAR POWER PLANT ACCIDENT OF APRIL 1986
}

\author{
(a) Analyses of Imported Food by the United States and Canada
}
(1) I-131 and Cs-134 \(+\mathrm{Cs}-\mathrm{I} 37\)

Shortly after the accident at Chernobyl on April 26, 1986, the FDA and FSIS of the USDA began sampling imported food for analysis to determine radionuclide activity concentrations. Regulatory actions were based on FDA Levels of Concern (LOCs) and the FSIS Screening Levels which were developed in 1986 and applied to I-131 and Cs-134 + Cs-137.

The regulatory results of FDA and FSIS import monitoring and analyses are summarized in Table C-1 \({ }^{16}\). The radionuclide activity concentrations (concentrations) exceeded the FDA LOCs (Cunningham ct al 1992) in 23 out of \(2,600(0.9 \%)\) food samples, and exceeded the FSIS Screening Values (equal to the LOCs) (Engel et al 1989, Randecker 1990) in 107 out of 6,295 ( \(1.7 \%\) ) meat and poultry samples. In general, Cs-134 and Cs-137 were the principal radionuclides detected by FDA and FSIS in the imported foods analyzed. I-131 was significant for only about two months. Cs-134 and Cs-137 were also the dominant radionuclides in imported foods analyzed by Canada (NHW 1987). The European countries of the Nuclear Energy Agency (NEA) also found that I-131 and Cs-134 + Cs-137 contributed most of the radiation dose from radionuclides ingested with food contaminated by the Chernobyl accident (NEA 1987, NEA 1989).
(2) Radionuclides Other Than I-131 and Cs-134 + Cs-137

In addition to the radionuclides used for regulatory actions (I-131, Cs-134 + Cs-137), a number of other radionuclides were detected in imported food entering the U. S. and Canada. Of these,

\footnotetext{
\(\overline{{ }^{16}}\) The International System of Units is used throughout the document. See Appendix A, Glossary, for equivalence to units used in previous FDA guidance.
}
the most commonly detected radionuclides were \(\mathrm{Ru}-103, \mathrm{Ru}-106, \mathrm{Ba}-140, \mathrm{Sr}-90, \mathrm{Ce}-144\) and \(\mathrm{Zr}-\) 95. The results of FDA and Canadian import sampling for the latter radionuclides are summarized in Table C-2. The data supported the prediction that I-131 and Cs-134 + Cs-137 were the most significant radionuclides for screening of imported foods, and that the other radionuclides were of significantly less importance.

During 1986, of about 500 imported samples monitored by FDA, Ru-103 and Ru-106 were above the detection levels for 18 samples and \(\mathrm{Ba}-140\) was above the detection levels in 9 samples (Cunningham et al 1992). These radionuclides were not detected after 1986. Only selected samples were analyzed for \(\mathrm{Sr}-90\). Two samples, containing relatively high amounts of \(\mathrm{Cs}-134+\) \(\mathrm{Cs}-137\) were analyzed for \(\mathrm{Sr}-90\) in 1986. In the following years, a total of 40 samples (those having Cs-134 + Cs-137 in excess of \(110 \mathrm{~Bq} / \mathrm{kg}\) ) were analyzed for \(\mathrm{Sr}-90\). The \(\mathrm{Sr}-90\) was above the detection levels in all 42 samples.

For Canadian imported foods, Ru-103 was above detection levels in 46 of 840 samples analyzed during 1986 and 1987, and below detection levels in all samples analyzed later. Ru-106 was above detection levels in 130 of 936 samples analyzed from 1986 through 1989 (Marshall 1992). Samples were analyzed for \(\mathrm{Ce}-144\) and \(\mathrm{Zr}-95\) from 1987 through 1989. Out of 486 samples, \(\mathrm{Ce}-\) 144 was above detection levels in 88 samples and \(\mathrm{Zr}-95\) was above detection levels in 3 samples.

Concentrations in FDA and Canadian imported samples were generally below \(10 \%\) of the respective Derived Intervention Levels (DILs) given in Appendices D and E . The main exceptions were for Ru-106 in Canadian samples which ranged up to \(42 \%\) of the DIL.

The results of analysis for imported samples collected by the U.S. and Canada are representative of collections distant from the accident site. Therefore, not only was the food variety relatively limited, but time delays between accident and sample collection, processing effects, and selective screening that exporters may have applied could have influenced the findings. Consequently, findings from samples collected at countries close to Chernobyl are most useful for U.S. decision-makers responding to a domestic release because these findings are more representative of a local contamination event.
(b) Analyses of Foods Collected Locally at Central and Eastern European Countries

In 1986, FDA received a variety of foods collected locally by United States Embassy staff in Central and Eastern European countries. A total of 48 samples from Bulgaria, Czechoslovakia, Finland, Hungary, Poland, Romania, Russia, and Yugoslavia, were analyzed. Results for Ru-103, \(\mathrm{Ru}-106\), and \(\mathrm{Ba}-140\) are summarized in Table C-3. The number of samples above detection levels for each radionuclide is given with the ranges of associated percentages relative to the DILs. I-131 and Cs-134 + Cs-137 (not shown) were also detected in most of the samples. I-131 concentrations exceeded the DIL for 27 samples; while Cs-134 + Cs-137 exceeded the DIL for 2 samples.

Most of the 48 embassy samples were fresh vegetables. The edible portions were leafy for 28 samples and roots, bulbs, shoots, or seedlings for 12 samples. Ru-103 was above detection levels in all vegetables, exceeding its DIL for 6 samples. Ru- 106 was above detection levels in all vegetables, exceeding its DIL for 14 samples. Ba-140 was above detection levels in 19 , but did not exceed its DIL in any vegetables (maximum, \(6.3 \%\) of DIL).

Other samples included 3 fresh fruit and 5 processed foods (cheese, yogurt, ice cream, and 2 milk samples). Ru-106 was above detection levels in all fruit (maximum, \(14 \%\) of DIL) and in 2 processed foods (maximum, 29\% of DIL). Ru-103 and Ba-140 were above detection levels but did not exceed \(2 \%\) of their DILs in the fruit or processed food samples.

In September 1986, 28 samples of spices from Turkey and Greece (not offered for import) were provided by the American Spice Trade Association (ASTA) for testing by FDA. This set of samples represented deposition at a distance comparable to many of the Eastern European embassy samples but were analyzed at a later time after the accident. FDA analyzed spices for gamma-ray emitting radionuclides and \(\mathrm{Sr}-90\). Findings are included in Table C-3. Following the advice of CEC (CEC 1989a) and CODEX (CODEX.1989) for minor foods, a dilution factor of ten was applied to the concentrations for herbs, spices and flavorings, because they will be consumed in very small quantities.

Cs-134 + Cs-137 (not shown in Table C-3), Ru-103, Ru-106, and Sr-90 were above detection levels in all samples. I-131 and Ba-140 were below detection levels having undergone ten or more half-lives of radioactive decay.

Ru-103, having decayed for over four half-lives, ranged to a maximum of only \(4.5 \%\) of its DIL while \(\mathrm{Sr}-90\), though having decayed very little, reached \(10 \%\) of the DIL in only 8 samples (maximum, \(30 \%\) of DIL). Ru-106 exceeded its DIL in 2 samples, was \(50 \%\) to \(100 \%\) in 5 , and \(10 \%\) to \(50 \%\) in another 17.
(c) Conclusions

The results support the expectation that concentrations of I-131 and Cs-134 + Cs-137 would serve as the main indicators of the need for protective actions for imported and local food. However, concentrations of Ru-106 were consistently in excess or at a significant fraction of the DIL, which suggests that Ru-106 should also serve as an indicator, i.e. be included as a principal radionuclide for nuclear reactor incidents.

Also, for local samples of fresh vegetables harvested during the first week of the incident, half of the samples had Ru-103 concentrations a significant fraction of the DIL and another quarter of the samples had \(\mathrm{Ru}-103\) concentrations in excess of the DIL. Consequently, it would be prudent to consider Ru -103 as a principal radionuclide for local deposition, particularly in the early phase of a nuclear reactor incident.
\(\mathrm{Sr}-90\) did not exceed \(11 \%\) of the DIL in imported food (Table C-2). For the series of 28 local (ASTA) spice samples (Table C-3), \(\mathrm{Sr}-90\) was less than \(30 \%\) of its DIL (generally a lower percent of the DIL than found for Ru-106 or Cs-134 + Cs-137). Also, the analytical method for determination of \(\mathrm{Sr}-90\) in food is lengthy compared to analysis for the gamma-ray emitting radionuclides, such that protective actions based on the concentration of \(\mathrm{Sr}-90\) could not be taken in a timely manner. Therefore, \(\mathrm{Sr}-90\) would not be an effective indicator of the need for protective actions in the early phase of a nuclear reactor incident.

During the first year after an accident, concentrations in local or imported food other than for I131, Cs-134, Cs-137, Ru-103 and Ru-106 are expected to be significant only when one or more of these principal radionuclides has exceeded its DIL. Therefore, the food would already have been subject to protective action.

\hline
\end{tabular}
(a) Embassy samples were received primarily in May and June 1986 and the ASTA samples in September 1986. Due to radioactive decay, the relative concentration of \(\mathrm{Ru}-103\) compared to \(\mathrm{Ru}-106\) is considerably lower for the ASTA samples than for the embassy samples.
NA Not analyzed.
ND Not detected.

\section*{APPENDIX D - DERIVATION OF RECOMMENDED DERIVED INTERVENTION LEVELS}

The Derived Intervention Level (DIL) for a specific radionuclide is calculated as follows:
\[
\begin{aligned}
\operatorname{DIL}(\mathrm{Bq} / \mathrm{kg}) & =\frac{\text { PAG }(\mathrm{mSv})}{\mathrm{f} \times \text { Food Intake }(\mathrm{kg}) \times \mathrm{DC}(\mathrm{mSv} / \mathrm{Bq})} \\
\text { Where: } \quad \begin{array}{l}
\text { DIL } \\
\text { PAG }
\end{array} & =\text { Derived Intervention Level } \\
\text { DC } & =\text { Protective Action Guide } \\
\text { Food Intake coefficient } & =\text { Quantity of food consumed in an appropriate period of time } \\
\mathrm{f} & =\text { Fraction of food intake assumed to be contaminated }
\end{aligned}
\]

The recommended Protective Action Guides (PAGs) are \(5 \mathrm{mSv}^{17}\) committed effective dose equivalent, or 50 mSv committed dose equivalent to individual tissues and organs, whichever is more limiting. These PAGs are consistent with the consensus of international organizations on the levels of radiation dose below which ingestion pathway interventions are generally not appropriate (see Appendix B).

Dose coefficients (DCs) are given in Table D-1 and food intakes are given in Tables D-2 and D3. The fraction of food intake assumed to be contaminated (f) equals 0.3 , except for I-131 in infant diets where f equals 1.0 .
(a) Radionuclides

Based upon data on radionuclides in human food following the Chernobyl accident, DILs for I131, Cs-134, Cs-137, Ru-103 and Ru-106 would facilitate application of food monitoring programs following accidents involving nuclear reactors. For accidents at nuclear fuel
\({ }^{17}\) The International System of Units is used throughout the document. See Appendix A, Glossary, for equivalence to units used in previous FDA guidance.
reprocessing facilities and nuclear waste storage facilities, DILs for \(\mathrm{Sr}-90, \mathrm{Cs}-137, \mathrm{Pu}-239\), and Am-241 would be used. For nuclear weapons accidents and accidents involving radioisotope thermal generators (RTGs) and radioisotope heater units (RHUs) used in space vehicles, DILs for \(\mathrm{Pu}-239\) and \(\mathrm{Pu}-238\), respectively, would be used. The selection of these radionuclides as the major contributors to radiation dose through ingestion is consistent with recommendations on DILs published by NEA, WHO, CODEX, and CEC (NEA 1989, WHO 1988, CODEX 1989, CEC 1989b, IAEA 1994).
(b) Age Groups and Dose Coefficients (DCs)

The general population was divided into six age groups ranging from infants to adults and corresponding to the age groups in ICRP Publication 56 (ICRP 1989) for which ICRP has published DCs. The age groups are 3 months, 1 year, 5 years, 10 years, 15 years, and adult. The radionuclides, age groups and dose coefficients used in the calculations are presented in Table D-1.
(C) Food Intake

Food intake included all dietary components including tap water used for drinking, and is the overall quantity consumed in one year, with exceptions in the period of time for \(\mathrm{I}-131\left(\mathrm{~T}_{1 / 2}=\right.\) 8.04 days) and \(\mathrm{Ru}-103\) ( \(\mathrm{T}_{1 / 2}=39.3\) days). For these, the quantities consumed were for a 60 -day period and a 280 -day period, respectively, due to the more rapid decay of these radionuclides. The intake periods for I-131 and Ru-103 are the nearest whole number of days for decay of these radionuclides to less than \(1 \%\) of the initial activities.

Dietary intakes were derived from a 1984 EPA report which presented average daily food intake by age and gender (EPA 1984a, EPA 1984b). The EPA intakes were based on data from the 1977-1978 Nationwide Food Consumption Survey published by the U. S. Department of Agriculture (USDA 1982, USDA 1983). The age groups and annual dietary intakes for various food classes and the total, calculated from data in the EPA report, are given in Table D-2.

The dietary intakes derived for the ICRP age groups for which DCs are available, using the results in Table D-2, are presented in Table D-3.
(d) Fractions of Food Intake Assumed to be Contaminated (f)

For food consumed by most members of the general public, ten percent of the dietary intakes was assumed to be contaminated. This assumption recognizes the ready availability of uncontaminated food from unaffected areas of the United States or through importation from other countries, and also that many factors could reduce or eliminate contamination of local food by the time it reaches the market \({ }^{18}\).

Use of ten percent of the dietary intake as the portion contaminated was consistent with recommendations made by a Group of Experts to the Commission of the European Communities (CEC 1986a) and by the Nuclear Energy Agency (NEA) of the Organization for Economic Cooperation and Development (NEA 1989). The NEA noted that modification of this value would be appropriate if justified by detailed local findings.

FDA applied an additional factor of three to account for the fact that sub-populations might be more dependent on local food supplies. Therefore, during the immediate period after a nuclear accident, a value of 0.3 (i.e., thirty percent) is the fraction of food intake that FDA recommends should be presumed to be contaminated. If, subsequently, there is convincing local information that the actual fraction of food intake that is contaminated (f) is considerably higher or lower, there will be adequate time for State and local officials to determine whether to adjust the value of \(f\) (and therefore adjust the values of the DILs) for the affected area.
For infants, (i.e., the 3-month and 1-year age groups) the diet consists of a high percentage of milk and the entire milk intake of some infants over a short period of time might come from supplies directly impacted by an accident. Therefore, f was set equal to 1.0 ( \(100 \%\) ) for the infant diet.

\footnotetext{
\({ }^{18}\) In most situations, one would expect less than ten percent of the dietary intakes to be contaminated.
}
(e) Selection of Recommended Derived Intervention Levels

DILs are presented in Table D-4 for Sr-90, I-131, Cs-134, Cs-137, Ru-103, Ru-106, Pu-238, Pu239 , and Am- 241 for six population age groups and applicable PAGs. To facilitate the execution of food monitoring programs, two criteria were used in selecting FDA's recommended DILs. First, the most limiting DIL for either of the applicable PAGs was selected for each of the nine radionuclides. These DILs are presented in Table D-5 for each of the six age groups. In addition, the average DIL is presented for the radionuclide group \(\mathrm{Pu}+\mathrm{Am}\), composed of \(\mathrm{Pu}-238, \mathrm{Pu}-239\), and Am-241, and the radionuclide group Cs, composed of Cs-134 + Cs-137. The three radionuclides in the \(\mathrm{Pu}+\mathrm{Am}\) group deposit on the bone surface and are alpha-particle emitters. The radionuclides in the Cs group are deposited throughout the body and are beta-particle and gamma-ray emitters. The average values are recommended for these groups because the calculated DILs for radionuclides in each group are similar.

The radionuclides \(\mathrm{Ru}-103\) and \(\mathrm{Ru}-106\) are chemically identical, are deposited throughout the body, and are beta-particle and gamma-ray emitters. However, their widely differing half lives (i.e., 39.3 days and 373 days, respectively) result in markedly differing individual DILs which do not permit simple averaging. Instead, the concentrations of Ru-103 ( \(\mathrm{C}_{3}\) ) and Ru-106 (C6) are divided by their respective DILs and are then summed \({ }^{19}\). The sum must be less than one.

Therefore, \(\quad \frac{\mathrm{C}_{3}}{\mathrm{DIL}_{3}}+\frac{\mathrm{C}_{6}}{\mathrm{DIL}_{6}}<1.0\)
(equation D-1)

This assures that the sum of the separate radiation dose contributions from the \(\mathrm{Ru}-103\) and \(\mathrm{Ru}-106\) concentrations will be less than that required by the Protective Action Guide during the first year after an accident.
\({ }^{19}\) Laboratories that are not equipped to resolve separately the concentrations for \(\mathrm{Ru}-103\) and Ru -
106 should contact FDA for alternate procedures.

Second, there are dietary components which are common to all six age groups. A principal example is fresh milk, for which the consumer of particular supplies cannot be identified in advance. Therefore, the most limiting DIL for all age groups in Table D-5, for each radionuclide or radionuclide group, was selected and is applicable to all components of the diet.

These DILs are presented in Table D-6 and were rounded to two significant figures (one significant figure for the \(\mathrm{Pu}+\) Am group). These are the FDA's recommended DILs.

The DILs in Table D-6 apply independently to each radionuclide or radionuclide group, because they apply to different types of accidents, or in the case of a nuclear reactor accident, to different limiting age groups. However, the DILs for \(\mathrm{Ru}-103\) and \(\mathrm{Ru}-106\) are used in equation D-1 to evaluate that criterion for the radionuclide group \(\mathrm{Ru}-103+\mathrm{Ru}-106\).

The FDA recommended DILs in Table D-6 are given in Table 2 in the main text, along with clarifying notes on application of the DILs.

\section*{Table D-1}

DOSE COEFFICIENTS (mSv/Bq) \({ }^{(\mathrm{a})}\)
\begin{tabular}{lllllll}

\hline
\end{tabular}
(a) Computed as: (DIL for Cs-134 + DIL for Cs-137)/2
(b) Computed as: (DIL for Pu-238 + DIL for Pu-239 + DIL for Am-241) \(/ 3\)

\section*{Table D-6}

DERIVED INTERVENTION LEVELS ( \(\mathrm{Bq} / \mathrm{kg}\) )
(radionuclide groups, most limiting of all diets)
\begin{tabular}{cc} 
Radionuclide Group & Derived Intervention Levels \\
\hline Sr-90 & 160 (15 years) \\
I-131 & 170 (1 year) \\
Cs group & 1200 (adult) \\
Ru-103 \({ }^{(a)}\) & 6800 (3 months) \\
Ru-106 \({ }^{(\mathrm{a})}\) & 450 (3 months) \\
Pu + Am group & 2 (3 months) \\
\hline
\end{tabular}
(a) Due to the large differences in DILs for \(\mathrm{Ru}-103\) and \(\mathrm{Ru}-106\), the individual concentrations of Ru-103 and Ru-106 are divided by their respective DILs and then summed. The sum must be less than one.

\section*{APPENDIX E - DERIVED INTERVENTION LEVELS FOR OTHER RADIONUCLIDES IN THE INVENTORY OF THE CORE OF AN OPERATING NUCLEAR REACTOR}

\begin{abstract}
After a reactor accident, radionuclides other than the principal radionuclides may also be detected in the food supply, usually at much lower concentrations (See Appendix C). However, in the event other radionuclides are present in significant concentrations, this Appendix presents Derived Intervention Levels (DILs) for a number of other radionuclides commonly found in a reactor core inventory.
\end{abstract}

The DILs for fifteen other radionuclides were determined by the same procedure used in Appendix D. The Protective Action Guides were also the same, i.e. \(5 \mathrm{mSv}^{20}\) committed effective dose equivalent, or 50 mSv committed dose equivalent to individual tissues and organs.

Age groups and their related food intakes for one year were given previously in Table D-3, Appendix D. Dietary intakes for seven of the fifteen other radionuclides that have half-lives much less than one year were computed for the periods of time (i.e. in nearest whole number of days) required for the radionuclides to decay to less than \(1 \%\) of the initial activities. Table E-1 and Table E-2 give the relevant data for these seven radionuclides.

Dose coefficients for seven of the fifteen other radionuclides included in this Appendix are provided in ICRP Publication 56 (ICRP 1989) for all six age groups. For the remaining eight radionuclides, DCs are available in NRPB Publication GS7 (NRPB 1987), but for only three age groups, i.e. 1-year, 10-year and adult. The more limited data in NRPB publication GS7 are supplemented as indicated in the next section.

Fractions of food intake assumed to be contaminated (f) are:
0.3 for all radionuclides except Te-132, I-133 and Np -239 in infant diets (i.e., the 3-month and 1-year age groups);
1.0 for Te-132, I-133 and Np-239 in infant diets.
\({ }^{20}\) The International System of Units is used throughout the document. See Appendix A,
Glossary, for equivalence to units used in previous FDA guidance. Glossary, for equivalence to units used in previous FDA guidance.

\section*{SELECTION OF DERIVED INTERVENTION LEVELS}

The dose coefficients in ICRP Publication 56 and NRPB Publication GS7 are for individual tissues and the effective dose equivalent, as formulated in ICRP Publication 26. ICRP has also developed dose coefficients for individual tissues and the effective dose, as formulated in ICRP publication 60. These latter dose coefficients were published in ICRP Publication 67 (ICRP 1993) and ICRP 72 Publication (ICRP 1996) for all six age groups. Review of all these DCs demonstrated that the trend for relative values of DCs with age for any given radionuclide or for radionuclides with common biokinetic characteristics and half lives is similar. Therefore, DCs for the missing 3-month, 5 -year, and 15-year age groups were derived for the eight radionuclides in NRPB Publication GS7, based on the trends observed in the three sets of ICRP tables. Table E-3 presents the derived DCs for these three age groups and the data from ICRP Publication 67 or 72 used in the derivations. Table E-4 gives the DCs used in computing the DILs for all fifteen radionuclides presented in Table E-5. DILs have been rounded to two significant figures (except one significant figure for \(\mathrm{Np}-237\) and \(\mathrm{Cm}-244\) ).

In the same manner as for the principal radionuclides in Appendix D, the most limiting Derived Intervention Level for a radionuclide for either PAG is given in Table E-6 for each age group. Then, the most limiting DIL for a radionuclide for each age group is presented in Table E-7.

During the immediate period after a nuclear reactor accident, decisions on protective actions for food may be required and may need to be based on the general status of the facility or the overall prognosis for worsening conditions. Once food monitoring data is available, the recommended DILs or criterion for the principal radionuclides I-131, Cs-134 + Cs-137, and Ru-103 + Ru-106 recommended in Table 2 of the main text should be used.

The more complex radiochemical or gamma-ray spectrometric analyses for the fifteen other radionuclides listed in this Appendix would not be generally available. If other radionuclides are subsequently detected in food, there will be adequate time to review the data on the concentrations of the other radionuclides to evaluate whether their contributions to radiation dose
via ingestion are unexpectedly high, and to determine whether additional radionuclides should be controlled by their respective DILs in Table E-7. The evaluation takes place with knowledge of the radiation dose represented by the concentrations of the principal radionuclides, which may already exceed one or more of their DILs.

Table E-1
NEAREST WHOLE NUMBER OF DAYS FOR SHORT-LIVED RADIONUCLIDES TO HAVE DECAYED TO LESS THAN \(1 \%\) OF INITIAL ACTIVITY ( \(\mathrm{A}_{0}\) )
\begin{tabular}{lcc} 
Radionuclide & Half-life & \begin{tabular}{c} 
Number of Days for Decay \\
to Less Than \(1 \%\) of \(\mathrm{A}_{0}\)
\end{tabular} \\
\hline \(\mathrm{I}-133\) & 20.8 h & 6 \\
\(\mathrm{~Np}-239\) & 2.36 d & 16 \\

\hline
\end{tabular}
(a) The dose coefficients (DCs) derived for age groups not available in NRPB Publication GS7 are indicated in bold font.
(b) The derived DCs were obtained by multiplying the DC for the NRPB age group contiguous to the missing NRPB age group by the following: the ratio of the DC for the desired age group to the DC of the contiguous age group, from the supporting ICRP data. When there were two contiguous age groups (i.e. for the 5-year and 15 -year age groups), the two resulting DCs for the missing NRPB age groups were averaged.
(c) The dose quantity used is noted for each radionuclide. LLI is lower large intestine, THY is thyroid, BS is bone surface, \(\mathrm{H}_{\mathrm{E}}\) is effective dose equivalent, and \(E\) is effective dose.

\section*{APPENDIX F - DERIVED INTERVENTION LEVELS ADOPTED BY THE COMMISSION OF THE EUROPEAN COMMUNITIES AND THE CODEX ALIMENTARIUS COMMISSION FOR INTERNATIONAL TRADE}

Foods exported from the U.S. are subject to the criteria used by the importing country, such as the recommendations of the CODEX Alimentarius Commission (CODEX) or the regulations of the Commission of the European Communities (CEC). CODEX is operated by the Joint Food Standards Programme of the Food and Agriculture Organization of the United Nations (FAO) and World Health Organization (WHO). CODEX develops and recommends standards and other guidance which are widely used in international trade. CEC regulations govern trade within the European Economic Community (EEC) and between the EEC and other countries. U.S. food exporters need to be familiar with the guidance from these organizations.

A discussion of CEC and CODEX Derived Intervention Levels (DILs) \({ }^{21}\) is given below to provide insight into their differences.
(a) Commission of The European Communities: DILs for Future Accidents

The CEC adopted regulations in 1987 and 1989, establishing DILs for human food and animal feeds following a nuclear accident or any other case of radiological emergency (CEC 1987, 1989a, 1989b). These were established for use following any future accident and do not apply to residual contamination from the accident at Chernobyl. DILs addressing radioactive contamination from the Chernobyl accident were adopted by the CEC in 1986 (CEC 1986b).

The DILs for foods contaminated by future accidents are presented in Table F-l. DILs were given for four radionuclide groups and four food categories. The radionuclide groups include: isotopes of strontium, notably Sr-90; isotopes of iodine, notably I-131; alpha-emitting isotopes of
\({ }^{21}\) The International System of Units is used throughout the document. See Appendix A, Glossary, for equivalence to units used in previous FDA guidance.
plutonium and transpiutonium elements, notably \(\mathrm{Pu}-239\) and \(\mathrm{Am}-241\); and all other radionuclides of half-life greater than 10 days, notably Cs-134 and Cs-137. For each group, CEC specified DILs for four food categories: baby foods, dairy produce, other food except minor food, and liquid foods.

Baby foods were defined as "foodstuffs intended for the feeding of infants during the first four to six months of life, \(\ldots\) and are put up for sale in packages which are clearly identified and labeled food preparation for infants". Dairy produce, liquid food, and minor foods were defined by reference to specific CEC regulations and nomenclature. Liquid foods included tap water and the CEC stated the "same values should be applied to drinking water supplies at the discretion of competent authorities of member states". Dried products referred to the products as prepared for consumption. Dilution factors were not specified and the CEC permitted member states to specify the dilution conditions.

DILs for minor foods such as spices were established, in a separate regulation, at ten times the DILs specified for "other foods" (CEC 1989a). Each DIL is to be applied independently. However, for each radionuclide group, the concentrations within the group are to be added when more than one radionuclide is present. The DILs are to be reviewed within three months following an accident to determine if they should be continued.

\section*{(b) CODEX Alimentarius Commission: DILs for Use in International Trade}

CODEX adopted guidance in 1989 establishing DILs for food contaminated with radionuclides. The CODEX DILs were issued as guideline levels following an accidental nuclear contamination event (CODEX 1989). The guidance was developed from earlier publications of FAO (FAO 1987, Lupien and Randall 1988) and WHO (Waight 1988, WHO 1988). The DILs are presented in Table F-2. They were given for several radionuclide groups categorized by the magnitude of their dose coefficients and two food groups.

The food groups are milk and infant foods and foods destined for general consumption. CODEX defined infant food as a food prepared specifically for consumption by infants in the first year of
life and stated that such foods are packaged and identified as being for this purpose (CODEX 1989). The radionuclides were grouped according to the magnitude of their dose coefficients (DCs). The specific groupings differed for the two food groups. CODEX listed representative radionuclides for each DC group. CODEX guidelines were not restricted to these radionuclides; any radionuclide can be placed into the appropriate DC group.

CODEX DILs apply for one year following a nuclear accident. They are intended to be applied to food prepared for consumption. Each DIL is to be applied independently. However, for each, the concentrations within the group are to be added. No guidance is provided for foods which are consumed in small quantities, although CODEX stated that application of the DILs to products of this type may be unnecessarily restrictive (CODEX 1989).

\section*{AVAILABILITY NOTICE}

\section*{Availability of Reference Materials Cited in NRC Publications}

Most documents cited in NRC publications will be available from one of the following sources:
1. The NRC Public Document Room, 2120 L Street, NW, Lower Level, Washington, DC 20555
2. The Superintendent of Documents, U.S. Government Printing Office, P.O. Box 37082, Washington, DC 20013-7082
3. The National Technical Information Service, Springfield, VA 22161

Although the listing that follows represents the majority of documents cited in NRC publications, it is not intended to be exhaustive.

Referenced documents available for inspection and copying for a fee from the NRC Public Document Roorn include NRC correspondence and internal NRC memoranda; NRC Office of Inspection and Enforcement bulletins, circulars, information notices, inspection and investigation notices; Licensee Event Reports; vendor reports and correspondence; Commission papers; and applicant and licensee documents and correspondence.

The following documents in the NUREG series are available for purchase from the GPO Sales Program: formal NRC staff and contractor reports, NRC-sponsored conference proceedings, and NRC booklets and brochures. Also available are Regulatory Guides, NRC regulations in the Code of Federal Regulations, and Nuclear Regulatory Commission Issuances.

Documents available from the National Technical Information Service inciude NUREG series reports and technical reports prepared by other federal agencies and reports prepared by the Atomic Energy Commission, forerunner agency to the Nuclear Regulatory Commission.

Documents available from public and special technical libraries include all open literature items, such as books, journal and periodical articles, and transactions. Federal Register notices, federal and state legislation, and congressional reports can usually be obtained from these libraries.

Docurnents such as theses, dissertations, foreign reports and translations, and non-NRC conference proceedings are available for purchase from the organization sponsoring the publication cited.

Single copies of NRC draft reports are available free, to the extent of supply, upon written request to the Office of Information Resources Management, Distribution Section, U.S. Nuclear Regulatory Commission, Washington, DC 20555.

Copies of industry codes and standards used in a substantive manner in the NRC regulatory process are maintained at the NRC Library, 7920 Norfolk Avenue, Bethesda, Maryland, and are available there for reference use by the public. Codes and standards are usually copyrighted and may be purchased from the originating organization or, If they are American National Standards, from the American National Standards Institute, 1430 Broadway, New York, NY 10018.

Division of Radiation Protection and Emergency Preparedness Office of Nuclear Reactor Regulation U.S. Nuclear Regulatory Commission Washington, DC 20555

\section*{PREFACE}

This compilation of Standard Radiological Effluent Controls (SREC) contains all of the controls addressed in Generic Letter 89-01, to be incorporated into a licensee's Offsite Dose Calculation Manual (ODCM) at the time the procedural details of the current Radiological Effluent Technical Specifications (RETS) are transferred out of the licensee's Technical Specifications (TS). It has been developed by recasting the RETS of the most current Standard Technical Specifications from the "LCO" format into the "Controls" format of an ODCM entry. Note that these GE-SREC have been patterned after the W-SREC. The following text guidance incorporates the wording of the most récent SREC, however, no attempt has been made to translate REC numbering of the \(\underline{W}\)-SREC into that of the BWR numbering system.

The following GE-SREC provide the latest version of staff guidance, and document current practice in the operating procedures required by 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36(a), and Appendix I to 10 CFR Part 50. This document contains no new requirements and its use is completely voluntary.

\section*{RADIOLOGICAL EFFLUERT TECHNICAL SPECIFICATIONS}

Licensee Technical Specification (TS) amendment requests for incorporation of Radiological Effluent Technical Specifications (RETS) pursuant to 10 CFR 50.36a and Appendix I to 10 CFR Part 50 were approved in the mid-1980s for most operating reactors licensed before 1979 (ORs). Plants licensed after 1979 (NTOLS), included the RETS as part of their initial Technical Specifications. By November 1987, the RETS were implemented by all licensees of operating power reactors. Detailed Safety Evaluation Reports (SERs) documented the acceptability of the plant-specific RETS of the ORs, while the acceptance of the RETS for the NTOLS followed the regular pattern of the Standard Technical Specifications (STS). Thus, for all operating plants, the compliance of the licensee with 10 CFR 50.36 a and Appendix I to 10 CFR Part 50 is a matter of record.

Early draft revisions of model RETS, distributed to licensees in mid-1978, contained equations for dose calculations, setpoint determinations and meteorological dispersion factors, as well as the procedural details for complying with Appendix I to 10 CFR Part 50. In later revisions, including Revision 2 used as the bench mark for the NRC staff's acceptance of OR RETS, the equations were removed and incorporated into an Offsite Dose Calculation Manual (ODCM) prepared by the licensee and provided to NRC for review along with the proposed RETS.

Early guidance for preparation of the Radiological Effluent Technical Specifications (RETS) and Offsite Dose Calculation Manual (ODCM) was published in NUREG-0133, "Preparation of Radiological Effluent Technical Specifications for Nuclear Power Plants," October 1978. Copies of model RETS, however, have been available only in draft form as NUREG-0472, Revision 2, "Radiological Effluent Technical Specifications for PWRs," February 1, 1980; NUREG-0473, Revision 2, "Radiological Effluent Technical Specifications for BWRs," February 1, 1980; and succeeding draft revisions. Staff guidance for the Radiological Environmental Monitoring Program is contained in the Radiological Assessment Branch Technical Position (RAB-BTP), originally issued in March 1978 and upgraded by Revision 1 in November 1979 as a result of the accident at Three Mile Island. This Revision 1 to the RAB-BTP was forwarded to all operating reactor licensees in November 1979 and remains in effect at the present time. Since this BTP was never incorporated into the Regulatory Guide System, a copy is reproduced in this document as Appendix \(A\). Even though it has been used extensively in reviewing ODCMs, guidance for the contents of the ODCM is found only in an appendix to a paper presented at an Atomic Industrial Forum conference in 1981, and has had only informal distribution since that time.

OFFSITE DOSE CALCULATION MANUAL
The potential for augmentation of a licensee's ODCM through transfer of the procedural details of the RETS following the guidance of Generic Letter 89-01, provides an opportunity to assemble in one set of documents the staff guidance for the ODCM.

The current overview guidance for development of the ODCM was prepared originally in July 1978 and revised in February 1979 after discussions with committees of the Atomic Industrial Forum. This guidance was made generally available as "Appendix B - General Contents of the Offsite Dose Calculation Manual (ODCM) (Revision 1, February 1979)" to the paper authored by C. A. Willis and F. J. Congel, "Status of NRC Radiological Effluent Technical Specification Activities" presented at the Atomic Industrial Forum Conference on NEPA and Nuclear Regulation, October 4-7, 1981, Washington, D.C. -A copy of this guidance that continues in effect to date, is reproduced in this document as Appendix B.

During the discussions leading up to the implementation of the RETS by the ORs, it became important to record in a "living" document certain interpretations and understandings reached in these discussions. The ODCM thus became a repository for such interpretations, as well as for other information requested by the staff in connection with its evaluation of licensee's commitments and performance under 10 CFR 50.36 a and Appendix 1 to 10 CFR Part 50.

TECHNICAL SPECIFICATION IMPROVEMENT PROGRAM
Recently, the NRC staff has examined the contents of the RETS in relation to the Commission's Interim Policy Statement on Technical Specification Improvements. The staff has determined that programmatic controls can be implemented in the Administrative Controls section of the Technical Specifications (TS) to satisfy existing regulatory requirements for RETS. At the same time, the procedural details of the current TS on radioactive effluents and radiological environmental monitoring can be relocated to the Offsite Dose Calculation Manual (ODCM).

To initiate the change, new programatic controls for radioactive effluents and radiological environmental monitoring are incorporated in the TS to conform to the regulatory requirements of 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36a, and Appendix I to 10 CFR Part 50. The procedural details included in licensees' present TS on radioactive effluents, environmental monitoring, and associated reporting requirements will be relocated to the ODCM. Licensees will handle future changes to these procedural details in the ODCM under the administrative controls for changes to the ODCM. Detailed guidance to effect the transfer of the RETS to the ODCM is given in Generic Letter 89-01, reproduced in its entirety as Appendix C.

\section*{GUIDANCE FOR THE TRANSFER OF RETS TO ODCM}

Enclosure 1 of Generic Letter (GL) 89-01 of Appendix B provides detailed guidance for the preparation of a license amendment request to implement the transfer of RETS to ODCM. Page 1 of the enclosure states:
"The NRC staff's intent in recommending --- the relocation of procedural details of the current RETS to the ODCM is to fulfill the goal of the Commission Policy Statement for Technical Specification Improvements. It is not the staff's intent to reduce the level of radiological effluent control. Rather, this amendment will provide programmatic controls for RETS consistent with regulatory requirements and allow relocation of the procedural details of current RETS to the ODCM."

Page 2 of Enclosure 1 states:
"...the procedural details covered in the licensee's current RETS, consisting of the limiting conditions for operation, their applicability, remedial actions, surveillance requirements, and the Bases section of the TS for these requirements, are to be relocated to the ODCM --- in a manner that ensures that these details are incorporated in plant operating procedures. The NRC staff does not intend to repeat technical reviews of the relocated procedural details because their consistency with the applicable regulatory requirements is a matter of record from past NRC reviews of RETS."

\section*{DISCUSSION}

For the purpose of the transfer described in GL 89-01 of Appendix B, the RETS will consist of the specifications from the STS listed in Enclosure 2 of Appendix B of GL 89-01. Licensees with nonstandard TS should consider the analogous TS in their format.

It is suggested that the most straightforward method of transferring a licensee's commitments in the RETS to the ODCM in accordance with GL 98-01 is to recast the RETS in the licensee's present TS from the "Limiting Condition for Operation (LCO)" format of the TS into the "Controls" format of the ODCM entry. The accompanying package provides an example of this recasting into Standard Radiological Effluent Controls (SREC) from the model RETS for Boiling Water Reactors (BWRS). This recasting is in format only. The TS pages have been transferred to the ODCM without change except for the substitution of "Controls" for "LCO." Plants that have RETS that closely follow the STS format will be able to use the accompanying examples directly as guidance. For plants with nonstandard RETS, the transfer of TS commitments to the ODCM should be made similarly page by page, again with the substitution of "Controls" for "LCO."

This NUREG report contains no new requirements; licensee implementation of this guidance is completely voluntary.

\section*{SUMMARY}

As part of the license amendment request for \(T S\) improvement relative to the RETS, a licensee confirms that the guidance of Generic Letter 89-01 has been followed. This guidance includes the following:
"The procedural details covered in the licensee's current RETS, consisting of the limiting conditions for operation, their applicability, remedial actions, surveillance requirements, and the Bases section of the TS for these requirements, are to be relocated to the ODCM --- in a manner that ensures that these details are incorporated in plant operating procedures."

The Standard Radiological Effluent Controls (SREC) compiled in this report document current staff practice in the operating procedures required by 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36(a), and Appendix I to 10 CFR Part 50. Thus they contain all of the controls required by Generic Letter 89-01, to be incorporated into a licensee's ODCM at the time the procedural details of the current RETS are transferred out of the licensee's TS.

GE-SREC

\title{
NOTE \\ These GE-SREC have been patterned after the W-SREC.
}

The following text guidance incorporates the wording of the most recent SREC; however, no attempt has been made to translate the REC numbering of the \(\underline{W}\)-SREC into that
of the BWR numbering system

\section*{SECTION 1.0}
definitions

The defined terms of this section appear in capitalized type and are applicable throughout these Controls.

ACTION
1.1 ACTION shall be that part of a Control that prescribes remedial measures required under designated conditions.

\section*{CHANNEL CALIBRATION}
1.4 An CHANNEL CALIBRATION shall be the adjustment, as necessary, of the channel such that it responds within the required range and accuracy to known values of input. The CHANNEL CALIBRATION shall encompass the entire channel including the sensors and alarm, interlock and/or trip functions and shall include the CHANNEL FUNCTIONAL TEST. The CHANNEL CALIBRATION may be performed by any series of sequential, overlapping, or total channel steps such that the entire channel is calibrated.

CHANNEL CHECK
1.5 A CHANNEL CHECK shall be the qualitative assessment of channel behavior during operation by observation. This determination shall include, where possible, comparison of the channel indication and/or status with other indications and/or status derived from independent instrument channels measuring the same parameter.

CHANNEL FUNCTIONAL TEST
1.6 A CHANNEL FUNCTIONAL TEST shall be:
a. Analog channels - the injection of a simulated signal into the channel as close to the sensor as practicable to verify OPERABILITY including alarm and/or trip functions and channel failure trips.
b. Bistable channels - the injection of a simulated signal into the sensor to verify OPERABILITY including alarm and/or trip functions.

The CHANNEL FUNCTIONAL TEST may be performed by any series of sequential, overlapping or total channel steps such that the entire channel is tested.

\section*{DOSE EQUIVALENT I-131}
1.10 DOSE EQUIVALENT I-131 shall be that concentration of l-131 (microCurie/gram) which alone would produce the same thyroid dose as the quantity and isotopic mixture of I-131, I-132, I-133, I-134, and I-135 actually present. The thyroid dose conversion factors used for this calculation shall be those listed in [Table Ill of TID-14844, "Calculation of Distance Factors for Power and Test Reactor Sites" or Table E-7 of NRC Regulatory Guide 1.109, Revision 1, October 1977].

\section*{FREQUENCY NOTATION}
1.13 The FREQUENCY NOTATION specified for the performance of Surveillance
Requirements shall correspond to the intervals defined in Table 1.1 .

\section*{GASEOUS RADWASTE TREATMENT SYSTEM}
1.14 A GASEOUS RADWASTE TREATMENT SYSTEM (e.g., the "augmented offgas system") is any system designed and installed to reduce radioactive gaseous effluents by collecting primary coolant system offgases from the main condenser evacuation system and providing for delay or holdup for the purpose of reducing the total radioactivity prior to release to the environment.

\section*{MEMBER(S) OF THE PUBLIC}
1.16 MEMBER(5) OF THE PUBLIC shall include all persons who are not occupationally associated with the plant. This category does not include employees of the licensee, its contractors, or vendors. Also excluded from this category are persons who enter the site to service equipment or to make deliveries. This category does include persons who use portions of the site for recreational, occupational, or other purposes not associated with the plant.

OFFSITE DOSE CALCULATION MANUAL
1.17 The OFFSITE DOSE CALCULATION MANUAL (ODCM) shall contain the methodology and parameters used in the calculation of offsite doses resulting from radioactive gaseous and liquid effluents, in the calculation of gaseous and liquid effluent monitoring Alarm/Trip Setpoints, and in the conduct of the Environmental Radiological Monitoring Program. The ODCM shall also contain (1) the Radioactive Effluent Controls and Radiological Environmental Monitoring Programs required by Section 6.8.4 and (2) descriptions of the information that should be included in the Annual Radiological Environmental Operating and Semiannual Radioactive Effluent Release Reports required by TS 6.9.1.3 and 6.9.1.4.

OPERABLE - OPERABILITY
1.18 A system, subsystem, train, component or device shall be OPERABLE or have OPERABILITY when it is capable of performing its specified function(s), and when all necessary attendant instrumentation, controls, electrical power, cooling or seal water, lubrication or other auxiliary equipment that are required for the system, subsystem, train, component, or device to perform its function(s) are also capable of performing their related support function(s).

OPERATIONAL CONDITION - CONDITION
1.19 An OPERATIONAL CONDITION, i.e., CONDITION, shall be any one inclusive combination of mode switch position and average reactor coolant temperatures as specified in Table 1.2.

\section*{PURGE - PURGING}
1.23 PURGE or PURGING shall be any controlled process of discharging air or gas from a confinement to maintain temperature, pressure, humidity, concentration or other operating condition, in such a manner that replacement air or gas is required to purify the confinement.

RATED THERMAL POWER
1.25 RATED THERMAL POWER shall be a total reactor core heat transfer rate to the reactor coolant of ___MWt.

REPORTABLE EVENT
1.27 A REPORTABLE EVENT shall be any of those conditions specified in Section 50.73 of 10 CFR Part 50.

SITE BOUNDARY
1.30 The SITE BOUNDARY shall be that line beyond which the land is neither owned, nor leased, nor otherwise controlled by the licensee.

\section*{SOURCE CHECK}
1.33 A SOURCE CHECK shall be the qualitative assessment of channel response when the channel sensor is exposed to a source of increased radioactivity.

THERMAL POWER

\subsection*{1.35 THERMAL POWER shall be the total reactor core heat transfer rate to the reactor coolant.}

UNRESTRICTED AREA
1.38 An UNRESTRICTED AREA shall be any area at or beyond the SITE BOUNDARY access to which is not controlled by the licensee for purposes of protection of individuals from exposure to radiation and radioactive materials, or any area within the SITE BOUNDARY used for residential quarters or for industrial, commercial, institutional, and/or recreational purposes.

VENTILATION EXHAUST TREATMENT SYSTEM
1.39 A VENTILATION EXHAUST TREATMENT SYSTEM shall be any system designed and installed to reduce gaseous radioiodine or radioactive material in particulate form in effluents by passing ventilation or vent exhaust gases through charcoal adsorbers and/or HEPA filters for the purpose of removing iodines or particulates from the gaseous exhaust stream prior to the release to the environment. Such a system is not considered to have any effect on noble gas effluents. Engineered Safety Features Atmospheric Cleanup Systems are not considered to be VENTILATION EXHAUST TREATMENT SYSTEM components.

\section*{VENTING}
1.40 VENTING shall be the controlled process of discharging air or gas from a confinement to maintain temperature, pressure, humidity, concentration, or other operating condition, in such a manner that replacement air or gas is not provided or required during VENTING. Vent, used in system names, does not imply a VENTING process.

\#The reactor mode switch may be placed in the Run or Startup/Hot Standby position to test the switch interlock functions provided that the control rods are verified to remain fully inserted by a second licensed operator or other technically qualified member of the unit technical staff.
\#\#The reactor mode switch may be placed in the Refuel position while a single control rod drive is being removed from the reactor pressure vessel per Specification 3.9.10.1.
*Fuel in the reactor vessel with the vessel head closure bolts less than fully tensioned or with the head removed.
**See Special Tests Exceptions 3.10.1 and 3.10.3.
***The reactor mode switch may be placed in the Refuel position while a single control rod is being recoupled provided that the one-rod-out interlock is OPERABLE.

\title{
SECTIONS 3.0 AND 4.0
} CONTROLS

AND

\section*{SURVEILLANCE REQUIREMENTS}
3.0.1 Compliance with the Controls contained in the succeeding controls is required during the OPERATIONAL CONDITIONS or other conditions specified therein; except that upon failure to meet the Control, the associated ACTION requirements shall be met.
3.0.2 Noncompliance with a control shall exist when the requirements of the Control and associated ACTION requirements are not met within the specified time intervals. If the Control is restored prior to expiration of the specified time intervals, completion of the ACTION requirements is not required.
3.0.3 When a Control is not met, except as provided in the associated ACTION requirements, within 1 hour action shall be initiated to place the unit in an OPERATIONAL CONDITION in which the control does not apply by placing it, as applicable, in:
1. At least STARTUP within the next 6 hours,
2. At least HOT SHUTDOWN within the following 6 hours, and
3. At least COLD SHUTDOWN within the subsequent 24 hours.

Where corrective measures are completed that permit operation under the ACTION requirements, the action may be taken in accordance with the specified time limits as measured from the time of failure to meet the Control. Exceptions to these requirements are stated in the individual controls.

This control is not applicable in OPERATIONAL CONDITIONS 4 or 5.
3.0.4 Entry into an OPERATIONAL CONDITION or other specified condition shall not be made unless the conditions for the Control are met without reliance on provisions contained in the ACTION requirements. This provision shall not prevent passage through or to OPERATIONAL CONDITIONS as required to comply with ACTION requirements. Exceptions to these requirements are stated in the individual controls.

\section*{SURVEILLANCE REQUIREMENTS}

\subsection*{4.0.1 Surveillance Requirements shall be met during the OPERATIONALCONDITIONS or other conditions specified for individual Controls unless otherwise stated in an individual Surveillance Requirement. \\ 4.0.2 Each Surveillance Requirement shall be performed within the specified time interval with:}
a. A maximum allowable extension not to exceed \(25 \%\) of the surveillance interval, but
b. The combined time interval for any three consecutive surveillance intervals shall not exceed 3.25 times the specified surveillance interval.
4.0.3 Failure to perform a Surveillance Requirement within the specified time interval shall constitute a failure to meet the OPERABILITY requirements for a Control. Exceptions to these requirements are stated in the individual controls. Surveillance Requirements do not have to be performed on inoperable equipment.
4.0.4 Entry into an OPERATIONAL CONDITION or other specified applicable condition shall not be made unless the Surveillance Requirement(s) associated with the Control has been performed within the applicable surveillance interval or as otherwise specified.
3.3.3.10 In accordance with [plant name] TS 6.8.4.g.1), the radioactive liquid effluent monitoring instrumentation channels shown in Table 3.3-12 shall be OPERABLE with their Alarm/Trip Setpoints set to ensure that the limits of Control 3.11.1.1 are not exceeded. The Alarm/Trip Setpoints of these channels shall be determined and adjusted in accordance with the methodology and parameters in the OFFSITE DOSE CALCULATION MANUAL (ODCM).

APPLICABILITY: At all times.
ACTION:
a. With a radioactive liquid effluent monitoring instrumentation channel Alarm/Trip Setpoint less conservative than required by the above control, immediately suspend the release of radioactive liquid effluents monitored by the affected channel, or declare the channel inoperable, or change the setpoint so it is acceptably conservative.
b. With less than the minimum number of radioactive liquid effluent monitoring instrumentation channels OPERABLE, take the ACTION shown in Table 3.3-12. Restore the inoperable instrumentation to OPERABLE status within 30 days and, if unsuccessful, explain in the next Semiannual Radioactive Effluent Release Report pursuant to Control 6.9.1.4 why this inoperability was not corrected in a timely manner.
c. The provisions of Controls 3.0.3 and 3.0.4 are not applicable. Report all deviations in the Semiannual Radioactive Effluent Release Report.

SURVEILLANCE REQUIREMENTS
4.3.3.10 Each radioactive liquid effluent monitoring instrumentation channel shall be demonstrated OPERABLE by performance of the CHANNEL CHECK, SOURCE CHECK, CHANNEL CALIBRATION, and CHANNEL FUNCTIONAL TEST at the frequencies shown in Table 4.3-8.

ACTION STATEMENTS

ACTION 35 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via this pathway may continue provided that prior to initiating a release:
a. At least two independent samples are analyzed in accordance with Control 4.11.1.1.1, and
b. At least two technically qualified members of the facility staff independently verify the release rate calculations and discharge line valving.

Otherwise, suspend release of radioactive effluents via this pathway.

ACTION 37 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via this pathway may continue provided that, at least once per 12 hours, grab samples are collected and analyzed for radioactivity at a lower limit of detection of no more than 10-7 microCurie/ml.

ACTION 38 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via this pathway may continue provided the flow rate is estimated at least once per 4 hours during actual releases. Pump performance curves generated in place may be used to estimate flow.

ACTION 39 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via this pathway may continue provided the radioactivity level is determined at least once per 4 hours during actual releases.

TABLE NOTATIONS
(1) The CHANNEL FUNCTIONAL TEST shall also demonstrate that automatic isolation of this pathway and control room alarm annunciation occur if any of the following conditions exists:
a. Instrument indicates measured levels above the Alarm/Trip Setpoint, or
b. Circuit failure, or
c. Instrument indicates a downscale failure, or
d. Instrument controls not set in operate mode.
(2) The CHANNEL FUNCTIONAL TEST shall also demonstrate that control room alarm annunciation occurs if any of the following conditions exists:
a. Instrument indicates measured levels above the Alarm Setpoint, or
b. Circuit failure, or
c. Instrument indicates a downscale failure, or
d. Instrument controls not set in operate mode.
(3) The initial CHANNEL CALIBRATION shall be performed using one or more of the reference standards certified by the National Bureau of Standards (NBS) or using standards that have been obtained from suppliers that participate in measurement assurance activities with NBS. These standards shall permit calibrating the system over its intended range of energy and measurement range. For subsequent CHANNEL CALIBRATION, sources that have been related to the initial calibration shall be used.
(4) CHANNEL CHECK shall consist of verifying indication of flow during periods of release. CHANNEL CHECK shall be made at least once per 24 hours on days on which continuous, periodic, or batch releases are made.
3.3.3.11 In accordance with [plant name] TS 6.8.4.g.1), the radioactive gaseous effluent monitoring instrumentation channels shown in Table 3.3-13 shall be OPERABLE with their Alarm/Trip Setpoints set to ensure that the limits of Control 3.11.2.1 are not exceeded. The Alarm/Trip Setpoints of these channels shall be determined and adjusted in accordance with the methodology and parameters in the ODCM.

APPLICABILITY: As shown in Table 3.3-13
ACTION:
a. With a radioactive gaseous effluent monitoring instrumentation channel Alarm/Trip Setpoint less conservative than required by the above control, immediately suspend the release of radioactive gaseous effiuents monitored by the affected channel, or declare the channel inoperable, or change the setpoint so it is acceptably conservative.
b. With less than the minimum number of radioactive gaseous effluent monitoring instrumentation channels OPERABLE, take the ACTION shown in Table 3.3-13. Restore the inoperable instrumentation to OPERABLE status within 30 days and, if unsuccessful, explain in the next Semiannual Radioactive Effluent Release Report pursuant to Control 6.9.1.4 why this inoperability was not corrected in a timely manner.
c. The provisions of Controls 3.0.3 and 3.0.4 are not applicable. Report all deviations in the Semiannual Radioactive Effluent Release Report.

SURVEILLANCE REQUIREMENTS
4.3.3.11 Each radioactive gaseous effluent monitoring instrumentation channel shall be demonstrated OPERABLE by performance of the CHANNEL CHECK, SOURCE CHECK, CHANNEL CALIBRATION and CHANNEL FUNCTIONAL TEST at the frequencies shown in Table 4.3-9.

\section*{ACTION STATEMENTS}

ACTION 45 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, releases to the environment may continue for up to 72 hours provided:
a. The offgas system is not bypassed, and
b. The offgas delay system noble gas activity effluent (downstream) monitor is OPERABLE;

Otherwise, be in at least HOT STANDBY within 12 hours.
ACTION 46 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via this pathway may continue provided the flow rate is estimated at least once per 4 hours.
ACTION 47 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via this pathway may continue provided grab samples are taken at least once per 12 hours and these samples are analyzed for radioactivity within 24 hours.
ACTION 48 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, immediately suspend release of radioactive effluents via this pathway.
ACTION 49 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, operation of the main condenser offgas treatment system may continue provided grab samples are collected at least once per 4 hours and analyzed within the following 4 hours.
ACTION 50 - With the number of channels OPERABLE one less than required by the Minimum Channels OPERABLE requirement, operation of this system may continue for up to 14 days.

ACTION 51 - With the number of channels OPERABLE less than required by the Minimum Channels OPERABLE requirement, effluent releases via the affected pathway may continue provided samples are continuously collected with auxiliary sampling equipment as required in Table 4.11-2.

TABLE NOTATIONS
*At all times.
**During main condenser offgas treatment system operation.
***During operation of the main condenser air ejector.
(1) The CHANNEL FUNCTIONAL TEST shall also demonstrate that automatic isolation of this pathway and control room alarm annunciation occurs if any of the following conditions exists:
a. Instrument indicates measured levels above the Alarm/Trip Setpoint, or
b. Circuit failure, or
c. Instrument indicates a downscale failure, or
d. Instrument controls not set in operate mode.
(2) The CHANNEL FUNCTIONAL TEST shall aiso demonstrate that control room alarm annunciation occurs if any of the following conditions exists:
a. Instrument indicates measured levels above the Alarm Setpoint, or
b. Circuit failure, or
c. Instrument indicates a downscale failure, or
d. Instrument controls not set in operate mode.
(3) The initial CHANNEL CALIBRATION shall be performed using one or more of the reference standards certified by the National Bureau of Standards (NBS) or using standards that have been obtained from suppliers that participate in measurement assurance activities with NBS. These standards shall permit calibrating the system over its intended range of energy and measurement range. For subsequent CHANNEL CALIBRATION, sources that have been related to the initial calibration shall be used.
(4) The CHANNEL CALIBRATION shall inciude the use of standard gas samples containing a nominal:
a. One volume percent hydrogen, balance nitrogen, and
b. Four volume percent hydrogen, balance nitrogen.
(5) The CHANNEL CALIBRATION shall include the use of standard gas samples containing a nominal:
a. One volume percent oxygen, balance nitrogen, and
b. Four volume percent oxygen, balance nitrogen.

\section*{3/4.11.1 LIQUID EFFLUENTS}

CONCENTRATION
CONTROLS
3.11.1.1 In accordance with [plant name] TS 6.8.4.g.2) and 3), the concentration of radioactive material released in liquid effluents to UNRESTRICTED AREAS (see figure 5.1-3) shall be limited to the concentrations specified in 10 CFR Part 20, Appendix B, Table II, Column 2 for radionuclides other than dissolved or entrained noble gases. For dissolved or entrained noble gases, the concentration shall be limited to \(2 \times 10^{-4}\) microCurie/ml total activity.

APPLICABILITY: At all times.
ACTION:
a. With the concentration of radioactive material released in liquid effluents to UNRESTRICTED AREAS exceeding the above limits, immediately restore the concentration to within the above limits.
b. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

SURVEILLANCE REQUIREMENTS
4.11.1.1.1 Radioactive liquid wastes shall be sampled and analyzed according to the sampling and analysis program of Table 4.11-1.
4.11.1.1.2 The results of the radioactivity analyses shall be used in accordance with the methodology and parameters in the ODCM to assure that the concentrations at the point of release are maintained within the limits of Control 3.11.1.1.

\end{tabular}
(1) The LLD is defined, for purposes of these controls, as the smallest concentration of radioactive material in a sample that will yield a net count, above system background, that will be detected with \(95 \%\) probability with only \(5 \%\) probability of falsely concluding that a blank observation represents a "real" signal.

For a particular measurement system, which may include radiochemical separation:
\(L L D=\frac{4.66 \mathrm{~s},}{E \cdot V \cdot 2.22 \times 10^{6} \cdot Y \cdot \exp (-\lambda \Delta t)}\)

Where:
LLD = the "a priori" lower limit of detection (microCurie per unit mass or volume),
\(s_{b}=\) the standard deviation of the background counting rate or of the counting rate of a blank sample as appropriate (counts per minute),
\(E=\) the counting efficiency (counts per disintegration),
\(V=\) the sample size (units of mass or volume),
\(2.22 \times 10^{6}=\) the number of disintegrations per minute per microCurie,
\(Y=\) the fractional radiochemical yield, when applicable,
\(\lambda=\) the radioactive decay constant for the particular radionuclide (sec-1), and
\(\Delta t=\) the elapsed time between the midpoint of sample collection and the time of counting (sec).
Typical values of \(E, V, Y\), and \(\Delta t\) should be used in the calculation.
It should be recognized that the LLD is defined as an a priori (before the fact) limit representing the capability of a measurement system and not as an a posteriori (after the fact) limit for a particular measurement.
(2) A batch release is the discharge of liquid wastes of a discrete volume. Prior to sampling for analyses, each batch shall be isolated, and then thoroughly mixed by a method described in the ODCM to assure representative sampling.

\section*{TABLE 4.11-1 (Continued)}

TABLE NOTATIONS (Continued)
(3) The principal gamma emmiters for which the LLD control applies include the following radionuclides: \(\mathrm{Mn}-54, \mathrm{Fe}-59, \mathrm{Co}-58, \mathrm{Co}-60, \mathrm{Zn}-65, \mathrm{Mo}-99\), Cs-134, Cs-137, and Ce-141. Ce-144 shall also be measured, but with an LLD of \(5 \times 10^{-6}\). This list does not mean that only these nuclides are to be considered. Other gamma peaks that are identifiable, together with those of the above nuclides, shall also be analyzed and reported in the Semiannual Radioactive Effluent Release Report pursuant to Control 6.9.1.4 in the format outlined in Regulatory Guide 1.21, Appendix B, Revision 1, June 1974.
(4) A composite sample is one in which the quantity of liquid sampled is proportional to the quantity of liquid waste discharged and in which the method of sampling employed results in a specimen that is representative of the liquids released.
(5) A continuous release is the discharge of liquid wastes of a nondiscrete volume, e.g., from a volume of a system that has an input flow during the continuous release.
(6)

To be representative of the quantities and concentrations of radioactive materials in liquid effluents, samples shall be collected continuousiy in proportion to the rate of flow of the effluent stream. Prior to analyses, all samples taken for the composite shall be thoroughly mixed in order for the composite sample to be representative of the effluent release.

DOSE
CONTROLS
3.11.1.2 In accordance with [plant name] TS 6.8.4.g.4) and 6.8.4.9.5), the dose or dose commitment to a MEMBER OF THE PUBLIC from radioactive materials in liquid effluents released, from each unit, to UNRESTRICTED AREAS (see Figure 5.1-3) shall be limited:
a. During any calendar quarter to less than or equal to 1.5 mrems to the whole body and to less than or equal to 5 mrems to any organ, and
b. During any calendar year to less than or equal to 3 mrems to the whole body and to less than or equal to 10 mrems to any organ.

APPLICABILITY: At all times.
ACTION:
a. With the calculated dose from the release of radioactive materials in liquid effluents exceeding any of the above limits, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that identifies the cause(s) for exceeding the limit(s) and defines the corrective actions that have been taken to reduce the releases and the proposed corrective actions to be taken to assure that subsequent releases will be in compliance with the above limits. This Special Report shall also include: (1) the results of radiological analyses of the drinking water source, and (2) the radiological impact on finished drinking water supplies with regard to the requirements of 40 CFR Part 141, Safe Drinking Water Act.*
b. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.1.2 Cumulative dose contributions from liquid effluents for the current calendar quarter and the current calendar year shall be determined in accordance with the methodology and parameters in the ODCM at least once per 31 days.

\footnotetext{
*The requirements of ACTION a.(1) and (2) are applicable only if drinking water supply is taken from the receiving water body within 3 miles of the plant discharge. In the case of river-sited plants this is 3 miles downstream only.
}

LIQUID RADWASTE TREATMENT SYSTEM
CONTROLS
3.11.1.3 In accordance with [plant name] TS 6.8.4.g.6), the Liquid Radwaste Treatment System shall be OPERABLE and appropriate portions of the system shall be used to reduce releases of radioactivity when the projected doses due to the liquid effluent, from each unit, to UNRESTRICTED AREAS (see Figure 5.1-3) would exceed 0.06 mrem to the whole body or 0.2 mrem to any organ in a 31-day period.

APPLICABILITY: At all times.

\section*{ACTION:}
a. With radioactive liquid waste being discharged without treatment and in excess of the above limits and any portion of the Liquid Radwaste Treatment System not in operation, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that includes the following information:
1. Explanation of why liquid radwaste was being discharged without treatment, identification of any inoperable equipment or subsystems, and the reason for the inoperability,
2. Action(s) taken to restore the inoperable equipment to OPERABLE status, and
3. Summary description of action(s) taken to prevent a recurrence.
b. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.1.3.1 Doses due to liquid releases from each unit to UNRESTRICTED AREAS shall be projected at least once per 31 days in accordance with the methodology and parameters in the ODCM when Liquid Radwaste Treatment Systems are not being fully utilized.
4.11.1.3.2 The installed Liquid Radwaste Treatment System shall be considered OPERABLE by meeting Controls 3.11.1.1 and 3.11.1.2.

\section*{RADIOACTIVE EFFLUENTS}

3/4.11.2 GASEOUS EFFLUENTS
DOSE RATE
CONTROLS
3.11.2.1 In accordance with [plant name] TS 6.8.4.g.3) and 7), the dose rate due to radioactive materials released in gaseous effluents from the site to areas at and beyond the SITE BOUNDARY (see Figure 5.1-3) shall be limited to the following:
a. For noble gases: Less than or equal to \(500 \mathrm{mrems} / \mathrm{yr}\) to the whole body and less than or equal to \(3000 \mathrm{mrems} / \mathrm{yr}\) to the skin , and
b. For Iodine-131, for Iodine-133, for tritium, and for all radionuclides in particulate form with half-lives greater than 8 days: Less than or equal to 1500 mrems/yr to any organ.

APPLICABILITY: At all times.
ACTION:
a. With the dose rate(s) exceeding the above limits, immediately restore the release rate to within the above limit(s).
b. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.2.1.1 The dose rate due to noble gases in gaseous effluents shall be determined to be within the above limits in accordance with the methodology and parameters in the OOCM.
4.11.2.1.2 The dose rate due to Iodine-131, Iodine-133, tritium, and all radionuclides in particulate form with half-lives greater than 8 days in gaseous effluents shall be determined to be within the above limits in accordance with the methodology and parameters in the ODCM by obtaining representative samples and performing analyses in accordance with the sampling and analysis program specified in Table 4.11-2.

TABLE 4．11－2
RADIOACTIVE GASEOUS WASTE SAMPLING AND ANALYSIS PROGRAM

TABLE NOTATIONS
(1) The LLD is defined, for purposes of these controls, as the smallest concentration of radioactive material in a sample that will yield a net count, above system background, that will be detected with \(95 \%\) probability with only 5\% probability of falsely concluding that a blank observation represents a "real" signal.

For a particular measurement system, which may include radiochemical separation:
\[
L L D=\frac{4.66 s_{b}}{E \cdot V \cdot 2.22 \times 10^{6} \cdot Y \cdot \exp (-\lambda \Delta t)}
\]

Where:
LLD = the "a priori" lower limit of detection (microCurie per unit mass or volume),
\(s_{b}=\) the standard deviation of the background counting rate or of the counting rate of a blank sample as appropriate (counts per minute),
\(E=\) the counting efficiency (counts per disintegration),
\(V=\) the sample size (units of mass or volume),
\(2.22 \times 10^{6}=\) the number of disintegrations per minute per microCurie,
\(Y=\) the fractional radiochemical yield, when applicable,
\(\lambda=\) the radioactive decay constant for the particular radionuclide (sec-1), and
\(\Delta t=\) the elapsed time between the midpoint of sample collection and the time of counting (sec).

Typical values of \(E, V, Y\), and \(\Delta t\) should be used in the calculation.
It should be recognized that the LLD is defined as an a priori (before the fact) limit representing the capability of a measurement system and not as an a posteriori (after the fact) limit for a particular measurement.

TABLE 4.11-2 (Continued)
TABLE NOTATIONS (Continued)
(2) The principal gamma emitters for which the LLD control applies include the following radionuclides: \(\mathrm{Kr}-87, \mathrm{Kr}-88, \mathrm{Xe}-133, \mathrm{Xe}-133 \mathrm{~m}, \mathrm{Xe}-135\), and \(\mathrm{Xe}-138\) in noble gas releases and \(\mathrm{Mn}-54, \mathrm{Fe}-59, \mathrm{Co}-58, \mathrm{Co}^{-60} \mathbf{- 6 0} \mathrm{Zn}-65, \mathrm{Mo}-99\), I-131, \(\mathrm{Cs}-134, \mathrm{Cs}-137, \mathrm{Ce}-141\) and \(\mathrm{Ce}-144\) in Iodine and particulate releases. This list does not mean that only these nuclides are to be considered. Other gamma peaks that are identifiable, together with those of the above nuclides, shall also be analyzed and reported in the Semiannual Radioactive Effluent Release Report pursuant to Control 6.9.1.4 in the format outlined in Regulatory Guide 1.21, Appendix B, Revision 1, June 1974.
\({ }^{(3)}\) Sampling and analysis shall also be performed following shutdown, startup, or a THERMAL POWER change exceeding 15\% of RATED THERMAL POWER within a 1-hour period.
(4) Not applicable.
(5)

Tritium grab samples shall be taken at least once per 7 days from the ventilation exhaust from the spent fuel pool area, whenever spent fuel is in the spent fuel pool.
(6)

The ratio of the sample flow rate to the sampled stream flow rate shall be known for the time period covered by each dose or dose rate calculation made in accordance with Controls 3.11.2.1, 3.11.2.2, and 3.11.2.3.
(7)

Samples shall be changed at least once per 7 days and analyses shall be completed within 48 hours after changing, or after removal from sampler. Sampling shall also be performed at least once per 24 hours for at least 7 days following each shutdown, startup, or THERMAL POWER change exceeding 15\% of RATED THERMAL POWER within a 1 -hour period and analyses shall be completed within 48 hours of changing. When samples collected for 24 hours are analyzed, the corresponding LLDs may be increased by a factor of 10. This requirement does not apply if: (1) analysis shows that the DOSE EQUIVALENT I-131 concentration in the reactor coolant has not increased more than a factor of 3 ; and (2) the noble gas monitor shows that effluent activity has not increased more than a factor of 3.

DOSE - NOBLE GASES
CONTROLS
3.11.2.2 In accordance with [plant name] TS 6.8.4.g.5) and 8), the air dose due to noble gases released in gaseous effluents, from each unit, to areas at and beyond the SITE BOUNDARY (see Figure 5.1-3) 5 hall be limited to the following:
a. During any calendar quarter: Less than or equal to 5 mrads for gamma radiation and less than or equal to 10 mrads for beta radiation, and
b. During any calendar year: Less than or equal to 10 mrads for gamma radiation and less than or equal to 20 mrads for beta radiation.

\section*{APPLICABILITY: At all times.}

ACTION
a. With the calculated air dose from radioactive noble gases in gaseous effluents exceeding any of the above limits, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that identifies the cause(s) for exceeding the limit(s) and defines the corrective actions that have been taken to reduce the releases and the proposed corrective actions to be taken to assure that subsequent releases will be in compliance with the above limits.
b. The provisions of Controls 3.0 .3 and 3.0 .4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.2.2 Cumulative dose contributions for the current calendar quarter and current calendar year for noble gases shall be determined in accordance with the methodology and parameters in the ODCM at least once per 31 days.

DOSE - IODINE-131, IODINE-133, TRITIUM, AND RADIOACTIVE MATERIAL IN PARTICULATE FORM

CONTROLS
3.11.2.3 In accordance with [plant name] TS 6.8.4.g.5) and 9), the dose to a MEMBER OF THE PUBLIC from Iodine-131, Iodine-133, tritium, and all radionuclides in particulate form with half-lives greater than 8 days in gaseous effluents released, from each unit, to areas at and beyond the SITE BOUNDARY (see Figure 5.1-3) shall be limited to the following:
a. During any calendar quarter: Less than or equal to 7.5 mrems to any organ and,
b. During any calendar year: Less than or equal to 15 mrems to any organ.

APPLICABILITY: At all times.
ACTION:
a. With the calculated dose from the release of Iodine-131, Iodine-133, tritium, and radionuclides in particulate form with half-lives greater than 8 days, in gaseous effluents exceeding any of the above limits, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that identifies the cause(s) for exceeding the limit(s) and defines the corrective actions that have been taken to reduce the releases and the proposed corrective actions to be taken to assure that subsequent releases will be in compliance with the above limits.
b. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.2.3 Cumulative dose contributions for the current calendar quarter and current calendar year for lodine-131, Iodine-133, tritium and radionuclides in particulate form with half-lives greater than 8 days shall be determined in accordance with the methodology and parameters in the ODCM at least once per 31 days.

\section*{RADIOACTIVE EFFLUENTS}

GASEOUS RADWASTE TREATMENT SYSTEM

CONTROLS
3.11.2.4 The GASEOUS RADWASTE TREATMENT SYSTEM shall be in operation.

APPLICABILITY: Whenever the main condenser air ejector (evacuation) system is in operation.

ACTION:
a. With gaseous radwaste from the main condenser air ejector system being discharged without treatment for more than 7 days, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that includes the following information:
1. Identification of the inoperable equipment or subsystems and the reason for inoperability,
2. Action(s) taken to restore the inoperable equipment to OPERABLE status, and
3. Summary description of action(s) taken to prevent a recurrence.
b. The provisions of Controls 3.0 .3 and 3.0 .4 are not applicable.

SURVEILLANCE REQUIREMENTS
4.11.2.4 The readings of the relevant instruments shall be checked every 12 hours when the main condenser air ejector is in use to ensure that the gaseous radwaste treatment system is functioning.

VENTILATION EXHAUST TREATMENT SYSTEM

CONTROLS
3.11.2.5 The VENTILATION EXHAUST TREATMENT SYSTEM shall be OPERABLE and appropriate portions of this system shall be used to reduce releases of radioactivity when the projected doses in 31 days due to gaseous effluent releases, from each unit, to areas at and beyond the SITE BOUNDARY (see figure 5.1-3) would exceed:
a. 0.2 mrad to air from gamma radiation, or
b. \(\quad 0.4 \mathrm{mrad}\) to air from beta radiation, or
c. 0.3 mrem to any organ of a MEMBER OF THE PUBLIC.

APPLICABILITY: At all times.
ACTION:
a. With radioactive gaseous waste being discharged without treatment and in excess of the above limits, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that includes the following information:
1. Identification of any inoperable equipment or subsystems, and the reason for the inoperability,
2. Action(s) taken to restore the inoperable equipment to OPERABLE status, and
3. Summary description of action(s) taken to prevent a recurrence.
b. The provisions of Controls 3.0 .3 and 3.0 .4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.2.5.1 Doses due to gaseous releases from each unit to areas at and beyond the SITE BOUNDARY shall be projected at least once per 31 days in accordance with the methodology and parameters in the ODCM when the Ventilation Exhaust Treatment System is not being fully utilized.
4.11.2.5.2 The installed VENTILATION EXHAUST TREATMENT SYSTEM shall be considered OPERABLE by meeting Controls 3.11.2.1, and either 3.11.2.2 or 3.11.2.3.

\section*{RADIOACTIVE EFFLUENTS}

3/4.11.2.6 (NOT USED)

RADIOACTIVE EFFLUENTS
3/4.11.2.7 (NOT USED)
3.11.2.8 VENTING or PURGING of the Mark I or II containment drywell shall be through the Standby Gas Treatment System.

APPLICABILITY: Whenever the drywell is vented or purged.
ACTION:
a. With the requirements of the above control not satisfied, suspend all VENTING and PURGING of the drywell.
b. The provisions of controls 3.0.3 and 3.0.4 are not applicable.

SURVEILLANCE REQUIREMENTS
4.11.2.8 The containment drywell shall be determined to be aligned for VENTING or PURGING through the Standby Gas Treatment System within 4 hours prior to start of and at least once per 12 hours during VENTING or PURGING of the drywell.

RADIOACTIVE EFFLUENTS
3/4.11.3 (NOT USED)

RADIOACTIVE EFFLUENTS
3/4.11.4 TOTAL DOSE
CONTROLS
3.11.4 In accordance with [plant name] TS 6.8.4.g.11), the annual (calendar year) dose or dose commitment to any MEMBER OF THE PUBLIC due to releases of radioactivity and to radiation from uranium fuel cycle sources shall be limited to less than or equal to 25 mrems to the whole body or any organ, except the thyroid, which shall be limited to less than or equal to 75 mrems.

APPLICABILITY: At all times.
ACTION:
a. With the calculated doses from the release of radioactive materials in liquid or gaseous effluents exceeding twice the limits of Control 3.11.1.2a., 3.11.1.2b., 3.11.2.2a., 3.11.2.2b., 3.11.2.3a., or 3.11.2.3b., calculations shall be made including direct radiation contributions from the units (including outside storage tanks etc.) to determine whether the above limits of Control 3.11.4 have been exceeded. If such is the case, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that defines the corrective action to be taken to reduce subsequent releases to prevent recurrence of exceeding the above limits and includes the schedule for achieving conformance with the above limits. This Special Report, as defined in 10 CFR 20.405(c), shall include an analysis that estimates the radiation exposure (dose) to a MEMBER OF THE PUBLIC from uranium fuel cycle sources, including all effluent pathways and direct radiation, for the calendar year that includes the release(s) covered by this report. It shall also describe levels of radiation and concentrations of radioactive material involved, and the cause of the exposure levels or concentrations. If the estimated dose(s) exceeds the above limits, and if the release condition resulting in violation of 40 CFR Part 190 has not already been corrected, the Special Report shall include a request for a variance in accordance with the provisions of 40 CFR Part 190. Submittal of the report is considered a timely request, and a variance is granted until staff action on the request is complete.
b. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

\section*{SURVEILLANCE REQUIREMENTS}
4.11.4.1 Cumulative dose contributions from liquid and gaseous effluents shall be determined in accordance with Controls 4.11.1.2, 4.11.2.2, and 4.11.2.3, and in accordance with the methodology and parameters in the ODCM.
4.11.4.2 Cumulative dose contributions from direct radiation from the units (including oütside storage tanks etc.) shall be determined in accordance with the methodology and parameters in the ODCM. This requirement is applicable only under conditions set forth in ACTION a. of Control 3.11.4.
3.12.1 In accordance with [plant name] TS 6.8.4.h.1), the Radiological Environmental Monitoring Program shall be conducted as specified in Table 3.12-1.
```

APPLICABILITY: At all times.

```

ACTION:
a. With the Radiological Environmental Monitoring Program not being conducted as specified in Table 3.12-1, prepare and submit to the Commission, in the Annual Radiological Environmental Operating Report required by Control 6.9.1.3, a description of the reasons for not conducting the program as required and the plans for preventing a recurrence.
b. With the level of radioactivity as the result of plant effluents in an environmental sampling medium at a specified location exceeding the reporting levels of Table 3.12-2 when averaged over any calendar quarter, prepare and submit to the Commission within 30 days, pursuant to Control 6.9.2, a Special Report that identifies the cause(s) for exceeding the limit(s) and defines the corrective actions to be taken to reduce radioactive effluents so that the potential annual dose* to a MEMBER OF THE PUBLIC is less than the calendar year limits of Controls 3.11.1.2, 3.11.2.2, or 3.11.2.3. When more than one of the radionuclides in Table 3.12-2 are detected in the sampling medium, this report shall be submitted if:
\[
\frac{\text { concentration (1) }}{\text { reporting level (1) }}+\frac{\text { concentration (2) }}{\text { reporting level (2) }}+\ldots \geq 1.0
\]

When radionuclides other than those in Table 3.12-2 are detected and are the result of plant effluents, this report shall be submitted if the potential annual dose* to a MEMBER OF THE PUBLIC from all radionuclides is equal to or greater than the calendar year limits of Control 3.11.1.2, 3.11.2.2, or 3.11.2.3. This report is not required if the measured level of radioactivity was not the result of plant effluents; however, in such an event, the condition shall be reported and described in the Annual Radiological Environmental Operating Report required by Control 6.9.1.3.

\footnotetext{
*The methodology and parameters used to estimate the potential annual dose to a MEMBER OF THE PUBLIC shall be indicated in this report.
}

ACTION (Continued)
c. With milk or fresh leafy vegetation samples unavailable from one or more of the sample locations required by Table 3.12-1, identify specific locations for obtaining replacement samples and add them within 30 days to the Radiological Environmental Monitoring Program given in the ODCM. The specific locations from which samples were unavailable may then be deleted from the monitoring program. Pursuant to Control 6.14, submit in the next Semiannual Radioactive Effluent Release Report documentation for a change in the ODCM including a revised figure(s) and table for the ODCM reflecting the new location(s) with supporting information identifying the cause of the unavailability of samples and justifying the selection of the new location(s) for obtaining samples.
d. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

SURVEILLANCE REQUIREMENTS
4.12.1 The radiological environmental monitoring samples shall be collected pursuant to Table 3.12-1 from the specific locations given in the table and figure(s) in the OOCM, and shall be analyzed pursuant to the requirements of Table 3.12-1 and the detection capabilities required by Table 4.12-1.

TABLE 3.12-1 (Continued)
TABLE NOTATIONS
(1) Specific parameters of distance and direction sector from the centerline of one reactor, and additional description where pertinent, shall be provided for each and every sample location in Table 3.12-1 in a table and figure(s) in the ODCM. Refer to NUREG-0133, "Preparation of Radiological Effluent Technical Specifications for Nuclear Power Plants," October 1978, and to Radiological Assessment Branch Technical Position, Revision 1, November 1979. Deviations are permitted from the required sampling schedule if specimens are unobtainable due to circumstances such as hazardous conditions, seasonal unavailability, and malfunction of automatic sampling equipment. If specimens are unobtainable due to sampling equipment malfunction, effort shall be made to complete corrective action prior to the end of the next sampling period. All deviations from the sampling schedule shall be documented in the Annual Radiological Environmental Operating Report pursuant to Control 6.9.1.3. It is recognized that, at times, it may not be possible or practicable to continue to obtain samples of the media of choice at the most desired location or time. In these instances suitable alternative media and locations may be chosen for the particular pathway in question and appropriate substitutions made within 30 days in the Radiological Environmental Monitoring Program given in the ODCM. Pursuant to Control 6.14, submit in the next
Semiannual Radioactive Effluent Release Report documentation for a change in the ODCM including a revised figure(s) and table for the ODCM reflecting the new location(s) with supporting information identifying the cause of the unavailability of samples for the pathway and justifying the selection of the new location(s) for obtaining samples.
(2) One or more instruments, such as a pressurized ion chamber, for measuring and recording dose rate continuously may be used in place of, or in addition to, integrating dosimeters. For the purposes of this table, a thermoluminescent dosimeter (TLD) is considered to be one phosphor; two or more phosphors in a packet are considered as two or more dosimeters. Film badges shall not be used as dosimeters for measuring direct radiation. (The 40 stations is not an absolute number. The number of direct radiation monitoring stations may be reduced according to geographical limitations; e.g., at an ocean site, some sectors will be over water so that the number of dosimeters may be reduced accordingly. The frequency of analysis or readout for TLD systems will depend upon the characteristics of the specific system used and should be selected to obtain optimum dose information with minimal fading.)
(3) Airborne particulate sample filters shall be analyzed for gross beta radioactivity 24 hours or more after sampling to allow for radon and thoron daughter decay. If gross beta activity in air particulate samples is greater than 10 times the yearly mean of control samples, gamma isotopic.analysis shall be performed on the individual samples.

TABLE 3.12-1 (Continued)

\section*{TABLE NOTATIONS (Continued)}
(4) Gamma isotopic analysis means the identification and quantification of gamma-emitting radionuclides that may be attributable to the effluents from the facility.
(5) The "upstream sample" shall be taken at a distance beyond significant influence of the discharge. The "downstream" sample shall be taken in an area beyond but near the mixing zone. "Upstream" samples in an estuary must be taken far enough upstream to be beyond the plant influence. Salt water shall be sampled only when the receiving water is utilized for recreational activities.
(6) A composite sample is one in which the quantity (aliquot) of liquid sampled is proportional to the quantity of flowing liquid and in which the method of sampling employed results in a specimen that is representative of the liquid flow. In this program composite sample aliquots shall be collected at time intervals that are very short (e.g., hourly) relative to the compositing period (e.g. : monthly) in order to assure obtaining a representative sample.
(7) Groundwater samples shall be taken when this source is tapped for drinking or irrigation purposes in areas where the hydraulic gradient or recharge properties are suitable for contamination.
(8) The dose shall be calculated for the maximum organ and age group, using the methodology and parameters in the ODCM.
(9) If harvest occurs more than once a year, sampling shall be performed during each discrete harvest. If harvest occurs continuousiy, sampling shall be monthly. Attention shall be paid to including samples of tuberous and root food products.

**If no drinking water pathway exists, a value of \(20 \mathrm{pCi} / 1\) may be used.

\footnotetext{
*If no drinking water pathway exists, a value of \(3000 \mathrm{pCi} / 1\) may be used.
** If no drinking water pathway exists, a value of \(15 \mathrm{pCi} / 1\) may be used.
}

\section*{TABLE 4.12-1 (Continued)}

\section*{TABLE NOTATIONS}
(1)This list does not mean that only these nuclides are to be considered. Other peaks that are identifiable, together with those of the above nuclides, shall also be analyzed and reported in the Annual Radiotogical Environmental Operating Report pursuant to Control 6.9.1.3.
(2)Required detection capabilities for thermoluminescent dosimeters used for environmental measurements shall be in accordance with the recommendations of Regulatory Guide 4.13.
(3)The LLD is defined, for purposes of these controls, as the smallest concentration of radioactive material in a sample that will yield a net count, above system background, that will be detected with 95\% probability with only \(5 \%\) probability of falsely concluding that a blank observation represents a "real" signal.

For a particular measurement system, which may include radiochemical separation:
\[
L L D=\frac{4.66 s_{b}}{E \cdot V \cdot 2.22 \cdot Y \cdot \exp (-\lambda \Delta t)}
\]

Where:
```

LLD = the "a priori" lower limit of detection (picoCuries per unit
mass or volume),
$s_{b}=$ the standard deviation of the background counting rate or of the
counting rate of a blank sample as appropriate (counts per minute),
$E=$ the counting efficiency (counts per disintegration),
$V=$ the sample size (units of mass or volume),
2.22 = the number of disintegrations per minute per picoCurie,
$\mathbf{Y}=$ the fractional radiochemical yield, when applicable,
$\boldsymbol{\lambda}=$ the radioactive decay constant for the particular radionuclide
(sec-${ }^{-1}$ ), and
$\Delta t=$ the elapsed time between environmental collection, or end of
the sample collection period, and time of counting (sec).
Typical values of $E, V, Y$, and $\Delta t$ should be used in the calculation.

```

It should be recognized that the LLD is defined as an a priori (before the fact) limit representing the capability of a measurement system and not as an a posteriori (after the fact) limit for a particular measurement. Analyses shall be performed in such a manner that the stated LLDs will be achieved under routine conditions. Occasionally background fluctuations, unavoidable small sample sizes, the presence of interfering nuclides, or other uncontrollable circumstances may render these LLDs unachievable. In such cases, the contributing factors shall be identified and described in the Annual Radiological Environmental Operating Report pursuant to Control 6.9.1.3.

\section*{3/4.12.2 LAND USE CENSUS}

CONTROLS
3.12.2 In accordance with [plant name] TS 6.8.4.h.2), a Land Use Census shall be conducted and shall identify within a distance of 8 km ( 5 miles ) the location in each of the 16 meteorological sectors of the nearest milk animal, the nearest residence, and the nearest garden* of greater than \(50 \mathrm{~m}^{2}\) ( \(500 \mathrm{ft}^{2}\) ) producing broad leaf vegetation. [For elevated releases as defined in Regulatory Guide 1.111, Revision 1, July 1977, the Land Use Census shall also identify within a distance of 5 km ( 3 miles) the locations in each of the 16 meteorological sectors of all milk animals and all gardens of greater than \(50 \mathrm{~m}^{2}\) producing broad leaf vegetation.]

\section*{APPLICABILITY: At all times.}

ACTION:
a. With a Land Use Census identifying a location(s) that yields a calculated dose or dose commitment greater than the values currently being calculated in Control 4.11.2.3, pursuant to Control 6.9.1.4, identify the new location(s) in the next Semiannual Radioactive Effluent Release Report.
b. With a Land Use Census identifying a location(s) that yields a calculated dose or dose commitment (via the same exposure pathway) 20\% greater than at a location from which samples are currently being obtained in accordance with Control 3.12.1, add the new location(s) within 30 days to the Radiological Environmental Monitoring Program given in the ODCM. The sampling location(s), excluding the control station location, having the lowest calculated dose or dose commitment(s), via the same exposure pathway, may be deleted from this monitoring program after [October 31] of the year in which this Land Use Census was conducted. Pursuant to Control 6.14, submit in the next Semiannual Radioactive Effluent Release Report documentation for a change in the ODCM including a revised figure(s) and table(s) for the ODCM reflecting the new location(s) with information supporting the change in sampling locations.
c. The provisions of Controls 3.0.3 and 3.0.4 are not applicable.

\footnotetext{
*Broad leaf vegetation sampling of at least three different kinds of vegetation may be performed at the SITE BOUNDARY in each of two different direction sectors with the highest predicted D/Qs in lieu of the garden census. Controls for broad leaf vegetation sampling in Table 3.12-1, Part 4.c., shall be followed, including analysis of control samples.
}

RADIOLOGICAL ENVIRONMENTAL MONITORING
SURVEILLANCE REQUIREMENTS
4.12.2 The Land Use Census shall be conducted during the growing season at least once per 12 months using that information that will provide the best results, such as by a door-to-door survey, aerial survey, or by consulting local agriculture authorities. The results of the Land Use Census shall be included in the Annual Radiological Environmental Operating Report pursuant to Control 6.9.1.3.
3.12.3 In accordance with [plant name] TS 6.8.4.h.3), analyses shall be performed on all radioactive materials, supplied as part of an Interlaboratory Comparison Program that has been approved by the Commission, that correspond to samples required by Table 3.12-1.

APPLICABILITY: At all times.
ACTION:
a. With analyses not being performed as required above, report the corrective actions taken to prevent a recurrence to the Commission in the Annual Radiological Environmental Operating Report pursuant to Control 6.9.1.3.
b. The provisions of Controls 3.0 .3 and 3.0 .4 are not applicable.

SURVEILLANCE REQUIREMENTS
4.12.3 The Interlaboratory Comparison Program shall be described in the ODCM. A summary of the results obtained as part of the above required Interlaboratory Comparison Program shall be included in the Annual Radiological Environmental Operating Report pursuant to Control 6.9.1.3.

\title{
BASES FOR \\ SECTIONS 3.0 AND 4.0 \\ CONTROLS \\ AND \\ SURVEILLANCE REQUIREMENTS
}

NOTE
The BASES contained in succeeding pages summarize the reasons for the Controls in Sections 3.0 and 4.0 , but are not part of these Controls.

\section*{3/4.3.3.10 RADIOACTIVE LIQUID EFFLUENT MONITORING INSTRUMENTATION}

The radioactive liquid effluent instrumentation is provided to monitor and control, as applicable, the releases of radioactive materials in liquid effluents during actual or potential releases of liquid effluents. The Alarm/Trip Setpoints for these instruments shall be calculated and adjusted in accordance with the methodology and parameters in the ODCM to ensure that the alarm/trip will occur prior to exceeding the limits of 10 CFR Part 20. The OPERABILITY and use of this instrumentation is consistent with the requirements of General Design Criteria 60, 63, and 64 of Appendix A to 10 CFR Part 50.

\section*{3/4.3.3.11 RADIDACTIVE GASEOUS EFFLUENT MONITORING INSTRUMENTATION}

The radioactive gaseous effluent instrumentation is provided to monitor and control, as applicable, the releases of radioactive materials in gaseous effluents during actual or potential releases of gaseous effluents. The Alarm/Trip Setpoints for these instruments shall be calculated and adjusted in accordance with the methodology and parameters in the ODCM to ensure that the alarm/trip will occur prior to exceeding the limits of 10 CFR Part 20 . The OPERABILITY and use of this instrumentation is consistent with the requirements of General Design Criteria 60, 63, and 64 of Appendix A to 10 CFR Part 50.

BASES

\section*{3/4.11.1 LIQUID EFFLUENTS}

\section*{3/4.11.1.1 CONCENTRATION}

This control is provided to ensure that the concentration of radioactive materials released in liquid waste effluents to UNRESTRICTED AREAS will be less than the concentration levels specified in 10 CFR Part 20, Appendix B, Table II, Column 2. This limitation provides additional assurance that the levels of radioactive materials in bodies of water in UNRESTRICTED AREAS will result in exposures within: (1) the Section II.A design objectives of Appendix I, 10 CFR Part 50, to a MEMBER OF THE PUBLIC, and (2) the limits of 10 CFR Part 20.106(e) to the population. The concentration limit for dissolved or entrained noble gases is based upon the assumption that \(\mathrm{Xe}-135\) is the controlling radioisotope and its MPC in air (submersion) was converted to an equivalent concentration in water using the methods described in International Commission on Radiological Protection (ICRP) Publication 2.

This control applies to the release of radioactive materials in liquid effluents from all units at the site.

The required detection capabilities for radioactive materials in liquid waste samples are tabulated in terms of the lower limits of detection (LLDs). Detailed discussion of the LLD, and other detection limits can be found in Currie, L. A., "Lower Limit of Detection: Definition and Elaboration of a Proposed Position for Radiological Effluent and Environmental Measurements," NUREG/CR-4007 (September 1984), and in the HASL Procedures Manual, HASL-300.

\section*{3/4.11.1.2 DOSE}

This control is provided to implement the requirements of Sections II.A, 1II. A, and IV.A of Appendix I, 10 CFR Part 50. The Control implements the guides set forth in Section II. A of Appendix I. The ACTION statements provide the required operating flexibility and at the same time implement the guides set forth in Section IV.A of Appendix I to assure that the releases of radioactive material in liquid effluents to UNRESTRICTED AREAS will be kept "as low as is reasonably achievable." Also, for fresh water sites with drinking water supplies that can be potentially affected by plant operations, there is reasonable assurance that the operation of the facility will not result in radionuclide concentrations in the finished drinking water that are in excess of the requirements of 40 CFR Part 141. The dose calculation methodology and parameters in the ODCM implement the requirements in Section III.A of Appendix I that conformance with the guides of Appendix I be shown by calculational procedures based on models and data, such that the actual exposure of a MEMBER OF THE PUBLIC through appropriate pathways is unlikely to be substantially underestimated. The equations specified in the ODCM for calculating the doses due to the actual release rates of radioactive materials in liquid effluents are consistent with the methodology provided in Regulatory Guide 1.109. "Calculation of Annual Doses to Man from Routine Releases of

\section*{RADIOACTIVE EFFLUENTS}

BASES
DOSE (Continued)
Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I," Revision 1, October 1977 and Regulatory Guide 1.113, "Estimating Aquatic Dispersion of Effluents from Accidental and Routine Reactor Releases for the Purpose of Implementing Appendix I," April 1977.

This control applies to the release of radioactive materials in liquid effluents from each unit at the site. For units with shared Radwaste Systems, the liquid effluents from the shared system are to be proportioned among the units sharing that system.

\section*{3/4.11.1.3 LIQUID RADWASTE TREATMENT SYSTEM}

The OPERABILITY of the Liquid Radwaste Treatment System ensures that this system will be available for use whenever liquid effluents require treatment prior to release to the environment. The requirement that the appropriate portions of this system be used when specified provides assurance that the releases of radioactive materials in liquid effluents will be kept "as low as is reasonably achievable." This control implements the requirements of 10 CFR 50.36a, General Design Criterion 60 of Appendix A to 10 CFR Part 50 and the design objective given in Section II.D of Appendix I to 10 CFR Part 50. The specified limits governing the use of appropriate portions of the Liquid Radwaste Treatment System were specified as a suitable fraction of the dose design objectives set forth in Section II.A of Appendix 1, 10 CFR Part 50 for liquid effluents.

This control applies to the release of radioactive materials in liquid effluents from each unit at the site. For units with shared Radwaste Systems, the liquid effluents from the shared system are to be proportioned among the units sharing that system.

3/4.11.2 GASEOUS EFFLUENTS

\section*{3/4.11.2.1 DOSE RATE}

This control is provided to ensure that the dose at any time at and beyond the SITE BOUNDARY from gaseous effluents from all units on the site will be within the annual dose limits of 10 CFR Part 20 to UNRESTRICTED AREAS. The annual dose limits are the doses associated with the concentrations of 10 CFR Part 20, Appendix B, Table II, Column I. These limits provide reasonable assurance that radioactive material discharged in gaseous effluents will not result in the exposure of a MEMBER OF THE PUBLIC in an UNRESTRICTED AREA, either within or outside the SITE BOUNDARY, to annual average concentrations exceeding the limits specified in Appendix B, Table II of 10 CFR Part 20 (10 CFR Part 20.106(b)). For MEMBERS OF THE PUBLIC who may at times be within the SITE BOUNDARY, the occupancy of that MEMBER OF THE PUBLIC will usually be sufficiently low to compensate for any increase in the atmospheric diffusion factor above that for the SITE BOUNDARY. Examples of calculations for such MEMBERS OF THE PUBLIC, with the appropriate occupancy factors, shall be given in the ODCM. The specified release rate limits restrict, at all times, the corresponding gamma and beta dose rates above background to a MEMBER OF THE PUBLIC at or beyond the SITE BOUNDARY to less than or equal to \(500 \mathrm{mrems} /\) year to the whole body or to less than or equal to 3000 mrems/year to the skin. These release rate limits also restrict, at all times, the corresponding thyroid dose rate above background to a child via the inhalation pathway to less than or equal to 1500 mrems/year.

This control applies to the release of radioactive materials in gaseous effluents from all units at the site.

The required detection capabilities for radioactive material in gaseous waste samples are tabulated in terms of the lower limits of detection (LLDs). Detailed discussion of the LLD, and other detection limits can be found in Currie, L. A., "Lower Limit of Detection: Definition and Elaboration of a Proposed Position for Radiological Effluent and Environmental Measurements," NUREG/CR-4007 (September 1984), and in the HASL Procedures Manual, HASL-300.

\section*{3/4.11.2.2 DOSE - NOBLE GASES}

This control is provided to implement the requirements of Sections II.B, III. A and IV.A of Appendix I, 10 CFR Part 50. The control implements the guides set forth in Section I.B of Appendix I. The ACTION statements provide the required operating flexibility and at the same time implement the guides set forth in Section IV.A of Appendix I to assure that the releases of radioactive material in gaseous effluents to UNRESTRICTED AREAS will be kept "as low as is reasonably achievable." The Surveillance Requirements implement the requirements in Section III. A of Appendix I that conformance with the guides of Appendix I be shown by calculational procedures based on models and data such that the actual exposure of a MEMBER OF THE PUBLIC through appropriate pathways is unlikely to be substantially underestimated. The dose calculation

\section*{DOSE-NOBLE GASES (Continued)}
methodology and parameters established in the ODCM for calculating the doses due to the actual release rates of radioactive noble gases in gaseous effluents are consistent with the methodology provided in Regulatory Guide 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I," Revision 1, October 1977 and Regulatory Guide 1.111, "Methods for Estimating Atmospheric Transport and Dispersion of Gaseous Effluents in Routine Releases from Light-Water Cooled Reactors," Revision 1, July 1977. The ODCM equations provided for determining the air doses at and beyond the SITE BOUNDARY are based upon the historical average atmospheric conditions.

This control applies to the release of radioactive materials in gaseous effluents from each unit at the site. For units with shared Radwaste Treatment Systems, the gaseous effluents from the shared system are proportioned among the units sharing that system.

\section*{3/4.11.2.3 DOSE - IODINE-131, IODINE-133, TRITIUM, AND RADIOACTIVE MATERIAL IN PARTICULATE FORM}

This control is provided to implement the requirements of Sections II.C, III. A and IV.A of Appendix I, 10 CFR Part 50. The Controls are the guides set forth in Section II.C of Appendix I. The ACTION statements provide the required operating flexibility and at the same time implement the guides set forth in Section IV. A of Appendix I to assure that the releases of radioactive materials in gaseous effluents to UNRESTRICTED AREAS will be kept "as low as is reasonably achievable." The ODCM calculational methods specified in the Surveillance Requirements implement the requirements in Section III.A of Appendix I that conformance with the guides of Appendix I be shown by calculational procedures based on models and data such that the actual exposure of a MEMBER OF THE PUBLIC through appropriate pathways is unlikely to be substantially underestimated. The ODCM calculational methodology and parameters for calculating the doses due to the actual release rates of the subject materials are consistent with the methodology provided in Regulatory Guide 1.109, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix 1," Revision 1, October 1977 and Regulatory Guide 1.111, "Methods for Estimating Atmospheric Transport and Dispersion of Gaseous Effluents in Routine Releases from Light-Water-Cooled Reactors," Revision 1, July 1977. These equations also provide for determining the actual doses based upon the historical average atmospheric conditions. The release rate controls for Iodine-131 Iodine-133, tritium, and radionuclides in particulate form with half-lives greater than 8 days are dependent upon the existing radionuclide pathways to man in the

DOSE - IODINE-131, IODINE-133, TRITIUM, AND RADIOACTIVE MATERIAL IN PARTICULATE FORM (Continued)
areas at and beyond the SITE BOUNDARY. The pathways that were examined in the development of the calculations were: (1) individual inhalation of airborne radionuclides, (2) deposition of radionuclides onto green leafy vegetation with subsequent consumption by man, (3) deposition onto grassy areas where milk animals and meat producing animals graze with consumption of the milk and meat by man, and (4) deposition on the ground with subsequent exposure of man.

This control applies to the release of radioactive materials in gaseous effluents from each unit at the site. For units with shared Radwaste Treatment Systems, the gaseous effluents from the shared system are proportioned among the units sharing that system.

3/4.11.2.4 AND 3/4.11.2.5 GASEOUS RADWASTE TREATMENT SYSTEM AND VENTILATION EXHAUST TREATMENT SYSTEM

The OPERABILITY of the WASTE GAS HOLDUP SYSTEM and the VENTILATION EXHAUST TREATMENT SYSTEM ensures that the systems will be available for use whenever gaseous effluents require treatment prior to release to the environment. The requirement that the appropriate portions of these systems be used, when specified, provides reasonable assurance that the releases of radioactive materials in gaseous effluents will be kept "as low as is reasonably achievable." This control implements the requirements of 10 CFR 50.36a, General Design Criterion 60 of Appendix A to 10 CFR Part 50 and the design objectives given in Section II.D of Appendix I to 10 CFR Part 50. The specified limits governing the use of appropriate portions of the systems were specified as a suitable fraction of the dose design objectives set forth in Sections II.B and II.C of Appendix I, 10 CFR Part 50, for gaseous effluents.

This control applies to the release of radioactive materials in gaseous effluents from each unit at the site. For units with shared Radwaste Treatment Systems, the gaseous effluents from the shared system are proportioned among the units sharing that system.

\section*{RADIDACTIVE EFFLUENTS}

\section*{BASES}

\section*{3/4 11.2.6 NOT USED}

3/4 11.2.7 NOT USED
3/4.11.2.8 MARK I CONTAINMENT
This specification provides reasonable assurance that releases from drywell purging operations will not exceed the annual dose limits of 10 CFR part 20 for unrestricted areas.

3/4.11.3 NOT USED

\section*{3/4.11.4 TOTAL DOSE}

This control is provided to meet the dose limitations of 10 CFR Part 190 that have been incorporated into 10 CFR Part 20 by 46 FR 18525. The control requires the preparation and submittal of a Special Report whenever the calculated doses due to releases of radioactivity and to radiation from uranium fuel cycle sources exceed 25 mrems to the whole body or any organ, except the thyroid, which shall be limited to less than or equal to 75 mrems. For sites containing up to four reactors, it is highly unlikely that the resultant dose to a MEMBER OF THE PUBLIC will exceed the dose limits of 40 CFR Part 190 if the individual reactors remain within twice the dose design objectives of Appendix I, and if direct radiation doses from the units

BASES
TOTAL DOSE (Continued)
(including outside storage tanks, etc.) are kept small. The Special Report will describe a course of action that should result in the limitation of the annual dose to a MEMBER OF THE PUBLIC to within the 40 CFR Part 190 limits. For the purposes of the Special Report, it may be assumed that the dose commitment to the MEMBER of the PUBLIC from other uranium fuel cycle sources is negligible, with the exception that dose contributions from other nuclear fuel cycle facilities at the same site or within a radius of 8 km must be considered. If the dose to any MEMBER OF THE PUBLIC is estimated to exceed the requirements of 40 CFR Part 190, the Special Report with a request for a variance (provided the release conditions resulting in violation of 40 CFR Part 190 have not already been corrected), in accordance with the provisions of 40 CFR 190.11 and 10 CFR 20.405c, is considered to be a timely request and fulfills the requirements of 40 CFR Part 190 until NRC staff action is completed. The variance only relates to the limits of 40 CFR Part 190, and does not apply in any way to the other requirements for dose limitation of 10 CFR Part 20, as addressed in Controls 3.11.1.1 and 3.11.2.1. An individual is not considered a MEMBER OF THE PUBLIC during any period in which he/she is engaged in carrying out any operation that is part of the nuclear fuel cycle.

BASES

\section*{3/4.12.1 MONITORING PROGRAM}

The Radiological Environmental Monitoring Program required by this control provides representative measurements of radiation and of radioactive materials in those exposure pathways and for those radionuclides that lead to the highest potential radiation exposure of MEMBERS OF THE PUBLIC resulting from the plant operation. This monitoring program implements Section IV.B. 2 of Appendix I to 10 CFR Part 50 and thereby supplements the Radiological Effluent Monitoring Program by verifying that the measurable concentrations of radioactive materials and levels of radiation are not higher than expected on the basis of the effluent measurements and the modeling of the environmental exposure pathways. Guidance for this monitoring program is provided by the Radiological Assessment Branch Technical Position on Environmental Monitoring, Revision 1, November 1979. The initially specified monitoring program will be effective for at least the first 3 years of commercial operation. Following this period, program changes may be initiated based on operational experience.

The required detection capabilities for environmental sample analyses are tabulated in terms of the lower limits of detection (LLDS). The LLDs required by Table 4.12-1 are considered optimum for routine environmental measurements in industrial laboratories. It should be recognized that the LLD is defined as an a priori (before the fact) limit representing the capability of a measurement system and not as an a posteriori (after the fact) limit for a particular measurement.

Detailed discussion of the LLD, and other detection limits, can be found in Currie, L. A., "Lower Limit of Detection: Definition and Elaboration of a Proposed Position for Radiological Effluent and Environmental Measurements," NUREG/CR-400? (September 1984), and in the HASL Procedures Manual, HASL-300.

\section*{3/4.12.2 LAND USE CENSUS}

This control is provided to ensure that changes in the use of areas at and beyond the SITE BOUNDARY are identified and that modifications to the Radiological Environmental Monitoring Program given in the ODCM are made if required by the results of this census. The best information from the door-to-door survey, from aerial survey or from consulting with local agricultural authorities shall be used. This census satisfies the requirements of Section IV.B. 3 of Appendix I to 10 CFR Part 50. Restricting the census to gardens of greater than \(50 \mathrm{~m}^{2}\) provides assurance that significant exposure pathways via leafy vegetables will be identified and monitored since a garden of this size is the minimum required to produce the quantity ( \(26 \mathrm{~kg} / \mathrm{year}\) ) of leafy vegetables assumed in Regulatory Guide 1.109 for consumption by a child. To determine this minimum garden size, the following assumptions were made: (1) \(20 \%\) of the garden was used for growing broad leaf vegetation (i.e., similar to lettuce and cabbage), and (2) a vegetation yield of \(2 \mathrm{~kg} / \mathrm{m}^{2}\).

RADIOLOGICAL ENVIRONMENTAL MONITORING
BASES

3/4.12.3 INTERLABORATORY COMPARISON PROGRAM
The requirement for participation in an approved Interlaboratory Comparison Program is provided to ensure that independent checks on the precision and accuracy of the measurements of radioactive materials in environmental sample matrices are performed as part of the quality assurance program for environmental monitoring in order to demonstrate that the results are valid for the purposes of Section IV.B. 2 of Appendix I to 10 CFR Part 50.

\section*{APPENDIX A \\ Radiological Assessment Branch Technical Position, Revision 1, November 1979}

\author{
Branch Technical Position
}

\section*{Background}

Regulatory Guide 4.8, Environmental Technical Specifications for Nuclear Power Plants, issued for comment in December 1975, is being revised based on comments received. The Radiological Assessment Branch issued a Branch Position on the radiological portion of the environmental monitoring program in March, 1978. The position was formulated by an NRC working group which considered compents received after the issuance of the Regulatory Guide 4.8. This is Revision 1 of that Branch Position paper. The changes are marked by a vertical line in the right margin. The most significant change is the increase in direct radiation measurement stations.

IO CFR Parts 20 and 50 require that radiological environmental monitoring programs be established to provide data on measurable levels of radiation and radioactive materials in the site environs. In addition, Appendix I to 10 CFR Part 50 requires that the relationship between quantities of radioactive material released in effluents during normal operation, including anticipated operational occurrences, and resultant radiation doses to individuals from principals pathways of exposure be evaluated. These programs should be conducted to verify the effectiveness of in-plant measures used for controlling the release of radioactive materials. Surveillance should be established to identify changes in the use of unrestricted areas (e.g., for agricultrual purposes) to provide a basis for modifications in the monitoring programs for evaluating doses to individuals from principal pathways of exposure. NRC Regulatory Guide 4.1, Rev. 1, "Programs for Monitoring Radioactivity in the Environs of Nuclear Power Plants," provides an acceptable basis for the design of programs to monitor levels of radiation and radioactivity in the station environs.

This position sets forth an example of an acceptabie minimum radiological monitoring program. Local site characteristics must be examined to determine if pathways not covered by this guide may significantly contribute to an individual's dose and should be included in the sampling program.

AN ACCEPTABLE RADIOLOGICAL
ENVIRONMENTAL MONITORING PROGRAM

\section*{Program Reouirements}

Environmental sampies shall be collected and analyzed according to Table 1 at locations shown in Figure 1. ' Analytical techniques used shall be such that the detection capabilities in Table 2 are achieved.

The results of the radiological environmental monitoring are intended to supf ement the results of the radiological effluent monitoring by verifying that :he measurable concentrations of radioactive materials and levels of radiation are not higher than experted on the basis of the effiuent measurements and modeling of the environmental exposure pathways. Thus, the specified environmental monitoring program provides measurements of radiation and of radioactive materials in those exposure patmways and for those radionuclides which lead to the highest potential radiation exposures of individuals resulting from the station operation. The initial radioiogical environmental monitoring program should be conducted for the ffrst three years of commercial operation (or other period corresponding to a maximum burnup in the initial core cycle). Following inis period, program changes may be proposed based on operational experience.

The specified detection capabilities are state-of-the-art for routine environmental measurements in industrial laboratories.

Deviations are permitted from the required sampling schedule if specimens are unobtainable due to hazardous conditions, seasonal unavallability, malfunction of automatic sampling equipment and other legitimate reasons. If specimens are unobtainable due to sampling equipment malfunction, every effort shall be made to complete corrective action prior to the end of the next sampling period. All deviations from the sampling schedule shall be documented in the annual report.

The laboratories of the licensee and licensee's contractors which perform analyses shall participate in the Environmental Protection Agency's (EPA's) Environmental Radioactivity Laboratory Intercomparisons Studies (Crosscheck) Program or equivaient program. This participation shall inciude all of the determinations (sample medium-radionuclide combination) that are offered by EPA and that also are included in the monitoring program. The results of analysis of these crosscheck samples shall be included in the annual report. The participants in the EPA crosscheck program may provide their EPA program code so that the NRC can review the EPA's participant data directly in lieu of submission in the annual report.

It may be necessary to require special studies on a case-by-case and site specific basis to establish the relationship between quantities of radioactive material released in effluents, the concentrations in environmental media, and the resultant doses for important pathways.

If the results of determination in the EPA crosscheck progran (or equivalent progrem) are outside the specified control limits, the laboratory shall investigate the cause of the problem and take steps to correct it. The results ci this investigation and corrective action shall be included in the annual report.

The requirement for the participation in the EPA crosscheck program, or similar program, is based on the need for independent checks on the precision and accuracy of the measurements of radioactive material in environmental sample matrices as part of the quality assurance program for environmental monitoring in order to demonstrate that the results are reasonably velid.

A census shall be conducted annually during the growing sasson to determine the location of the nearest milk animal and nearest garden greater than 50 square meters ( 500 sq . ft.) producing broad leaf vegetation in each of the 16 meteorological sectors within a distance of 8 km ( 5 miles). 2 For elevated releases as defined in Regulatory Guide 1.211, Rev. 1., the census shall also didentify the locations of all milk animals, and gardens greater than 50 square meters producing broad leaf vegetation out to distance of 5 km . (3 miles) for each radial sector.

If it is learned from this census that the milk animals or gardens are present at a location which yields a calculated thyroid dose greater than those previously sampled, or if the census results in changes in the location used in the radioactive effluent technical specifications for dose calculations, a written report shall be submitted to the Director of Operating Reactors, NRR (with a copy to the Director of the NRC Regional Office) within 30 days identifying the new location (distance and diraction). Milk animal or garden locations resulting in higher calculated doses shall be added to the surveillance program as soon as practicable.

The sampling location (excluding the control sample location) having the lowest calculated dose may then be dropped from the survelllance program at the end of the grazing or growing season during which the census was conducted. Any location from whien milk can no longer be obtained may be dropped from the surveillance program after notifying the NRC in writing that they are no longer obtainable at that location. The results of the land-use census shall be reported in the annual report.

The census of milk animals and gardens producing broad leaf vegetation is based on the requirement in Appendix I of 10 CFR Part 50 to "Identify changes in the use of unrestricted areas (e.g. for agricultural purposes) to permit modifications in monitoring programs for evaluating doses to individuals from principal pathways of exposure.' The consumption of milk from animals grazing on contaminated pasture and of lesiy vegetation contaninated by airborne

\footnotetext{
\({ }^{2}\) Broad leaf vegetation sampling ray be performed at the site boundary in a sector with the highest D/Q in lied of the garden census.
}

\begin{abstract}
radioiodine is a major potential source of exposure. Samples from milk animals are considered a better indicator of radioiodine in the environment then vegetation. If the census reveals milk animals are not present or are unavailable for sampling, then vegetation must be sampled.

The 50 square meter garden, considering \(20 \%\) used for growing broad leaf vegetation (i.e., similar to lettuce and cabbage), and a vegetation yield of \(2 \mathrm{~kg} / \mathrm{m}^{2}\), will produce the \(26 \mathrm{~kg} / \mathrm{yr}\) assumed in Regulatory Guide 1.109, Rev 1., for child consumption of leafy vegetation. The option to consider the garden to be broad leaf vegetation at the site boundary in a sector with the highest D/Q should be conservative and that location may be used to calculate doses due to radioactive effluent releases in place of the actual locations which would be determined by the census. This option does not appiy to plants with elevated releases as defined in Regulatory Guide 1.111, Rev. 1.

The increase in the number of direct radiation stations is to better characterize the individual exposure (mrem) and population exposure (man-rem) in accordance with Criterion 64 - Monitoring radioactivity releases, of 10 CFR Part 50, Appendix A. The NRC will place a similar anount of stations in the area between the two rings designated in Table 1.
\end{abstract}

\section*{NOTE}

Guidance on the subjects contained on pages 4 through 16 of the Radiological Assessment Branch Technical Position (RAB-BTP) has been modifjed and upgraded based on operating experience since Revision 1 was published in 1979. The current staff guidance for the following items has been incorporated in the Section 3/4-12 and Section 6 Controls of NUREG-1301 and 1302.
- Reporting Requirement
- Table 1: Operational Radiological Environmental Monitoring Report
- Table 2: Detection Capatilities for Environmental Sample Analysis
- Table 4: Reporting Levels for Radioactivity Concentrations in Environmental Samples

The following items remain unchanged:
- Footnote to Table 1 on page 10
- Table 3 of page 14
- Figure 1 of page 16
```

Pages 5, 6, 7, 8, 9, 11, 12, 13, 15

```

The above pages have been superceded by text and tables in NUREG-1301 and 1302.

\section*{TABLE 1 (Continued)}

Note: In addition to the above guldance for operational molitoring, the following material is supplied for guidance on preoperational proyrams.
Preoperational Einvironmental Surveillance Program
A Preoperational Environmental Surveillance Program should be instituted two years prior to the institution of station plant operation.
The purposes of this program are:
1. To measure background levels and their variations along the anticipated critical pathways in the area surrounding the station.
2. To train personnel
3. To evaluate procedures, equipment and techniques

The elements (sampling media and type of analysis) of both preoperational and operational programs should be essentially the same. The duration of the preoperational program, for specific media, presented in the following table should te followed:
Duration of Preoperalional Sampling Program for Specific Media

6 months 1 year
- airborne lodine
. Jodine in milk (while animals are in pasture)
. airborne particulates
. milk (remaining analyses)
- surface water
- groundwater
. drinking water

2 years
- direct radiation
- fish and invertebrates
- food products
. sediment from shoreline

\section*{Figure 1}
(This figure shall be of a suitable scale to show the distance and direction of each monitoring station. A key shall be provided to indicate what is sampled at each location.)

\section*{APPENDIX B}
"Appendix B - General Contents of the Offsite Dose Calculation Manual (ODCM) (Revision 1, February 1979)" to the paper authored by C. A. Willis and F. J. Congel, "Status of NRC Radiological Effluent Technical Specification Activities" presented at the Atomic Industrial Forum Conference on NEPA and Nuclear Regulation, October 4-7, 1981, Washington, D.C.

\section*{APPENDIX B}

GENERAL CONTENTS OF THE OFFSITE DOSE CALCULATION MANUAL (ODCM*) (Rev. 1, February 1979)

\section*{Section 1-Set Points}

Provide the equations and methodology to be used at the station or unit for each alarm and trip set point on each effluent release point according to the Specifications 3.3.3.8 and 3.3.3.9. The instrumentation for each alarm and trip set point, including radiation monitoring and sampling systems and effluent control features, should be identified by reference to the FSAR for Final Hazard Summary). This information should be consistent with the recommendations of Section I of Standard Review Plan 11.5, NUREG-75/087, (Revision 1). If the alarm and/or trip set point value is variable. provide the equation to determine the set point value to be used, based on actual release conditions, that will assure that the Specification is met at each release point; and provide the value to be used when releases are not in progress. If dilution or dispersion is used, state the onsite equipment and measurement method used during release, the site related parameters and the set points used to assure that the Specification is met at each release point. The fixed and variable set points should consider the radioactive effluent to have a radionuciide distribution represented by nomal and anticipated operational occurrences.

Section 2 - Liquid Effluent Concentration
Provide the equations and methodology to be used at the station or unit for each liquid release point according to the Specification 3.11.1.1. For systems with continuous or batch releases, and for systems designed to monitor and control both continuous and batch releases, provide the assumptions and parameters to be used to compare the output of the monitor with the liquid concentration specified. State the limitations for combined discharges to the same release point. In addition, describe the method and assumptions for obtaining representative samples from each batch and use of previous post-release analyses or composite sample analyses to meet the Specification.

\section*{Section 3 - Gaseous Effluent Dose Rate}

Provide the equations and methodology to be used at the station or unit for each gaseous release point according to Specification 3.11.2.1. Consider the various pathways, release point elevations, site related parameters and radionuclide contribution to the dose impact limitation. Provide the
*The format for the ODCM is left up to the licensee and may be simplified by tables and grid printout. Each page should be numbered and indicate the facility approval and effective date.

\begin{abstract}
dose factors to be used for the identified radionuclides released. Provide the annual average dispersion values ( \(X / Q\) and \(D / Q\) ), the site specific parameters and release point elevations.
\end{abstract}

Section 4 - Liquid Effluent Dose,
Provide the equations and methodology to be used at the station or unit for each liquid release point according to the dose objectives given in Specification 3.11.1.2. The section should describe how the dose contributions are to be calculated for the various pathways and release points, the equations and assumptions to be used, the site specific parameters to be measured and used, the receptor location by direction and distance, and the method of estimating and updating cumulative doses due to liquid releases. The dose factors, pathway transfer factors, pathway usage factors, and dilution factors for the points of pathway origin, etc., should be given, as well as receptor age group, water and food consumption rate and other factors assumed or measured. Provide the method of detemining the dilution factor at the discharge during any liquid effluent release and any site specific parameters used in these determinations.

\section*{Section 5 - Gaseous Effluent Dose}

Provide the equations and methodology to be used at the station or unit for each gaseous release point according to the dose objectives given in Specifications 3.11.2.2 and 3.11.2.3. The section should describe how the dose contributions are to be calculated for the various pathways and release points, the equations and assumptions to be used, the site specific parameters to be measured and used, the receptor location by direction and distance, and the method to be used for estimating and updating cumulative doses due to gaseous releases. The location, direction and distance to the nearest residence, cow, goat, meat animal, garden, etc., should be given, as well as receptor age group, crop yield, grazing time and other factors assumed or measured. Provide the method of determining dispersion values ( \(X / Q\) and \(D / Q\) ) for releases and any site specific parameters and release point elevations used in these determinations.

\section*{Section 6 - Projected Doses}

For liquid and gaseous radwaste treatment systems, provide the method of projecting doses due to effluent releases for the normal and alternate pathways of treatment according to the specifications, describing the components and subsystems to be used.

Section 7 - Operability of Equipment
Provide a flow diagram(s) defining the treatment paths and the components of the radioactive liquid, gaseous and solid waste management systems that are to be maintained and used, pursuant to 10 CFR 50.36a, to meet Technical Specifications 3.11.1.3, 3.11.2.4 and 3.11.3.1. Subcomponents of packaged equipment can be identified by a list. For operating reactors whose construction permit applications were filed prior to January 2, 1971, the flow diagram(s) shall be consistent with the information prowided in conformance with Section V.B. 1 of Appendix 1 to 10 CFR Part 50. For OL applications whose construction permits were filed after January 2, 1971, the flow diagram(s) shall be consistent with the information provided in Chapter 11 of the Final Safety Analysis Report (FSAR) or amendments thereto.

Section 8 - Sample Locations
Provide a map of the Radiological Environmental Monitoring Sample Locations indicating the numbered sampling locations given in Table 3.12-1. Further clarification on these numbered sampling locations can be provided by a list, indicating the direction and distance from the center of the building complex of the unit or station, and may include a discriptive name for identification purposes.

\section*{APPENDIX C}

\section*{GENERIC LETTER 89-01}

IMPLEMENTATION OF PROGRAMMATIC CONTROLS FOR RADIOLOGICAL EFFLUENT TECHNICAL SPECIFICATIONS IN THE ADMINISTRATIVE CONTROLS SECTION OF THE TECHNICAL SPECIFICATIONS AND THE RELOCATION OF PROCEDURAL DETAILS OF RETS TO THE OFFSITE DOSE CALCULATION MANUAL OR TO THE PROCESS CONTROL PROGRAM

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D. C. 20555

January 31, 1989

TO ALL POHER REACTOR LICENSEES AND A.PPLICANTS
SUBJECT: IMPLEMENTATION OF PROGRAMMATIC CONTROLS FOR RADIOLOGICAL EFFLUENT TECHNICAL SPECIFICATIORIS IN THE ADMINISTRATIVE CONTROLS SECTION OF THE TECHNICAL SPECIFICATIONS AND THE RELOCRTION OF PROCEDURAL DETAILS Of GETS TO THE OFFSITE DOSE CALCULATION MANUAL OR TO THE PROCESS COKTROL PROGRAM (GENERIC LETTER 89-01)

The NRC staff has examined the contents of the Radiological Effluent Technical Specifications (RETS) in relation to the Commission's Interim Policy Statement on Technical specification Improvenents. The staff has determined that programatic controls can be implemented in the Administrative Controls section of the Technical Specifications (TS) to satisfy existing regulatory reouirements for RETS. At the same time, the procedural detalls of the current is on radioactive effluents and radiological environmental monitoring can be relocated to the Offsite Dose Calculation Manual (ODCM). Likewise, the procedural details of the current TS on solid radioactive wastes can be relocated to the Process Control Program (PCP). These actions siaplify the RETS, meet the regulatory reouirements for radioactive effluents and radiological environmental monitoring, and are provided as a line-item improvenent of the TS, consistent with the goals of the Policy Statement.

New programmatic controls for radioactive effluents and radiological environmental monitoring are incorporated in the TS to conform to the regulatory requirements of 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36a, and Appendix I to 10 CFR Part 50. Existing prograumatic requirements for the PCP are being retained in the TS. The procedural details included in licensees' present is on radioactive effluents, solid radioactive wastes, environmental monitoring, and associated reporting requirements will be relocated to the ODCM or PCP as appropriate. Licensees will handle future changes to these procedural details In the ODCH and the PCP under the administrative controls for changes to the ODCF or PCP. Finallv, the definitions of the ODCM and PCP are updated to reflect these changes.

Enclosure 1 provides guidance for the preparation of a license amendment reouest to implement these alternatives for RETS. Enclosure 2 provides a listing of existing RETS and a description of how each is addressed. Enclosure 3 provides model TS for programmatic controls for RETS and its associated reporting reauirements. Finally, Enclosure 4 provides model specifications for retaining existing reouirements for explosive gas monitoring instrumentation recuirements that apply on a plant-specific basis. Licensees are encouraged to propose changes to is that are consistent with the guidance provided in the enclosures. Conforming aurendment reouests will be expeditiousiv reviewed by
the NRC Project Manager for the facility. Proposed amendments that deviate from this guidance will require a longer, more detailed review. Please contact the appropriate Project Manager if you have questions on this matter.

\section*{Sincerely,}

Acting Associate Dfesctor for Projects Office of Nuclear Reactor Regulation

\section*{Enclosures:}

1 through 4 as stated

GUIDANCE FOR THE IMPLEMENTATION OF PROGRAMMATIC CONTROLS FOR RETS In The administrative controls section of technical specifications and the relocation of procedural details of current rets to the OFFSITE DOSE CALCULATION MANUAL OR PRDCESS CONTROL PROGRAM

\section*{INTRODUCTION}

This enclosure provides guidance for the preparation of license amendment request to implement programmatic controls in Technical Specifications (TS) for radioactive effluents and for radiological environmental monitoring conforming to the applicable regulatory requirements. This will allow the relocation of existing procedural details of the current Radiological Effluent Technical Specifications (RETS) to the Offsite Dose Calculation Manual (ODCM). Procedural details for solid radioactive wastes will be relocated to the Process Control Program (PCP). A proposed amendment will (1) incorporate programmatic controis in the Administrative Controls section of the TS that satisfy the requirements of 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36a. and Appendix 1 to 10 CFR Part 50, (2) relocate the existing procedural details in current specifications involving radioactive effluent monitoring instrumentation, the control of liquid and gaseous effluents, equipment requirements for liquid and gaseous effluents, radiological environmental monitoring, and radiological reporting details from the TS to the ODCM, (3) relocate the definition of solidification and existing procedural details in the current specification on solid radioactive wastes to the PCP, (4) simplify the associated reporting requirements, (5) simplify the administrative controls for changes to the ODCM and PCP, (6) add record retention requirements for changes to the ODCM and PCP, and (7) update the definitions of the ODCM and PCP consistent with these changes.

The NRC staff's intent in recommending these changes to the TS and the relocation of procedural details of the current RETS to the ODCM and PCP is to fulfill the goal of the Commission Policy Statement for Technical Specification Improvements. It is not the staff's intent to reduce the level of radiological efficent control. Rather, this amendment will provide programmatic controls for RETS consistent with regulatory requirements and allow relocation of the procedural details of current RETS to the ODCM or PCP. Therefore, future changes to these procedural details will be controlled by the controls for changes to the ODCM or PCP included in the Administrative Controls section of the TS. These procedural details are not required to be included in TS by 10 CFR 50.36a.

\section*{DISCUSSION}

Enclosure 2 to Generic Letter 89- provides a summary listing of specifications that are included under the heading of RETS in the Standard Technical Specifications (STS) and their disposition. Most of these specifications will be addressed by programmatic controls in the Administrative Controls section of the TS. Some specifications under the heading of RETS are not covered by the new programatic controls and will be retained as requirements in the existing plant TS. Examples include requirements for explosive gas monitoring instrumentation, limitations on the quantity of radioactivity in liquid or gaseous holdup or storage tanks or in the condenser exhaust for BWRs, or limitations on explosive gas mixtures in offgas treatment systems and storage tanks.

Licensees with nonstandard TS should follow the guidance provided in Enclosure 2 for the disposition of similar requirements in the format of their TS.

Because solid radioactive wastes are addressed under existing programatic controls for the Process Control Program, which is a separate program from the new programmatic controls for liquid and gaseous radioactive effluents, the requirements for solid radioactive wastes and associated solid waste reporting requirements in current TS are included as procedural details that will be relocated to the PCP as part of this line-item improvement of TS. Also, the staff has concluded that records of licensee reviews performed for changes made to the ODCM and PCP should be documented and retained for the duration of the unit operating license. This approach is in lieu of the current requirements that the reasons for changes to the ODCM and PCP be addressed in the Semiannual Effluent Release Report.

The following items are to be included in a license amendment request to implement these changes. First, the model specifications in Enclosure 3 to Generic Letter 89- should be incorporated into the TS to satisfy the requirements of 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36a, and Appendix I to 10 CFR Part 50. The definitions of the ODCM and PCP should be updated to reflect these changes. The programmatic and reporting requirements are general in nature and do not contain plant-specific details. Therefore, these changes to the Administrative Controls section of the TS are to replace corresponding requirements in plant TS that address these items. They should be proposed for incorporation into the plant's TS without change in substance to replace existing requirements. If necessary, only changes in format should be proposed. If the current TS include requirements for explosive gas monitoring instrumentation as part of the gaseous effluent monitoring instrumentation requirements, these requirements should be retained. Enclosure 4 to Generic Letter 89- provides model specifications for retaining such requirements.

Second, the procedural details covered in the licensee's current RETS, consisting of the limiting conditions for operation, their applicability, remedial actions, surveillance requirements, and the Bases section of the \(T S\) for these requirements, are to be relocated to the ODCM Or PCP as appropriate and in a manner that ensures that these details are incorporated in plant operating procedures. The NRC staff does not intend to repeat technical reviews of the relocated procedural details because their consistency with the applicable regulatory requirements is a matter of record from past NRC reviews of RETS. If licensees make other than editorial changes in the procedural details being transferred to the ODCM, each change should be identified by markings in the margin and the requirements of new Specification 6.14a. (1) and (2) followed.

Finally, licensees should confirm in the amendment request that changes for relocating the procedural details of current RETS to either the ODCM or PCP have been prepared in accordance with the proposed changes to the Administrative Controls section of the TS so that they may be implemented imediately upon issuance of the proposed amendment. A complete and legible copy of the revised ODCM should be forwarded with the amendment request for NRC use as a reference. The NRC staff will not concur in or approve the revised ODCM.

Licensees should refer to "Generic Letter 89- * in the Subilect line of license amendment requests implementing the guidance of this Generic Letter. This will facilitate the staff's tracking of licensees' responses to this Generic Letter.

SUMMARY
The license amendment request for the line-item improvements of the TS relative to the RETS will entail (1) the incorporation of programatic controls for radioctive effluents and radiological environmental monitoring in the Administrative Controls section of the TS, (2) incorporatation of the procedural details of the current RETS in the ODCM or PCP as appropriate, and (3) confirmation that the guidance of this Generic Letter has been followed.

OFFSITE DOSE CALCULATION MANUAL
1.17 The OFFSITE DOSE CALCULATION MANUAL (ODCM) shall contain the methodology and parameters used in the calculation of offsite doses resulting from radioactive gaseous and liquid effluents, in the calculation of gaseous and liquid effluent monitoring Alarm/Trip Setpoints, and in the conduct of the Environmental Radiological Monitoring Program. The ODCM shall also contain (1) the Radioactive Effluent Controls and Radiological Environmental Monitoring Programs required by Section 6.8.4 and (2) descriptions of the information that should be included in the Annual Radiological Environmental Operating and Semiannual Radioactive Effluent Release Reports required by Specifications 6.9.1.3 and 6.9.1.4.
1.22 The PROCESS CONTROL PROGRAM (PCP) shall contain the current formulas, sampling, analyses, test, and determinations to be made to ensure that processing and packaging of solid radioactive wastes based on demonstrated processing of actual or simulated wet solid wastes will be accomplished in such a way as to assure compliance with 10 CFR Parts 20, 61, and 71, State regulations, burial ground requirements, and other requirements governing the disposal of solid radioactive waste.

\subsection*{6.0 ADMINISTRATIVE CONTROLS}

\subsection*{6.8 PROCEDURES AND PROGRAMS}
6.8.4 The following programs shall be established, implemented, and maintained:

\section*{g. Radioactive Effluent Controls Program}

A program shall be provided conforming with 10 CFR 50.36a for the control of radioactive effluents and for maintaining the doses to MEMBERS OF THE PUBLIC from radioactive effluents as low as reasonably achievable. The program (1) shall be contained in the ODCM,
(2) shall be implemented by operating procedures, and (3) shall include remedial actions to be taken whenever the program limits are exceeded. The program shall include the following elements:
1) Limitations on the operability of radioactive liquid and gaseous monitoring instrumentation including surveillance tests and setpoint determination in accordance with the methodology in the ODCM,
2) Limitations on the concentrations of radioactive material released in liquid effluents to UNRESTRICTED AREAS conforming to 10 CFR Part 20, Appendix B, Table 11, Column 2,
3) Monitoring, sampling, and analysis of radioactive liquid and gaseous effluents in accordance with 10 CFR 20.106 and with the methodology and parameters in the ODCM.
4) Limitations on the annual and quarterly doses or dose commitment to a MEMBER OF THE PUBLIC from radioactive materials in liquid effluents released from each unit to UNRESTRICTED AREAS conforming to Appendix I to 10 CFR Part 50,
5) Determination of cumulative and projected dose contributions from radioactive effluents for the current calendar quarter and current calendar year in accordance with the methodology and parameters in the ODCM at least every 31 days.
6) Limitations on the operability and use of the liquid and gaseous effluent treatment systems to ensure that the appropriate portions of these systems are used to reduce releases of radioactivity when the projected doses in a 31-day period would exceed 2 percent of the guidelines for the annual dose or dose commitment conforming to Appendix I to 10 CFR Part 50,
7) Limitations on the dose rate resulting from radioactive material released in gaseous effluents to areas beyond the SITE BOUNDARY conforming to the doses associated with 10 CFR Part 20, Appendix B, Table II, Column 1,
6.8.4 g. Radioactive Effluent Controls Program (Cont.)
8) Limitations on the annual and quarterly air doses resulting from noble gases released in gaseous effluents from each unit to areas beyond the SITE BOUNDARY conforming to Appendix I to 10 CFR Part 50,
9) Limitations on the annual and quarterly doses to a MEMBER OF THE PUBLIC from Iodine-131, Iodine-133, tritium, and all radionuclides in particulate form with half-lives greater than 8 days in gaseous effluents released from each unit to areas beyond the SITE BOUNDARY conforming to Appendix I to 10 CFR Part 50,
10) Limitations on venting and purging of the Mark II containment through the Standby Gas Treatment System to maintain releases as low as reasonably achievable (BWRs w/Mark II containments), and
11) Limitations on the annual dose or dose commitment to any MEMBER OF THE PUBLIC due to releases of radioactivity and to radiation from uranium fuel cycle sources conforming to 40 CFR Part 190.
h. Radiological Environmental Monitoring Program

A program shall be provided to monitor the radiation and radionuclides in the environs of the plant. The program shall provide (1) representative measurements of radioactivity in the highest potential exposure pathways, and (2) verification of the accuracy of the effluent monitoring program and modeling of environmental exposure pathways. The program shall (1) be contained in the ODCM, (2) conform to the guidance of Appendix I to 10 CFR Part 50, and (3) include the following:
1) Monitoring, sampling, analysis, and reporting of radiation and radionuclides in the environment in accordance with the methodology and parameters in the ODCM,
2) A Land Use Census to ensure that changes in the use of areas at and beyond the SITE BOUNDARY are identified and that modifications to the monitoring program are made if required by the results of this census, and
3) Participation in a Interlaboratory Comparison Program to ensure that independent checks on the precision and accuracy of the measurements of radioactive materials in environnental sample matrices are performed as part of the quality assurance program for environmental monitoring.

\subsection*{6.9 REPORTING REQUIREMENTS}

ANNUAL RADIOLOGICAL ENVIRDNMENTAL OPERATING REPORT*
6.9.1.3 The Annual Radiological Environmental Operating Report covering the operation of the unit during the previous calendar year shall be submitted before May 1 of each year. The report shall include summaries, interpretations, and analysis of trends of the results of the Radiological Environmental Monitoring Program for the reporting period. The material provided shall be consistent with the objectives outlined in (1) the ODCM and (2) Sections IV.B.2, IV.B.3, and IV.C of Appendix I to 10 CFR Part 50.

SEMIANNUAL RADIDACTIVE EFFLUENT RELEASE REPORT**
6.9.1.4 The Semiannual Radioactive Effluent Release Report covering the operation of the unit during the previous 6 months of operation shall be submitted within 60 days after January 1 and July 1 of each year. The report shall include a summary of the quantities of radioactive liquid and gaseous effluents and solid waste released from the unit. The material provided shall be (1) consistent with the objectives outlined in the ODCM and PCP and (2) in conformance with 10 CFR 50.36 a and Section IV.B. 1 of Appendix I to 10 CFR Part 50.

\subsection*{6.10 RECORD RETENTION}
6.10.3 The following records shall be retained for the duration of the unit Operating License:
0. Records of reviews performed for changes made to the OFFSITE DDSE CALCULATION MANUAL and the PROCESS CONTROL PROGRAM.
6.13 PROCESS CONTROL PROGRAM (PCP)

Changes to the PCP:
a. Shall be documented and records of reviews performed shall be retained as required by Specification 6.10.30. This documentation shall contain:
1) Sufficient information to support the change together with the appropriate analyses or evaluations justifying the change(s) and
*A single submittal may be made for a multi-unit station.
**A single submittal may be made for a multi-unit station. The submittal should combine those sections that are common to all units at the station; however, for units with separate radwaste systems, the submittal shall specify the releases of radioactive material from each unit.
6.13 PROCESS CONTROL PROGRAM (PCP) (Cont.)
2) A determination that the change will maintain the overall conformance of the solidified waste product to existing requirements of Federal, State, or other applicable regulations.
b. Shall become effective after review and acceptance by the [URG] and the approval of the Plant Manager.
6. 14 OFFSITE DOSE CALCULATION MANUAL (ODCM)

Changes to the ODCM:
a. Shall be documented and records of reviews performed shall be retained as required by Specification 6.10.30. This documentation shall contain:
1) Sufficient information to support the change together with the appropriate analyses or evaluations justifying the change(s) and
2) A determination that the change will maintain the level of radioactive effluent control required by 10 CFR 20.106, 40 CFR Part 190, 10 CFR 50.36a, and Appendix I to 10 CFR Part 50 and not adversely impact the accuracy or reliability of effluent. dose, or setpoint calculations.
b. Shall become effective after review and acceptance by the [URG] and the approval of the Plant Manager.
c. Shall be submitted to the Commission in the form of a complete, legible copy of the entire ODCM as part of or concurrent with the Semiannual Radioactive Effluent Release Report for the period of the report in which any change to the ODCM was made. Each change shall be identified by markings in the margin of the affected pages, clearly indicating the area of the page that was changed, and shall indicate the date (e.g., month/year) the change was implemented.

Subject: Dose Projection for Yokosuka

Gentlemen,

Attached is the dose projection for Yokosuka based on the gamma analysis of the portable air sampler filter from the YR 95 barge, decayed to \(3 / 22 / 11\). Also attached is the Sum of Fractional Limits calculation used to develop the projection. These documents are being transmitted to and discussed with the NRC and DOE in parallel. If there are any questions, I can be reached in the ECC at 2027815601.

\section*{VR/}

John M Hallworth
Naval Reactors

\footnotetext{
Assumptions:
1. The Thyroid CDE and CEDE dose estimates would not apply to personnel using KI
2. SOFL (Sum of Fractional Limits) Limit Based on barge sample at Yokosuka with iodines; Ba-137m and \(\mathrm{Y}-90\) were removed
3. All of the iodine dose is assumed to target the thyroid
4. NOTE: 1 AMAD was used in lieu of 5 AMAD for selection of DCFs in ICRP 68 for determination of the percent of iodines versus non-iodines. (See
below). The selection of 5 AMAD versus 1 AMAD would change the percent of iodines and non-iodines in this spreadsheet.
5. When more than one ICRP 68 DCF is provided, the most conservative value for 1 AMAD was used.
}
```

Method

1. Use actual radiation measurement data (air samples, direct gamma readings) to calcuate dose estimates.
2. Use acruai raciaion measurement dara lair somples, direr, gamma readings) o calcuate dose e
2.The particulate airborne dose rate is derived from
3.The thyroid dose is calulated based on the lodines
3. Ratios based on dispersion factors are used to populate the dose estimates out to specific distances.
4. The airborne concentrationlevel divided the SOFL air limit multiplied by the NR annual aiborne radiation limit ( }500\textrm{mrem}/\textrm{yr}\mathrm{ ), then divided by the number
of hours (2000 hours) will calculate the CEDE.
```

Input values
Airborne Conc.
SOFL Limit
Annual Limit
Hours per Year
External Rad.
Measurement \(\quad 0.02 \mathrm{mR} / \mathrm{hr}\)

Average airborne reading at Yokosuka, March 15 / 16, 2011 [Yokosuka dose assessment.xlsx file] (SOFL Limit Based on barge sample at Yokosuka without lodine)

Reading at Yokosuka
- This value is the external rad measurement, all others in column based on dispersion of this value

This value is based on the SOFL Limit, all others in column based on dispersion of this value
This value is based on the dose to the thyroid from iodine using ICRP-68 dose conversion factors and ratioing that value to the SOFL.

Example calculation for establishing the Unit Conversion
Example calc
7.09E-09 Sv/B
\(0.000709 \mathrm{mrem} / \mathrm{Bq}\)
\(26233000 \mathrm{mrem} / \mathrm{Cl}\)
\(26.233 \mathrm{mrem} / \mathrm{uCl}\)
3.70E +09 conversion factor mrem/ \(\mu \mathrm{Cl}\) per \(\mathrm{Sv} / \mathrm{Bq}\)

For occupational exposure, the default value now recommended for AMAD is \(5 \mu \mathrm{~m}\) which is considered to be more representative of work place aerosols than the \(1 \mu \mathrm{~m}\) default value adopted by ICRP 30 : For environmental exposure, the default AMAD is taken to be \(1 \mu \mathrm{~m}^{\prime \prime}\) - Reference ICRP 66 paragraph 181.

\footnotetext{
The particulate airborne dose rate is derived from the airborn concentration with the iodines removed
The thyroid dose is calulated based on the iodines that were removed from the particulate aiborne sample data
This dose estimate assumes no Kl was taken
Wind speed is taken into account by the Pasquill Stability Class assumption
Over 1000 samples have been taken that are consistent with this chart
Groundshine is not included because itis insignificant at larger distances, however it needs to be reevaluated inside 50 miles
}

Inputvalues
Airborme Conc. \(7.72 \mathrm{E}-09 \mathrm{\mu Cimm} \quad\) Average airbome reading at Yokosuka, March \(15 / 16,2011\) Yokosuka dose assessment.x.lsx file]
SOFL Limit \(\quad 3.37 E-09 \mu C i / m\)
Annual Limit 500 mrem
Hours per Year 2000 hrs
Extemal Rad.
Measurement \(\quad 0.02 \mathrm{mRhr} \quad\) Reading at Yokosuka [basis date \(\&\) time needed]

This value is the extermal rad measurement, all others in column based on dispersion of this value This value is based on the SOFL Limit, all others in column based on dispersion of this value This value is based on the dose to the thyroid from iodine using ICRP-68 dose conversion factors and rationg that value to the SOFL.
