Cell Lines

HCT116 cell was purchased from American Type Culture Collection (Manassas, VA, USA). Gastric cancer TMK1 cell was obtained from Dr. Eiichi Tahara (University of Hiroshima, Hiroshima, Japan). Cells were maintained in complete 1640 medium supplemented with 10% fetal bovine serum (Gibco), 100 IU/mL penicillin and 100 µg/mL streptomycin (Gibco, Invitrogen, CA).

Drug Treatment

The METTL3-METTL14 inhibitor SAH (S-adenosylhomocysteine) was purchased from Sigma (No. A9384). The FTO inhibitor MA (Meclofenamic acid) was purchased from Toronto Research Chemicals (M202750). Cells were treated with a concentration of 1 µM for both drugs at 37°C for 48 h.

Somatic Alteration Data

We applied two platforms to determine the alteration of m⁶A-related genes in each tumor sample. First, a copy number collection of functional relevant amplifications and deletions was done using the cBioportal analysis of the GISTIC 2.0 database,

GISTIC was applied separately on each individual cancer type. Second, somatic mutations were mainly obtained from the OncoKB database (<http://oncokb.org/>) and cBioPortal and calculated with R statistical software.

Supplementary Figures

Figure S1. (A-E), Co-expression analysis of GI cancer related genes with m6A “writer” (METTL3, METTL14, WTAP) and “eraser” (FTO, ALKBH5) by cBioportal. For Pearson and Spearman correlation analysis, score ≥ 0.3 indicates positive correlation between the genes and score ≤ -0.3 indicates negative correlation between the genes (Score >0.3 or <-0.3). Candidate genes were presented with Venny diagrams. (F) multiple condition alteration of TP53BP1 in stomach adenocarcinoma. Missense mutation, truncating mutation, mRNA up-regulation and protein down-regulation were shown in various color type columns. (G) TP53BP1 Copy number units from TCGA stomach statistic. Copy numbers have a similar status in blood (n=236) and stomach (n=94) Copy number in stomach adenocarcinoma (n=173) was obviously lower than which in normal blood and stomach. (H) Kaplan-Meier survival curves represents the overall survival of stomach adenocarcinoma with TP53BP1 expression above. (I) correlation of TP53BP1 expression with TP53BP1 DNA methylation status in stomach adenocarcinoma. The Pearson and Spearman correlation score represent negative expression relationship.

Figure S2. Genes deregulated in FOXO, MAPK and p53 pathways and co-occurrence of PI3K-Akt and mTOR signaling pathway. (A-C) Heatmap of gene alteration frequency in MAPK, FoxO and p53 pathway. Circumambient column displayed the fraction of samples influenced by each type of somatic alteration (mutation, copy-number amplification or deletion) in each pathway gene (Side) and each cancer type (Top). (D) Co-occurrence of genetic alteration in the PI3K-Akt and mTOR signaling pathway by tumor subtypes. e, Simplified pathway network showing the interaction of key PI3K-Akt and mTOR signaling pathway members.

Figure S3. DNA methylation status of five pathway genes in GI cancer. (A-F) Clustered Heatmap showing methylation of m⁶A regulators (n=9) and five pathway genes (n=57) in GI cancer. The tumor/normal samples (columns) and genes (rows) were both

clustered.

Figure S4. (A) Phylogenetic tree of five pathway genes and m⁶A regulators constructed by MEGA7 software. Each branch of the binary tree structure was given a weight based on the distance from node. The PI3K/Akt pathway genes were very closely related to known m⁶A regulators as indicated by green lines. Red dot size showing the stability of the phylogenetic relationships by bootstrap method. (B) Combined genetic co-expression detected by the STRING database. Correlated gene were displayed with co-expression score. Color intensity reflect the reliability of co-expression. Co-expression of METTL14 and PIK3CA was found (score=0.195). (C) Multi-centric protein-protein interaction (PPI) network of five pathway members and m⁶A regulators in human by STRING database. Two highly interconnected regions were detected: m⁶A regulator group and the pathway group. (D) Alteration in expression of FOXO, MAPK and p53 pathway genes in U2SO, Hela, HEK293T and A549 cells upon METTL3 knockdown based on the MeT-DB V2.0 and GEO databases. (E) AKT1S1 transcript reads coverage peaks visualized exon region expression upon METTL3 knockdown in Hela and A549 cells. (F) SNP alteration of m⁶A motif, the sequence logo was generated automatically based on DRA(m⁶A)CH structure. (G) Recurrent known SNP mutation relevant to m⁶A modification in AKT1S1. Recurrent known SNP mutations were color coded in green and annotated with dbSNP label.

Figure S5. (A) Distribution of m⁶A peak count in the genome. Light blue and light red were represented advance and reverse chain, respectively. (B) m⁶A peak enrichment in different sub-transcript regions. (C) m⁶A peak detection number compared to expected. Grey represented the expected detection number in different sub-transcript regions and the colored bar showed the actual detection number. (D) Distribution of m⁶A peak across the length of TMK1 mRNA. Each region of 5'UTR, CDS, and 3'UTR were binned into 100 segments in the window. (E) TMK1 cell genome m⁶A signaling was estimated on these gene bodies (between transcription start site, TSS and transcription termination site, TTS). (F) TMK1 cell genome m⁶A-binding peaks on CpG islands

(CpGI). (G) m⁶A/MeRIP-seq analysis of four RNAs (mTOR, AKT1, PIK3CA and PTEN) tested for m⁶A peak status in this work. The red lines correspond to all DRACH consensus motifs. The m⁶A-antibody-IP data are in blue color and the input sample is in gray color.

Figure S6. Validation of m⁶A regulation on PI3K/Akt/mTOR pathway. (A) m⁶A levels in GI cancer cells, including esophageal cancer cell TE-1, gastric cancer cell TMK1, colon cancer cell SW480, liver cancer cell lines Huh-7, colorectal cancer cell line HCT116 after treating with 1 μM of SAH or MA. (B) Expression mRNA levels of m⁶A methylation target genes were measured by qPCR, after the cells were treatment with 1 μM of METTL3-METTL14 inhibitor S-adenosylhomocysteine (SAH) or 1 μM of m⁶A demethylase FTO inhibitor meclofenamic acid (MA) for 48 h. (C) Forty-eight hours after siRNA transfection, the mRNA levels of METTL3, AKT1, mTOR, PIK3CA, and PTEN were analyzed by qPCR. (D) mRNA lifetime detection. TMK1 and HCT116 cells were treated with SAH or MA for 48 hours, then cells were treated with Act D (5 μg/mL), an inhibitor of gene transcription, for 0 h, 3 h, and 6 h. The half-life time of AKT1, mTOR, PIK3CA, and PTEN was calculated after checking the mRNA expression levels of these genes. (Student's t-test, *P<0.05, **P<0.01, ***P<0.001, compared with control).
