Re: Revised Site-specific Background Soil Concentration Evaluation  
Exide Technologies Former Operating Plant  
7471 South 5<sup>th</sup> Street, Frisco, Texas

Dear Mr. Beyer:

Please find enclosed two copies of the Revised Site-specific Background Soil Concentration Evaluation performed for Exide Technologies Former Operating Plant in Frisco, Texas. This evaluation was prepared for Exide Technologies by Pastor, Behling & Wheeler, LLC (PBW) and represents an update to the evaluation previously submitted to you on April 12, 2013. Specifically, this update incorporates data for three additional soil samples that were collected from within the background study area on May 9, 2013 in accordance with your verbal request.

Should you or your staff have any questions or comments regarding this revised evaluation, please contact this office at (610) 921-4054.

Sincerely,

EXIDE TECHNOLOGIES

Re: Revised Site-specific Background Soil Concentration Evaluation  
Exide Technologies Frisco Recycling Center, 7471 South 5<sup>th</sup> Street, Frisco, Texas 75034  
TCEQ SWR No. 30516; EPA ID No. TXD006451090; Customer No. CN600129787; Regulated Entity No. RN100218643

Dear Mr. Beyer:

Pastor, Behling & Wheeler, LLC (PBW), on behalf of Exide Technologies (Exide), is pleased to provide herewith the results of a site-specific background soil concentration evaluation performed in support of the affected property assessment for the former operating plant at the Exide Frisco Recycling Center (the Site). This information represents an update to the previous letter regarding site-specific background concentrations submitted to you on April 12, 2013. Upon your approval, this evaluation will be included as Appendix 8 to the Affected Property Assessment Report (APAR) for the Site.

As you know, collection of background soil samples for the Site was specified in a Sampling and Analysis Work Plan (Work Plan) that was submitted to the United States Environmental Protection Agency (EPA) on November 14, 2011. This Work Plan was approved by EPA on December 2, 2011. The background study area was approved by the EPA in a meeting on January 4, 2012. Soil samples used in the April 12, 2013 site-specific background evaluation were collected from the background study area on March 29, 2012. In accordance with your verbal request, three additional soil samples were collected from the background study area on May 9, 2013. Collection, analysis and validation activities were performed in accordance with procedures described in the EPA-approved Work Plan. Sample location information, sample analytical reports, statistical evaluation results and calculation details for determination of site-specific background concentrations are provided in Appendix A to this letter. As indicated therein, the proposed site-specific background soil concentrations for arsenic and lead are 15.9 mg/kg and 31.5 mg/kg, respectively.

Mr. Gary Beyer  
May 30, 2013

**APPENDIX A**

**SITE-SPECIFIC BACKGROUND SOIL CONCENTRATION EVALUATION**  
**TOLERANCE LIMIT CALCULATIONS**

**APPENDIX A**  
**SITE-SPECIFIC BACKGROUND SOIL CONCENTRATION EVALUATION**  
**TOLERANCE LIMIT CALCULATIONS**

Background soil samples were collected on March 29, 2012 and May 9, 2013, within an area of the City of Frisco's Grand Park near the intersection of Legacy Drive and Stonebrook Parkway (see Figures 1 and 2). The background sample area was approved by the United States Environmental Protection Agency (EPA) in a meeting on January 4, 2012. The samples were collected from a depth interval of 0 to 2 feet below ground surface. Background soil sample analytical results are summarized in Table 1. The data were validated and the data are considered usable for the intended purpose. The laboratory analytical reports and the data usability summaries are provided as Attachment 1.

Tolerance limits were calculated for background metals using the procedure described in Gibbons (1994) and the EPA Pro-UCL Technical Guide (EPA, 2010). Relevant pages from Gibbons (1994) describing this procedure are provided as Attachment 2. A step-by-step discussion of the procedure and calculations is provided below.

Step 1 – Identify outlying values using the following 5 steps (EPA, 2010):

1. Identify extreme high values that may be potential outliers;
2. Apply a statistical test;
3. Scientifically review the statistical outliers and decide on their proper disposition;
4. Conduct data analysis with and without the statistical outliers; and
5. Document the entire process.

The Dixon test, performed using EPA's *Pro UCL* statistical software package (EPA, 2010), statistically evaluated potential outliers for arsenic and lead. If multiple outliers were suspected, the test was applied to the least extreme value first and then subsequent values. The results of the outlier tests are provided in Attachment 3.

Following the above procedure, outliers were removed based on statistical analysis and professional judgment. For lead, outlying concentrations for samples 2012-BG-9 and 2012-BG-10 were excluded from tolerance limit calculations. Due to the high number of non-detect results, outlier tests and tolerance limit calculations were not performed for cadmium. The arsenic data set did not contain outliers and the full data set was utilized for tolerance limit calculations.

Step 2 - Calculate the Background Mean and Standard Deviation

After confirming the data were normally distributed, the background mean and standard deviation were calculated for arsenic and lead using EPA's *Pro UCL* statistical software package (EPA, 2010). These parameters are summarized in Table 1.

Step 3- Calculate Tolerance Limit

Since the purpose of the tolerance limit is to identify metals concentrations that are higher than background, a one-sided upper tolerance limit was calculated. As provided in Gibbons (1994), the tolerance limit is calculated from:

$$TL = \text{mean} + K * (\text{std. deviation})$$

Where K is a factor determined from statistical tables based on the number of samples in the background data set and the desired confidence and coverage goals. Consistent with Gibbons (1994) a 95% confidence level with 95% coverage was used. Based on these goals and background data sets of 11 samples for lead (after exclusion of 2 outliers) and 10 samples for arsenic, Table 4.2 of Gibbons (1994, see Attachment 2) was used to set K at 2.815 for the lead background data set and 2.911 for the arsenic background data set. The resultant upper tolerance limits, which are proposed as site-specific background concentrations, are listed in Table 1.

Table

**TABLE 1**  
**BACKGROUND SAMPLE SOIL ANALYTICAL AND STATISTICAL ANALYSIS RESULTS**

Sample I. D.	Concentration (mg/Kg)		
	Arsenic	Cadmium	Lead
2012-BG-1	11.2	< 0.0313 UJ	13.2 J
2012-BG-2	9.29	< 0.0287 UJ	13 J
2012-BG-3	11.6	< 0.0301 UJ	11.5 J
2012-BG-4	10.8	< 0.0315 UJ	15.7 J
2012-BG-5	14.8	< 0.031 UJ	13.5 J
2012-BG-6	10.0	< 0.0314 UJ	14.3 J
2012-BG-7	9.74	< 0.031 UJ	14.1 J
2012-BG-8	9.83	0.122 J	24 J
2012-BG-9	12.6	8.09 J	302 J
2012-BG-10	11	< 0.615 UJ	67.6 J
2012-BG-11	--	--	20.6
2012-BG-12	--	--	27.5
2012-BG-13	--	--	18.9
Background Mean	11.1	Not Calculated <sup>3</sup>	16.9
Standard Deviation	1.64	Not Calculated <sup>3</sup>	5.16
K-Value	2.911	--	2.815
UTL <sup>4</sup>	15.9	Not Calculated <sup>3</sup>	31.5

Notes:

<sup>1</sup>All samples collected from the 0 to 2 ft below ground surface depth interval.

<sup>2</sup>See Figures 1 and 2 for sample locations.

<sup>3</sup>Statistical analysis was not performed on cadmium due to the high number of non-detect results.

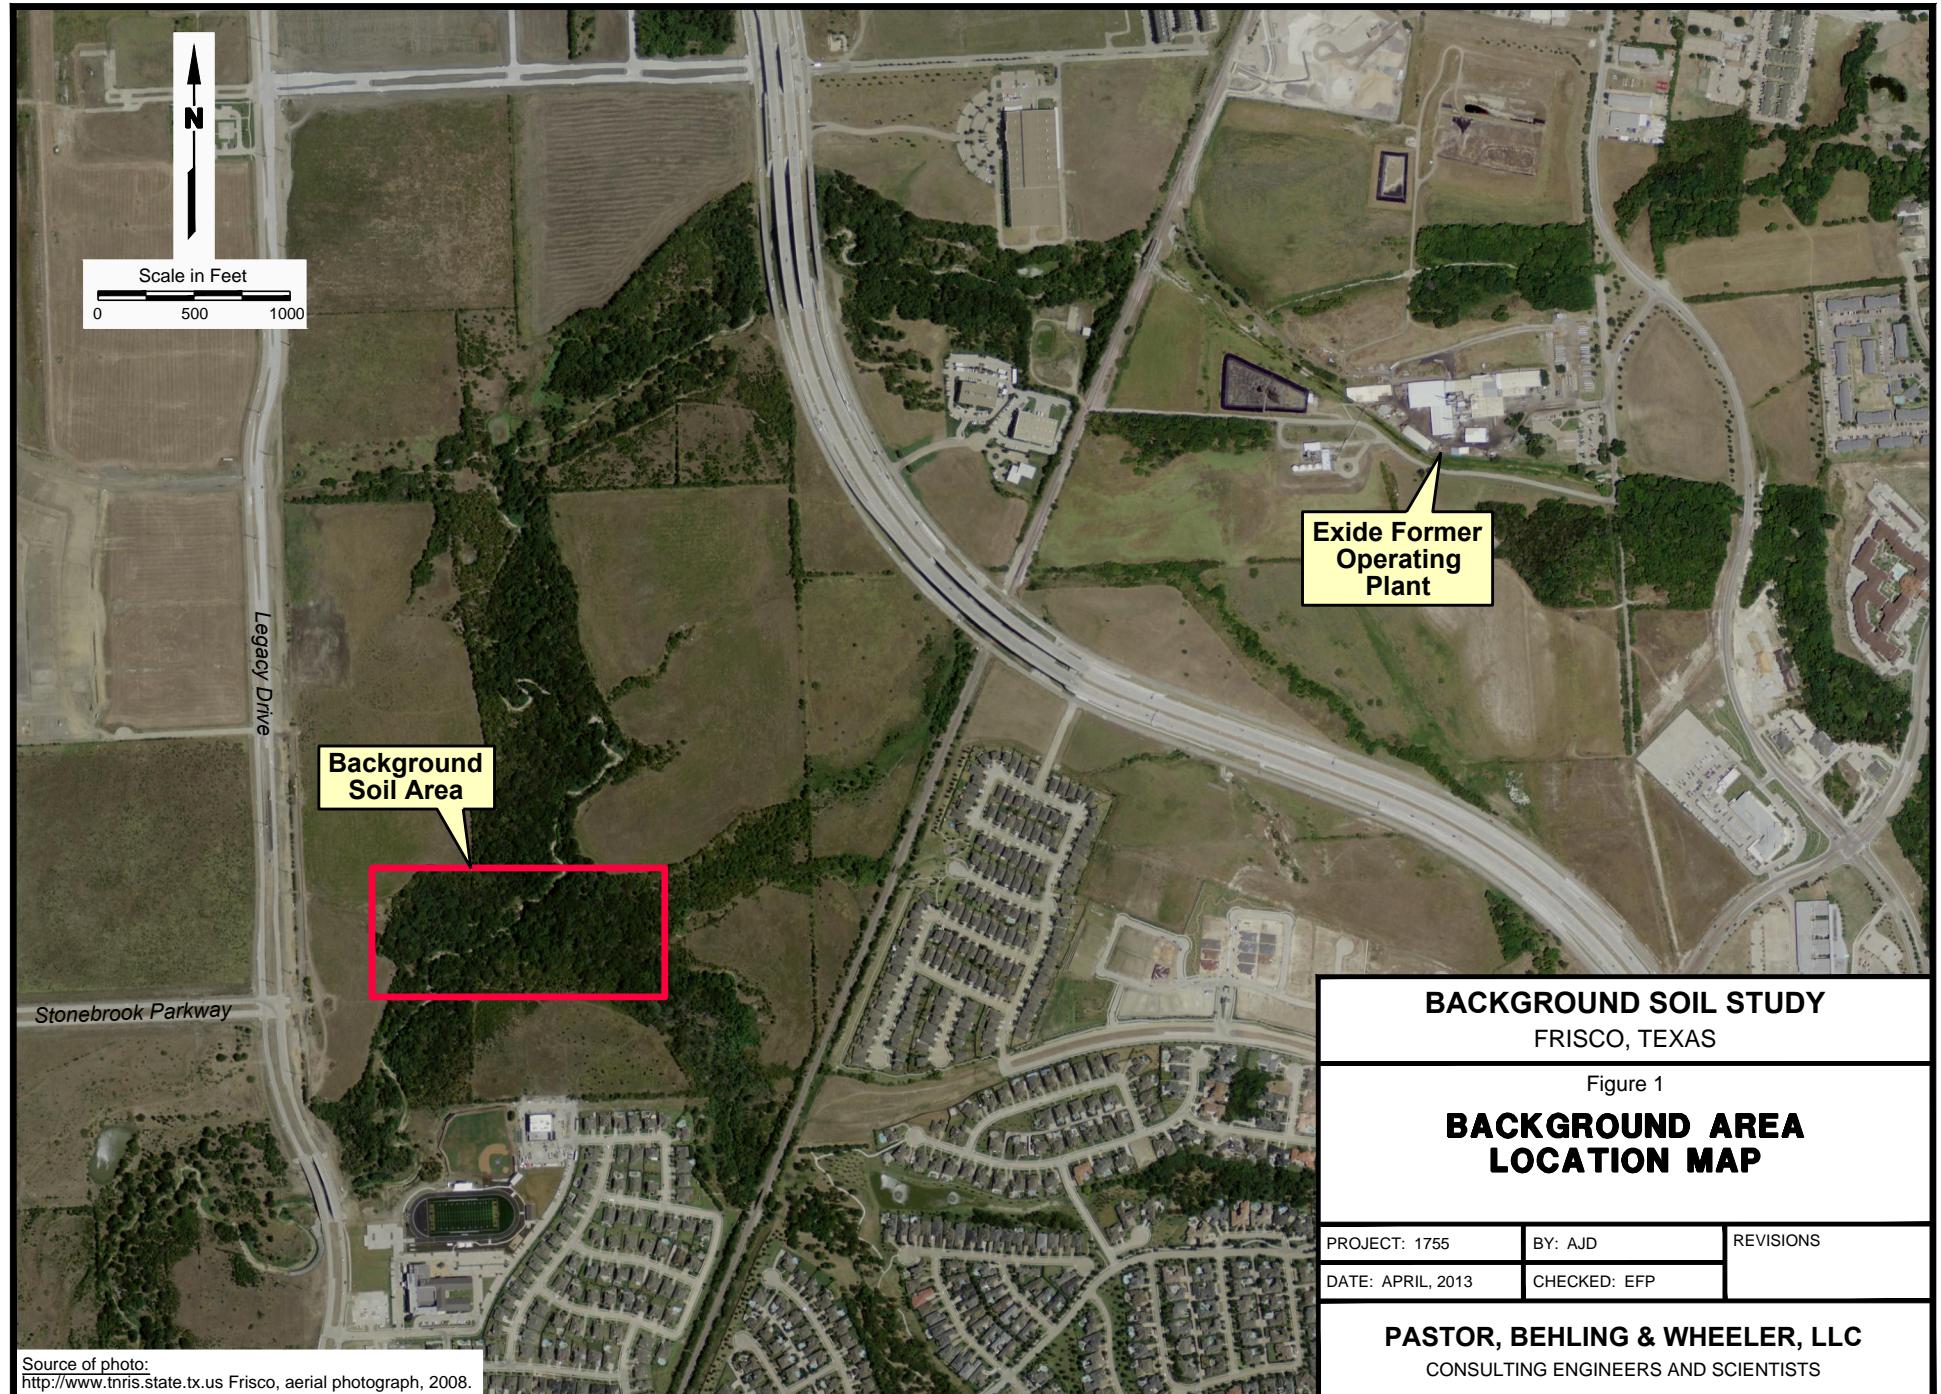

<sup>4</sup>UTL = upper tolerance limit

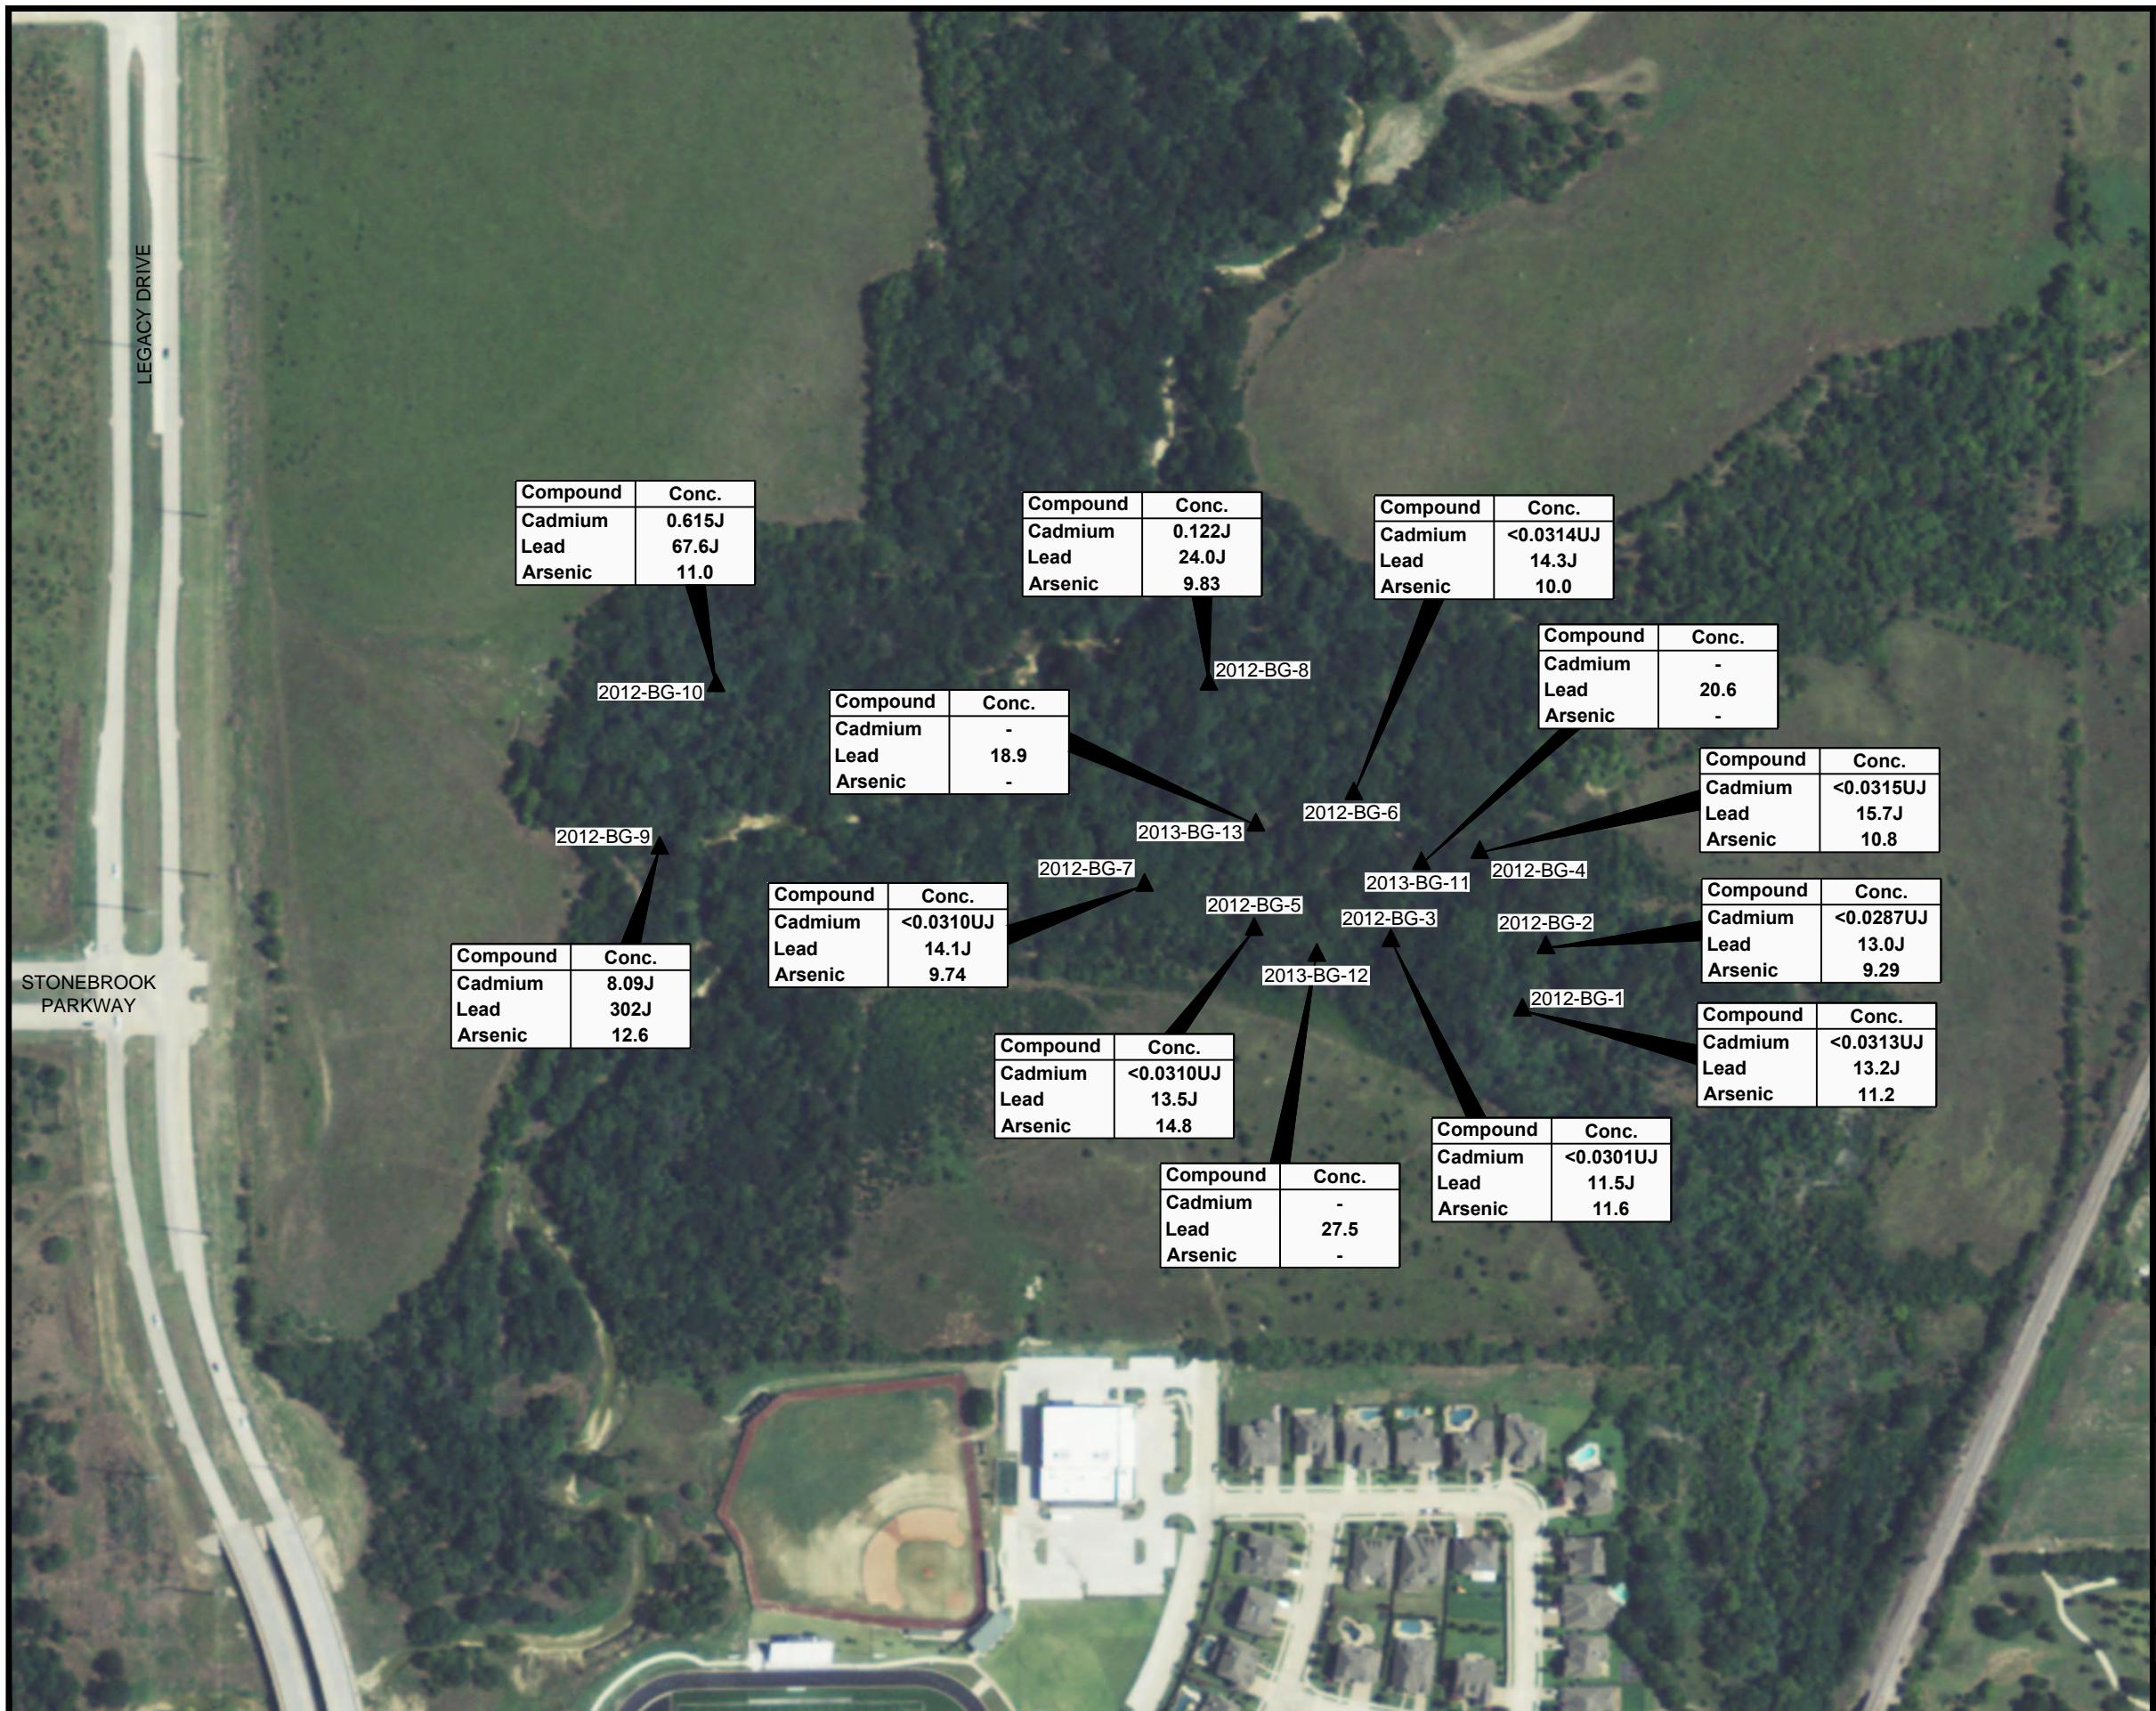

Data Qualifiers: J = estimated concentration; UJ - compound not detected at the indicated detection limit, estimated value.

mg/Kg - milligram/Kilogram

Values presented in *italic* type were excluded from background statistical analyses because they were statistically identified as outliers.

## TRRP Data Package Cover Page

Job Number: 600-52867-1

Project Name/Number: Exide Recycling Center, Frisco TX

This Data Package consists of:

This signature page, the laboratory review checklist, and the following Reportable Data:

- R1 Field Chain-of-Custody Form
- R2 Sample Identification Cross-reference;
- R3 Test Reports (Analytical Data Sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC Chapter 5
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate Recovery Data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- R5 Test Reports/Summary Forms for Blank Samples;
- R6 Test Reports/Summary Forms for Laboratory Control Samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - d) The laboratory's LCS QC limits
- R7 Test Reports for Matrix Spike/Matrix Spike Duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked sample,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicates (if applicable) recovery and precision, including:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limit (MQL) and detectability check sample results for each analyte for each method and matrix;
- R10 Other problems or anomalies

The exception report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under Texas laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm, to the best of my knowledge, that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

		Were all points generated between the lowest and highest standard used to calculate the curve?			X	
		Are ICAL data available for all instruments used?	X			
		Has the initial calibration curve been verified using an appropriate second source standard?	X			
S2	OI	<b>Initial and continuing calibration verification (ICCV and CCV) and continuing calibration</b>				
		Was the CCV analyzed at the method-required frequency?	X			
		Were percent differences for each analyte within the method-required QC limits?	X			
		Was the ICAL curve verified for each analyte?	X			
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X			
S3	O	<b>Mass spectral tuning:</b>				
		Was the appropriate compound for the method used for tuning?			X	
		Were ion abundance data within the method-required QC limits?			X	
S4	O	<b>Internal standards (IS):</b>				
		Were IS area counts and retention times within the method-required QC limits?			X	
S5	OI	<b>Raw data (NELAC section 5.5.10)</b>				
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X			
		Were data associated with manual integrations flagged on the raw data?			X	
S6	O	<b>Dual column confirmation</b>				
		Did dual column confirmation results meet the method-required QC?			X	
S7	O	<b>Tentatively identified compounds (TICs):</b>				
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X	
S8	I	<b>Interference Check Sample (ICS) results:</b>				
		Were percent recoveries within method QC limits?	X			
S9	I	<b>Serial dilutions, post digestion spikes, and method of standard additions</b>				
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X	4
S10	OI	<b>Method detection limit (MDL) studies</b>				
		Was a MDL study performed for each reported analyte?	X			
		Is the MDL either adjusted or supported by the analysis of DCSs?	X			
S11	OI	<b>Proficiency test reports:</b>				
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X			
S12	OI	<b>Standards documentation</b>				
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X			
S13	OI	<b>Compound/analyte identification procedures</b>				
		Are the procedures for compound/analyte identification documented?	X			
S14	OI	<b>Demonstration of analyst competency (DOC)</b>				
		Was DOC conducted consistent with NELAC Chapter 5?	X			
		Is documentation of the analyst's competency up-to-date and on file?	X			
S15	OI	<b>Verification/validation documentation for methods (NELAC Chapter 5)</b>				
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X			
S16	OI	<b>Laboratory standard operating procedures (SOPs):</b>				
		Are laboratory SOPs current and on file for each method performed?	X			

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s).

Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

### **Appendix A (cont'd): Laboratory Review Checklist: Exception Reports**

Laboratory Name: TestAmerica-Houston	LRC Date: 04/13/12
Project Name: Exide Recycling Center, Frisco TX	Laboratory Job Number: 600-52867
Reviewer Name: TWR	Prep Batch Number(s): 600-76449- ICP
ER# <sup>1</sup>	DESCRIPTION
1	See Case Narrative
2	The lead recoveries in samples 52867-10 MS and MSD were above acceptance limits due to matrix interference. Method performance is demonstrated by an acceptable LCS recovery.
3	The cadmium and lead RPDs between samples 52867-1 and 52867-1 MD were above acceptance limits due to the non-homogenous nature of the samples.
4	The lead percent difference between samples 52867-1 and 52867-1 SD was above acceptance limits due to matrix interference.

ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked on the LRC)

600-52867-1****Comments**

No additional comments.

**Receipt**

The samples were received on 3/30/2012 9:31 AM; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 9.00 C.

**Except:**

The following sample(s) was received at the laboratory outside the required temperature criteria: 2012-BG-1 (600-52867-1), 2012-BG-10 (600-52867-9), 2012-BG-2 (600-52867-2), 2012-BG-3 (600-52867-3), 2012-BG-4 (600-52867-7), 2012-BG-5 (600-52867-6), 2012-BG-6 (600-52867-8), 2012-BG-7 (600-52867-4), 2012-BG-8 (600-52867-10), 2012-BG-9 (600-52867-5).

The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC): 2012-BG-8 (600-52867-10). The container labels list 2012-BG-8. The COC lists 2012-BG-10.

Client: Pastor, Behling &amp; Wheeler LLC

TestAmerica Job ID: 600-52867-1

Project/Site: Exide Recycling Center, Frisco TX Projec

**Qualifiers****Metals**

Qualifier	Qualifier Description
U	Analyte was not detected at or above the SDL.
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.
F	Duplicate RPD exceeds the control limit
N	MS, MSD: Spike recovery exceeds upper or lower control limits.

**Glossary****Abbreviation** **These commonly used abbreviations may or may not be present in this report.**

⊗	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## METHOD INFORMATION \*\*

Sample Introduction Device: Normal  
 Calibration Mode: Concentration

## Default Setup:

Number of Repeats : 2	Auto-store Analysis Data? Yes
Flush Time (sec) : 45.0	Auto-store Stdzn Data? Yes
Auto-Increment Sample Names? No	Store Individual Repeats? No
	Auto-print Analysis Data? Yes
	Auto-print Stdzn Report : +Readback
	Condensed Print Format? Yes

## Default File Names:

Analysis Data File : A040512	Autosampler Table : TRAVIS
	Sample Limits Table : LCTAB
Calibration Data File : CALDATA	Blank Limits Table : BLCTAB
Calibration Stds Table : CALSTDS	QC Check Table : LCTAB

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****1.0 PROJECT OVERVIEW AND SUMMARY**

Quality Assurance Associates (QAA) completed a third party QA/QC data validation of chemical analysis data from the Exide Technologies Frisco Recycling Center in Frisco, Texas. The independent data validation, which included a data verification process and usability determination, was completed in accord with the Quality Assurance Project Plan (revised November 2011), hereinafter called the QAPP, using Level IV data packages and electronic data deliverables (EDD) supplied by the laboratory (TestAmerica-Houston). The data include 17 metals samples, with 7 soil samples from the site and 10 background soil samples, as listed in Table 1. The samples were collected by Pastor, Behling, and Wheeler, LLC (PBW) in March 2012 and the results will be used to define the nature, location, extent, and movement of hazardous wastes and/or hazardous constituents, which are present at or have been released from the site, specifically by comparison of the results to delineation standards and to establish background levels of metals. QAA performed the validation per the procedures specified in section 6.0 of the QAPP using the guidelines presented in the U.S. EPA Contract Laboratory Program *National Functional Guidelines for Inorganic Superfund Data Review* (January 2010), hereinafter called the NFG, and the QC requirements in the analytical methodology used by the laboratory.

The results of the review are summarized in Table 4, which lists all of the qualified sample results. All qualified data is considered useable with limitations as discussed in Section 5.0. Additionally, all unqualified results for non-detects are at or below the delineation standards and thus suitable for demonstrating conformance with standards.

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****2.0 PROCEDURES**

QAA completed the validation by examining the hardcopy packages and EDD produced by the laboratory, which include analysis results, QC reports, and raw data. QAA examined the data for all of the samples for:

- Data Package Completeness,
- Chain-of-Custody Procedures,
- Sample Preservation and Holding Time,
- Instrument Calibration and Performance,
- Calibration Verification,
- Blanks (Laboratory and Field),
- Matrix Spike/Matrix Spike Duplicates (MS/MSD),
- Matrix Duplicates (MD),
- Serial Dilutions (SD),
- Laboratory Control Sample/Laboratory Control Sample Duplicates (LCS/LCSD), and
- Field Duplicates

The remaining QC Level IV checks (surrogates, internal standards, and target compound identification) do not apply for the SW846-6010 methodology employed by the laboratory for this event.

Additionally, using the EDD, the validator verified that the reporting limits and detection limits for all of the samples were properly adjusted for sample-specific factors such as dilution, dry-weight correction, and use of a smaller or larger sample aliquot. For three of the 17 samples with one from each laboratory work order, the validator reviewed the raw data and determined that the sample results were correctly calculated and reported.

The validator performed the validation using data validation checklists (Attachment A) and the following QC criteria:

- Laboratory Accuracy – the method-specified recovery control limits of 75-125% for metals with a data rejection limit of 30%
- Laboratory Precision – the method-specified RPD control limit of 20% or an absolute difference control limit of 1x the reporting limit (if either result is less than or equal to 5x the reporting limit) per the NFG

After completing the examination, the validator applied qualifying flags to any data with a QC deficiency. The qualifiers were applied in accord with the NFG and include the expected direction of bias if apparent from the QC outcome. The validator considered each QC deficiency separately and then, for multiple deficiencies, applied the most severe flag. The data validation qualifiers (DVQs) are defined in Table 2. Note that the DVQ replaces all qualifiers applied by the laboratory.

Upon completion of the validation, QAA performed data verification to assess the entire data set for overall trends in data quality and usability. Data quality was examined in terms of precision, accuracy, representativeness, sensitivity, completeness, and comparability. Data usability was then determined considering the intended use, laboratory reporting limits, and QC deficiencies found during validation using the U.S. EPA's Guidance for Data Useability in Risk Assessment, Part A (April 1992).

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****3.0 DATA VALIDATION RESULTS**

The soil samples were analyzed for total metals and synthetic precipitation leaching procedure (SPLP) metals. All of the samples were included in the validation and the outcomes are summarized below.

**3.1 PRECISION**

QAA evaluated the sampling and analytical precision of the sample results using the relative percent difference (RPD) for the laboratory control sample duplicates (LCSD), the unspiked matrix duplicates (MD) and matrix spike duplicates (MSD), and the field duplicates (FD). LCSD are prepared using a clean sample matrix (reagent water or sand) and provide an indication of the precision of the preparation and analysis technique on a sample free of matrix effects. MD and MSD are prepared by the laboratory using a field sample. They provide an indication of the precision of the preparation and analysis technique on the specific sample matrix. FD are prepared by the sampler in the field and provide an indication of the precision of the sampling technique plus the preparation and analysis technique on the specific sample matrix.

**3.1.1 LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) PRECISION**

No LCSD were analyzed or required per the analytical methodology for the tests performed during this event.

**3.1.2 MATRIX DUPLICATE (MD) AND MATRIX SPIKE DUPLICATE (MSD) PRECISION**

The laboratory analyzed an MD and MSD with every analytical batch (maximum 20 samples) and reported RPDs for all target compounds for MD and MSD prepared using a sample from the site. As indicated in Table 1, at least one MD and MSD was prepared using a sample from the site for each test and each investigative media (site soil, background soil).

Some MD and MSD RPDs are above the QC criteria (maximum 20%) and the validator qualified the associated data per the NFG as detailed in Table 3. Table 4 lists all qualified sample results. Note that, for cases where either result for the duplicate pair is less than 5x the reporting limit, the validator compared the absolute difference between the two results to a control limit of 1x the reporting limit rather than evaluating the RPD per the NFG. Additionally, the validator considered samples of the same media to be of similar matrix (e.g., if deficiencies were noted for a MD or MSD prepared using a background soil sample, all background soil samples in the same analytical batch were qualified).

**3.1.3 FIELD DUPLICATE (FD) PRECISION**

No FD were collected or required per the QAPP for the media sampled during this event.

**3.2 ACCURACY**

QAA evaluated the analytical accuracy of the sample results using the results for the laboratory control samples (LCS/LCSD), matrix spikes (MS/MSD) and post-digestion spikes (PDS), and serial dilutions (SD). LCS/LCSD are prepared using a clean sample matrix (reagent water or sand) and provide an indication of the accuracy of the preparation and analysis technique on a sample free of matrix effects. MS/MSD are prepared using a field sample and provide an indication of the accuracy of the preparation and analysis technique on the specific sample matrix. PDS are prepared like MS/MSD except the spike is added after preparation just before analysis rather than before preparation. SD are prepared using a field sample and indicate whether or not matrix interferences are affecting the accuracy of the preparation and analysis technique on the specific sample matrix.

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****3.2.1 LABORATORY CONTROL SAMPLE (LCS/LCSD) ACCURACY**

The laboratory analyzed a LCS with every analytical batch (maximum 20 samples) as required and reported recoveries for all target compounds. No LCSD were analyzed or required for the analytical methodology used for this event. All LCS recoveries are within the QC criteria (75-125% for metals).

**3.2.2 MATRIX SPIKE (MS/MSD) AND POST-DIGESTION SPIKE (PDS) ACCURACY**

The laboratory analyzed an MS and MSD for every analytical batch (maximum 20 samples) and reported recoveries for all target compounds for MS/MSD prepared using a sample from the site. Additionally, the laboratory analyzed a PDS for every metals analytical batch and reported recoveries for any target metals with a MS/MSD recovery outside the control limits. As indicated in Table 1, at least one MS/MSD was prepared using a sample from the site for each test and each investigative media (site soil, background soil).

Some MS, MSD and/or PDS recoveries are outside the QC criteria (75-125% for metals) and the validator qualified the associated data per the NFG as detailed in Table 3. Table 4 lists all qualified sample results. Note that if an analyte was detected in the unspiked parent sample at a concentration well above (greater than four times) the concentration of spike added to the sample, thereby rendering the recoveries inconclusive, the check was waived and the validator did not qualify the data. Additionally, the validator considered samples of the same media to be of similar matrix (e.g., if deficiencies were noted for a MS/MSD prepared using a background soil sample, all background soil samples in the same analytical batch were qualified).

**3.2.3 SERIAL DILUTION (SD) %DIFFERENCE**

For each metals MS/MSD, the laboratory analyzed an SD and reported the %difference for all target metals detected above 50x the method detection limit (MDL) for SD prepared using a sample from the site.

Some SD %differences are above the QC criteria (10%) and the validator qualified the associated data per the NFG as detailed in Table 3. Table 4 lists all qualified sample results. Note that the validator considered samples of the same media (site soil, background soil) to be of similar matrix (e.g., if deficiencies were noted for a SD prepared using a background soil sample, all background soil samples in the same analytical batch were qualified).

**3.3 REPRESENTATIVENESS**

QAA evaluated representativeness of the sample results by examining the custody procedures, calculating holding times, examining blanks for evidence of contamination, and examining sample results for outliers or suspect values.

**3.3.1 CHAIN-OF-CUSTODY**

All samples were delivered to the laboratory by an overnight, commercial carrier within two days of collection with properly executed chain-of-custody records, which confirms that sample integrity was maintained. The validator noted a few minor inconsistencies between the information on the custody records and that assigned by the laboratory. However, all issues were resolved and/or do not affect the integrity of the investigative samples. Details are listed in the validator's checklists included as Attachment A.

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****3.3.2 SAMPLE PRESERVATION AND HOLDING TIME**

All samples were properly preserved and analyzed within the holding times listed in Table 5-1 of the QAPP, which confirms that sample results are not affected by sample degradation, except as follows:

- The samples in work order 600-52864 and 600-52867 were received at 9.0 C.

The samples were analyzed for total arsenic, cadmium, and lead, which require preservation at 4 $\pm$ 2 C per Table 3 in the QAPP. However, no preservation is required for metals in solid samples per the analytical method and thus analyte degradation is not suspected and the sample results were not qualified.

**3.3.3 BLANK CONTAMINATION**

The laboratory analyzed a preparation blank for every analytical batch (maximum 20 samples) and a calibration blank for every 10 metals analyses. Additionally, the QAPP requires one equipment rinsate blank per day of soil sample collection, which requires re-usable equipment. However, no equipment rinsate blanks were collected with the 17 soil samples for this event.

One detect is reported in the laboratory QC blanks and the validator qualified the associated data per the NFG as detailed in Table 3. Table 4 lists all qualified sample results. Note that the validator calculated a blank equivalent concentration taking into account the sample weight, moisture content, and dilution factor for each sample when determining if the contamination in the blank is near that in the sample, and thus if data quality is affected for that sample.

**3.3.4 SAMPLE RESULTS EVALUATION**

As previously noted, no field duplicate results are available for comparison. For samples with total metals and SPLP metals, the validator examined the results to determine the maximum possible leachate concentration and found no apparent outliers.

**3.4 SENSITIVITY**

QAA evaluated sensitivity by examining the instrument performance and the sample reporting limits as compared to decision criteria.

**3.4.1 INSTRUMENT PERFORMANCE AND CALIBRATION**

The laboratory calibrated each instrument and analyzed a calibration verification standard at the beginning of every analytical shift and for every 10 metals analyses. Recoveries for all calibration verification standards are within the QC criteria (70-130%), which indicates the instruments were properly calibrated and stable throughout the analytical shift.

The laboratory also analyzed quarterly low-level detectability check standards (DCS). The DCS confirm the reasonableness of the laboratory method detection limits (MDLs) (i.e., they indicate that the analyte is recoverable at a spike level within about 3x the MDL) for all investigative samples.

**DATA VALIDATION AND USABILITY SUMMARY****Quality Assurance Associates***QAA, L.L.C.***3.4.2 COMPARISON OF REPORTING LIMITS TO DECISION CRITERIA**

The laboratory reported non-detects at the sample detection limit (SDL), which is the method detection limit (MDL) adjusted for sample-specific actions such as dilution, dry-weight correction, or use of a smaller sample aliquot. Detects above the SDL but below the SQL, which is the method quantitation limit (MQL) adjusted for sample-specific actions, are reported as laboratory J values. All of the SDLs for non-detects are at or below the delineations standards for this event.

**3.5 COMPLETENESS**

QAA evaluated completeness by examining the laboratory data packages and by determining the amount of valid data obtained for the samples.

The Level IV data packages contain all necessary information, or the information was provided upon request as follows:

- For work orders 600-52584-1 and 600-52864-1, the original packages do not include the post digestion spike (PDS) results, serial dilution (SD) results, and/or raw data for one or more metals analytical shifts. The laboratory added the necessary data and submitted revised reports.
- For the same two work orders, the packages do not include the bench logs for the synthetic precipitation leaching procedure. The laboratory provided these pages separately and they are included in Attachment B.

QAA evaluated field completeness by comparing the total number of tests performed with the total number of tests planned for investigative samples. All planned investigative samples were collected and analyzed for the requested tests, giving a field completeness of 100%. The typical goal is 90%. (The QAPP does not include completeness goals.)

QAA evaluated laboratory completeness by comparing the total number of valid analytical results with the total number of results reported for investigative samples. The validator did not reject any results, giving a laboratory completeness of 100%. The typical goal is 90%. (The QAPP does not include completeness goals.)

**3.6 COMPARABILITY**

Samples were analyzed using standard EPA protocols as shown in Table 1. The methodologies employed by the laboratory are specified for use in the QAPP and provide definitive, quantitative data. The hardcopy sample results are reported with the sample detection limit (SDL) and the method quantitation limit (MQL). The EDD includes the SDL (under the Low Limit column) and the sample quantitation limit (SQL, under the High Limit column). A detection limit corresponds to the lowest concentration at which a target analyte can be positively identified but not necessarily accurately measured and is statistically determined by the laboratory. A quantitation limit reflects the lowest concentration at which a target analyte can be both positively identified and accurately measured. The SDLs and SQLs reported by the laboratory are adjusted for sample-specific actions such as dilution or use of a smaller aliquot size and include dry-weight correction for all solid samples. Results for the total metals soil samples are reported in mg/kg and results for the SPLP samples are reported in mg/L. Non-detects are reported as less than the SDL and detects between the SDL and SQL are reported with a laboratory J flag. Since these detects are below the calibration range, the validator qualified each as estimated with an unknown bias (J).

The analytical results were reviewed and are classified as Level IV data. The analytical results are considered comparable to other results similarly generated.

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****4.0 DATA VERIFICATION RESULTS**

Upon completion of the validation, data verification was completed to summarize overall trends in data quality as follows:

1. Precision is the degree of mutual agreement among individual measurements of the same property, usually under prescribed similar conditions, without assumption of any prior information as to the true result. Precision is measured through the analysis of replicate or duplicate samples and calculation of the relative percent difference (RPD) between the results. The validator assessed precision using the laboratory duplicates. The laboratory prepared at least one MD and MSD using a sample from the site for each test and each investigative media. The RPDs for these laboratory duplicates are within the limits, which indicates good precision for the analytical method on the specific sample matrix, or the validator qualified the results for similar samples in the same analytical batch as the duplicate. Of the 50 results, 30 results (all of which are for total metals in soil) are qualified as estimated (J) based on laboratory duplicate precision.
2. Accuracy is the degree of agreement of a measurement with an accepted reference or true value. Accuracy is measured through the analysis of reference samples or the introduction of reference materials (spikes) to field samples and calculation of the percent recovery of the known value. The validator assessed accuracy using the laboratory spikes and matrix spikes. The laboratory prepared a laboratory control sample (LCS) using reagent water or sand with each analytical batch and reported the recoveries for all target compounds. All LCS recoveries are within the limits, which indicates good accuracy for the analytical method on a sample free of matrix effects. Additionally, the laboratory prepared at least one matrix spike using a sample from the site for each test and each investigative media and also prepared several post digestion spikes (PDS) and serial dilutions (SD) for the metals analyses. The MS/MSD and PDS recoveries are within the laboratory limits, which indicates good accuracy for the analytical method on the specific sample matrix, or the validator qualified the results for similar samples in the same analytical batch as the MS/MSD. Likewise, the SD %differences are within the laboratory limits, which indicates there is no matrix interference affecting the accuracy of the results, or the validator qualified the results for similar samples in the same analytical batch as the SD. None of the results are qualified as rejected due to extremely poor accuracy. Of the 50 results, 20 results (all of which are for total metals in soil) are qualified as estimated based on matrix spike, post digestion spike, and/or serial dilution results.
3. Representativeness expresses the degree to which sample data accurately and precisely represent environmental conditions and parameter variations at a sampling location. Representativeness is a qualitative parameter most concerned with the proper design of the sampling program and is also ensured by using the proper analytical procedures. The validator assessed representativeness by examining custody procedures, sample preservation and holding times, the laboratory blanks, and comparable sample results. Sample preservation and holding times met the method requirements, which indicates the results are not affected by sample degradation. The laboratory prepared a method blank with each analytical batch and analyzed calibration blanks throughout each analytical shift. The laboratory blanks show no contamination, which indicates the samples were not affected by laboratory procedures, or the validator qualified the samples associated with the blank that have a concentration similar to that in the blank. This resulted in the qualification of two detects below the reporting limit (i.e., laboratory J values) for cadmium as not detected substantially above the blank concentration (U). No field duplicates were required or collected for this event. A comparison of total metals versus SPLP metals results do not show any apparent outliers.
4. Sensitivity (S) is the capability of a method or instrument to discriminate between measurement responses representing different levels of the parameter of interest. Sensitivity is expressed in terms of the laboratory detection

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY***QAA, L.L.C.*

limits (which are a measure of the concentration an instrument can detect or ‘see’ in a sample) and the laboratory reporting limits or quantitation limits (which are a measure of the concentration an instrument can accurately measure in a sample). The laboratory method detection limits (MDLs) are confirmed reasonable by detectability check standards (DCS). For all non-detects, the sample detection limits (SDLs) are at or below the decision criteria (i.e., the delineation standards for the site). Additionally, proper analytical procedures were used and calibration results met the method requirements.

5. Completeness (C) is the amount of valid data obtained from a measurement system compared to the amount that was expected and required to meet the project data goals. QAA calculated field completeness at 100% and laboratory completeness at 100%.
6. Comparability (C) is an expression of the confidence with which one data set can be compared to another. The samples were analyzed using standard EPA protocols as specified in the QAPP. The analytical results were reviewed and are classified as Level IV data and are considered comparable to other results similarly generated. Note that results are reported in mg/kg with dry-weight correction for total metals in soils and in mg/L for SPLP metals.

**Quality Assurance Associates****DATA VALIDATION AND USABILITY SUMMARY*****QAA, L.L.C.*****5.0 RECONCILIATION WITH USER REQUIREMENTS**

Samples results will be used to define the nature, location, extent, and movement of hazardous wastes and/or hazardous constituents, which are present at or have been released from the site, specifically by comparison of the results to delineation standards and to establish background levels for metals.

**5.1 USABILITY OF UNQUALIFIED DATA FOR NONDETECTED RESULTS**

The laboratory reported non-detects at the sample detection limit (SDL), which is the method detection limit (MDL) adjusted for sample-specific actions such as dilution, dry-weight correction, or use of a smaller sample aliquot. The MDLs are confirmed reasonable by the analysis of detectability check standards (DCS) and the SDLs for all nondetected results are at or below the decision criteria (i.e., the delineation standards for the site).

**5.2 USABILITY OF QUALIFIED DATA**

Table 4 shows the qualified data for all samples. No results are qualified as rejected (R) and thus all data is suitable for the intended use. Some results are qualified as not substantially above the blank concentration (U) or as estimated (J or UJ) with a low, high, or indeterminate bias.

Analytes that were not detected substantially above the blank concentration (U) should be considered not present at the reporting limit or SQL. Thus, the reported concentration is replaced with the SQL. Table 4 includes the SQL under the 'Adjusted Result' column for U-flagged results.

For data that are estimated, results that are considered biased low (J-) can be used for determining the presence of the analyte and as an indication that the concentration of the analyte exceeds a given criterion. However, the concentration reported may be low. Results that are biased high (J+) can be used for determining the presence of the analyte and as an indication that the concentration of the analyte is less than a given criterion. However, the concentration reported may be high. Similarly, results with an indeterminate bias may be either low or high. Note that none of the SPLP metals data is qualified as estimated and that the site soil samples that are qualified as estimated are above the delineation standard and exceed the standard by a factor of two or more.

**Quality Assurance Associates***QAA, L.L.C.*

TABLE 2  
 EXIDE TECHNOLOGIES FRISCO RECYCLING CENTER  
 MARCH 2012 SOIL SAMPLING EVENT

## DATA VALIDATION QUALIFIERS (DVQs)

The DVQ replaces all flags applied by the laboratory.

- J* = Estimated. The analyte was positively identified; however, the reported sample concentration is approximate due to exceedance of one or more QC requirements. Directional bias cannot be determined
- J-* = Estimated low. The analyte was positively identified; however, the reported sample concentration is approximate due to exceedance of one or more QC requirements. The actual value is expected to be lower.
- J+* = Estimated high. The analyte was positively identified; however, the reported sample concentration is approximate due to exceedance of one or more QC requirements. The actual value is expected to be higher.
- UJ* = Estimated. The analyte was not detected above the reporting limit; however, the reporting limit is approximate due to exceedance of one or more QC requirements.
- U* = Blank contamination. The analyte was not detected substantially above the level reported in an associated laboratory and/or field blanks.
- R* = Rejected. The sample result is rejected due to serious QC deficiencies that make it impossible to verify the presence or absence of the analyte.

NOTE: For multiple deficiencies, the reviewer applied the most severe flag. (R>U>J>J-/J+ and R>UJ)

VALIDATOR'S CHECKLISTS

## Data Validation Checklist - General

Client Name: PBW	Project Number/ Manager: 1755/Eric Pastor		
Site Name: Exide	QC Level: IV		
Laboratory: TestAmerica (Houston)	Laboratory Job No: 600-52584-1, 600-52864-1, 600-52867-1		
Reviewer: Taryn Scholz	Date Checked: 5/8/12		
Parameters: As/Cd/Pb - SPLP and Total	Methods: SW1312&3010A/ SW3050B/ SW6010B		
ITEM	YES	NO	N/A
Laboratory NELAP accredited?	x		
Signed Narrative included?	x		
No analytical discrepancies noted in narrative?		x	see Narrative Comments
Chain of Custody (COC)/ Sample Receipt			
Date/time of sample collection included?	x		
Sample temp upon receipt 2-6 C?		x	see comment no. 1
Proper containers/preservation?	x		
COCs properly executed and seals used?	x		some minor discrepancies, see comment no. 2
Samples received within 2 days?	x		
No. of samples analyzed agrees with work plan?		x	(Sampling and Analysis Work Plan, Rev Nov 2011) see comment no. 3
Analytical Results			
Field, Laboratory, and Batch ID included?	x		
Date of sample collection/receipt included?	x		
Date of sample preparation/analysis included?	x		
NDs at DL or QL and J-values as needed?	x		NDs at SDL and J-values reported; SDL,MQL (Adj) included in HC and EDD (called MDL and MQL in EDD)
Target analyte list complete?		x	see comment no. 3
RLs acceptable?	x		SDL <= Delineation Std for NDs
MDLs reasonable per DCS?	x		DCS spike within approx 3x MDL and within 3 mos
No sample dilutions required?		x	dilutions only for detects
Prep/Analysis method references included?	x		
Sample matrix included?	x		
Sample result units reported correctly?	x		mg/kg for soils and mg/L for SPLP
Soils/sediments on dry weight?	x		
Holding time to analysis not expired?	x		
Holding time to preparation not expired?	x		
QC Samples			
Lab QC frequency met?	x		1 MB/LCS per 20
Field duplicate frequency met?		x	1/20 for SW, GW
Equipment blank frequency met?	x		1/day/reusable eq type - see comment no. 4
Field blank frequency met?		x	1/day/eq type for VOC (i.e., TPH)
Trip blank frequency met?		x	1/cooler w VOC (i.e., TPH)
MS/MSD or MS/DUP frequency met?	x		1/20 for SW, Sed, GW - also done for soils
Completeness criteria met?	x		
Field Notes			
Agree with custody records?		x	not included
Field instruments calibrated daily?		x	
Well conditions constant before sampling?		x	
Samples filtered? If so, give turbid/size		x	
Definitions: AA - Atomic Absorption; CCV - Continuing Calibration Verification; COI - Compound of Interest; %D - Percent Difference, DL - Detection Limit; DUP - Duplicate; FDUP - Field Duplicate; ICP - Inductively Coupled Plasma; ICV - Initial Calibration Verification; IDL - Instrument Detection Limit; LCS - Laboratory Control Sample; MDL - Method Detection Limit; MS/MSD - Matrix Spike/Matrix Spike Duplicate; QL - Quantitation Limit; %R - Percent Recovery; RL - Reporting Limit; RPD - Relative Percent Difference; RRF - Relative Response Factor; RT - Retention Time; RSD - Relative Standard Deviation; TA - Target Analyte			
COMMENTS			
Comment no. 1			
The samples in work order 600-52864 and 600-52867 were received at 9.0 C. The samples were analyzed for total arsenic, cadmium, and lead, which requires preservation at 4±2 C per Table 3 in the QAPP. However, no preservation is required for metals in solid samples per the analytical method and thus analyte degradation is not suspected and the sample results were not qualified.			

Comment no. 2
For sample 600-52584-2, SPLP-lead is requested on the chain-of-custody but results are not reported. This test was canceled based on the total lead result.
SPLP-cadmium was added for samples 600-52864-1,3,4 and SPLP-lead was added for samples 600-52864-1,3,4,5 based on the total metals results.
For samples in work order 600-52867, arsenic is not requested on the chain-of-custody but is reported per the client's request
For sample 600-52867-10, the sampler entered a field ID of 2012-BG-10 on the custody record. The laboratory assigned the correct ID of 2012-BG-8 upon receipt per the sample labels and sampler's instructions.
Comment no. 3
All samples for this event are additional samples not delineated in the work plan - 10 background samples for As/Cd/Pb, 1 sample at BSA-1, 1 sample at BSA-3, and 5 samples at BSA-4 for total/SPLP metals determination determination.
Comment no. 4
No equipment blanks collected with the additional samples for this event

Lab Job No.	Method	Batch/Sample	Narrative Comment	Validator Action
600-52584-1	6010B	-1 MS/D	%R out for Cd but background result > 4x spk added, LCS passes	none - check waived
		-1	SDL for Cd elev due to analyte > linear range	NA, result is detect
		-1 PDS	%R not calculated due to background result > 4x spk added, SD confirms MI NA (actually passes)	NA
		SPLP	extant sample for PDS/SD	NA
600-52864-1	6010B	76425	Cd >MDL but < MQL in leachate blank, appropriate flags applied	flagged per NFG
		-2 MS/D	%R out for Pb but background result > 4x spk added, LCS passes	none - check waived
		-2 MSD	RPD for Pb above limit due to nonhomogen nature	flagged per NFG
		-2 MD	RPD for Cd, Pb above limit due to nonhomogen nature	flagged per NFG
		-2 PDS	%R for Cd low due to MI	none - MS/MSD passes
		-2 SD	%D for Cd,Pb above limit due to MI	flagged per NFG
600-52867-1	6010B	all	sx received at 9.0 C	none - cooling not req'd per method
		all	sx received at 9.0 C	none - cooling not req'd per method
		-10 MS/D	%R for Pb above limit due to MI, LCS passes	flagged per NFG
		-1 MD	RPD for Cd, Pb above limit due to nonhomogen nature	flagged per NFG
		-1 SD	%D for Pb above limit due to MI	flagged per NFG

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

# TestAmerica Houston TRRP Data Package Cover Page

Job Number: 600-72907-1  
 Project Name/Number: Exide Recycling Center, Frisco TX Project

This Data Package consists of:

This signature page, the laboratory review checklist, and the following Reportable Data:

- R1 Field Chain-of-Custody Form
- R2 Sample Identification Cross-reference;
- R3 Test Reports (Analytical Data Sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC Chapter 5
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate Recovery Data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- R5 Test Reports/Summary Forms for Blank Samples;
- R6 Test Reports/Summary Forms for Laboratory Control Samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - d) The laboratory's LCS QC limits
- R7 Test Reports for Matrix Spike/Matrix Spike Duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked sample,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicates (if applicable) recovery and precision, including:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limit (MQL) and detectability check sample results for each analyte for each method and matrix;
- R10 Other problems or anomalies

The exception report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under Texas laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm, to the best of my knowledge, that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

<b>Appendix A (cont'd): Laboratory Review Checklist: Reportable Data</b>						
Laboratory Name: TestAmerica-Houston		LRC Date: 05/14/13				
Project Name: Exide Recycling Center, Frisco TX		Laboratory Job Number: 600-72907				
Reviewer Name: TWR		Prep Batch Number(s): 600-105843(W), 105922, 105993(S)- ICP				
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>	NR <sup>4</sup>
R1	OI	<b>Chain-of-custody (C-O-C)</b>				ER# <sup>5</sup>
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X			
		Were all departures from standard conditions described in an exception report?		X		
R2	OI	<b>Sample and quality control (QC) identification</b>				
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X			
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X			
R3	OI	<b>Test reports</b>				
		Were all samples prepared and analyzed within holding times?	X			
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X			
		Were calculations checked by a peer or supervisor?	X			
		Were all analyte identifications checked by a peer or supervisor?	X			
		Were sample detection limits reported for all analytes not detected?	X			
		Were all results for soil and sediment samples reported on a dry weight basis?	X			
		Were % moisture (or solids) reported for all soil and sediment samples?	X			
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?		X		
		If required for the project, TICs reported?		X		
R4	O	<b>Surrogate recovery data</b>				
		Were surrogates added prior to extraction?		X		
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X		
R5	OI	<b>Test reports/summary forms for blank samples</b>				
		Were appropriate type(s) of blanks analyzed?	X			
		Were blanks analyzed at the appropriate frequency?	X			
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X			
		Were blank concentrations < MQL?	X			
R6	OI	<b>Laboratory control samples (LCS):</b>				
		Were all COCs included in the LCS?	X			
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X			
		Were LCSs analyzed at the required frequency?	X			
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X			
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X			
		Was the LCSD RPD within QC limits?		X		
R7	OI	<b>Matrix spike (MS) and matrix spike duplicate (MSD) data</b>				
		Were the project/method specified analytes included in the MS and MSD?	X			
		Were MS/MSD analyzed at the appropriate frequency?	X			
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X			
		Were MS/MSD RPDs within laboratory QC limits?	X			
R8	OI	<b>Analytical duplicate data</b>				
		Were appropriate analytical duplicates analyzed for each matrix?	X			
		Were analytical duplicates analyzed at the appropriate frequency?	X			
		Were RPDs or relative standard deviations within the laboratory QC limits?	X			
R9	OI	<b>Method quantitation limits (MQLs):</b>				
		Are the MQLs for each method analyte included in the laboratory data package?	X			
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X			
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X			
R10	OI	<b>Other problems/anomalies</b>				
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X			
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X			1
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X			

- Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
- O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
- NA = Not applicable;
- NR = Not reviewed;
- ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

<b>Appendix A (cont'd): Laboratory Review Checklist: Reportable Data</b>						
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>	NR <sup>4</sup>
S1	OI	<b>Initial calibration (ICAL)</b>				
		Were response factors and/or relative response factors for each analyte within QC limits?			X	
		Were percent RSDs or correlation coefficient criteria met?			X	
		Was the number of standards recommended in the method used for all analytes?	X			
		Were all points generated between the lowest and highest standard used to calculate the curve?			X	
		Are ICAL data available for all instruments used?	X			
		Has the initial calibration curve been verified using an appropriate second source standard?	X			
S2	OI	<b>Initial and continuing calibration verification (ICCV and CCV) and continuing calibration</b>				
		Was the CCV analyzed at the method-required frequency?	X			
		Were percent differences for each analyte within the method-required QC limits?	X			
		Was the ICAL curve verified for each analyte?	X			
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X			
S3	O	<b>Mass spectral tuning:</b>				
		Was the appropriate compound for the method used for tuning?			X	
		Were ion abundance data within the method-required QC limits?			X	
S4	O	<b>Internal standards (IS):</b>				
		Were IS area counts and retention times within the method-required QC limits?			X	
S5	OI	<b>Raw data (NELAC section 5.5.10)</b>				
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X			
		Were data associated with manual integrations flagged on the raw data?			X	
S6	O	<b>Dual column confirmation</b>				
		Did dual column confirmation results meet the method-required QC?			X	
S7	O	<b>Tentatively identified compounds (TICs):</b>				
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X	
S8	I	<b>Interference Check Sample (ICS) results:</b>				
		Were percent recoveries within method QC limits?	X			
S9	I	<b>Serial dilutions, post digestion spikes, and method of standard additions</b>				
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?	X			
S10	OI	<b>Method detection limit (MDL) studies</b>				
		Was a MDL study performed for each reported analyte?	X			
		Is the MDL either adjusted or supported by the analysis of DCSs?	X			
S11	OI	<b>Proficiency test reports:</b>				
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X			
S12	OI	<b>Standards documentation</b>				
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X			
S13	OI	<b>Compound/analyte identification procedures</b>				
		Are the procedures for compound/analyte identification documented?	X			
S14	OI	<b>Demonstration of analyst competency (DOC)</b>				
		Was DOC conducted consistent with NELAC Chapter 5?	X			
		Is documentation of the analyst's competency up-to-date and on file?	X			
S15	OI	<b>Verification/validation documentation for methods (NELAC Chapter 5)</b>				
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X			
S16	OI	<b>Laboratory standard operating procedures (SOPs):</b>				
		Are laboratory SOPs current and on file for each method performed?	X			

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s).

Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

**Qualifiers****Metals**

Qualifier	Qualifier Description
U	Analyte was not detected at or above the SDL.

**Glossary****Abbreviation** **These commonly used abbreviations may or may not be present in this report.**

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	7.8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True	

# **Data Usability Summary**

## **Exide Recycling Center**

### **May 9, 2013 Soil Sampling Event**

#### **TestAmerica Laboratories DATA PACKAGE 600-72907-1**

Pastor, Behling & Wheeler, LLC reviewed one data package from TestAmerica Laboratories in Houston, Texas for the analysis of the soil samples collected May 9, 2013 from the EPA-approved background study area in Frisco, Texas. Data were reviewed for conformance to the requirements of the guidance document, *Review and Reporting of COC Concentration Data* (RG-366/TRRP-13) and adherence to project objectives. At the time the laboratory data were generated for the project, TestAmerica Laboratories was NELAC-accredited under the Texas Laboratory Accreditation Program for the matrices, analytes and methods of analysis requested on the chain-of-custody documentation.

**Intended Use of Data:** To provide current data on concentrations of lead in soil.

Analyses requested included:

- Method SW6010B – Metals (ICP)

Data were reviewed and validated as described in *Review and Reporting of COC Concentration Data*, (RG-366/TRRP-13) and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- the field notes with respect to field instrument calibrations, filtering procedures, sampling procedures preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the Laboratory Review Checklists (LRCs), Exception Reports, and case narrative, all of which were included in this review.

#### **Introduction**

Three (3) soil samples were collected and analyzed for lead. Table 1 lists the sample identifications cross-referenced to the laboratory identifications.

#### **Project Objectives**

Project QA/QC objectives were established as the TRRP-13 recommended control limits:

- For organic analytes: percent recoveries between 60% and 140%, relative percent differences (RPD) within 40%, and
- For inorganic analytes: percent recoveries between 70% and 130%, RPD within 30%.

#### **DATA REVIEW / VALIDATION RESULTS**

##### **Analytical Results**

Soil analytical results for lead are reported corrected for moisture content. None of the sample data were qualified.

### **Preservation and Holding Times**

Samples were evaluated for agreement with the chain-of-custody (COC). Samples were received in appropriate containers in good condition. Paperwork was filled out properly. Sample receipt temperatures were within the acceptance criteria. Samples were preserved in the field as specified in SW-846 Table 2-40(B). Samples were prepared and analyzed within holding times as specified in SW-846 Table 2-40(B).

### **Calibrations**

The LRC indicates the initial calibration and continuing calibration data met SW-846 method requirements for metals.

### **Blanks**

Lead was reported as non-detect (ND) in the equipment blank submitted with the soil samples to the laboratory. The laboratory method blank was within project control limits.

### **Laboratory Control Samples**

Laboratory control sample (LCS) recoveries were within the project control limits for lead.

### **Matrix Spike/Matrix Spike Duplicates**

MS/MSD precision and accuracy results were within the project-defined QC acceptance criteria for lead.

### **Laboratory Certification**

At the time the laboratory data were generated for this project, the laboratory was NELAC accredited under the Texas Laboratory Accreditation Program (TLAP) for the matrices, methods and parameters of analysis requested on the chain-of-custody.

### **Field Precision**

Field duplicate samples were not collected.

### **Field Procedures**

Samples were collected using documented SOPs.

### **SUMMARY**

The analytical data are usable for the purpose of determining current lead concentrations in the soil at the affected property.

## NORMAL TOLERANCE LIMITS 85

allowable, the costly verification stage would not be required. This two-stage procedure is quite similar to the prediction limit approach described by Davis and McNichols (1987).

#### 4.2 NORMAL TOLERANCE LIMITS

Assume that we have available estimates  $\bar{x}$  and  $s$  of the mean and standard deviation based on  $n$  background observations with degrees of freedom  $f = n - 1$  from a normal distribution. We require the factor  $K$  from the two-sided interval

$$\bar{x} \pm Ks \quad (4.1)$$

which leads to the statement, "At least a proportion  $P$  of the normal population is between  $\bar{x} - Ks$  and  $\bar{x} + Ks$  with confidence  $1 - \alpha$ ." Wald and Wolfowitz (1946) showed that  $K$  can be approximated by

$$K \sim ru \quad (4.2)$$

where  $r$  is a function of  $n$  and  $P$  and is determined from the normal distribution

$$\frac{1}{\sqrt{2\pi}} \int_{(1/\sqrt{n})-r}^{(1/\sqrt{n})+r} \exp\left(-\frac{x^2}{2}\right) dx = P \quad (4.3)$$

and  $u$  is a function of  $f$  and  $\alpha$  and is defined as the  $(1 - \alpha)100\%$  of the chi-square distribution as

$$u = \sqrt{\frac{f}{\chi_{\alpha,f}^2}} \quad (4.4)$$

By selecting a coverage probability  $P$ , (4.3) may be solved for  $r$  (since  $n$  is known), and by selecting a confidence level  $P$ , (4.4) may be solved for  $u$  (since  $f = n - 1$  is known). Two-sided values of  $K$  are provided in Table 4.1 for  $n = 4$  to  $\infty$ , 95% confidence and 95% and 99% coverage.

For one-sided tolerance limits  $\bar{x} + Ks$ , we require the factor  $K$  which leads to the statement, "At least a proportion  $P$  of the normal population is less than  $\bar{x} + Ks$  with confidence  $1 - \alpha$ ." Owen (1962) determines  $K$  by

$$\Pr\{(\text{noncentral } t \text{ with } \delta = z\sqrt{n}) \leq K\sqrt{n}\} = 1 - \alpha \quad (4.5)$$

where  $\delta$  is the noncentrality parameter of the noncentral  $t$ -distribution with

## 86 TOLERANCE INTERVALS

(4.6) limit for the next  $k = 100$  measurements based on a previous sample of  $n = 20$ , and a corresponding 95% confidence 95% coverage normal tolerance limit and 95% confidence 99% coverage normal tolerance limit. Inspection of Figure 4.1 reveals that the probability of failing at least one of the 100 comparisons by chance alone is much greater for the tolerance limits which have expected failure rates of 1% and 5%, respectively, versus the prediction limit that is designed to include 100% of the next 100 measurements with 95% confidence. Use of these two alternative limits for groundwater detection monitoring is anything but a "matter of personal preference."

For 1% significance level, 67.6 is an outlier.

#### 2. Data Value 11.5 is a Potential Outlier (Lower Tail)?

Test Statistic: 0.106

For 10% significance level, 11.5 is not an outlier.

For 5% significance level, 11.5 is not an outlier.

For 1% significance level, 11.5 is not an outlier.

## **Appendix 9**

### **Development of Non-Default RBELs and PCLs**

## Appendix 9

### Development of Non-Default RBELs and PCLs

#### Tier 2 Soil PCL Development

In accordance with TRRP Rule §350.75(c)(1), Tier 2  ${}^{GW}Soil_{Class3}$  PCLs were developed for arsenic, cadmium, lead, and selenium using site-specific data and equation provided in TRRP Figure 30 TAC §350.75(b)(1). The TRRP Tier 2  ${}^{GW}Soil_{Class3}$  PCL calculations for these COCs are presented in Table A9.1. Site-specific pH soil sample results were used to determine soil-water partition coefficient (Kd) values for calculating Tier 2 PCLs in accordance with 30 TAC §350.73(f)(1). Sixty-five soil samples were evaluated for pH; the results are presented in Table 4E. The average pH value for soils was 7.5, with corresponding Kd values of 30 L/kg for arsenic, 590 L/kg for cadmium, 1830 L/kg for lead, and 3.1 L/kg for selenium (based on TRRP Figure 30 TAC §350.73(e)(1)(A) for lead in clayey soils and Figure 30 TAC §350.73(f)(1)(C) for other metals).

#### TPH Mixture Soil RAL Development

A Tier 1 TPH Mixture RAL was developed in accordance with RG-366/TRRP-27, *Development of Human Health PCLs for Total Petroleum Hydrocarbon Mixtures* (TCEQ, 2010c), to evaluate TPH in surface soil at the Site. The TPH Mixture RAL was calculated for the only soil sample analyzed for TPH that exceeded default Tier 1 TPH RALs, 2012-FWFS-9 (4-5), using TPH TX1006 fractionation data for the sample. The TPH Mixture RAL result is summarized in the table below:

Sample ID	Date Collected	${}^{Tot}Soil_{Comb}$ Res 30-Acre RAL <sub>TPH Mixture</sub> (mg/kg)	Comments
2012-FWFS-9 (4-5')	4/29/2013	12,500	Protective of GW ( ${}^{GW}Soil_{Ing}$ HQ < 1; HI < 10)

The TPH concentration in soil sample 2012-FWFS-9 (4-5') did not exceed the calculated TPH Mixture RAL. No TPH soil sample concentrations exceeded the TPH Mixture RAL; therefore, a critical TPH Mixture PCL was not developed.

Based on the TCEQ guidance document RG-366/TRRP-27, if the Hazard Index (HI), which is the sum of the Hazard Quotients (HQ) for the  ${}^{GW}Soil_{Ing}$  pathway, is less than 10 and HQ values are all less than 1, then TPH is protective of the underlying groundwater. For soil sample 2012-FWFS-9 (4-5'), HIs were less than 10 and HQs were less than 1; therefore, TPH is considered protective of groundwater at the Site, and only the  ${}^{Tot}Soil_{Comb}$  (surface soil) PCL is applicable for determining the RAL for TPH. Summary tables of the calculations used for developing TPH Mixture PCLs are provided in this appendix as Tables A9.2 and A9.3. Although the TPH concentration in 2012-FWFS-9 (4-5') exceeds the theoretical soil saturation limit, as noted in Table A9.2, NAPL was not observed in this sample.

#### Recreational Surface Water PCL

While surface water at the Site is currently not available for general public contact because of fencing and site security, it may be in the future. In addition, surface water leaves the Site and may impact downstream recreational receptors. As such, and in accordance with TRRP-24, *Determining PCLs for Surface Water and Sediment* (TCEQ, 2007), contact recreation surface water PCLs were used to evaluate

the surface water data for human health receptors. TCEQ has developed Tier 1 Contact Recreation Surface Water PCLs (last update March 31, 2006) for receptors that occasionally contact surface water while wading, fishing, and other recreational pursuits.

There currently is not a contact recreation surface water PCL for lead because there is not a standard toxicity value for lead, which serves as the basis for the PCL calculation. However, a value of 1.5 mg/L was developed for this Site. This value was estimated using the drinking water standard for lead of 0.015 mg/L and scaling it to the assumptions used to calculate the contact recreation PCL of 50 mL water ingestion per day for 39 days per year and the relative drinking water assumptions of 2 L water ingestion per day for 350 days per year (TCEQ, 2007). The exposure difference for the contact recreation scenario is roughly 0.27 percent of the drinking water exposure and, therefore, the drinking water standard was divided by 1 percent to derive a contact recreation PCL that is fully protective of the receptor with occasional contact.

### **Recreational Sediment PCL**

Like surface water, sediment may be contacted by trespassers to the site, if the use of the creeks change in the future, or if sediment is transported downstream. The TCEQ developed Tier 1 Sediment PCLs (last update March 31, 2006) for receptors occasionally contacting sediment while wading, fishing, and other recreational pursuits. These values were used in the assessment of sediment data as discussed in Section 7.0 of the APAR.

July 9, 2013

## Introduction

As discussed in Section 5.2 of the APAR, selenium has been detected in monitoring well LMW-9 at concentrations that exceed the <sup>SW</sup>GW PCL. The <sup>SW</sup>GW PCL is established for groundwater concentrations at the point of groundwater discharge, or point-of-exposure (POE) to surface water (<sup>SW</sup>GW POE). Monitoring well LMW-9 is located about 660 feet upgradient from the North Tributary, the nearest POE to surface water (Figure A11.1). Per TRRP-24 (TCEQ, 2007), the <sup>SW</sup>GW PCL does not apply to groundwater data at this location since it is not at the <sup>SW</sup>GW POE. Nevertheless in order to evaluate the potential significance of selenium concentrations in groundwater at LMW-9, a selenium groundwater attention demonstration was performed using a computer model developed to simulate the migration of selenium from LMW-9 toward the North Tributary. The <sup>SW</sup>GW PCL at the <sup>SW</sup>GW POE is 0.02 mg/L. A model cross section was established parallel to the groundwater flow direction between LMW-9 and the POE, as shown on Figure A11.1. For modeling purposes, LMW-9 is designated as the “source area” for the selenium detected in groundwater.

## Computer Simulations of COC Fate and Transport

The computer program Visual MODFLOW (including the fate-and-transport module MT3DMS) was used to model selenium migration from LMW-9 toward the POE. The MODFLOW computer program is one of the most widely accepted codes for the three-dimensional simulation of fluid and solute transport. The program was also selected over more simplistic analytical models, such as Domenico’s Model or BIOSCREEN, because it allows more flexibility in simulating the Site hydrogeology and fate-and-transport processes.

Groundwater models are mathematical simplifications of complex hydrogeologic systems. Such models are useful in identifying the most important components of flow systems and simulating the transport process. For this task, computer simulations were conducted to predict the extent of selenium migration from LMW-9 for an arbitrary period of 500 years into the future. A two-dimensional model in cross-sectional view was developed to simulate selenium migration downgradient from LMW-9. The following sections briefly describe the procedures, rationale, and results related to the transport model simulations. In general, the following steps were conducted:

- The appropriate model was chosen, given the characteristics of the Site and the modeling objectives;
- The appropriate input parameter values were selected and input into the model;

July 9, 2013

- The simulation time was conservatively assumed to be 500 years;
- A sensitivity analysis was performed.

### Boundary Conditions and Grid Dimensions

A simple flow model was developed for the simulations. The cross-sectional model consists of 1 row, 33 columns, and 1 layer. The model was developed at a sufficiently small nodal spacing to minimize the potential effects of numerical errors resulting from “numerical dispersion”. The columns are evenly spaced at a constant width of 20 feet per column. The row is arbitrarily set at a constant width of 10 feet. The layer thickness is also constant at 10 feet. The first column of the cross section (Figure A11.2) is modeled as a constant head boundary representing the selenium concentrations detected in groundwater at (LMW-9). The last column in the grid represents the interpolated water elevation at a distance about 660 feet downgradient of LMW-9.

### Input Parameters

Key model inputs parameters are summarized in Table A11.1. The following provides the justification for choosing these input parameters:

1. Hydraulic conductivity (K) values were assigned to the model domain based on aquifer testing results and the subsurface geology between LMW-9 and the POE. Aquifer testing results for the three geologic units encountered at the Site are discussed in more detail in Appendix 7 (Groundwater Classification Evaluation).
2. The maximum observed selenium concentration is 0.994 mg/L. As a measure of conservatism in the model, LMW-9 was assigned a constant source concentration of 1.5 mg/L throughout the simulation period.
3. The current hydraulic gradient observed between LMW-9 and the POE is reasonable and similar to future Site conditions (about 0.02 ft/ft), based on an assumed 15 foot decline in the potentiometric surface over the 660 feet distance between LMW-9 and the POE.
4. The default TCEQ attenuation coefficient (Kd) for selenium (3.1 L/kg) was assigned throughout the model domain based on a soil pH of 7.5 standard units (see Appendix 9).

*July 9, 2013*

## **Modeling Procedures and Results**

Steady state groundwater flow conditions were first established using the boundary conditions shown on Figure A11.2 to mimic the 15-foot drop in the potentiometric surface over the model domain. The model was then run in “predictive” transient mode for a period of 500 years to simulate the migration of selenium in the future (2013 to 2513).

The predictive modeling indicates that selenium concentrations in groundwater at the <sup>SW</sup>GW POE will not exceed the critical surface water PCL of 0.02 mg/L during the simulation period of 500 years. At the end of the 500-year simulation period (2513), the <sup>SW</sup>GW PCL concentration contour is exceeded approximately 180 feet downgradient of the LMW-9 (or 480 feet upgradient from the <sup>SW</sup>GW POE). Selenium concentrations in Table A11.2 are shown as the distance from the LMW-9 along the centerline of the model toward the POE.

## **Sensitivity Analyses**

A sensitivity analysis was conducted to evaluate the sensitivity of the model results when changing key input parameters one at a time. The key parameters (hydraulic conductivities, Kd value, and source concentration) were increased and decreased by a factor of 2. The results of the sensitivity analyses are shown in Table A11.3. In none of the sensitivity runs was the <sup>SW</sup>GW PCL exceeded at the <sup>SW</sup>GW POE. The model appears equally sensitive to the tested parameters.

## **Conclusions**

The attenuation modeling results indicate that it is unrealistic to assume that the selenium detected in a groundwater sample from LMW-9 is capable of migrating to the <sup>SW</sup>GW POE at concentrations that would exceed the <sup>SW</sup>GW PCL of 0.02 mg/L. After 500 years of transport, using conservative assumptions, the selenium concentration of 0.02 mg/L had migrated just over 25 percent of the distance to the <sup>SW</sup>GW POE.

**TABLE A11.1**

**KEY INPUT PARAMETERS USED IN SELENIUM TRANSPORT MODEL  
EXIDE RECYCLING CENTER  
FRISCO, TEXAS**

<b>Property</b>	<b>Units</b>	<b>Value</b>	<b>Description</b>

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Project Name/Number: Exide Recycling Center, Frisco TX

This Data Package consists of:

This signature page, the laboratory review checklist, and the following Reportable Data:

- R1 Field Chain-of-Custody Form
- R2 Sample Identification Cross-reference;
- R3 Test Reports (Analytical Data Sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC Chapter 5
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate Recovery Data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- R5 Test Reports/Summary Forms for Blank Samples;
- R6 Test Reports/Summary Forms for Laboratory Control Samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - d) The laboratory's LCS QC limits
- R7 Test Reports for Matrix Spike/Matrix Spike Duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked sample,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicates (if applicable) recovery and precision, including:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limit (MQL) and detectability check sample results for each analyte for each method and matrix;
- R10 Other problems or anomalies

The exception report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under Texas laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm, to the best of my knowledge, that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

<b>Appendix A (cont'd): Laboratory Review Checklist: Reportable Data</b>						
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>	NR <sup>4</sup>
R1	OI	<b>Chain-of-custody (C-O-C)</b>				
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X			
		Were all departures from standard conditions described in an exception report?		X		
R2	OI	<b>Sample and quality control (QC) identification</b>				
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X			
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X			
R3	OI	<b>Test reports</b>				
		Were all samples prepared and analyzed within holding times?		X		1
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X			
		Were calculations checked by a peer or supervisor?	X			
		Were all analyte identifications checked by a peer or supervisor?	X			
		Were sample detection limits reported for all analytes not detected?	X			
		Were all results for soil and sediment samples reported on a dry weight basis?		X		
		Were % moisture (or solids) reported for all soil and sediment samples?	X			
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?		X		
		If required for the project, TICs reported?		X		
R4	O	<b>Surrogate recovery data</b>				
		Were surrogates added prior to extraction?		X		
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X		
R5	OI	<b>Test reports/summary forms for blank samples</b>				
		Were appropriate type(s) of blanks analyzed?		X		
		Were blanks analyzed at the appropriate frequency?		X		
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?		X		
		Were blank concentrations < MQL?		X		
R6	OI	<b>Laboratory control samples (LCS):</b>				
		Were all COCs included in the LCS?	X			
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X			
		Were LCSs analyzed at the required frequency?	X			
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X			
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?			X	
		Was the LCSD RPD within QC limits?			X	
R7	OI	<b>Matrix spike (MS) and matrix spike duplicate (MSD) data</b>				
		Were the project/method specified analytes included in the MS and MSD?		X		
		Were MS/MSD analyzed at the appropriate frequency?		X		
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?		X		
		Were MS/MSD RPDs within laboratory QC limits?		X		
R8	OI	<b>Analytical duplicate data</b>				
		Were appropriate analytical duplicates analyzed for each matrix?	X			
		Were analytical duplicates analyzed at the appropriate frequency?	X			
		Were RPDs or relative standard deviations within the laboratory QC limits?			X	2
R9	OI	<b>Method quantitation limits (MQLs):</b>				
		Are the MQLs for each method analyte included in the laboratory data package?		X		
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?		X		
		Are unadjusted MQLs and DCSs included in the laboratory data package?		X		
R10	OI	<b>Other problems/anomalies</b>				
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X			
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X			
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X			

1. Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

## Appendix A (cont'd): Laboratory Review Checklist: Reportable Data

Laboratory Name: TestAmerica-Houston	LRC Date: 04/30/12						
Project Name: Exide Recycling Center, Frisco TX	Laboratory Job Number: 600-53710						
Reviewer Name: BDG	Prep Batch Number(s): 77687 - pH						
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>	NR <sup>4</sup>	ER# <sup>5</sup>
<b>S1 OI</b>	<b>Initial calibration (ICAL)</b>						
		Were response factors and/or relative response factors for each analyte within QC limits?			X		
		Were percent RSDs or correlation coefficient criteria met?			X		
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?			X		
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
<b>S2 OI</b>	<b>Initial and continuing calibration verification (ICCV and CCV) and continuing calibration</b>						
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
<b>S3 O</b>	<b>Mass spectral tuning:</b>						
		Was the appropriate compound for the method used for tuning?			X		
		Were ion abundance data within the method-required QC limits?			X		
<b>S4 O</b>	<b>Internal standards (IS):</b>						
		Were IS area counts and retention times within the method-required QC limits?			X		
<b>S5 OI</b>	<b>Raw data (NELAC section 5.5.10)</b>						
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?			X		
<b>S6 O</b>	<b>Dual column confirmation</b>						
		Did dual column confirmation results meet the method-required QC?			X		
<b>S7 O</b>	<b>Tentatively identified compounds (TICs):</b>						
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
<b>S8 I</b>	<b>Interference Check Sample (ICS) results:</b>						
		Were percent recoveries within method QC limits?			X		
<b>S9 I</b>	<b>Serial dilutions, post digestion spikes, and method of standard additions</b>						
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
<b>S10 OI</b>	<b>Method detection limit (MDL) studies</b>						
		Was a MDL study performed for each reported analyte?			X		
		Is the MDL either adjusted or supported by the analysis of DCSs?			X		
<b>S11 OI</b>	<b>Proficiency test reports:</b>						
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
<b>S12 OI</b>	<b>Standards documentation</b>						
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
<b>S13 OI</b>	<b>Compound/analyte identification procedures</b>						
		Are the procedures for compound/analyte identification documented?	X				
<b>S14 OI</b>	<b>Demonstration of analyst competency (DOC)</b>						
		Was DOC conducted consistent with NELAC Chapter 5?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
<b>S15 OI</b>	<b>Verification/validation documentation for methods (NELAC Chapter 5)</b>						
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
<b>S16 OI</b>	<b>Laboratory standard operating procedures (SOPs):</b>						
		Are laboratory SOPs current and on file for each method performed?	X				

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s).  
Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

<b>Appendix A (cont'd): Laboratory Review Checklist: Exception Reports</b>	
Laboratory Name:	TestAmerica-Houston
Project Name:	Exide Recycling Center, Frisco TX
Reviewer Name:	BDG
ER # <sup>1</sup>	DESCRIPTION
1	The EPA has clarified that the Analyzed Immediately holding time is fifteen minutes from sample collection time. As a result, the holding times for pH had already expired by the time the samples arrived at our laboratory.
2	The laboratory selected another client's sample to perform as the DUP.

ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked on the LRC)

<b>Appendix A (cont'd): Laboratory Review Checklist: Reportable Data</b>						
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>	NR <sup>4</sup>
R1	OI	<b>Chain-of-custody (C-O-C)</b>				
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X			
		Were all departures from standard conditions described in an exception report?		X		
R2	OI	<b>Sample and quality control (QC) identification</b>				
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X			
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X			
R3	OI	<b>Test reports</b>				
		Were all samples prepared and analyzed within holding times?	X			
		Other than those results < MQL, were all other raw values bracketed by calibration standards?		X		
		Were calculations checked by a peer or supervisor?	X			
		Were all analyte identifications checked by a peer or supervisor?	X			
		Were sample detection limits reported for all analytes not detected?		X		
		Were all results for soil and sediment samples reported on a dry weight basis?		X		
		Were % moisture (or solids) reported for all soil and sediment samples?		X		
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?		X		
		If required for the project, TICs reported?		X		
R4	O	<b>Surrogate recovery data</b>				
		Were surrogates added prior to extraction?		X		
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X		
R5	OI	<b>Test reports/summary forms for blank samples</b>				
		Were appropriate type(s) of blanks analyzed?	X			
		Were blanks analyzed at the appropriate frequency?	X			
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X			
		Were blank concentrations < MQL?		X		
R6	OI	<b>Laboratory control samples (LCS):</b>				
		Were all COCs included in the LCS?	X			
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X			
		Were LCSs analyzed at the required frequency?	X			
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X			
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?		X		
		Was the LCSD RPD within QC limits?		X		
R7	OI	<b>Matrix spike (MS) and matrix spike duplicate (MSD) data</b>				
		Were the project/method specified analytes included in the MS and MSD?		X		
		Were MS/MSD analyzed at the appropriate frequency?		X		
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?		X		
		Were MS/MSD RPDs within laboratory QC limits?		X		
R8	OI	<b>Analytical duplicate data</b>				
		Were appropriate analytical duplicates analyzed for each matrix?	X			
		Were analytical duplicates analyzed at the appropriate frequency?	X			
		Were RPDs or relative standard deviations within the laboratory QC limits?			X	1
R9	OI	<b>Method quantitation limits (MQLs):</b>				
		Are the MQLs for each method analyte included in the laboratory data package?		X		
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?		X		
		Are unadjusted MQLs and DCSs included in the laboratory data package?		X		
R10	OI	<b>Other problems/anomalies</b>				
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X			
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X			
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X

<b>Appendix A (cont'd): Laboratory Review Checklist: Exception Reports</b>	
ER # <sup>1</sup>	DESCRIPTION
1	Barium was detected above the MDL, but below the MQL in the leachate blank for batch 77501. The level of detection is below the recommended reporting limit and the appropriate flags have been applied.
2	The lead recoveries in samples 53710-1 MS and MSD were outside acceptance limits, but were not flagged due to the background sample result being greater than four times the spike added concentration. Method performance is demonstrated by acceptable LCS recoveries.
3	The lead RPD between samples 53710-1 MS and MSD was above acceptance limits due to the non-homogenous nature of the samples.
4	The lead RPD between samples 53710-1 and 53710-1 MD was above acceptance limits due to the non-homogenous nature of the samples.
5	The lead percent difference between samples 53710-1 and 53710-1 SD was above acceptance limits due to matrix interference.

ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked on the LRC)

<b>Appendix A (cont'd): Laboratory Review Checklist: Reportable Data</b>						
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>	NR <sup>4</sup>
R1	OI	<b>Chain-of-custody (C-O-C)</b>				
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X			
		Were all departures from standard conditions described in an exception report?		X		
R2	OI	<b>Sample and quality control (QC) identification</b>				
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X			
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X			
R3	OI	<b>Test reports</b>				
		Were all samples prepared and analyzed within holding times?	X			
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X			
		Were calculations checked by a peer or supervisor?	X			
		Were all analyte identifications checked by a peer or supervisor?	X			
		Were sample detection limits reported for all analytes not detected?	X			
		Were all results for soil and sediment samples reported on a dry weight basis?		X		
		Were % moisture (or solids) reported for all soil and sediment samples?		X		
		Were bulk soil/solid samples for volatile analysis extracted with methanol per SW846 Method 5035?		X		
		If required for the project, TICs reported?		X		
R4	O	<b>Surrogate recovery data</b>				
		Were surrogates added prior to extraction?		X		
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X		
R5	OI	<b>Test reports/summary forms for blank samples</b>				
		Were appropriate type(s) of blanks analyzed?	X			
		Were blanks analyzed at the appropriate frequency?	X			
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X			
		Were blank concentrations < MQL?	X			
R6	OI	<b>Laboratory control samples (LCS):</b>				
		Were all COCs included in the LCS?	X			
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X			
		Were LCSs analyzed at the required frequency?	X			
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X			
		Does the detectability check sample data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X			
		Was the LCSD RPD within QC limits?		X		
R7	OI	<b>Matrix spike (MS) and matrix spike duplicate (MSD) data</b>				
		Were the project/method specified analytes included in the MS and MSD?	X			
		Were MS/MSD analyzed at the appropriate frequency?	X			
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X			
		Were MS/MSD RPDs within laboratory QC limits?	X			
R8	OI	<b>Analytical duplicate data</b>				
		Were appropriate analytical duplicates analyzed for each matrix?	X			
		Were analytical duplicates analyzed at the appropriate frequency?	X			
		Were RPDs or relative standard deviations within the laboratory QC limits?	X			
R9	OI	<b>Method quantitation limits (MQLs):</b>				
		Are the MQLs for each method analyte included in the laboratory data package?	X			
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X			
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X			
R10	OI	<b>Other problems/anomalies</b>				
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X			
		Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results?	X			
		Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package?	X			

1. Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
3. NA = Not applicable;
4. NR = Not reviewed;
5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

## Appendix A (cont'd): Laboratory Review Checklist: Reportable Data

Laboratory Name: TestAmerica-Houston	LRC Date: 05/02/12				
Project Name: Exide Recycling Center, Frisco TX	Laboratory Job Number: 600-53710				
Reviewer Name: TWR	Prep Batch Number(s): 600-77591 - Mercury				
# <sup>1</sup>	A <sup>2</sup>	Description	Yes	No	NA <sup>3</sup>
S1	OI	<b>Initial calibration (ICAL)</b>			NR <sup>4</sup>
		Were response factors and/or relative response factors for each analyte within QC limits?		X	
		Were percent RSDs or correlation coefficient criteria met?	X		
		Was the number of standards recommended in the method used for all analytes?	X		
		Were all points generated between the lowest and highest standard used to calculate the curve?	X		
		Are ICAL data available for all instruments used?	X		
		Has the initial calibration curve been verified using an appropriate second source standard?	X		
S2	OI	<b>Initial and continuing calibration verification (ICCV and CCV) and continuing calibration</b>			
		Was the CCV analyzed at the method-required frequency?	X		
		Were percent differences for each analyte within the method-required QC limits?	X		
		Was the ICAL curve verified for each analyte?	X		
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X		
S3	O	<b>Mass spectral tuning:</b>			
		Was the appropriate compound for the method used for tuning?		X	
		Were ion abundance data within the method-required QC limits?		X	
S4	O	<b>Internal standards (IS):</b>			
		Were IS area counts and retention times within the method-required QC limits?		X	
S5	OI	<b>Raw data (NELAC section 5.5.10)</b>			
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X		
		Were data associated with manual integrations flagged on the raw data?		X	
S6	O	<b>Dual column confirmation</b>			
		Did dual column confirmation results meet the method-required QC?		X	
S7	O	<b>Tentatively identified compounds (TICs):</b>			
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?		X	
S8	I	<b>Interference Check Sample (ICS) results:</b>			
		Were percent recoveries within method QC limits?		X	
S9	I	<b>Serial dilutions, post digestion spikes, and method of standard additions</b>			
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?	X		
S10	OI	<b>Method detection limit (MDL) studies</b>			
		Was a MDL study performed for each reported analyte?	X		
		Is the MDL either adjusted or supported by the analysis of DCSs?	X		
S11	OI	<b>Proficiency test reports:</b>			
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X		
S12	OI	<b>Standards documentation</b>			
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X		
S13	OI	<b>Compound/analyte identification procedures</b>			
		Are the procedures for compound/analyte identification documented?	X		
S14	OI	<b>Demonstration of analyst competency (DOC)</b>			
		Was DOC conducted consistent with NELAC Chapter 5?	X		
		Is documentation of the analyst's competency up-to-date and on file?	X		
S15	OI	<b>Verification/validation documentation for methods (NELAC Chapter 5)</b>			
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X		
S16	OI	<b>Laboratory standard operating procedures (SOPs):</b>			
		Are laboratory SOPs current and on file for each method performed?	X		

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s).  
Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

## Definitions/Glossary

Client: Pastor, Behling & Wheeler LLC  
 Project/Site: Exide Recycling Center, Frisco TX Projec

TestAmerica Job ID: 600-53710-1

### Qualifiers

#### Metals

Qualifier	Qualifier Description
U	Analyte was not detected at or above the SDL.
b	The compound was found in the blank and sample
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.
F	Duplicate RPD exceeds the control limit
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
N	RPD of the MS and MSD exceeds the control limits

#### General Chemistry

Qualifier	Qualifier Description
U	Analyte was not detected at or above the SDL.

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
◊	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## METHOD INFORMATION \*\*

2

Sample Introduction Device: Normal  
 Calibration Mode: Concentration

3

## Default Setup:

4

Number of Repeats : 2	Auto-store Analysis Data? Yes
Flush Time (sec) : 45.0	Auto-store Stdzn Data? Yes
Auto-Increment Sample Names? No	Store Individual Repeats? No
	Auto-print Analysis Data? Yes
	Auto-print Stdzn Report : +Readback
	Condensed Print Format? Yes

5

## Default File Names:

6

Analysis Data File : A042412	Autosampler Table : TRAVIS
	Sample Limits Table : LCTAB
Calibration Data File : CALDATA	Blank Limits Table : BLCTAB
Calibration Stds Table : CALSTDs	QC Check Table : LCTAB
