1. Introduction

1.1. Background Information

Amey have been commissioned by Transport Scotland to progress the A77 Maybole Bypass through DBRB Stage 3, Statutory Procedures, Procurement and Construction Supervision.

The A77 passes through the centre of Maybole along the High Street, which is the main retail area in the town. The High Street has evolved from a medieval street and has restricted carriageway and footway widths. These restricted widths combined with the large number of cars and heavy goods vehicles (HGVs) using the A77 to travel to the port facilities at Cairnryan have resulted in a bottleneck for strategic traffic and poor conditions for pedestrians and local traffic. In addition, there is a fatal accident cluster at the Smithson railway bridge to the north of Maybole.

In order to address these concerns, it is proposed to construct a bypass to the west of the existing route.

A geotechnical statement of intent for the site was issued by Amey Consulting in June 2012.

1.2. Geotechnical Category

This desk study report is required to aid preliminary design. In accordance with the DMRB; Volume 4, SH4/89 Geotechnical Certification Procedures: Trunk Road Ground Investigations (Incorporating Amendment No. 1, dated March 1990), the scheme has been classified as a Geotechnical Category 'B'.

1.3. Objectives of the Desk Study Report

The objectives of the desk study report are to provide:

- A description of the site, including information relating to the topography, geology, mining, hydrogeology, hydrology, historical development and potential contamination along the route of the proposed bypass;
- A preliminary conceptual site model for the site;
- A description of the anticipated ground conditions along with their probable engineering properties;
- A preliminary engineering assessment;
- A preliminary geotechnical risk register; and
- Recommendations for ground investigation.

1.4. Limitations of the Report

This Report has been prepared for Transport Scotland, in accordance with DMRB Volume 4, Part 2, HD22/08 Managing Geotechnical Risk and Part 7, Technical Memorandum SH4/89 Geotechnical Certification Procedures: Trunk Road Ground Investigations.

Amey have prepared this Report for the sole use of Transport Scotland under the agreed framework within which Amey provide technical services to Transport Scotland. Professional services supplied by Amey and advice within this desk study carry no other warranty, stated or implied beyond the framework. No guarantee is provided for third party use of this document without prior written permission from Amey.

Amey have based the conclusions and recommendations within this report upon information supplied by third parties. Amey have assumed that all relevant information has been supplied from whom it was requested. Unless otherwise stated in this Report, independent verification of the supplied information has not been carried out by Amey.

2. The Site

2.1. Site Location

The A77 is a major arterial road linking the city of Glasgow and town of Kilmarnock with the port facilities at Cairnryan. The road generally runs in a northeast to southwest direction and passes through the centre of the town of Maybole in South Ayrshire.

The proposed Maybole Bypass is located to the north of the town, tying in to the existing A77 at Broomknowles farm approximately 400 m to the west of Maybole (NGR 228815 609466) and immediately to the south of Bankend Bridge approximately 3.5 km northeast of Maybole (NGR 232096 612948), as shown in Figure 1 below:

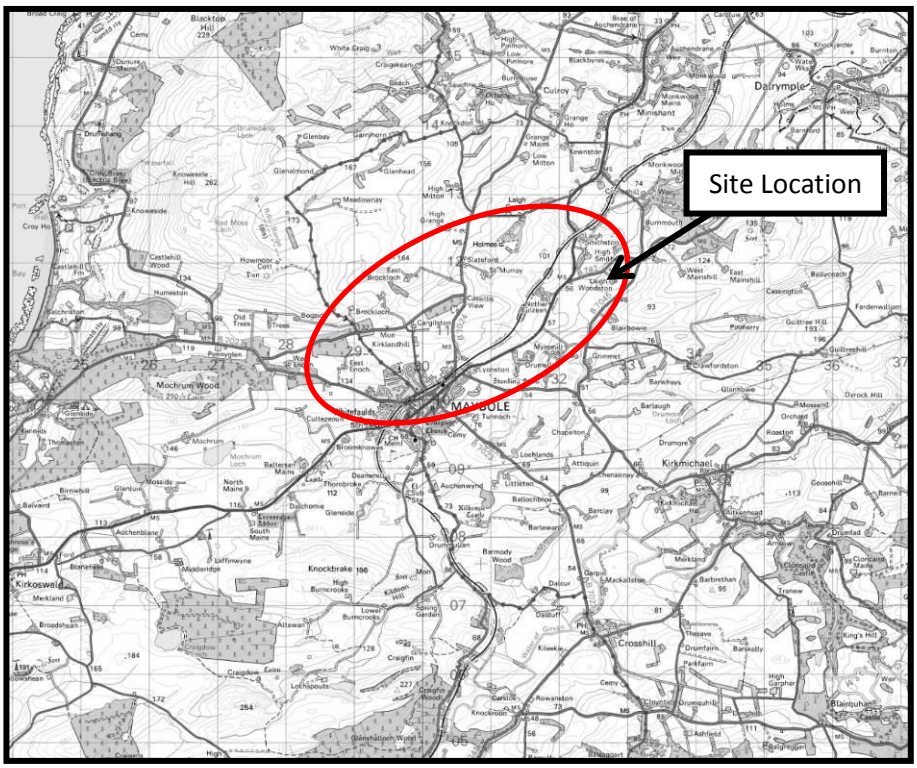

Figure 1: Site Location Plan

2.2. Scheme Proposals

It is proposed to construct a new A77 bypass of Maybole and the recommended route and junction arrangement was determined in a DMRB Stage 2 report issued in 2007[1]. This report identified the "yellow" route comprising a 5.2km bypass of the existing A77 to the north of the town as shown in Figure 2 overleaf.

The natural topography of the area is undulating, with a number of glacial moraines and drumlins, as illustrated in the photographs overleaf. As a result large sections of the proposed bypass will be constructed in cutting and embankment, with a maximum embankment height of approximately 6.5 m and a maximum cutting depth of approximately 20 m.

In addition, a minimum of three principal road crossings (overbridges or underbridges) will be required throughout the scheme.

2.3. Site Description & Topography

The scheme generally passes through undulating agricultural land, as illustrated in the photographs overleaf. From the southern tie-in with the existing A77 the proposed route trends north-eastwards, cutting through the centre of Gallow Hill and Kirkland Hill. The recorded elevations along this section, taken from the OS plans, vary between 90 mAOD at the start of the route to a maximum of 139 mAOD and 110 mAOD at the top of Gallow Hill and Kirkland Hill respectively.

The proposed route continues north-eastwards cutting through the side of several unnamed hills, with recorded elevations around 85 mAOD to 100mOAD. The natural topography then falls rapidly towards the northern tie-in, which is recorded at an elevation of 60 mAOD.

The scheme intersects four minor roads, the B7023, Kirklandhill Path, Gardenrose Path and the B7024, all of which trend southwards into Maybole. The route also passes over two small watercourses, one at the centre of the route to the east of the B7024 and one at the northern tie-in with the existing A77.

To the south and east of the proposed route, the Glasgow to Stranrear railway line runs generally parallel with the existing A77. The railway is constructed in cutting and embankment and is approximately 100 m from the proposed route at its closest point.

During the site walkover, overhead electricity pylons and telephone pylons were noted along the scheme, as illustrated in the photographs overleaf.

Photograph 8: Looking northeast from the southwest tie-in with the A77

2.4. Utilities

Utility companies were contacted for information regarding the position of their assets in relation to the proposed route of the A77 Maybole Bypass.

The following utilities are present at the site or within its immediate vicinity:

- The BT Openreach plans recorded several areas of overhead and buried apparatus along the proposed route. Overhead and buried apparatus were recorded adjacent to the proposed southern tie-in, running along the B7023 adjacent to the proposed intersection and adjacent to the proposed northern tie-in. Buried apparatus was also recorded in the vicinity of the proposed intersection with Gardenrose Path road and the B7024. Further overhead apparatus was recorded along the Kirklandhill Path road adjacent to the proposed intersection.
- The Scottish Power plans recorded overhead lines along the scheme. High voltage and extra high voltage overheads were recorded at the proposed soutern tie-in, in the vicinity of the proposed intersections with the B7023 and Gardenrose Path road and adjacent to the proposed northern tie-in.
- The Scottish Water plans indicate a water pipe running along Gardenrose Path road.

The Scottish Gas, Orange and Virgin Media plans indicated no assets at the site or within its immediate vicinity.

Copies of the relevant correspondence received from the utility companies contacted as part of the desk study research are included within Appendix B.

2.5. Historical Development

In order to determine the historical development of the site, historic Ordnance Survey (OS) sheets were obtained through Landmark Envirocheck[2]. A summary of the historical development of the scheme, taken from a review of the OS sheets is presented below. A copy of the relevant OS sheets is included in Appendix C.

The earliest available OS plans (1859/1860) recorded the scheme and surrounding area as predominately undeveloped agricultural land, with localised areas of woodland and a small area of marshy land approximately 300 m to the south of the scheme's northern extent. Several small farm buildings were also shown in the surrounding area,

[2] Envirocheck Report, Landmark Information Group, Report Ref 40002230_1_1, 03 July 2012

An unnamed road was recorded trending west to northeast to the south and west of the scheme, generally following the route of the present day A77. The northern and southern extents of the scheme tie in with the road which passed through the village of Maybole sited to the southwest of the scheme. Between the existing road and the scheme, the Glasgow to Stanraer railway line was shown constructed on embankment. The railway line was approximately 100 m from the scheme at its closest point and was shown crossing the road at Smithston Bridge, approximately 500 m from the scheme's northern extent.

Intersecting the scheme, four minor roads were recorded, generally following the route of the present day B7023, Kirklandhill Path road, Gardenrose Path road and B7024.

Approximately 100 m to the west of the scheme's northern extent a reservoir was recorded. A small watercourse was shown flowing from the reservoir south eastwards towards the main road and bisecting the scheme. Several pumps, wells and field drains were also noted in the surrounding area.

A number of sand, gravel and sandstone quarries were recorded to the north of the scheme, all generally over 300 m from the scheme extents. However, an old quarry was noted approximately 80 m to the north of the scheme, near the present day Kirklandhill Path road.

No significant changes were noted on the 1896-1987 OS plans. The northern extent of the site was named as Backend Bridge and the southern extent was named as Parish Marsh Bridge.

The 1910-1911 OS plans recorded the expansion of Maybole to the south of the scheme. No changes were noted on the 1938 OS plans.

No significant changes were noted relative to the scheme on the 1957-1958 OS plan. However, the marshy area in the north of the scheme was no longer shown nor the reservoir to the west of the northern extent. A small watercourse was noted flowing through the centre of the scheme west to southwest towards the railway line. A second small watercourse was noted to the south of the scheme flowing northwest to southeast. Maybole to the southeast of the scheme continued to expand.

The 1971-1978 OS plans no longer recorded the old quarry 80 m to the north of the scheme, which appeared to be infilled.

The 2006 OS plans recorded the expansion of Maybole to the southeast of the scheme. No other significant changes were noted on this or subsequent OS plans.

2.6. General Geology

Geological information published by the British Geological Survey (BGS)[3] and supplied by Landmark Information Group[2] was reviewed to determine the anticipated geology at the site.

[3] www.bgs.ac.uk

The geology maps show the superficial deposits underlying the proposed route to be predominately glacial till. This is described as comprising brown or blue-grey clay with variable sand and gravel content and many rounded cobbles and boulders.

Along the western half of the route (to the west of the B7024), the maps record the glacial till to occur as glacial moraines described as mounds or ridges of boulder clay, sand and gravel possibly laid down at the margins of a wasting mass of ice. Two drumlins were also noted on the map immediately to the north of the proposed route, one near the centre of the route and one towards the northern extent. The drumlins were described as ice-moulded mounds of boulder clay elongated in the direction of ice flow.

A band of alluvium was recorded close to Bankend Bridge at the northern tie-in with the existing A77. The alluvium is described as mixed silt, sand and gravel.

The artificial ground and landslip map contained within the Envirocheck report recorded a small area of made ground at the southern tie-in with the A77. This is likely to have been placed during the construction of the existing A77. Several other small areas of made ground were also recorded to the south and west of the route, predominately at the intersection with the B7024 and close to Smithston Railway Bridge, south of the northern tie in.

The underlying bedrock shown along the route is the Swanshaw Sandstone Formation, part of the Siluro-Devonian Lower Old Red Sandstone. The formation comprises up to 750 m of red-brown, grey-green and chocolate-brown, medium and coarse-grained terrestrial sandstones with subordinate pebble beds and conglomerates, minor sandstones, siltstones and mudstones. The formation is continuous along the scheme and dips were noted to the north and northwest.

A single dyke of crianite (an analcite olivine dolerite) or basalt was shown intruding into the Old Red Sandstone immediately to the east of the route, to the north east of Maybole town centre.

An examination of the Envirocheck Mining and Ground Stability report indicates that several geo-hazards associated with the underlying geology may be present beneath the site as shown below.

Table 1: Summary of Potential Geo-hazards (west of B7024)

Geo-hazards	Nil	Very Low	Low	Moderate	Significant
Compressibility Potential		√			
Collapsibility Potential		√			
Running Sand	√				
Solution Potential	√				

Table 1: Summary of Potential Geo-hazards (west of B7024)					
Geo-hazards	**Nil**	**Very Low**	**Low**	**Moderate**	**Significant**
Swell – Shrink Potential	√				
Landslides		√			

Table 2: Summary of Potential Geo-hazards (east of B7024)					
Geo-hazards	**Nil**	**Very Low**	**Low**	**Moderate**	**Significant**
Compressibility Potential		√			
Collapsibility Potential		√			
Running Sand			√		
Solution Potential	√				
Swell – Shrink Potential			√		
Landslides		√			

A localised area of moderate potential of compressibility strata was recorded at the northern tie in, probably associated with the area of alluvium.

2.7. Mining Activity and Quarrying

A review of the gazetteer, published by The Coal Authority[4] indicated that the site lies within an area for which a Coal Mining Report is not required. In addition, information published by the BGS website[3] (Mining Access Portal GIS) relating to coal and non-coal mineral extraction indicates that there are no mine plans available for the area and the area is not within an area of known mining.

The mining and ground stability map provided by Envirocheck indicated no areas of mining were present within the site or surrounding areas.

However, a historic sandstone quarry (named as Kirklandhill) was recorded 80 m north of the proposed route adjacent to the Kirklandhill Path road. The operator of the quarry was unknown. This quarry was also recorded on the historic OS plans, noted as old quarry from the first edition plans (1859/1860) until the 1971/1978 plans where it appeared to be infilled.

[4] www.coal.decc.gov.uk

A number of other historic quarries were noted both on the historic OS plans and Envirocheck report, all more than 300 m from the scheme extents.

2.8. Hydrogeology

The Groundwater Vulnerability Map of Scotland[5] records the underlying bedrock to generally comprise rocks of moderate permeability. These are fractured or potentially fractured rocks, which do not have a high primary permeability or other formations of variable permeability. Although these formations will seldom produce large quantities of water for abstraction they are important for local supplies and in supplying base flow to rivers.

In addition, the Groundwater Vulnerability Map also indicates that the superficial deposits may be substantial in thickness.

The Hydrogeological Map of Scotland[6] indicates the route is underlain by Lower and Middle Old Red Sandstone. These deposits contain locally important aquifers in which flow is dominantly in fissures and other discontinuities.

2.9. Hydrology

The available Ordnance Survey plans[2] noted three small watercourses/ drains flowing through the scheme. Two watercourses/ drains were recorded flowing west to southeast adjacent to the northern tie-in with the existing A77. They were shown flowing into the Chapelton Burn, which flows southwest to northeast approximately 700 m from the scheme. The third watercourse/drain was recorded flowing west to southeast at the centre of the scheme, approximately 700 m to the east of B7024.

Immediately to the south of the scheme a small watercourse was also recorded flowing northwest to southeast beneath the existing A77 and towards Abbeymill Burn. Abbeymill Burn flows north to southeast approximately 1.6 km to the southeast of the scheme. A number of other small watercourses, field drains, issues, sinks and wells were also noted in the surrounding area.

The Scottish Environment Protection Agency (SEPA)[7] website River Basin Planning interactive database (2012) was consulted to obtain water quality data for the two larger watercourses near the site. The following information was available:

[5] Groundwater Vulnerability Map of Scotland, British Geological Survey, 1, 625,000, 1995
[6] Hydrogeological Map of Scotland, British Geological Survey, 1:625,000: 1988
[7] www.sepa.org.uk

Table 3 : Summary of Water Quality Data		
Watercourse Name	**Current Classification (2012)**	**Objective 2015**
Chapleton Burn	Moderate	Good
Abbeymill Burn	Moderate	Good

The Landmark Envirocheck Report[2] 2012 OS plan also depicted a number of pond features as follows:

- 2 surface water bodies, each approximately 300m^2, located 150 m to the east of the southern tie-in; and
- 1 larger surface water body, approximately 12,000m^2, located 500 m to the west of the proposed northern tie-in.

The Scottish Environment Protection Agency (SEPA)[7] website indicates that the site does not lie within an area susceptible to flooding.

2.10. Environmental Assessment

A Landmark Envirocheck Report[2] was obtained for the site and surrounding area. The report contains information which is provided by a number of bodies including Ordnance Survey (OS), the British Geological Survey (BGS), Scottish Environment Protection Agency (SEPA) and the Coal Authority. A copy of the Envirocheck Report is included within Appendix C.

The report noted one Local Authority recorded landfill site approximately 140 m to the west of the scheme at Kirklandhill. The landfill was closed in 1970 and was operated by South Ayrshire Council. The type of waste was not indicated.

In addition, one contemporary trade entry named as LCR Auto Solutions was noted approximately 240 m north of the scheme at McAdam Way, Maybole. This was classified as Garage Services and is currently active.

The Scottish Natural Heritage (SNH) website[8] indicated that the scheme and surrounding area are not within an area designated as a SSSI, Special Area of Conservation, Ramsar, Special Protection Area, National Nature Reserve, National Park or a Local Nature Reserve.

A separate Environmental Assessment has been undertaken by Amey and reported to Transport Scotland separately. The assessment did not indicate any environmental issues or concerns along the scheme.

[8] www.snh.gov.uk

3. Previous Exploratory Works

The British Geological Survey[2] holds information from a site investigation carried out by Norwest Holst under the direction of Strathclyde Regional Council in 1986. The investigation was originally designed to explore the suitability of various bypass routes north and south of Maybole.

The ground investigation comprised a number of exploratory holes and trial pits of which only six boreholes and four trial pits are considered relevant to the current scheme. The relevant exploratory holes are summarised in Table 4 below and illustrated in Drawing No CON-HW/2500182/DOC-009/002 contained in Appendix A.

Table 4 : Summary of Historic Boreholes and Trial Pits

Borehole	Easting	Northing	Depth (mbgl)	Distance from the site and Direction	Date
TP 229	230000	610630	3.1	90 m West	28/04/1986
S108	230430	610800	11	30 m West	28/04/1986
TP 222	230440	610830	4.5	5 m West	28/04/1986
TP 213	231540	611570	4	60 m North East	29/01/1985
S110	231760	611850	6	50 m South	31/01/1986
S111	231820	611970	6	40 m South	01/05/1986
S112	231900	612090	15.2	45 m South	02/05/1986
S113	231970	612210	16.3	45 m South East	08/05/1986
S114	232080	612420	5	120 m South East	09/05/1986
TP 227	232100	612490	3.4	140m South East	29/01/1986

The generalised sequence of strata as encountered by the exploratory holes is given in Table 5 overleaf:

Table 5: Summary of Strata		
Stratum	**Depth to underside (m)**	**Thickness (m)**
Topsoil	0.1 to 0.8	0.1 to 0.8
Glacial Till	2.0 to 15.8	1.7 to 15.0
Bedrock	Bedrock was encountered at depths of between 2.0 mbgl and 15.8 mbgl (60.79mAOD to 124.9mAOD)	

3.1. Topsoil

Topsoil was encountered in all the exploratory holes to a depth of between 0.1 m and 0.80 m and was generally described as brown sandy topsoil.

3.2. Glacial Till

Beneath the topsoil, glacial till was encountered in all of the exploratory holes. The material was generally described as firm becoming very stiff brown sandy silty clay with some gravel and occasional cobbles and boulders. Four of the exploratory holes terminated within these deposits.

3.3. Bedrock

Trial pits 219, 227 and 229 encountered possible bedrock, described as greyish brown fine to medium grained sandstone, at depths of 2.0 mbgl, 3.1 mbgl and 2.7 mbgl (101.2mAOD, 60.79 mOAD and 124.9 mAOD) respectively.

Boreholes S110, S111, S112 and S113 also encountered bedrock at depths varying between 2.7 mbgl and 15.8 mbgl (74.57mAOD to 63.16mAOD). The bedrock was described as moderately weathered fine to medium grained sandstone.

It should be noted that the exploratory holes above have been sunk substantial distances apart and as such there is a considerable variation in ground level at each location and subsequently in the recorded depth to bedrock.

3.4. Groundwater

No groundwater was encountered in any of the exploratory holes during fieldwork, however 24 hours after drilling, groundwater was observed in boreholes S108, S111, S112 and S113, varying in depth between 2 mbgl and 15.7 mbgl.

4. Preliminary Conceptual Site Model

4.1. General

The Environment Protection Act 1990 (Part IIA) was adopted as statute in England and Wales on 1st of April, 2000 and enacted in Scotland on 14th of July 2000. This legislation defines the regime for identifying, assessing and, where appropriate, remediating land that is deemed to be 'contaminated' on the basis that it does, or could, adversely impact health or the environment.

In line with this legislation, the interpretation of the data compiled in connection with this report has been undertaken using risk-based principles adopting the contaminant source-pathway-receptor principle whereby in the context of land contamination, there are three essential elements to any risk:

- A **source** of contamination, for example due to historical site operations;
- A **pathway**: a route by which receptors can become exposed to contaminants. Examples include vapour inhalation, soil ingestion and groundwater migration; and
- A **receptor**; a target that may be exposed to contaminants via the identified pathways. Examples include site workers, the Water Environment, property and ecosystems.

Each of these elements can exist independently, but they create a risk only where they are linked together so that a particular contaminant affects a particular receptor through a particular pathway.

This kind of linked combination of contaminant-pathway-receptor is described as a pollutant linkage. The absence of one or more of these elements would prohibit a viable pollutant linkage being established. Defining a conceptual site model (CSM) for a site requires identification of all potential sources, pathways and receptors and any plausible combinations of these three components.

A preliminary CSM has been developed using the method summarised above in the context of the proposed bypass construction. This preliminary CSM can then be used in the design of subsequent intrusive investigations. The key potential sources, pathways and receptors identified at the site are described in the following sections.

4.2. Potential Sources

Potential sources of contamination associated with land use on the site may include:

- Hydrocarbon contamination of soils associated with vehicles using the A77 carriageway at the tie in locations along with the B7024, Kirklandhill Path, Gardenrose Path and B7023 heading north from Maybole town centre;

- Made Ground deposits associated with the construction of the A77 carriageway and B7024, Kirklandhill Path, Gardenrose Path and B7023 may contain heavy metals, sulphates and sulphides, poly-aromatic hydrocarbons and petroleum hydrocarbons;
- Contaminants associated with the site's historic use as agricultural land including a range of pesticides and herbicides.

4.3. Potential Receptors

Potential receptors associated with the site include:

- Human health receptors – construction workers and future site users;
- Shallow groundwater in the superficial deposits;
- Surface watercourses (Culroy Burn, Chapelton Burn and Abbeymill Burn); and
- Building materials – pavement construction.

4.4. Potential Pathways

For a risk to be present a pathway must exist between a source and receptor. The following potential pathways have been identified at the site including:

- Human health – dermal contact, ingestion and inhalation;
- Shallow groundwater and surface water– leaching and downward/lateral migration of contaminants; and
- Chemical attack of sulphates, unfavourable pH conditions and hydrocarbons, if present in made ground deposits.

4.5. Pollutant Linkages

A qualitative assessment of the potential risks to receptors has been made based on the sources and pathways identified above. It should be noted that this assessment is based solely on desk study information and may require to be revised following any subsequent site investigation works or as additional information becomes available.

4.6. Human Health

A source-pathway-receptor linkage may be created during construction of the Bypass.

Earthworks cuttings up to 20m are anticipated in order to construct the road pavement foundation. Construction workers may, therefore be exposed to potentially contaminated material through direct contact with soils, inhalation of vapours and dust or through the ingestion of soils and dust. This potential linkage should, therefore, be investigated.

Construction of the road pavement will essentially cap any potentially contaminated soils along the extents of the scheme, limiting the potential for exposure to these soils should they exist. The risk to site operatives involved in the maintenance and upkeep of the road are, therefore considered low. Human health pollutant linkages are not considered to be present in the context of future use of the site.

4.7. The Water Environment

If contaminants are present in shallow soils, a pollutant linkage may exist through the mechanism of leaching and downwards/lateral migration to groundwater in these deposits and also to nearby surface water features that are in hydraulic continuity with the shallow deposits,

4.8. Construction Materials

Construction materials following the construction of the bypass could be susceptible to attack should particular contaminants be present at the site,

5. Preliminary Engineering Assessment

5.1. General

The proposed bypass is located to the north of Maybole, tying in to the existing A77 at Broomknowles farm approximately 400 m to the west of the town and immediately to the south of Bankend Bridge approximately 3.5 km northeast of the town.

A review of the available historic borehole records together with published geological information suggests the following sequence of strata at the site:

- Topsoil;
- Glacial Till; and
- Bedrock.

However, the available geology plans indicate that localised alluvial deposits may be present near the northern tie-in. In addition, localised pockets of made ground associated with road construction may be present at the tie-ins with the A77 and where the minor roads (B7024, Kirklandhill Path, Gardenrose Path and B7023) cross the scheme.

5.2. Embankments

5.2.1. Stability

Ground conditions over the majority of the scheme are expected to comprise glacial till in which case no stability issues are anticipated where the embankments are founded within this material. This should be confirmed by the ground investigation.

However, an area of alluvial deposits may be present near the northern tie-in with the existing A77. The nature and depth of the alluvial deposits is not known but given the likely compressible nature of such material the embankment along this section may not be stable at full construction height without the need for additional works. Options could include removal and replacement of the poor quality material (dependant on the depth to competent strata), basal reinforcement or staged construction.

The extent, nature and depth of any alluvial deposits should be determined during the ground investigation. Appropriate engineering measures should be confirmed after the ground investigation.

5.2.2. Settlements

Over the majority of the scheme, where embankments will be constructed on the natural glacial till, settlements are anticipated to be within acceptable limits. This should be confirmed after the ground investigation.

However, where embankments are underlain by alluvial deposits, anticipated settlements may be in excess of acceptable limits. Options could include removal and replacement of the poor quality material (dependant on the depth to competent strata), use of lightweight fill or pre-loading.

The extent, nature and depth of any alluvial deposits should be determined by the ground investigation. Appropriate engineering measures should be confirmed after the ground investigation.

5.2.3. Side Slopes

Permissible earthworks batters will be a function of the fill material utilised and the foundation soil properties. However, assuming that site won glacial till is utilised a general side slope of 1 in 2 to 1 in 2.5 may be assumed. This should be confirmed after the ground investigation.

5.3. Cuttings

5.3.1. Side Slopes

It is anticipated that the cuttings will be predominately constructed in glacial till. However, the historic exploratory hole information indicated that towards the north of the scheme, the base of the cutting may be in bedrock.

The depths of the cuttings vary over the length of the scheme, with a maximum depth of approximately 20 m. The permissible side slope angle will be a function of the cutting slope height, material type and groundwater level.

At this stage it may be assumed that a side slope angle of 1 in 2 will generally be acceptable. In areas of deep cutting or high groundwater level, a side slope angle of 1 in 2.5 or 1 in 3 may be necessary. This should be confirmed after the ground investigation.

5.3.2. Acceptability of site won material for reuse

A proportion of the site won material should be suitable for reuse within the engineered embankments. The exact percentage shall be confirmed after the ground investigation but it can reasonably be assumed at this stage that 60% to 70% of the glacial till may be acceptable. The remaining material may be suitable for reuse in landscaping areas.

5.3.3. Excavatabilty of rock

The historic exploratory hole information indicated that to the north of the scheme, the base of the cutting may be within bedrock, recorded to comprise weak to moderately weak sandstone.

The most common methods of excavating rock are scraping, ripping and digging for weak rocks and blasting for strong rocks. The level and nature of bedrock should, therefore be confirmed during the ground investigation, to allow a detailed assessment of the best method of excavating the material.

5.4. Road Pavement Design

The design of the capping layers will be dependent on the underlying material type. Based on the available information, the majority of the scheme will be constructed on engineered fill (forming new embankments), or on the underlying glacial till or on bedrock.

The CBR value for a new engineered fill will be dependent on the fill material utilised.

It is anticipated that the natural glacial till will have a CBR of 4% to 5% and the bedrock will have a CBR of 15%. However, this should be confirmed after the ground investigation.

5.5. Structures

Three new road bridges will be required to carry the B7024, Kirklandhill Path and Gardenrose Path across the proposed bypass. Based on the available information, it is anticipated that the structures will be founded within the glacial till. Assuming the material is encountered as firm to stiff and there are no abnormal loadings, normal spread foundations may be feasible. This should be confirmed after the ground investigation which should allow for the possibility of pile foundations being necessary.

5.6. Mineral Assessment

The available information indicates that the site lies outwith any areas of underground mining in coal or other minerals.

With the exception of an old sandstone quarry located to the east of Kirklandhill cottages, there is no evidence of any mineral extraction within the site or its immediate vicinity.

Based on the above it is considered that the mineral stability of the site is satisfactory.

5.7. Contamination Assessment

Based upon the historical land uses for the site and surrounding area, it is considered that the following contaminants may be present at the site:

- Pesticides and Herbicides
- Polyaromatic hydrocarbons (PAHs),
- Petroleum hydrocarbons (TPHs),
- Heavy metals,
- Sulphates and Sulphides; and
- Asbestos

It is recommended that a selection of soil, and where possible groundwater and surface water samples, are tested for a range of contaminants as part of the ground investigation works.

5.8. Other Considerations

Two of the historic exploratory holes (S111 and S108) recorded groundwater at depths of 2 mbgl and 2.5 mbgl. The potential presence of shallow groundwater could have an impact on the stability of the cutting slopes and the overall road drainage design. The depth of groundwater should be investigated fully during the ground investigation.

6. Geotechnical Risk Register

Using the tables 6, 7 and 8 (overleaf) it is possible to provide a qualitative figure for the various perceived geotechnical risks for the site.

A geotechnical risk register was compiled for the proposed bypass and is presented in Table 9 overleaf.

Using the equation: Risk = Likelihood x Impact

Several areas of geotechnical risk were identified for the site, these included:

Table 6: Likelihood

Likelihood (P)	
Very likely	5
Likely	4
Probable	3
Unlikely	2
Negligible	1

Table 7: Project Impact

Impact (I)		Time and Cost Impact	
Very high	5	>10 weeks on completion	> £1m
High	4	>1 week on completion	£100k to £1m
Medium	3	>4 weeks but <1 week on completion	£10k to £100k
Low	2	1 to 4 weeks on completion	£1k to £10k
Very low	1	<1 week to activity, none on completion	<£1k

Table 8: Project Impact

Risk (P x I)	Risk Rating	Response
13 to 25	Intolerable	Unacceptable
9 to 12	Substantial	Early attention
5 to 8	Tolerable	Regular attention
1 to 4	Trivial	Monitor

Table 9: Geotechnical Risk Register

		Before Control					
Risk No	Hazard/Risk	Likelihood	Impact	Risk	Consequence	Control Measure	Residual Risk
Ground Investigation Works							
1	Ground conditions differ to those anticipated.	2	2	4	Inappropriate equipment on site for ground investigation. Additional cost and delays to programme.	Carry out a thorough review of available information. Pass all appropriate information to site investigation contractor. Establish contingency plan for mobilising alternative equipment to site.	2
2	Encountering contaminated material.	2	3	6	Health and Safety implications. Additional cost and delays to programme.	Fully review all available information and pass on to the Contractor, ensure appropriate PPE is worn at all times. Ensure contamination contingency plan is available. Any visual or olfactory evidence of contamination to be recorded and appropriate personnel notified.	2
4	Encountering unrecorded buried utilities.	2	3	6	Health and Safety implications. Additional cost and time implications for repairs.	Review all available Utility records. Cable detectors to be used before any excavations are undertaken. Hand excavated inspection pits to be sunk at all exploratory holes locations prior to any excavations being undertaken.	2
5	Working on undulating land	4	2	8	Health and safety implications for site personnel. Inappropriate equipment on site for ground investigation, delay to programme and additional costs.	Liaise with site investigation contractor to ensure appropriate ground investigation techniques selected. If necessary set up level platform for drilling rig. Establish contingency for mobilising alternative equipment.	4
6	Encountering boulders within the glacial till	3	2	6	Difficulties drilling through strata. Inappropriate equipment on site for ground investigation. Additional cost and delays to programme	Carry out a thorough review of available information. Liaise with site investigation contractor to ensure appropriate ground investigation techniques selected. Establish contingency plan for mobilising alternative equipment to site.	3

		Before Control					
Risk No	Hazard/Risk	Likelihood	Impact	Risk	Consequence	Control Measure	Residual Risk
7	Working adjacent to/ on live carriageway	5	4	20	Health & Safety implications. Additional costs and delays to programme	Ensure adequate traffic management systems are in place prior to any excavation works being undertaken.	5
Construction Works							
8	Ground conditions differ to those anticipated/ unforeseen ground conditions.	2	3	6	Inappropriate equipment on site for construction works. Possible redesign of proposed foundation and earthworks. Additional cost and delays to programme.	Carry out thorough site investigation and review available information to develop robust ground model. Pass all appropriate ground investigation information to appointed contractor.	3
9	Insufficient bearing capacity / excessive settlement of embankments and structural foundations during construction	2	3	6	Delays for design and construction of remedial works. Additional cost.	Develop robust ground model. Adopt appropriate design parameters and adequate factors of safety.	2
10	Encountering localised contaminated material.	2	2	4	Health and safety implications for site personnel. Additional costs and delays to programme whilst contamination is quantified and remedial measures implemented.	Pass all appropriate ground investigation information to appointed contractor. Any visual or olfactory evidence of contamination to be recorded and appropriate personnel notified. Remedial works. Appropriate PPE to be worn.	2
11	Presence of boulders/ obstructions within glacial till	2	3	6	Difficulties in excavating cuttings and structural foundations. Additional cost and delays to the programme.	Carry out thorough site investigation and review available information to develop robust ground model Pass all appropriate information to appointed contractor. Correct plant on site.	3
12	Chemical attack on buried structural elements.	2	3	6	Premature degradation and failure of buried elements.	Adequate laboratory testing to determine appropriate protection measures.	3
13	Encountering unrecorded buried utilities.	2	2	4	Health and Safety implications. Additional cost and delays to programme.	On-going consultations with utility companies during design process. Pass all appropriate information relating to utilities to design team and appointed contractor. All known utilities to be identified prior to construction works commencing.	2

		Before Control					
Risk No	Hazard/Risk	Likelihood	Impact	Risk	Consequence	Control Measure	Residual Risk
14	Stability of cutting slopes	3	3	9	Health & Safety implications for site personnel. Cost and time implications for remedial works.	Carry out thorough ground investigation and review of available information to formulate robust ground model. Adopt appropriate design parameters and adequate factors of safety.	3
15	Stability of temporary excavations	2	3	6	Works disturbing excavations and causing movement. Health & Safety implications for site personnel. Cost and time implications for repairs.	Ensure excavations are inspected by site personnel, reinforced if necessary and the perimeter is fenced off.	2
16	Shallow groundwater or perched groundwater.	2	2	4	Inappropriate equipment on site. Implications for design. Cost and time implications.	Carry out thorough ground investigation and review of available information to formulate robust ground model. Pass all information to contractor. Establish contingency plan for mobilising dewatering equipment.	2
17	Working adjacent to/ on live carriageway	5	4	20	Health and safety implications for site personnel.	Ensure appropriate traffic management system is put in place before works commence. Ensure appropriate construction techniques are selected.	5

7. Proposed Ground Investigation Works

In order to determine the most suitable earthworks design and foundation solutions for the construction of the A77 Maybole Bypass, it is proposed to undertake detailed ground investigation works at the site, as detailed below.

- 52 No hand dug inspection pit at the location of the boreholes to determine the presence of any underground utilities. The inspection pit will not exceed 1.2m depth below ground level;
- 52 No cable percussion boreholes with in-situ testing to provide geotechnical information on the superficial deposits. Recovered soil samples shall be forwarded for geotechnical and environmental testing;
- 10 No rotary follow on boreholes to prove bedrock depth and cores for geotechnical testing
- Installation of 20 No groundwater monitoring standpipes/ piezometers;
- 50 No machine excavated trial pits, excavated at selected locations throughout the route of the proposed bypass, to a depth of 4.5m in order to provide geotechnical information on the natural soils beneath the site. Recovered soil samples shall be forwarded for geotechnical and environmental testing;
- 21 No machine excavated trial pits, excavated at the proposed SUDs pond locations, to a depth of 4.5m, in order to provide geotechnical information on the natural soils. Recovered soil samples shall be forwarded for geotechnical and environmental testing;
- Laboratory analysis of soil samples for a range of geotechnical and environmental testing. The actual testing schedule will be determined following completion of the exploratory hole, however at this stage it is anticipated to comprise the following:
- Geotechnical (soil): natural moisture content, Atterberg limits, particle size distribution, undrained triaxial compression, consolidated undrained triaxial compression test with measurement of porewater pressure, one dimensional consolidation, Moisture Condition Value (MCV), pH and sulphate;
- Geotechnical (rock): uniaxial compressive strength (UCS) and point load tests;
- Environmental (soil): arsenic, cadmium, chromium, nickel, zinc, lead, mercury, selenium, water soluble boron (WSB), iron, hexavalent chromium, total cyanide, free cyanide, total sulphate, sulphide, total sulphur, pH, total organic carbon and asbestos, PAH, TPH, pesticides and herbicide.
- Environmental (leachate/groundwater): arsenic, cadmium, chromium, hexavalent chromium, lead, mercury, selenium, nickel, copper, zinc, boron, iron, cyanide, sulphur, sulphide, sulphate, ammonia, nitrogen, PAH, TPH, pesticides and herbicides.

It should be noted that all intrusive works will be undertaken in accordance with BS EN 1997-1:2004 Eurocode 7: Geotechnical design - Part 1 / BS EN 1997-2:2007 Eurocode 7: Geotechnical design - Part 2:2007 together with UK National Annex to Part 1 / Part 2 and BS 10175:2011 Investigation of potentially contaminated sites – Code of practice.

Information about apparatus given on this drawing is indicative only as the original depths and lines of cables and pipes may have been changed by persons unknown. Normally electricity cables are laid in trenches between 450mm and 1m deep, but cellars or structures such as bridges may prevent cables and pipes being laid at these standard depths. Also, the depth may be above or below the standard due to regrading of the surface or other work after the cables are laid. Where known, non-standard depths are indicated. Any interference with, or damage to, ScottishPower apparatus may result in serious accident. Health and Safety Executive booklet HSG47 provides information on the avoidance of danger from underground services. Authorities and contractors will be held liable both for the full cost of repairs to ScottishPower apparatus and all claims made against ScottishPower by Third parties as a result of interference or damage. In the event of an emergency or should you require further assistance contact 0845 2727 999 (ScottishPower area) or 0845 272 2424 (SP Manweb area).

Information about apparatus given on this drawing is indicative only as the original depths and lines of cables and pipes may have been changed by persons unknown. Normally electricity cables are laid in trenches between 450mm and 1m deep, but cellars or structures such as bridges may prevent cables and pipes being laid at these standard depths. Also, the depth may be above or below the standard due to regrading of the surface or other work after the cables are laid. Where known, non-standard depths are indicated. Any interference with, or damage to, ScottishPower apparatus may result in serious accident. Health and Safety Executive booklet HSG47 provides information on the avoidance of danger from underground services. Authorities and contractors will be held liable both for the full cost of repairs to ScottishPower apparatus and all claims made against ScottishPower by Third parties as a result of interference or damage. In the event of an emergency or should you require further assistance contact 0845 2727 999 (ScottishPower area) or 0845 272 2424 (SP Manweb area).

Envirocheck® Geology

Geology 1:10,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:10,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around a site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page.

Please Note: Not all of the layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Envirocheck® Geology

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Envirocheck® Geology

Superficial Geology

BGS 1:10,000 Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Envirocheck® Geology

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults and thin beds mapped as lines such as coal seams and mineral veins. These are not restricted by age and could relate to features of any of the 1:10,000 geology datasets.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:10,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected. For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities. Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.	
Historical Land Use Information (1:2,500)	-
The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative. For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.	
Historical Land Use Information (1:10,000)	2
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses. For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.	
Ground Stability Data (1:50,000)	3
The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.	
Motion Map Data (1:2,500)	-
The Motion Map Data (1:2,500) section contains data which is plotted to indicate long-term stability trends from analysis of satellite radar data.	
Historical Map List	5
The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.

Envirocheck®

Ayrshire

Published 1859

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1946

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Ordnance Survey Plan

Published 1957

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2006

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Geology 1:10,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:10,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around a site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page.

Please Note: Not all of the layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Envirocheck® Geology

Superficial Geology

BGS 1:10,000 Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Envirocheck® Geology

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults and thin beds mapped as lines such as coal seams and mineral veins. These are not restricted by age and could relate to features of any of the 1:10,000 geology datasets.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:10,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected. For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities. Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.	
Historical Land Use Information (1:2,500)	2
The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative. For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.	
Historical Land Use Information (1:10,000)	3
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses. For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.	
Ground Stability Data (1:50,000)	4
The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.	
Motion Map Data (1:2,500)	-
The Motion Map Data (1:2,500) section contains data which is plotted to indicate long-term stability trends from analysis of satellite radar data.	
Historical Map List	6
The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.

Ayrshire

Published 1859 - 1860

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1946

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

10k Raster Mapping

Published 2006

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

- 1 - 2m estimated 100yr flood depth
- Over 2m estimated 100yr flood depth

The flooded areas have been generated using a generalised technique and should not, by themselves, be used to infer that specific areas are or are not at risk of inundation. Flood risk at any specific location may be influenced by local factors - not least flood defence - that have not been taken into account.

Geology 1:10,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:10,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around a site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page.

Please Note: Not all of the layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Envirocheck® Geology

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Envirocheck® Geology

Superficial Geology

BGS 1:10,000 Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Envirocheck® Geology

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults and thin beds mapped as lines such as coal seams and mineral veins. These are not restricted by age and could relate to features of any of the 1:10,000 geology datasets.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:10,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected. For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities. Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.	
Historical Land Use Information (1:2,500)	2
The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative. For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.	
Historical Land Use Information (1:10,000)	3
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses. For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.	
Ground Stability Data (1:50,000)	4
The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.	
Motion Map Data (1:2,500)	-
The Motion Map Data (1:2,500) section contains data which is plotted to indicate long-term stability trends from analysis of satellite radar data.	
Historical Map List	6
The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.

Envirocheck®

Ayrshire

Published 1859 - 1860

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Envirocheck®

Ayrshire

Published 1910 - 1911

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1946

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

10k Raster Mapping

Published 2006

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.
