R.F. - I.F. CHASSIS

**SERVICE SELECTOR ELECTRICAL PARTS LIST**

C1	3-219	Capacitor, fixed: paper; 0.5 mfd; 200 V; ±25%
J1	9-276	Connector, female: 1 contact; shielded
J2		Same as J1
J3		Same as J1
J4		Same as J1
P1	9-366	Connector, chassis: male; 8 pin
S1	5C-4804	Switch, push button; 5 position

**RECORD CHANGER ELECTRICAL LIST.**

(DE-1978—Type 7007-A1)		
C1	3-1257	Capacitor, fixed: paper; .02 mfd; 600 V
P1	9-340	Connector, male: 2 prong
R1	RC21BF473K	Resistor, fixed: composition; 47,000 ohm; 1/2 W; ±10%
RC1	69-2	Record Changer, Intermix
L2	39-5	Lamp, incandescent, 6 W; 110 V
S2	5-222	Switch, sensitive, SPST, spring return, normally closed
(DE-1979—Issue 3—Type 7018-A1)		
C1	3-1257	Capacitor, fixed: paper; .02 mfd; 600 V
L2	39-5	Lamp, incandescent, 6 watt; 110 V
P1	9-340	Connector, male: 2 prong
R1	RC21BF473K	Resistor, fixed: composition; 47,000 ohm; 1/2 W; ±10%
RC1	69-1	Record Changer, non-Intermix
S2	5-222	Switch, sensitive, SPST, spring return, normally closed

**CATHODE-RAY TUBE AND OTHER CABINET MOUNTINGS ELECTRICAL PARTS LIST.**

(DE-1952—Type 7008-A1)		
M1	30-739	Meter, 150 ma., zero center, dwgs. no. DD4649B with scale dwg. DD4640B
(DE-1957—Issue 2—Type 7005-A1)		
F1	11-54	Fuse, cartridge: 8 amp; 250 V
F2		Same as F1
L1	40-6	Lamp, glow: neon; 115 V; 1/4 watt
L1	21-C4882-101	Focus Coil Assembly
L2	21-354	Inductor, fixed: deflection yoke
S1	5-51	Switch, push: SPST
S7		Same as S1
(DE-1958—Issue 1—Type 7012-A1)		
F1	11-54	Fuse, cartridge: 8 amp; 250 V
F2		Same as F1
L1	40-6	Lamp, glow: neon; 115 V; 1/4 watt
L1	21-C4882-101	Focus Coil Assembly
L2	21-354	Inductor, fixed: deflection yokes
S1	5-51	Switch, push: SPST
(DE-2014—Issue 2—Type 7017-A1)		
LS1	53-11	Speaker, Dynamic, 12"
(DE-2013—Issue 1—Type 7006-A1)		
LS1	30-761	Loudspeaker, 15", Permanent Magnet Dynamic
(DE-2060—Issue 1—Types 7022-A1, A2, 7023-A1)		
M1	53-60	Motor, A.C.: series; 100 pound inches
F1	11-56	Fuse, cartridge: 1/2 amp; 250 V
P1	9-340	Connector, male: 2 prong
S3	5-218	Switch, sensitive: SPST, normally open
S4	5-217	Switch, sensitive: SPST, normally closed
S5		Same as S4
S6	5-220	Switch, pull: SPDT; no off
V1	25-20BP4	Tube, electron: type 20BP4; cathode-ray
(DE-2061—Issue 1—Types 7024-A1, A2, 7025-A1, A2, and 7026-A1, A2)		
V1	25-15AP4	Tube, electron: Type 15AP4, cathode-ray

NOTE: PIN CONNECTIONS ON J1 ARE SHOWN FROM BOTTOM OR WIRING SIDE OF CONNECTOR.  
CONNECTIONS ON P1 ARE FROM TOP OR PLUS SIDE.

PARTS LIST

AUDIO AMPLIFIER ELECTRICAL PARTS LIST DE-1949.

Type 7001-A

Table with columns: Sym-bol No., Reference Drawing or Part No., Description. Lists parts for Type 7001-A audio amplifier.

SWEEP CHASSIS ELECTRICAL PARTS LIST DE-1950.

Type 7002-A1

Table with columns: Sym-bol No., Reference Drawing or Part No., Description. Lists parts for Type 7002-A1 sweep chassis.

Table with columns: Part No., Description. Lists parts for various components including capacitors, resistors, and transformers.

Table with columns: Part No., Description. Lists parts for various components including resistors, capacitors, and tubes.

RF ASSEMBLY ELECTRICAL PARTS LIST DE-1955.

Type 7027-A1

Table with columns: Part No., Description. Lists parts for Type 7027-A1 RF assembly.

Table with columns: Part No., Description. Lists parts for various components including coils, tubes, and resistors.

IF ASSEMBLY ELECTRICAL PARTS LIST DE-1951.

Type 7003-A1

Table with columns: Part No., Description. Lists parts for Type 7003-A1 IF assembly.

Table with columns: Part No., Description. Lists parts for various components including tubes, resistors, and capacitors.

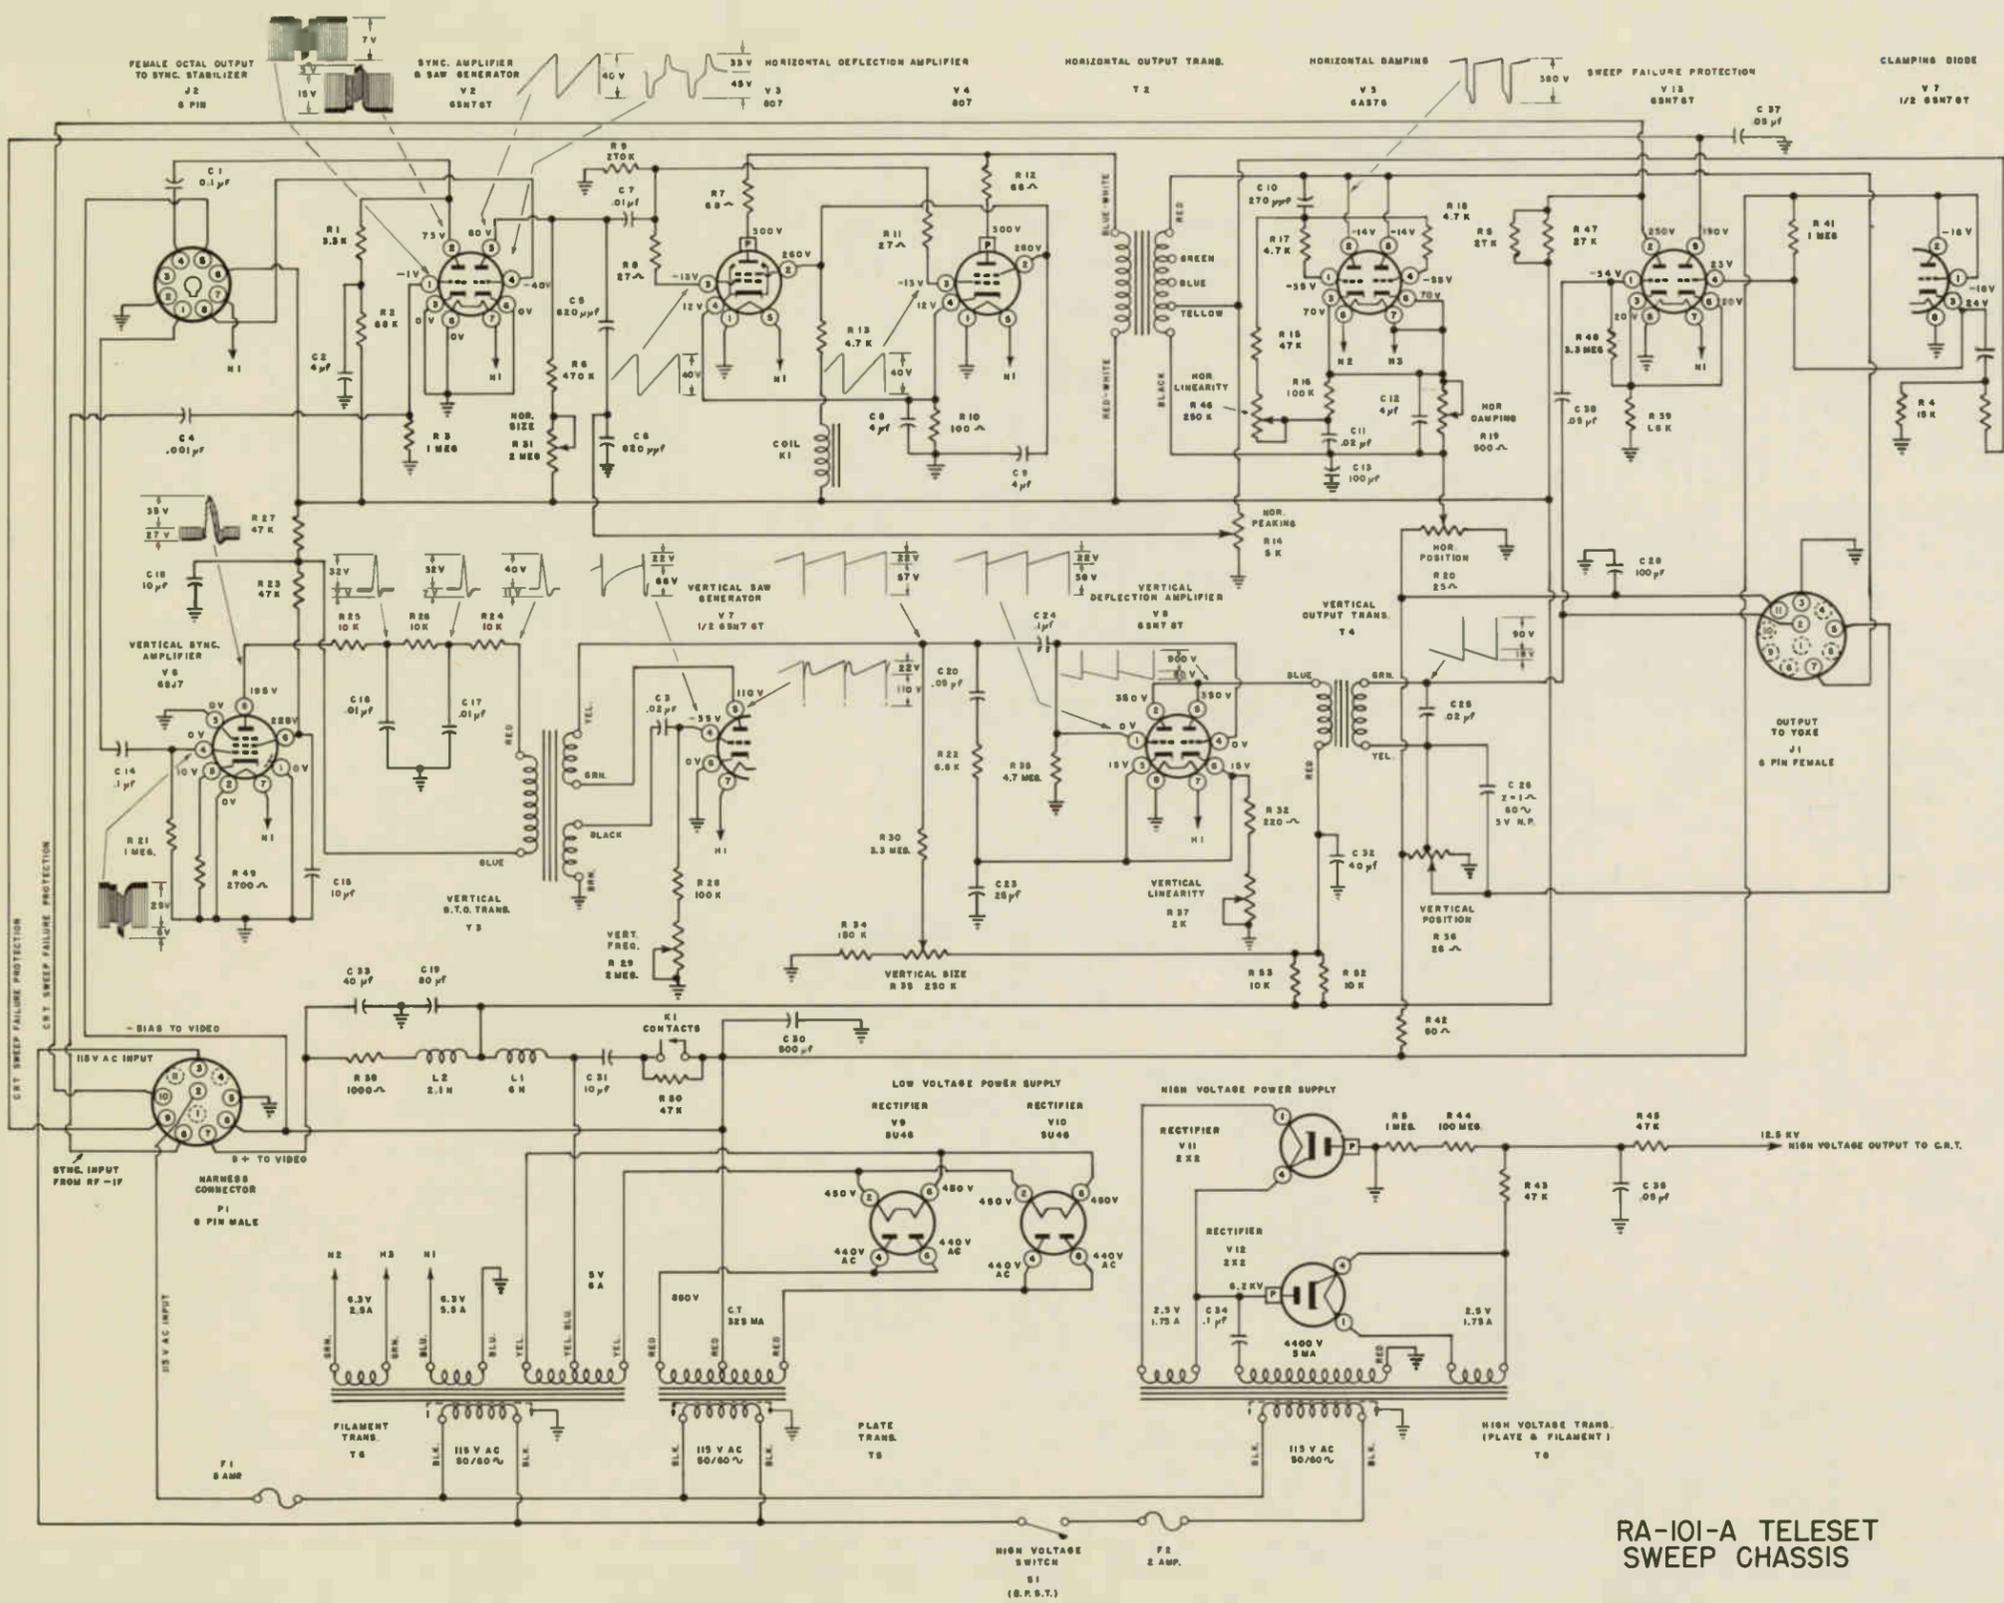

Table with columns: Part No., Description. Lists parts for various components including tubes, resistors, and capacitors.

Table with columns: Part No., Description. Lists parts for various components including tubes, resistors, and capacitors.

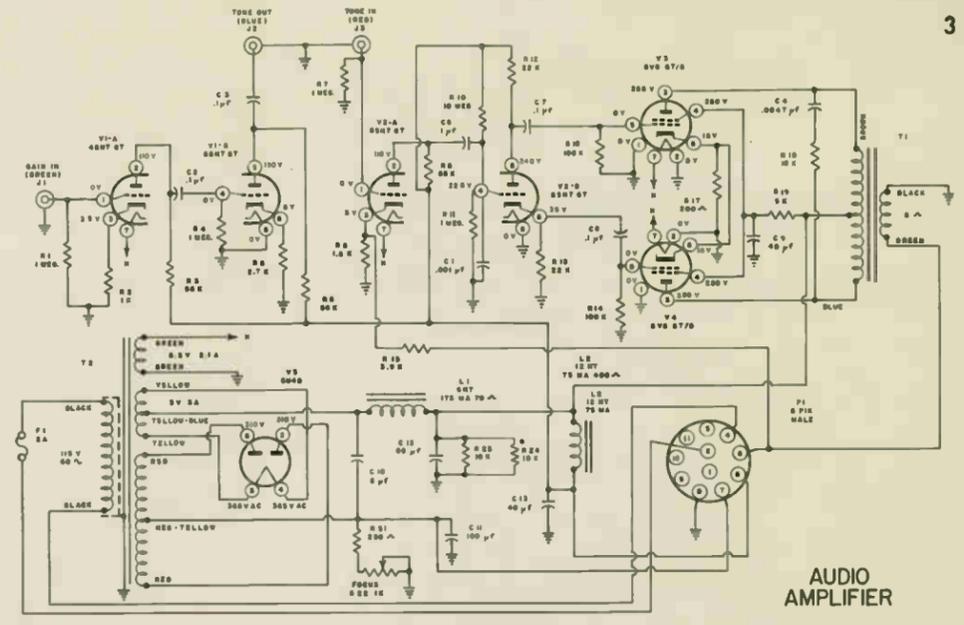

TONE SELECTOR ELECTRICAL PARTS LIST DE-1953.

Type 7009-A1

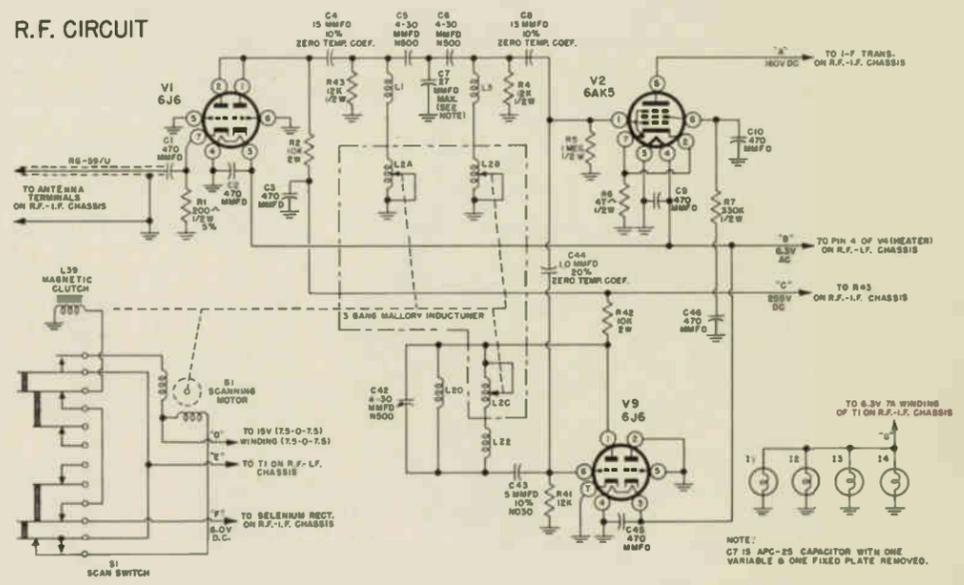

Table with columns: Part No., Description. Lists parts for Type 7009-A1 tone selector.

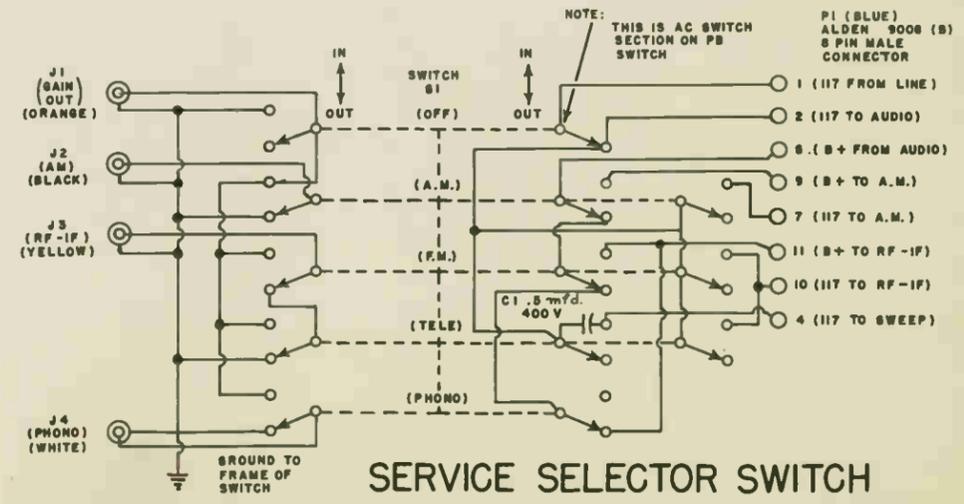

RA-101-A TELETSET SWEEP CHASSIS

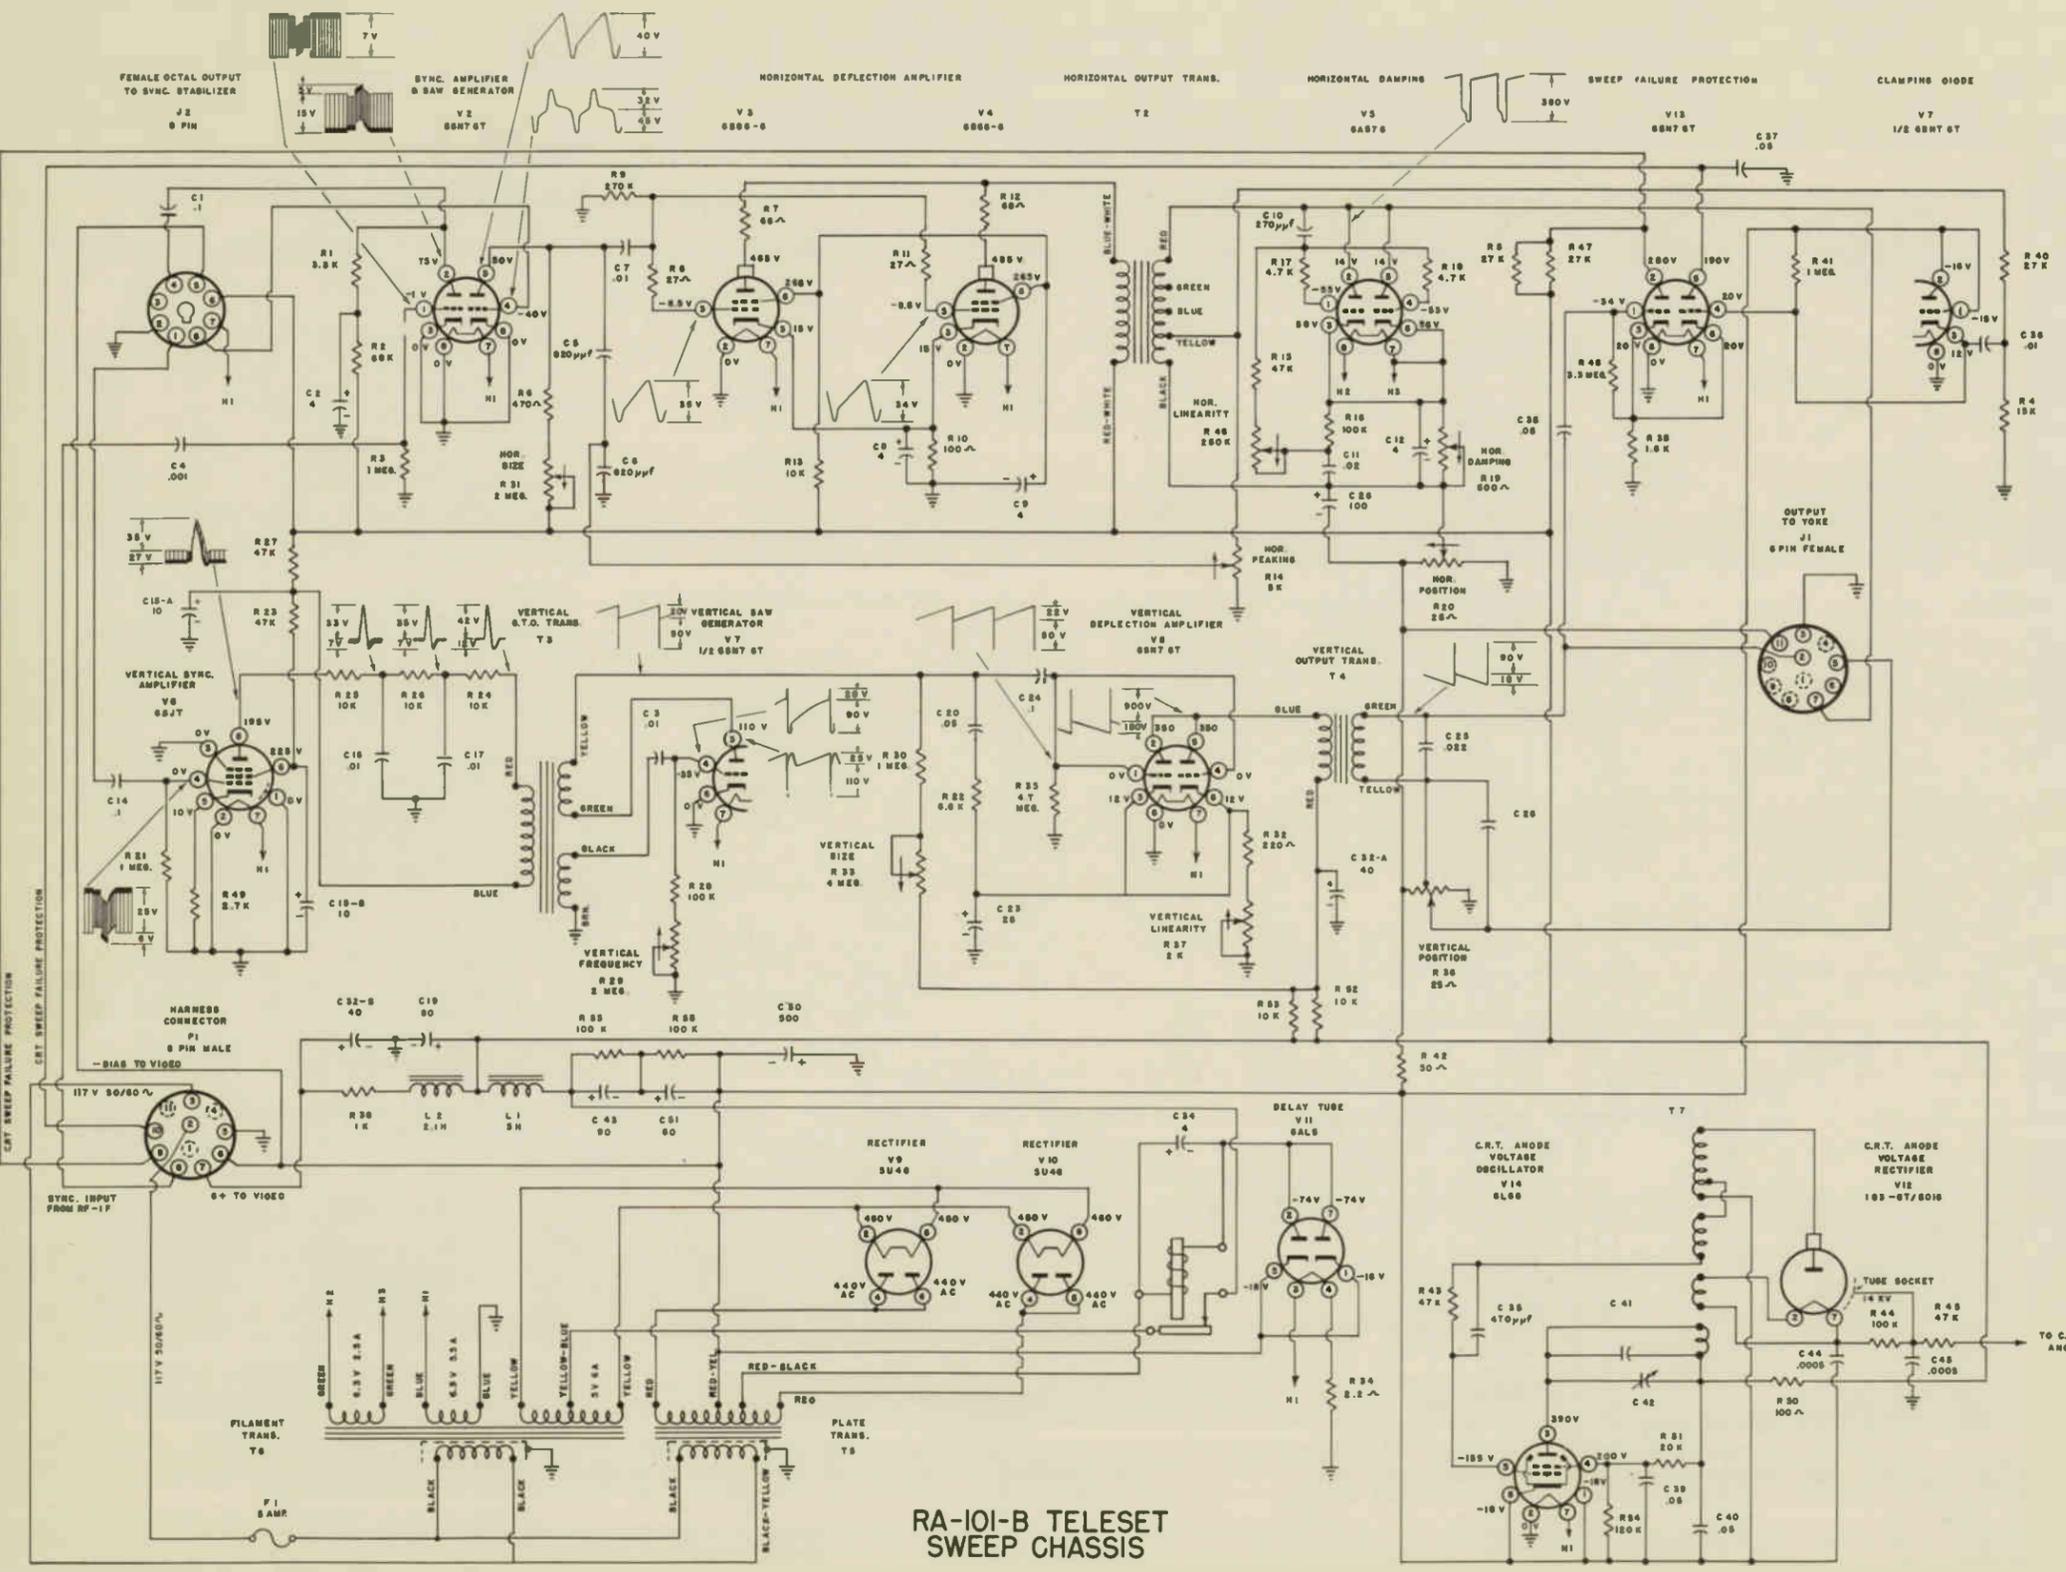

AUDIO AMPLIFIER

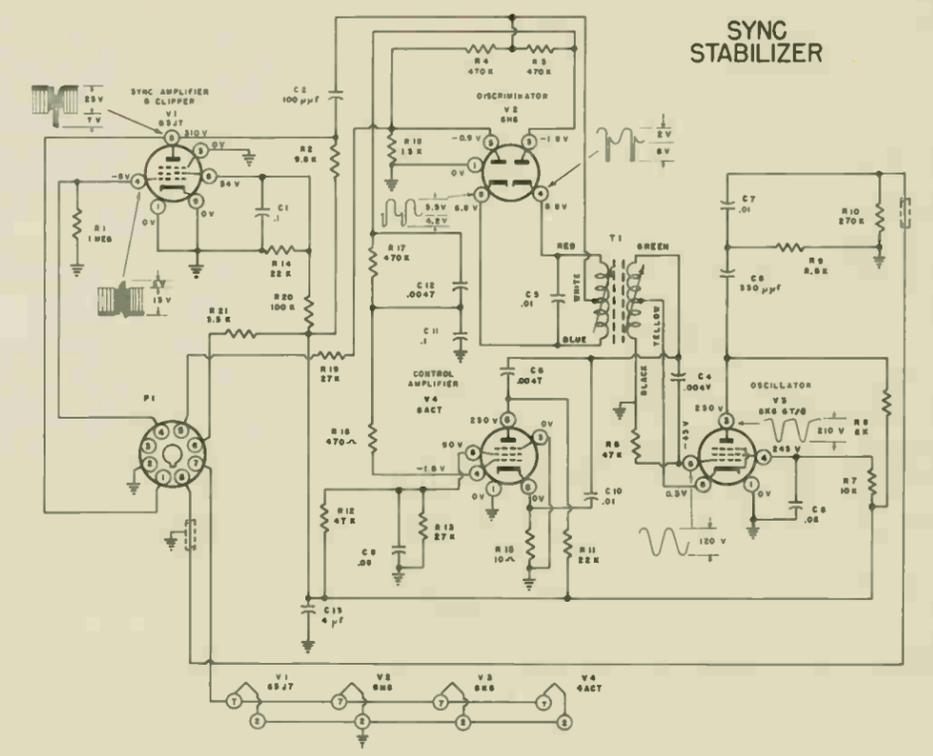

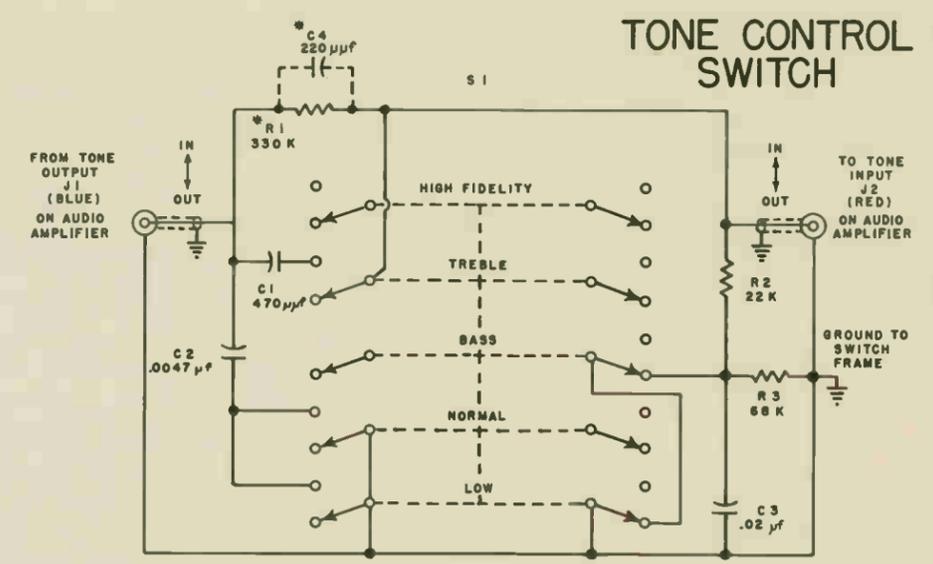

R.F. CIRCUIT

SERVICE SELECTOR SWITCH

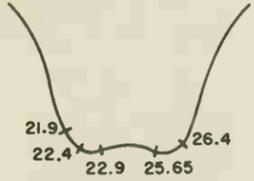

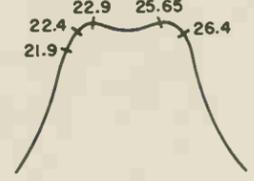

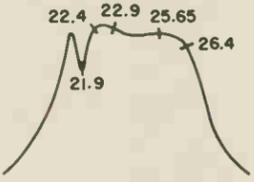

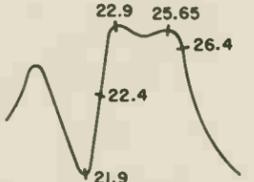

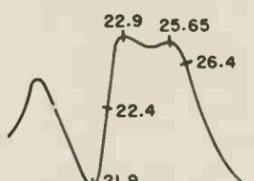

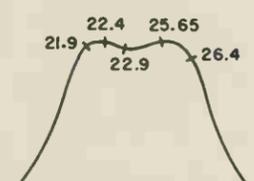

RA-101-B TELESET SWEEP CHASSIS

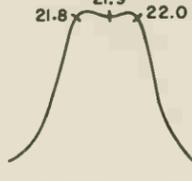

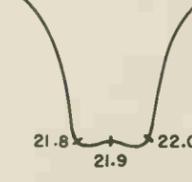

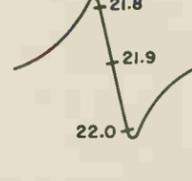

SYNC STABILIZER

**VIDEO IF ALIGNMENT RA-101**

Before beginning alignment, see notes. Remove 6J6 (V1) RF amplifier, 6AK5 (V2) mixer and 6J6 (V9) oscillator tubes. Use 6AK5 (V2) mixer tube with short length of wire connected to pin 1 ((see figure 1).

STEP	SIGNAL GENERATOR		OSCILLOGRAPH	ADJUST	WAVEFORM	REMARKS
	FREQUENCY	CONNECT TO				
1	24 mc. center frequency 10 mc. deviation (min.)	Pin 4 - V14	Pin 8 - V16 Direct	L 37 L 44		Use high generator output and low scope gain. Be careful to avoid overload.
2	As above	Pin 1 - V13	Pin 8 - V14 use Xtal Probe	L 34 L 35		As above.
3	As above	Pin 1 - V12	Pin 5 - V13 use Xtal Probe	L 31 L 32 L 9		As above. Sound trap L 9 adjusts the 21.9 mc dip in curve.
4	As above	Pin 1 - V11	Pin 5 - V12 use Xtal Probe	L 27 L 28 L 26		Use high generator output and low scope gain. Be careful to avoid overload. Sound trap L 26 adjusts the 21.9 mc dip in curve.
5	As above	Pin 1 - V10	Pin 5 - V11 use Xtal Probe	L 24 L 25		Use high generator output and low scope gain. Be careful to avoid overload.
6	As above	Pin 1 - V2	Pin 5 - V10 use Xtal Probe	L 5 L 6		As above. Readjust the contrast control if necessary.
7	As above	As above	Pin 8 - V16 Direct			As above. Overall response curve. See phasing adjustment.
8	4.5 mc. 400 cps AM	Pin 7 - V19	Pin 8 - V16 use Xtal Probe	L 48	Minimum scope indication.	Frequency must be accurate. Use crystal oscillator or crystal calibrated signal.

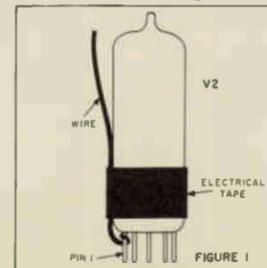

**SOUND IF ALIGNMENT RA-101**

STEP	SIGNAL GENERATOR		OSCILLOGRAPH	ADJUST	WAVEFORM	REMARKS
	FREQUENCY	CONNECT TO				
1	22 mc. center frequency 1 mc deviation (min.)	Pin 1 - V3	Pin 5 - V4 use Xtal Probe	Z2 Primary and secondary		Use high generator output and low scope gain. Be careful to avoid overload.
2	As above	Pin 1 - V4	Pin 5 - V5 Use Xtal Probe	Z3 Primary and secondary	As above	As above
3	As above	Pin 1 - V5	Junction R25 and R27 Direct	Z4 Primary and secondary		Avoid overload. Connect 100K resistor in series with scope lead.
4	As above	Pin 1 - V3	As above	Z2 Z3 Z4 If necessary	As above	As above. Overall sound IF curve.
5	As above	Pin 1 - V7	Pin 1 - V8 Direct	Z5 Primary and secondary		Discriminator curve. Adjust for maximum curve. Re-adjust Z3, Z4 if necessary.
STEP	SIGNAL SOURCE		ADJUST	INDICATION	REMARKS	
6	TV Signal test pattern. Adjust for best picture quality.		Z5 secondary (top slug)	Tuning meter swing equal either side of sound carrier.	Best picture quality and tuning meter null should coincide.	

**PHASING**

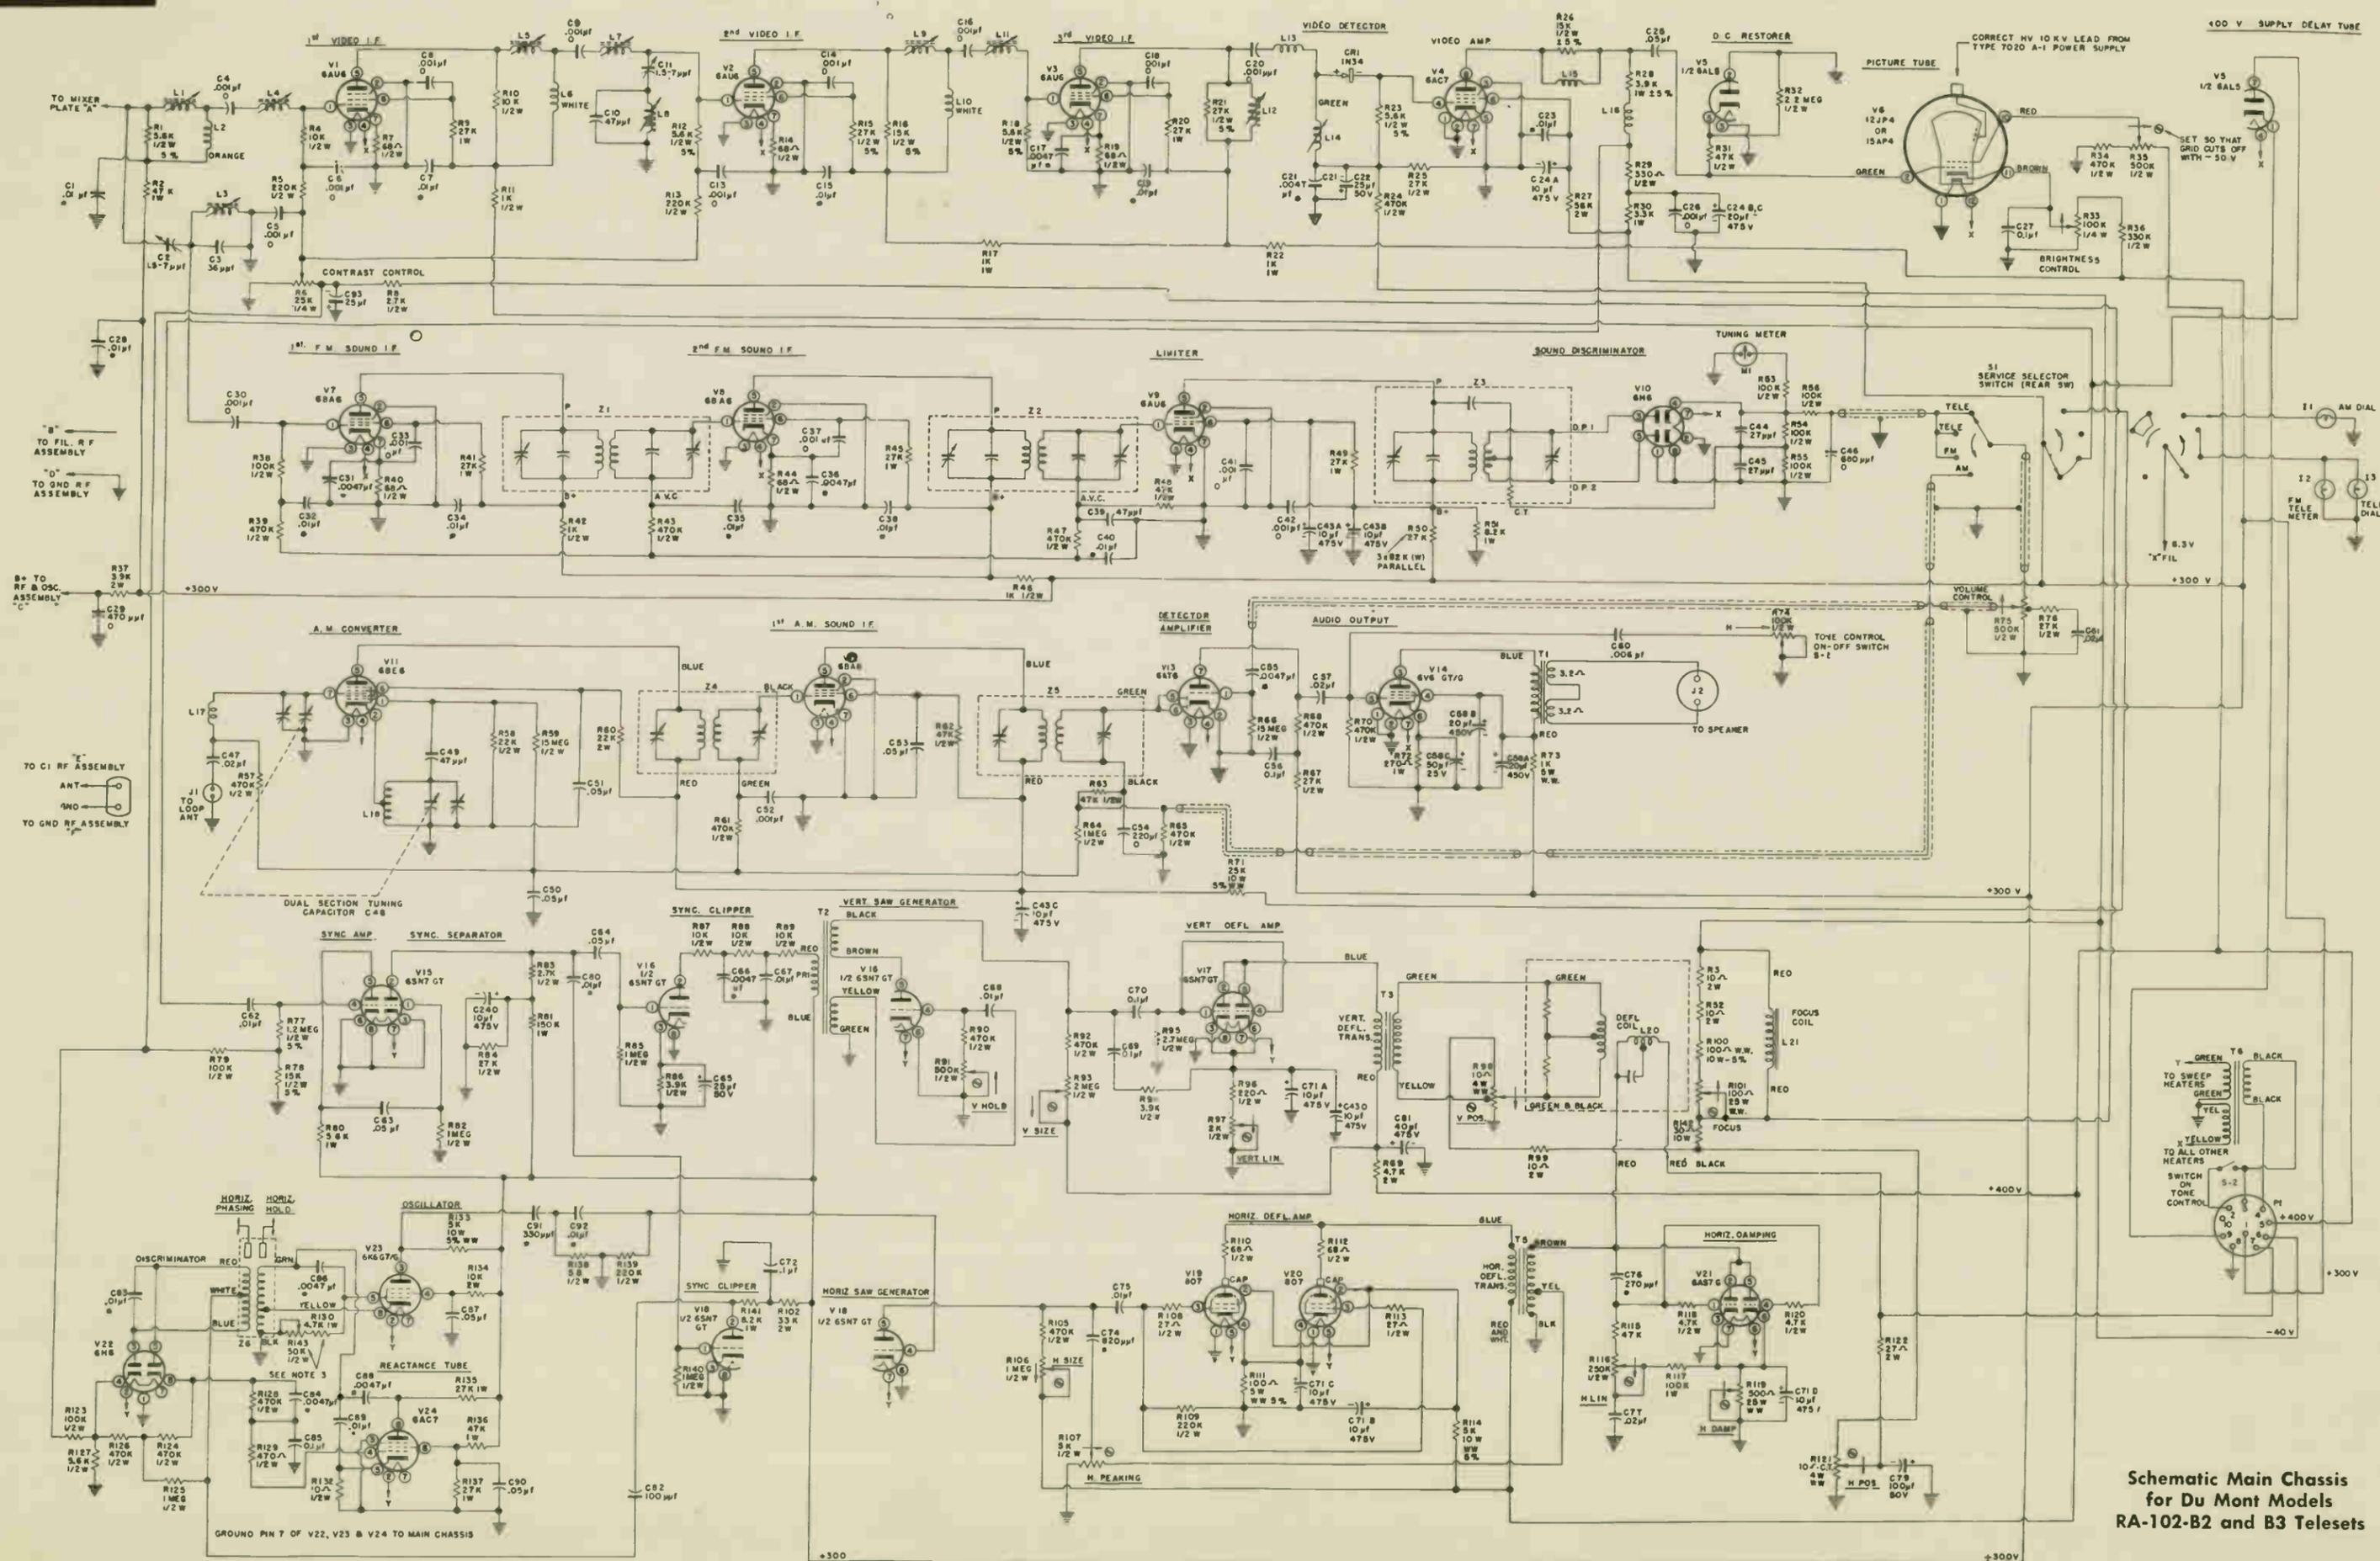

- When the alignment procedure has been completed, the phasing of the video IF strip should be checked and corrected if required.
1. Tune the receiver to the best signal available, preferably a station transmitting a test pattern.
  2. Adjust the Fine Tuning control to tuning meter null point.

3. Carefully examine the picture for ringing or the presence of spurious black response (smear) following black elements of the picture.
4. If either of these conditions is encountered, the V.I.F. slugs may be readjusted slightly to correct either condition.

**ALIGNMENT NOTES**

1. Remove the i-f, audio, sweep and sync chassis, yoke, focus-coil, service selector switch, tuning meter and inter-chassis cables from cabinet for required bench set up.
2. Place service selector switch in the TV position.
3. Disable the sweep chassis high voltage.  
RA-101A — Place high voltage switch in off position.  
RA-101B — Remove 1B3 high voltage rectifier tube.

for Du Mont Models  
RA-102-B2 and B3 Teletests

PARTS LIST

Table with columns: Sym. No., Reference Drawing or Part No., Description, Part No., Description, Part No., Description, Part No., Description, Part No., Description. Lists various electronic components like capacitors, resistors, lamps, and transformers.

Continuation of the parts list table, listing components such as resistors, capacitors, and transformers with their respective part numbers and descriptions.

RF ASSEMBLY section listing components like capacitors and transformers used in the radio frequency section.

AM TUNER PARTS section listing components like capacitors and transformers used in the AM tuner section.

RF SECTION PARTS section listing components like capacitors and transformers used in the radio frequency section.

CLIFTON CABINET PARTS section listing components like dials, knobs, and switches used in the Clifton cabinet.

POWER SUPPLY CHASSIS PARTS section listing components like capacitors, resistors, and transformers used in the power supply chassis.

CLUB CABINET PARTS section listing components like dials, knobs, and switches used in the Club cabinet.

INDICATOR (RECEIVER) CHASSIS PARTS section listing components like capacitors, resistors, and transformers used in the indicator (receiver) chassis.

## POWER SUPPLY CHASSIS

Tube	Pin No.	Voltage

T 401	5.5	200.0

**ALIGNMENT PROCEDURE FOR DUMONT AM TUNER**

The alignment should be made with the volume control fully on and tone control set for high frequency response. The output from the signal generator should be maintained as low as possible to prevent A. V. C. action from interfering with the correct alignment.

Connect an output meter across the voice coil of the speaker. Turn on signal generator and AM Tuner for approximately five minutes to stabilize. Connect a common ground to each unit. When connecting the signal generator output leads to the receiver, place a .25 mfd condenser in series with the inner conductor of the signal generator output lead.

1. Turn the tuning dial to the extreme low frequency end. (Gang condenser fully closed.)
2. Connect the signal generator output lead to the converter stator of the tuning capacitor C 401.
3. Set signal generator to 455 KC, and adjust tuning slugs on I. F. coils Z 402 and Z 401 (secondary and primary) in the order given for maximum deflection, reducing generator output as required. Repeat tuning until maximum output is obtained.
4. Connect generator to antenna input terminal.
5. Turn tuning dial pointer to 1500 KC. Feeding in a 1500 KC signal from generator adjust RF, converter and oscillator trimmers on tuning capacitor C 401 for maximum audio output.

**DUMONT A.M. TUNER USED IN  
\*SAVOY AND WELLINGTON TELESETS**

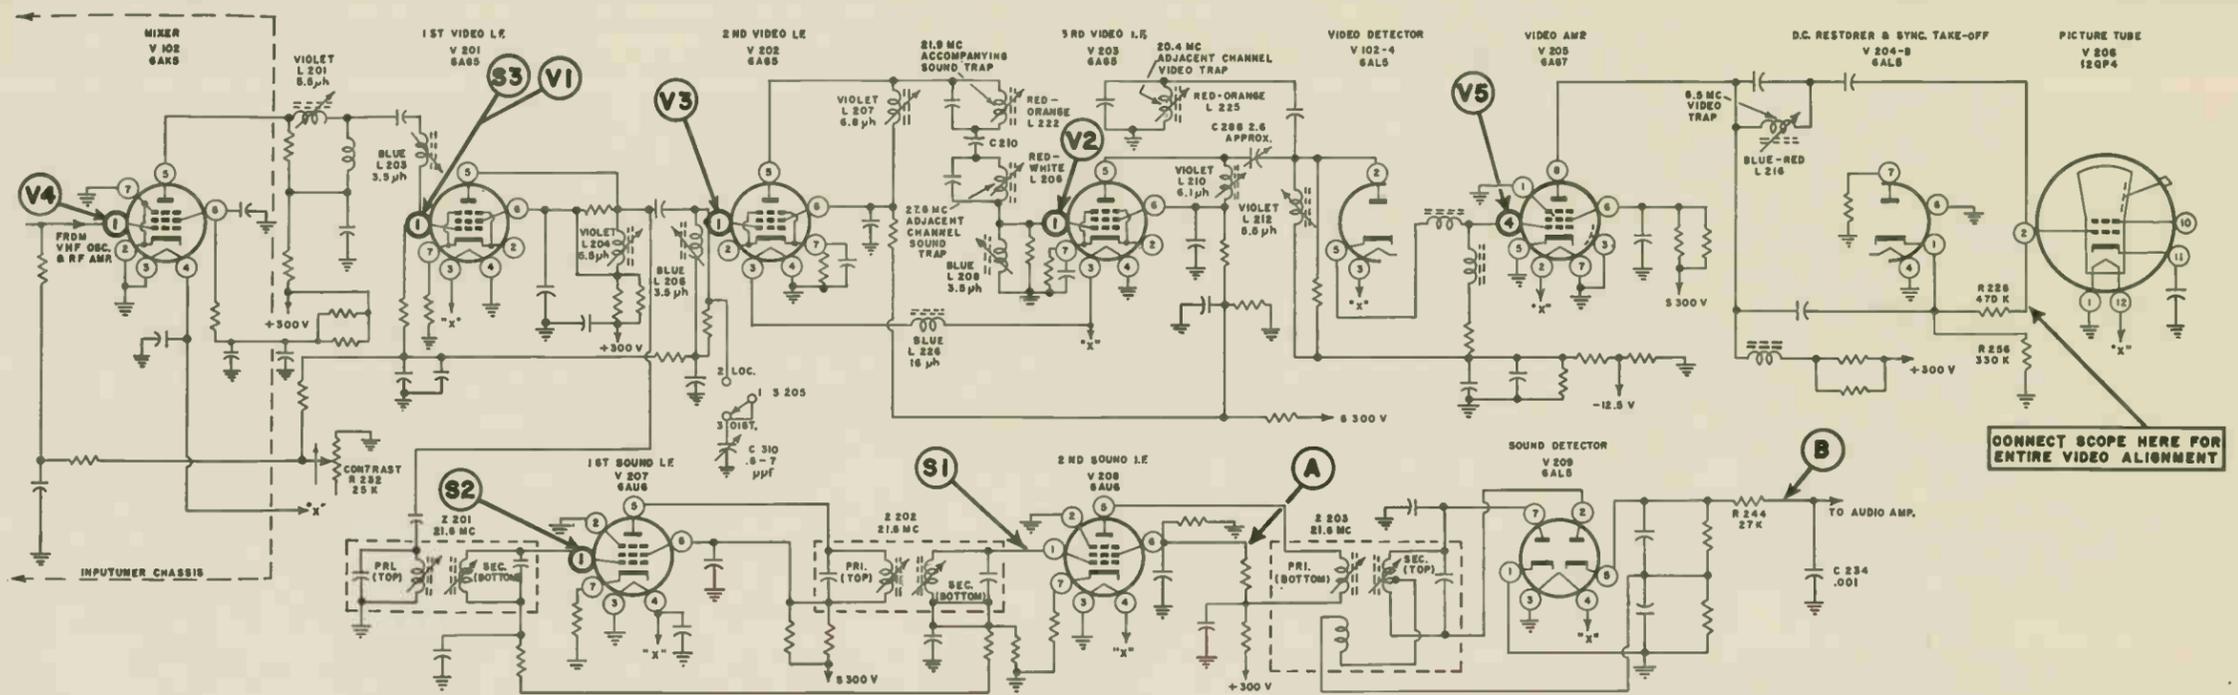

PHASE CORRECTION PROCEDURE

Even though the alignment has been performed properly, it is usually necessary to correct the phase response of the video IF strip in order to remove smear and ringing from the picture. The procedure for this is to tune in to a strong test pattern known to be of good quality and ghost-free (by observation on several normal Tele-sets). If smear or ringing is observed, the following adjustments are recommended. No other adjustments should be made. Limit adjustments only to those absolutely necessary.

Make the following adjustments in the order given, not more than one-half turn either way.

- Smear: L207, L208, L212, L203
- Ringing: L204, L210, L211
- Resolution: L204, Primary (top) Z201, L222, L216

Be careful not to introduce sound into the picture.

ALIGNMENT PROCEDURE

The alignment of a Television receiver is a procedure that must be followed very carefully in order that the end result is comparable to that obtained when aligned at the factory.

Before attempting to align, the serviceman must be sure that alignment is required. If there is any doubt in the serviceman's mind regarding the need for alignment, a quick check can be made by viewing the overall response of the video IF strip. This is accomplished by performing step No. 6 in the alignment procedure.

EQUIPMENT NEEDED

Sweep Generator

This generator should be capable of putting out a band of frequencies from about 20 to 30 megacycles. Some means for identifying the frequency of various parts of the response curve must be available. To effect this, the sweep generator must either have an internal marker circuit or an external RF generator to perform the same function, will have to be used.

In the alignment table under the heading "Type of Input Signal Required," the description "Wobulated and unmodulated RF" means that both the sweep generator output (wobulator) and the unmodulated RF generator are to be fed into the point designated. It should be understood that both these units will have to be used if the sweep generator does not have an internal marker generator.

If, however, the sweep generator has an internal marker generator only the output from this one unit need be fed into the designated point.

Oscillograph

An oscillograph is used as a means of visually indicating the response of the stage or stages under observation.

GENERAL INFORMATION

All of this equipment must be securely grounded to the receiver being aligned. This grounding can be accomplished by using a metal top bench, preferably copper. If such a bench is not available, these units should be bonded together by the use of heavy metal braid between the chassis. Ordinary wire is not enough to effectively place all units at the same potential.

Once the equipment is set in place, the generators and receiver should be allowed to run at least 15 minutes before starting to align.

Additional equipment necessary for alignment is what is referred to as a 6AK5 adapter tube. This is simply a 6AK5 with a fine wire soldered to pin No. 1. It may be necessary to fasten this wire to the side of the tube with scotch tape to prevent it from shorting against the bottom of the shield. This tube is used to permit feeding the generator output into the grid of the mixer stage without disturbing the Inputuner.

In the procedure, reference is made to the use of a "Probe Detector." This device is merely a crystal rectifier with the necessary filter. Its purpose is to permit the observation of the response of a single stage when viewed ahead of the video detector.

VIDEO IF ALIGNMENT TABLE (RA-103D)

- Notes:
1. Remove 6AB4 oscillator V103 and 6J6 RF amplifier V101 from Inputuner before attempting to align set.
  2. Place tuner at extreme high end of range.
  3. Set R-232 to give -5V from center arm to ground on VTVM unless otherwise noted.

Step No.	To Adjust	Type of input signal required	Connect generator at point number	Scope thru crystal probe or direct	Remarks
1	L222 Z201 (top)	21.9 mc with 400 cycles AM	V1	Direct	Tune for minimum signal on scope.
2	L225	20.4 mc with 400 cycles AM	V1	Direct	Tune for minimum signal on scope.
3	L209	27.9 mc with 400 cycles AM	V1	Direct	Tune for minimum signal on scope.
4	L212 L210 C288	Wobulated and unmodulated RF 6 mc sweep	V2	Direct	Short junction of L209 and C210 to ground. Contrast control off. L212 tunes left side of curve. L210 tunes right side of curve. C288 affects band-width. Peaks should be even. Carrier must not exceed 15% down from right peak. See Fig. 1.
5	L208 L207 L209	Wobulated and unmodulated RF	V3	Direct	L208 positions center peak. L207 affects shoulder amplitude. L209 positions carrier on right shoulder. See Fig. 2.
6	L206 L204	Wobulated and unmodulated RF	V1	Direct	Use 100 mmf in series with generator. See Fig. 3.
7	L203 L201 L204 L206	Wobulated and unmodulated RF	V4 use 6AK5 with lead attached.	Direct	Use 100 mmf in series with generator. 22.9 mc marker slightly inside low frequency peak. 26.4 mc 50% down. See Fig. 4. If peak at 22.9 mc cannot be obtained, re-adjust L-208 slightly to get dashed curve of Fig. 2.
8	L216	4.5 mc with 400 cycles AM	V5	Probe detector	Tune for minimum signal on scope.

SOUND IF ALIGNMENT TABLE

1	Z203	21.9 mc with 400 cycles modulation	S1	Direct at point B	Detune secondary (top) Z203, tune bottom for maximum, then tune top for sharp minimum on scope.
2	Z203	Wobulated and unmodulated RF IMC sweep Set center frequency at 22 mc	S1	Direct at point B	If necessary, tune bottom for symmetry of curve.
3	Z202	Wobulated and unmodulated RF IMC sweep	S2	Direct at point A	Tune Z202 for maximum amplitude and symmetry. Primary (top) affects frequency. Secondary affects symmetry and amplitude. See Fig. 5.
4	Z201	Wobulated and unmodulated RF IMC sweep	S3	Direct at point A	Tune secondary (bottom) Z201. If necessary to obtain curve of Fig. 5, retune top and bottom of Z202 slightly.
5	Overall	Wobulated and unmodulated RF IMC sweep	S3	Direct at point B	If necessary readjust Z202 primary or secondary or Z201 secondary for symmetrical S curve.
6	See phase correction procedure.

NOTE:  
1. This tuner used on RA-103D Telesets beginning with serial number 033070 and RA-104A Telesets beginning with serial number 04924. Some earlier Telesets which utilize this tuner have ECN 1829 stamped on the right hand side of the main chassis. For all other RA-103D and RA-104A Telesets bearing earlier serial numbers see inputuner diagram issued with RA-105 service manual.  
2. This tuner used on all RA-110A Telesets.  
3. Issue #2. Date 7/19/49.

**VIDEO IF ALIGNMENT TABLE**

Step No.	To Adjust	Type of Input Signal Required	Connect Generator Leads Across	Connect Output Leads Across	Feed Output leads directly into Oscillograph or into Oscillograph via Probe Detector	Adjust to Conform to response. Curve Shows in	Remarks
1.	C213 L211 L212	Wobb and unmodulated R.F. signal.	Pin 1 (grid) V203 and chassis	Pin 1 (grid) V205 and chassis	Direct	Fig. 100	C213 adjusts curve for double peak. L211 and L212 adjusts markers. L209 should be shorted to ground.
2.	R251 AGC						Set for 3.2V. At junction of R246 and C226.
3.	L210 Z201 (top)	Mod. signal at 21.9 mc.	Pin 1 (grid) V201 and chassis	Pin 1 (grid) V205 and chassis	Direct	None	Adjust both for minimum output.
4.	L209	Mod. signal at 27.9 mc.	Pin 1 (grid) V201 and chassis	Pin 1 (grid) V205 and chassis	Direct	None	Adjust for minimum output.
5.	L207 L208	Wobb and unmodulated R.F. signal.	Pin 1 (grid) V202 and chassis	Pin 1 (grid) V205 and chassis	Direct	Fig. 101	
6.	L204 L206	Wobb and unmodulated R.F. signal.	Pin 1 (grid) V201 and chassis	Pin 5 (plate) V202 and chassis	Probe Detector	Fig. 102	
7.	To check 1st, 2nd and 3rd Video IF stages	Wobb and unmodulated R.F. signal.	Pin 1 (grid) V201 and chassis	Pin 1 (grid) V205 and chassis	Direct	Fig. 103	If necessary readjust L204 and L206
8.	L201 L203	Wobb and unmodulated R.F. signal.	Pin 1 (grid) V201 and chassis	Pin 5 (plate) V201 and chassis	Probe Detector	Fig. 104	Grid of V202 should be grounded.
9.	Check overall Video IF stages	Wobb and unmodulated R.F. signal.	Pin 1 (grid) V102 and chassis	Pin 1 (grid) V205 and chassis	Direct	Fig. 105	If necessary readjust L206, L204.

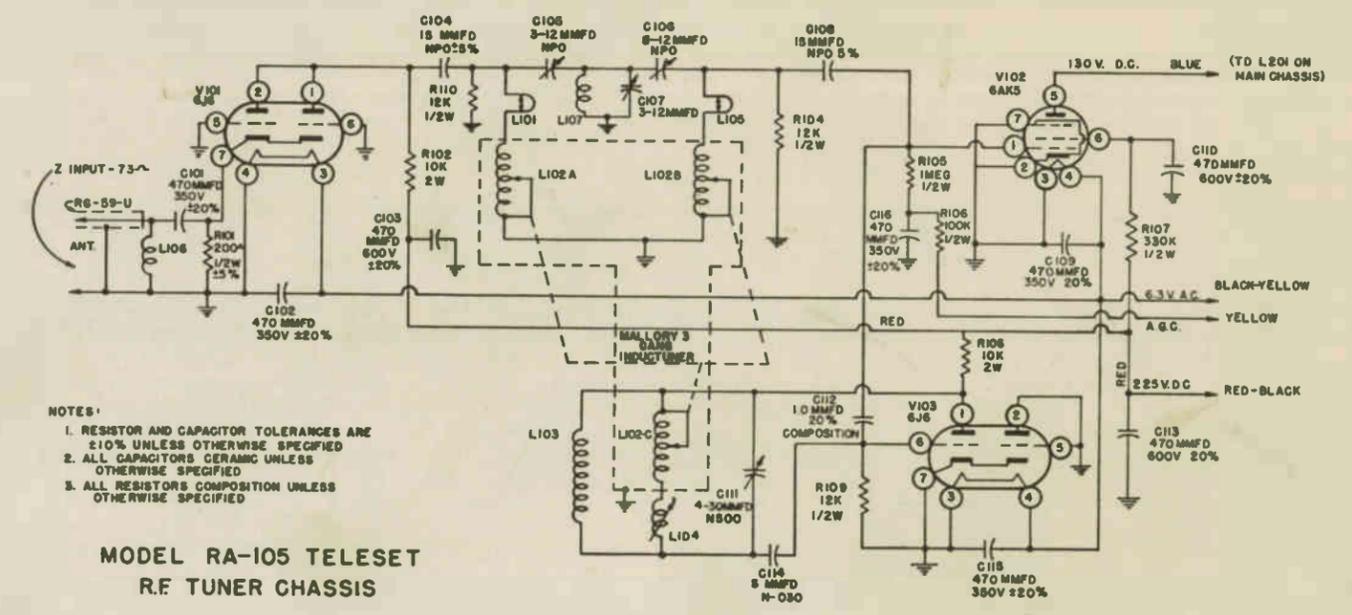

**SOUND IF ALIGNMENT TABLE**

1.	Z203	Wobb and unmodulated R.F. signal at 21.9 mc.	Pin 1 (grid) V211 and chassis	Pin 5 (plate) V212 and chassis	Probe Detector	Fig. 106	Adjust for a symmetrical response.
2.	Z202	Wobb and unmodulated R.F. signal at 21.9 mc.	Pin 1 (grid) V210 and chassis	Pin 5 (plate) V212 and chassis	Probe Detector	Fig. 107	Adjust for a symmetrical response.
3.	Z201 bottom coil	Wobb and unmodulated R.F. signal at 21.9 mc.	Pin 1 (grid) V201 and chassis	Pin 5 (plate) V212 and chassis	Probe Detector	Fig. 108	Adjust for a symmetrical response. (If AGC is set too high the 1st video IF tube will cut off, resulting in no signal.)
4.	Z204 top coil (sec.) bottom coil (pr.)	Wobb and unmodulated R.F. signal at 21.9 mc.	Pin 1 (grid) V201 and chassis	Junction of R274 and C250	Direct	Fig. 109	Center the 21.9 mc marker on S response curve with secondary control. Then adjust for maximum response with primary control.

**GRAIN TRAP ADJUSTMENT**

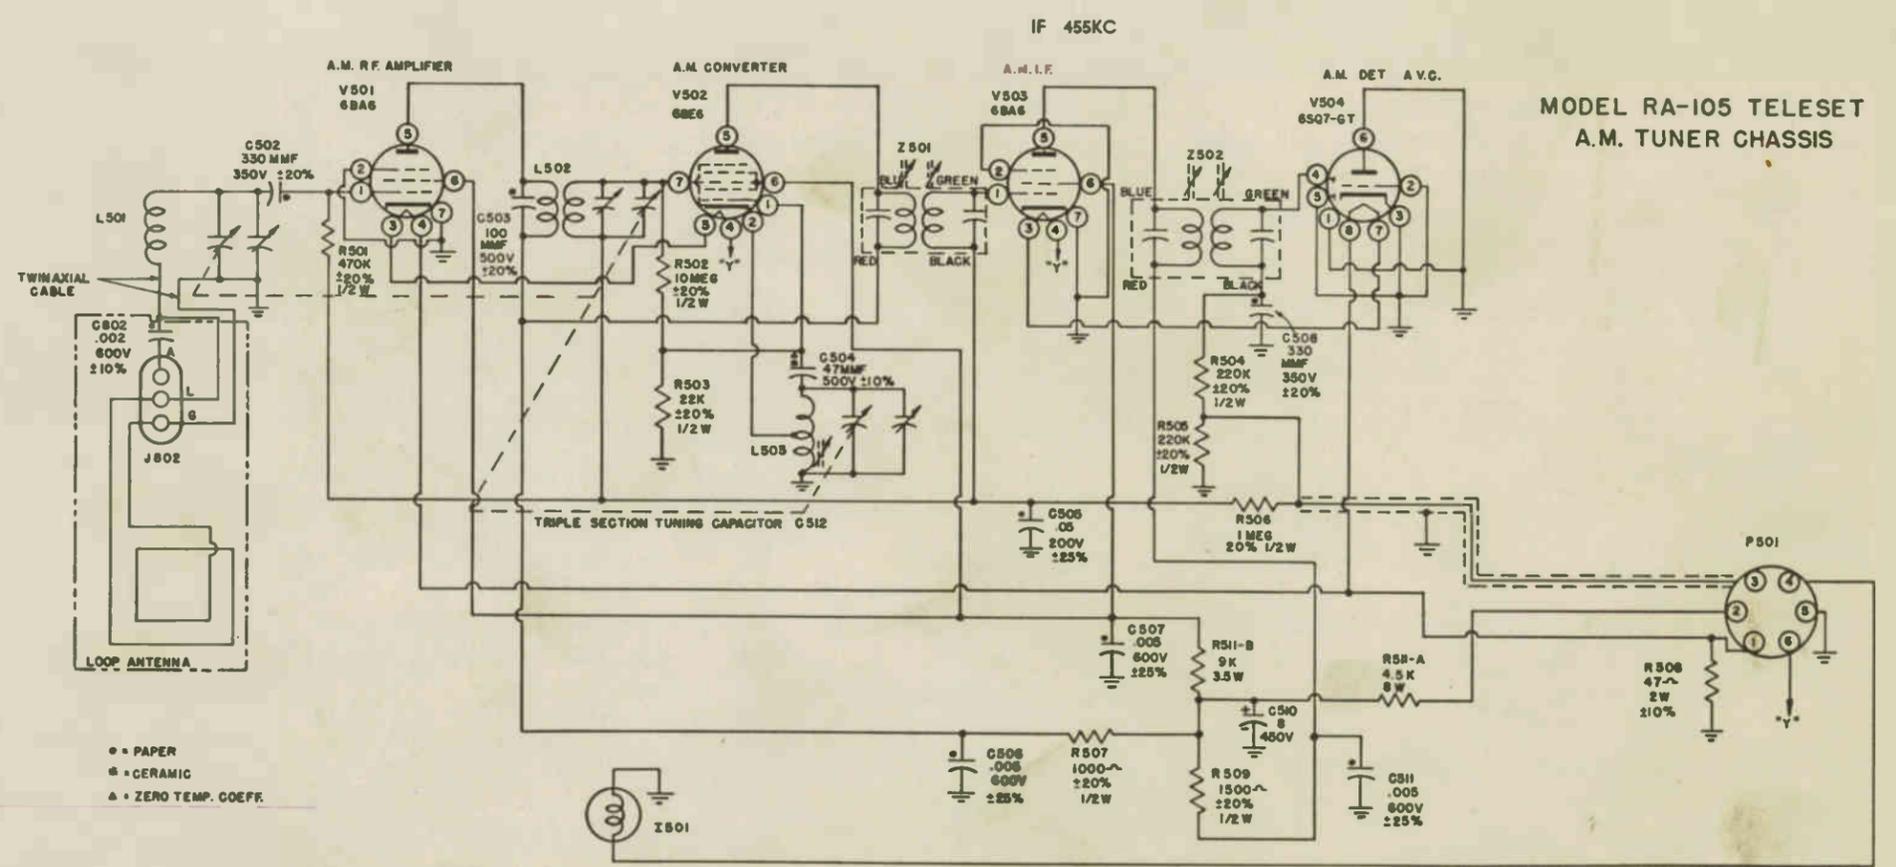

1.	L216	Modulated R.F. at 4.5 mc.	Pin 1 (grid) V205 and chassis	At grid, pin 2 CRT	Probe Detector		Adjust for minimum output. (Contrast control at maximum setting.)
----	------	---------------------------	-------------------------------	--------------------	----------------	--	---

\*Use 6AK5 adaptor. Connect hot lead of generator to the wire on Pin No. 1. After completing the alignment, be sure to properly adjust the AGC control.

RA-105B POWER SUPPLY RESISTANCE MEASUREMENTS

All Readings to Ground

Table with 10 columns: Tube, 1, 2, 3, 4, 5, 6, 7, 8, 9, Cap. Rows include V401, V402, V403, V404, V406, V407.

Note: All cables disconnected.

RA-108A POWER SUPPLY RESISTANCE MEASUREMENTS

All Readings to Ground

Table with 10 columns: Tube, 1, 2, 3, 4, 5, 6, 7, 8, 9. Rows include V701, V702, V703, V704, V705, V706, V707, V708.

Note: All cables disconnected.

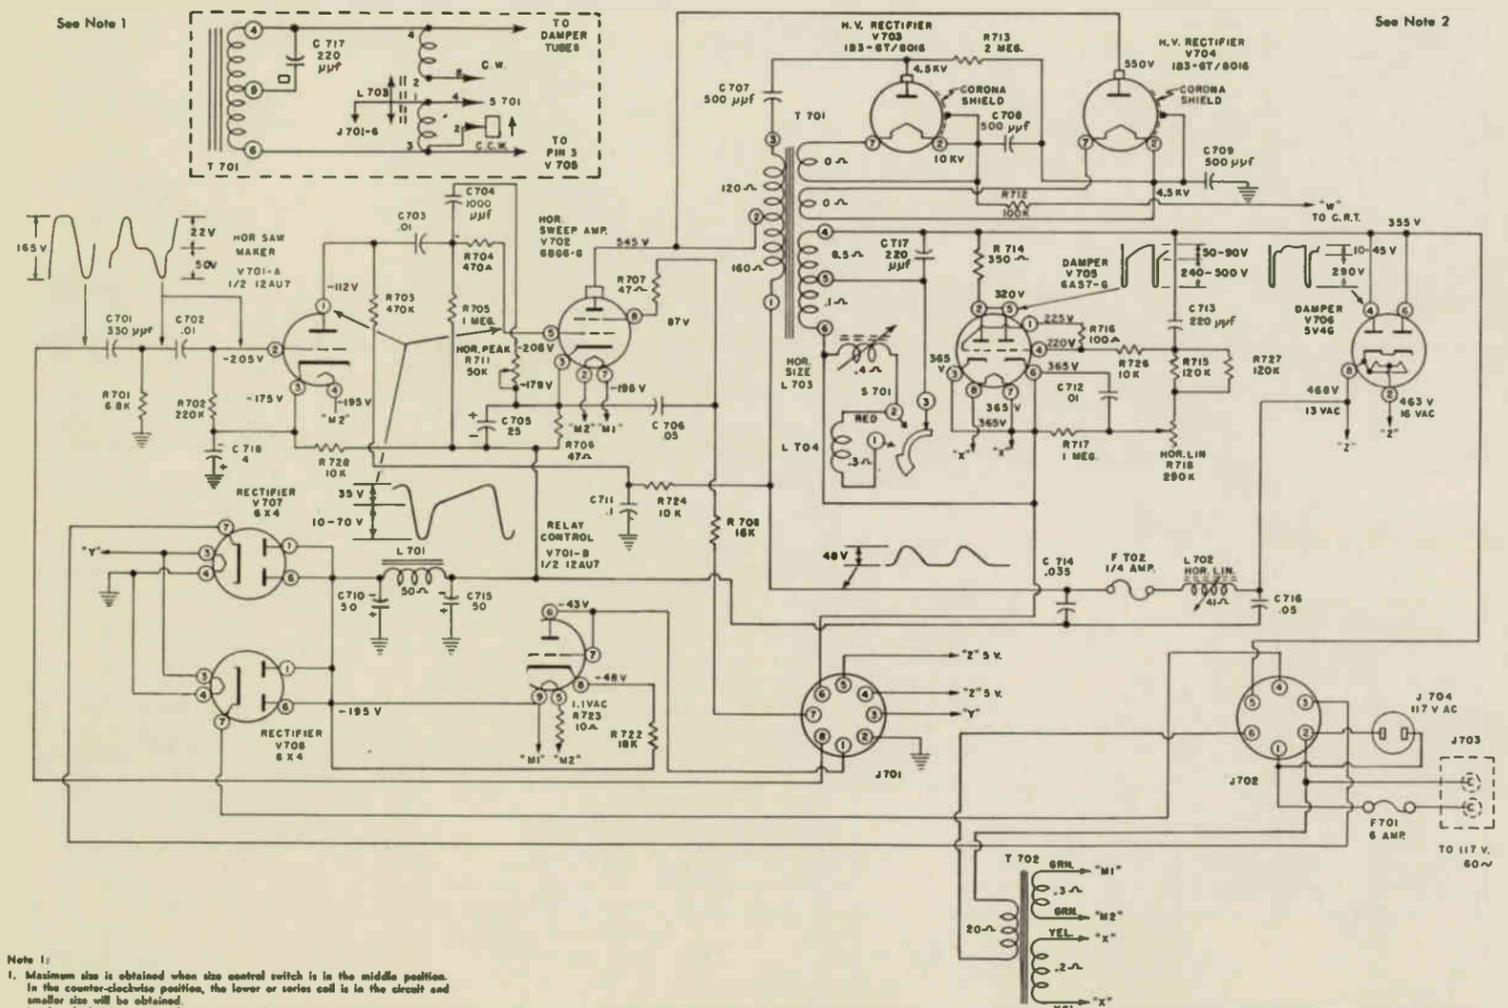

Instrument Used—EQA Model 195-A Volt-ohmyst (for voltage and resistance) All readings in ohms K = thousand m = million

POWER SUPPLY PARTS LIST RA-108A

Abbreviations used: Composition, E, Electrolytic, Pa, Paper, Cap, Resistor, Wire Wound. Unless otherwise stated, the tolerance shown is plus and minus of the indicated value.

Large parts list table for RA-108A with columns for Symbol No., Part No., Description, Symbol No., Part No., Description. Includes various capacitors, resistors, tubes, and other components.

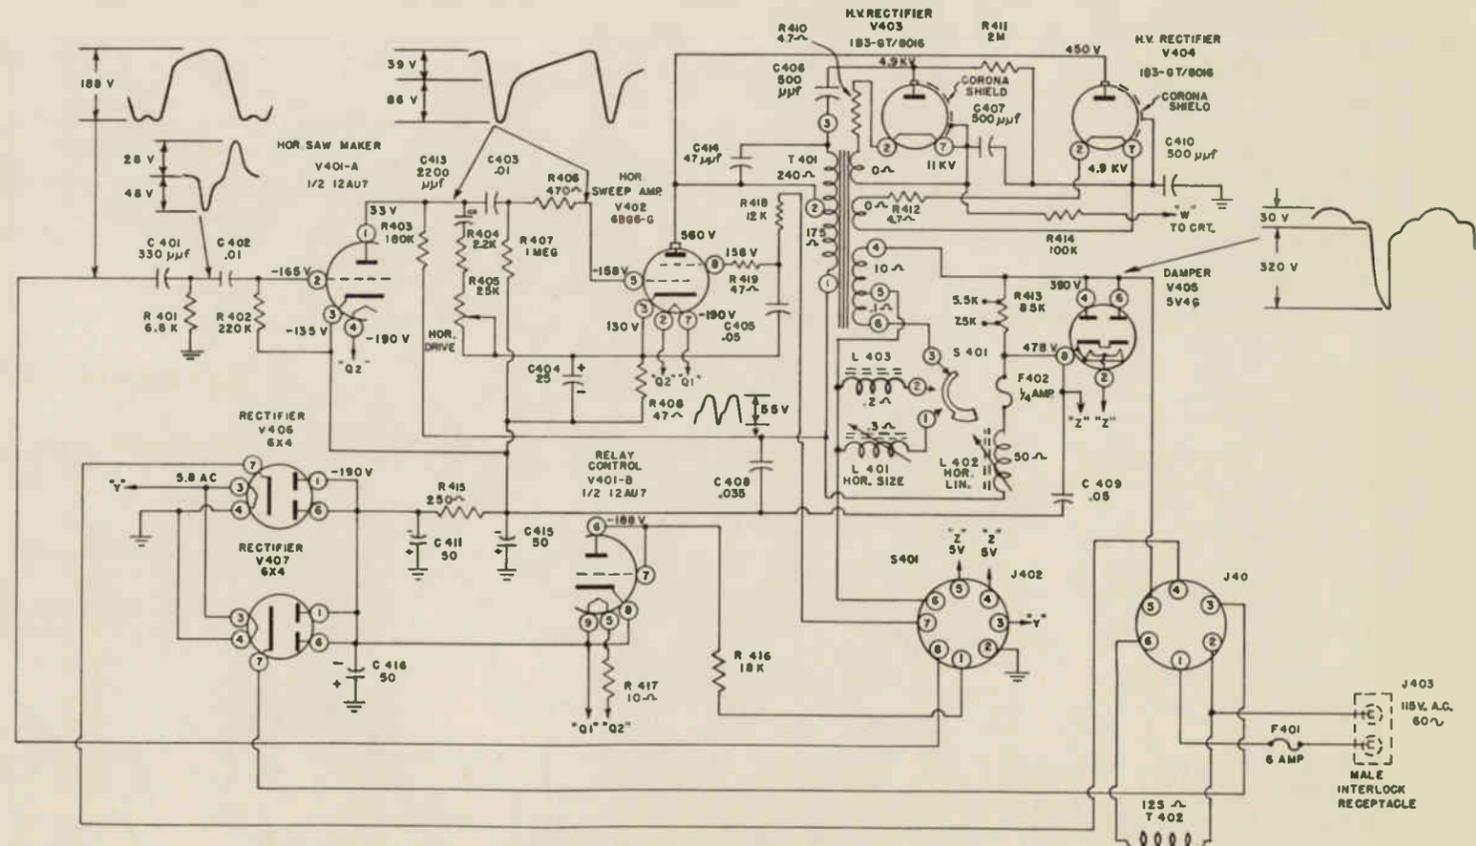

Late Model Sets: L703, S701, 21005321, 06003681, Inductor Hor Size, Switch 3 position

Note 1: Maximum size is obtained when size control switch is in the middle position. In the counter-clockwise position, the lower or series coil is in the circuit and smaller size will be obtained.

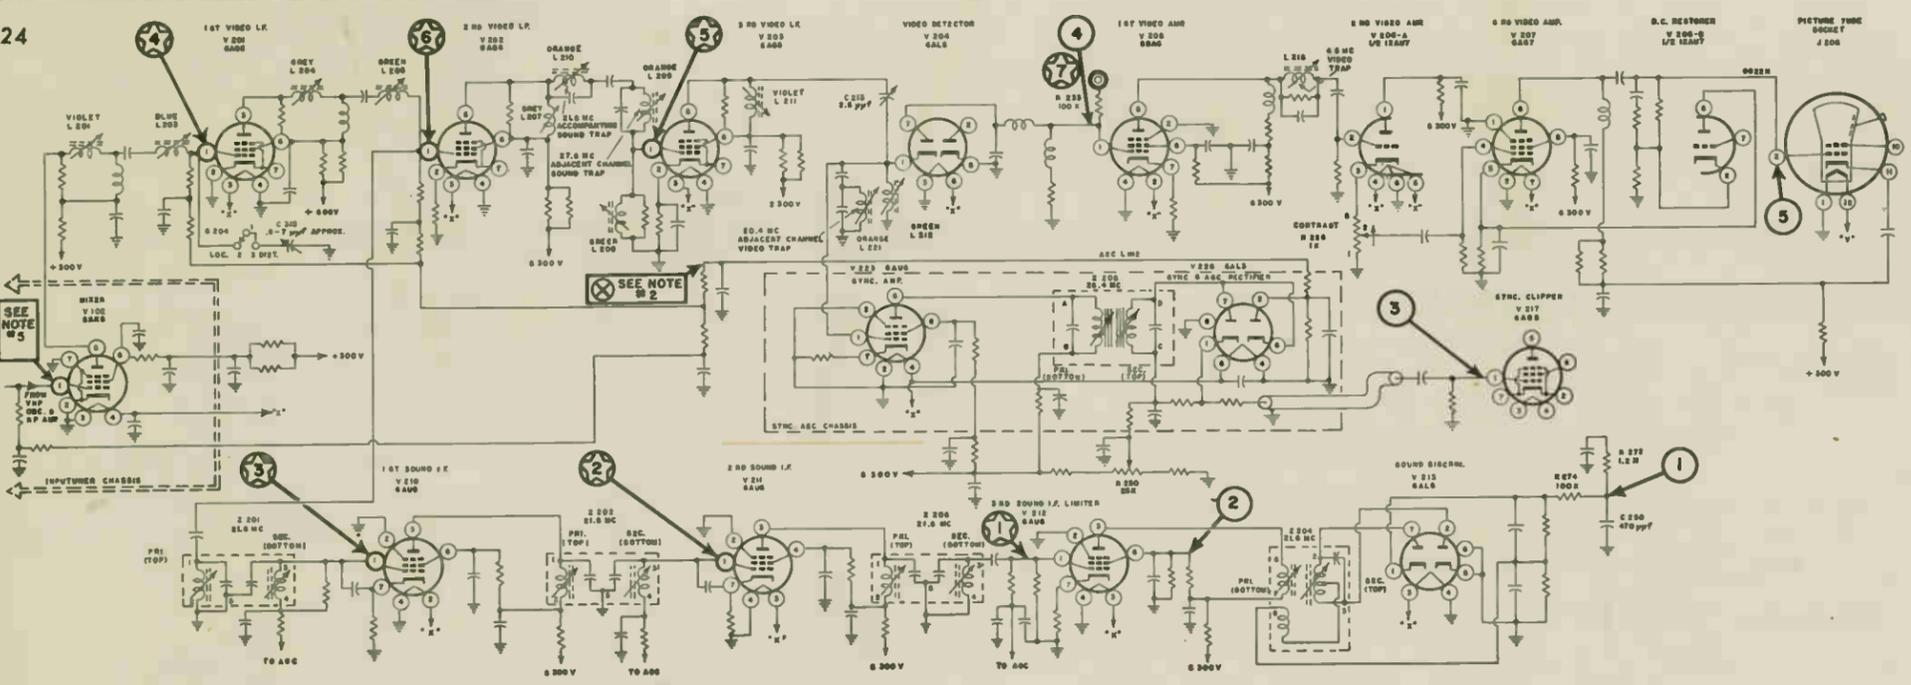

MODEL RA-108-A TELESET FLYBACK POWER SUPPLY CHASSIS

Note 2: The upper portion of the waveforms in the plate circuits of V705 and V706 are subject to variation between sets.

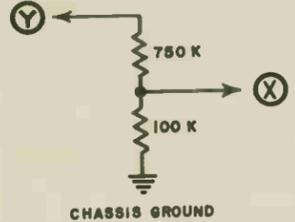

MODEL RA-105-B TELESET FLYBACK POWER SUPPLY CHASSIS

Note: The upper portion of the waveforms shown for the plate circuit of V405 is subject to variations between sets.

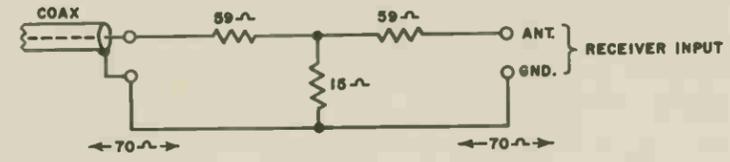

### ALIGNMENT NOTES

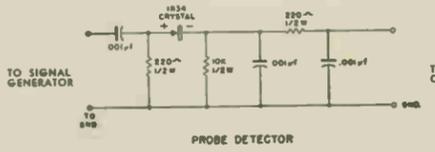

- Du Mont Telesets are designed for TV and high-fidelity FM reception. Full bandpass characteristic in sound I.F. system is required so that full dynamic range of FM may be obtained.
- During Video I.F. alignment fixed bias MUST be applied to the tubes operating with AGC. This bias is obtained by removing V226 (6AL5 sync-AGC rectifier) and applying -5 volts to the junction of C303 and R246 (point X in photograph). A convenient method of obtaining this fixed bias voltage is shown below.
- Undesired indentations in response curve may be caused by stages ahead of those being aligned. The removal of tubes in these stages will sometimes aid in obtaining correct curves. L212 affects left side of curve, L210 right side, and C21 affects band-width.
- If 26.4 mc marker position is not as shown and cannot be obtained by varying L207 and L208; L209 (27.9 mc trap) may be adjusted slightly to place marker in proper position. Slugs will be nearly all the way out. L208 positions center peak, L207 affects shoulder amplitude.
- To perform step 14, a 6AK5 adapter as shown below is required to replace V102.

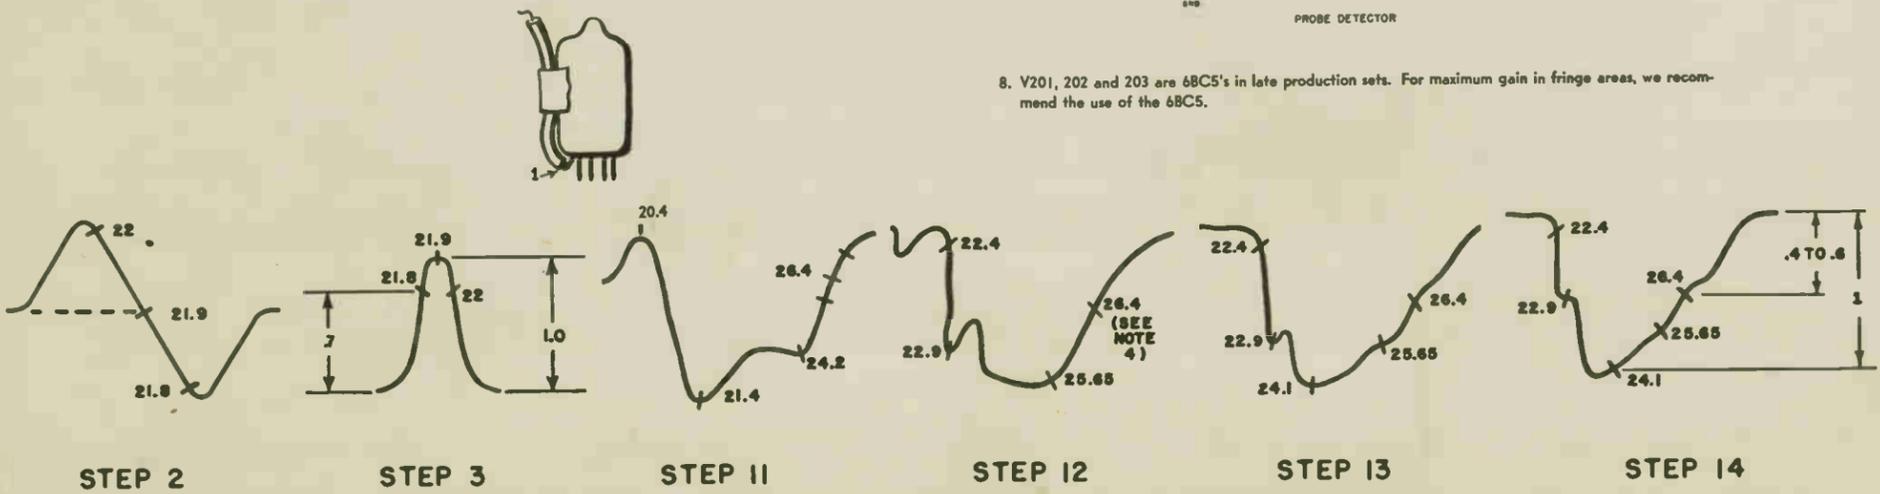

6. When aligning RA-105B and RA-108A Telesets which incorporate a "local-distance" switch, place the switch in the "local" position, set C315 at about one-half maximum capacitance, and proceed with the normal alignment procedure as outlined above. After the receiver has been aligned, remove -5 volts fixed bias, place switch in "distance" position and tune in a weak test pattern. Turn down brightness control until picture is barely visible. Peak L201 and L203 for maximum picture signal. Now, place switch in "local" position, tune in normally strong signal and adjust C315 for best picture quality. If smear or trailing blacks are present in strong signal picture and cannot be removed by adjusting C315, L206 may be slightly readjusted to eliminate this condition. A weak signal may be simulated by the use of a resistance-pad attenuator connected in series with the transmission line and the receiver antenna terminal. An attenuator circuit is shown below.

7. In the procedure, reference is made to the use of a "Probe Detector." This device is merely a crystal rectifier with the necessary filter.

8. V201, 202 and 203 are 6BC5's in late production sets. For maximum gain in fringe areas, we recommend the use of the 6BC5.

### ALIGNMENT TABLE

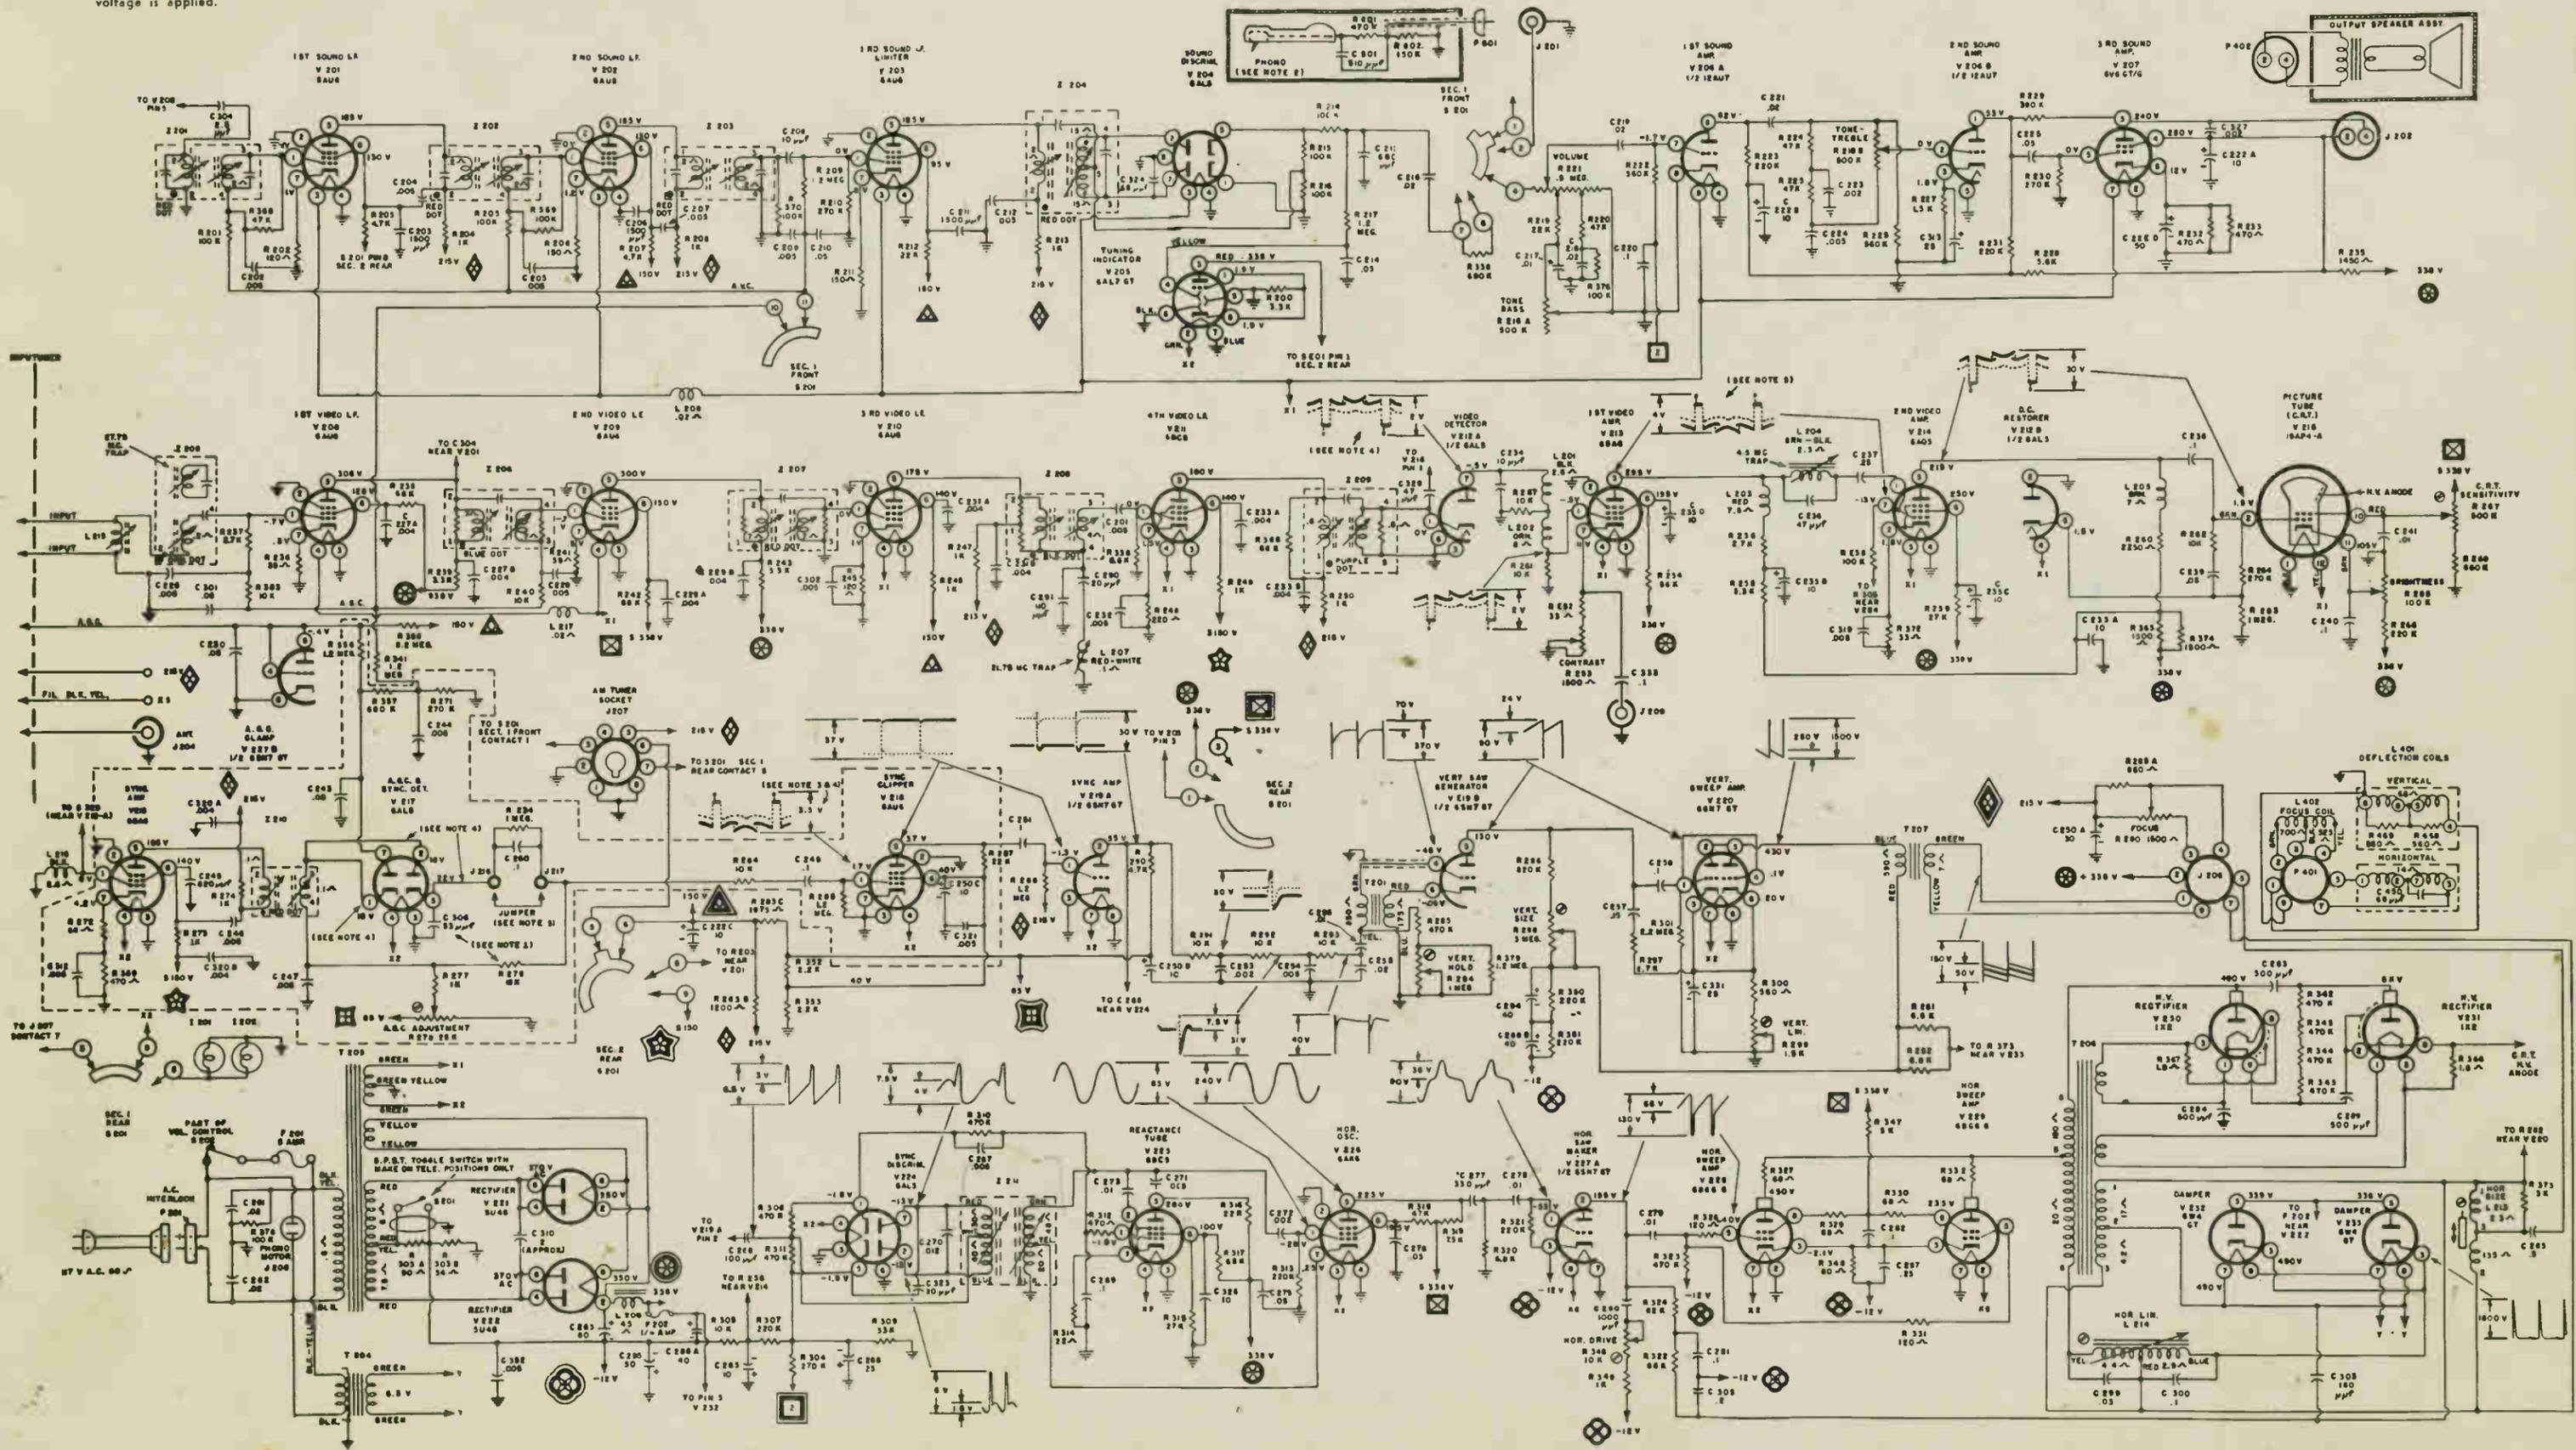

Note: Remove 6AB4 Oscillator V-103 and 6J6 RF Amplifier V101 From Tuner Before Attempting to Align Set

Step No.	Connect Sweep and Marker in Series with 100 mmf Condenser to:	Marker Frequencies (mc)	Sweep Generator Center Frequency (megacycles)	Connect Oscillograph to:	Adjust:	Remarks:
<b>SOUND DISCRIMINATOR ALIGNMENT</b>						
1	Pin #1 V212	21.9 400 cycles AM	Not Used	Junction R274 - R273 - C250	Z204 Top (secondary)	Adjust for minimum 400 cycles indication. Correct adjustment will be critical and should approach a straight line on oscillograph.
2	Same as Above	21.9 21.8 22.0 No modulation	21.9 1 mc. deviation	Same as Above	Z204 Bottom (primary)	Adjust for symmetrical response each side of 21.9 mc position. 21.8 mc and 22.0 mc markers must be as indicated or at peaks of curve. RECHECK STEP 1 to make certain Z204 secondary is correctly adjusted. (See note #1)
<b>SOUND I. F. ALIGNMENT</b>						
3	Pin #1 V211	21.9 21.8 22.0 No modulation	21.9 1 mc deviation	Pin #6 V212	Z203 Top and Bottom	21.9 mc marker MUST be centered on curve; 21.8 and 22.0 mc markers must not be at a position less than .7 maximum amplitude.
4	Pin #1 V210	Same as Above	Same as Above	Same as Above	Z202 Top and Bottom	Same as above. However, if flat top portion of curve is not easily obtained, adjust for 21.9 mc marker to be centered and readjust top Z203 for maximum flat top on curve.
5	Pin #1 V201	Same as Above	Same as Above	Same as Above	Z201 Bottom (secondary)	Same as Above. DO NOT READJUST Z203.
<b>SYNC-A.G.C. AMPLIFIER AND I.F. TRAP ALIGNMENT</b>						
6	Same as Above	26.4 400 cycles AM	Not Used	Pin #1 V217	Z206 Top and Bottom (on sub-chassis)	Bottom adjustment through hole in main chassis. Adjust for MAXIMUM 400 cycle indication.
7	Same as Above	21.9 400 cycles AM	Not Used	Pin #1 V205	Z201 Top	Adjust for MINIMUM 400 cycle indication.
8	Same as Above	Same as Above	Not Used	Same as Above	L210	Same as Above
9	Same as Above	20.4 400 cycles AM	Not Used	Same as Above	L221	Same as Above
10	Same as Above	27.9 400 cycles AM	Not Used	Same as Above	L209	Same as Above
<b>VIDEO I.F. ALIGNMENT</b>						
11	Pin #1 V203	21.4 22.2 26.4 No modulation	24 mc 6 - 8 mc deviation	Pin #1 V205	L212, L211 and C213	(See note #2) Short circuit L209. Adjust for typical response curve. Curves may vary slightly in individual sets. (See note #3)
12	Pin #1 V202	22.4 22.9 25.65 26.4 No modulation	Same as Above	Same as Above	L207 and L208	Remove short circuit from L209. Adjust for typical response curve
13	Pin #1 V201	22.4 22.9 24.1 25.65 26.4 No modulation	Same as Above	Same as Above	L204 and L206	Adjust for typical response curve
14	Pin #1 V102 (See note #5)	Same as Above	Same as Above	Same as Above	L201 and L203	Local-Distance switch in "local" position. C315 screw about 1/2 way in. Adjust for typical response curve. THIS IS THE OVERALL VIDEO I.F. RESPONSE AND SHOULD CLOSELY RESEMBLE TYPICAL CURVE SHOWN. (See note #6)
<b>4.5 MC "GRAIN" TRAP ALIGNMENT</b>						
15	Pin #1 V205	4.5 mc 400 cycles AM	Not Used	CRT Grid (green lead) through probe detector.	L216	Adjust for MINIMUM 400 cycle indication.
16	See phase correction procedure on other side.					

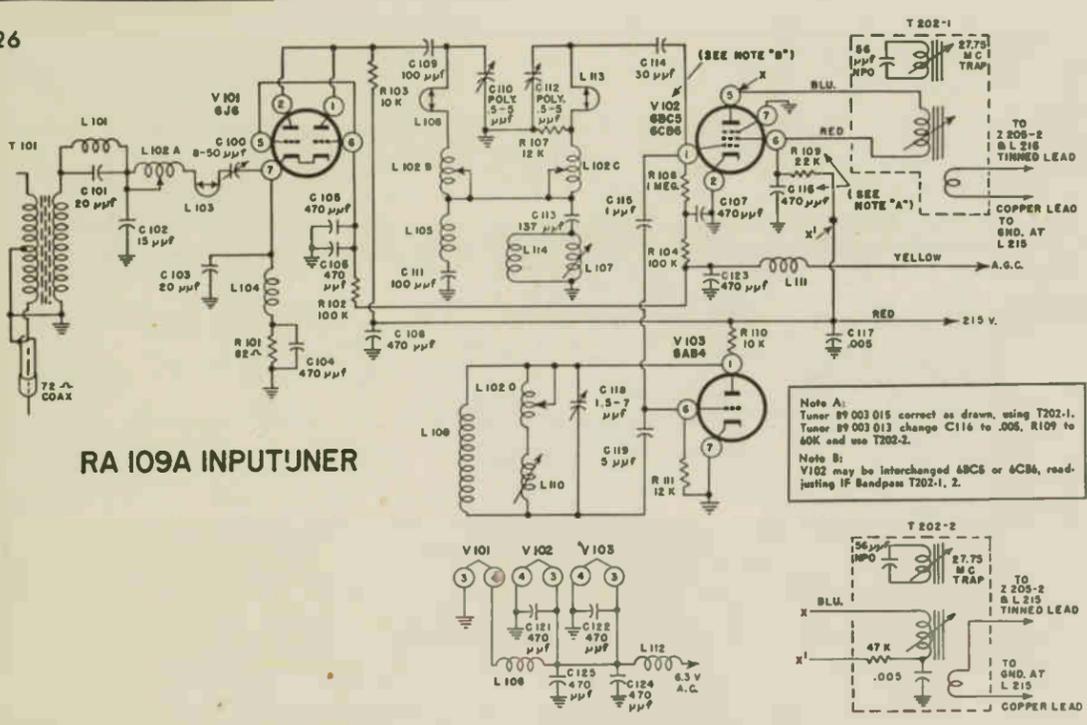

USE OF SYMBOLS

Large encircled symbol indicates source of voltage.

Small unencircled symbol indicates point to which voltage is applied.

AM TUNER PARTS LIST Sherbrooke RA-109A

RA 109A INPUT TUNER

Table listing parts for the AM Tuner, including symbols, part numbers, descriptions, and values for various components like capacitors, inductors, and tubes.

RF TUNING ASSEMBLY PARTS LIST

Table listing parts for the RF Tuning Assembly, including symbols, part numbers, descriptions, and values for various components like capacitors, inductors, and tubes.

Table listing parts for Winslow, Hanover and Westbury II, including symbols, part numbers, descriptions, and values for various components like tubes, capacitors, and inductors.

Table listing parts for Winslow, Hanover, Westbury II, and Sherbrooke, including symbols, part numbers, descriptions, and values for various components like tubes, capacitors, and inductors.

Large table listing parts for various other components, including symbols, part numbers, descriptions, and values for various electronic parts.

Selector switch in "Television Light On" position.  
Instrument Used — RCA Model WV97A Volt Ohmyst (for voltage and resistance)  
All readings in ohms K = thousand M = million  
Two readings for a given point indicate an adjustable resistance is in the measured circuit.

NOTES

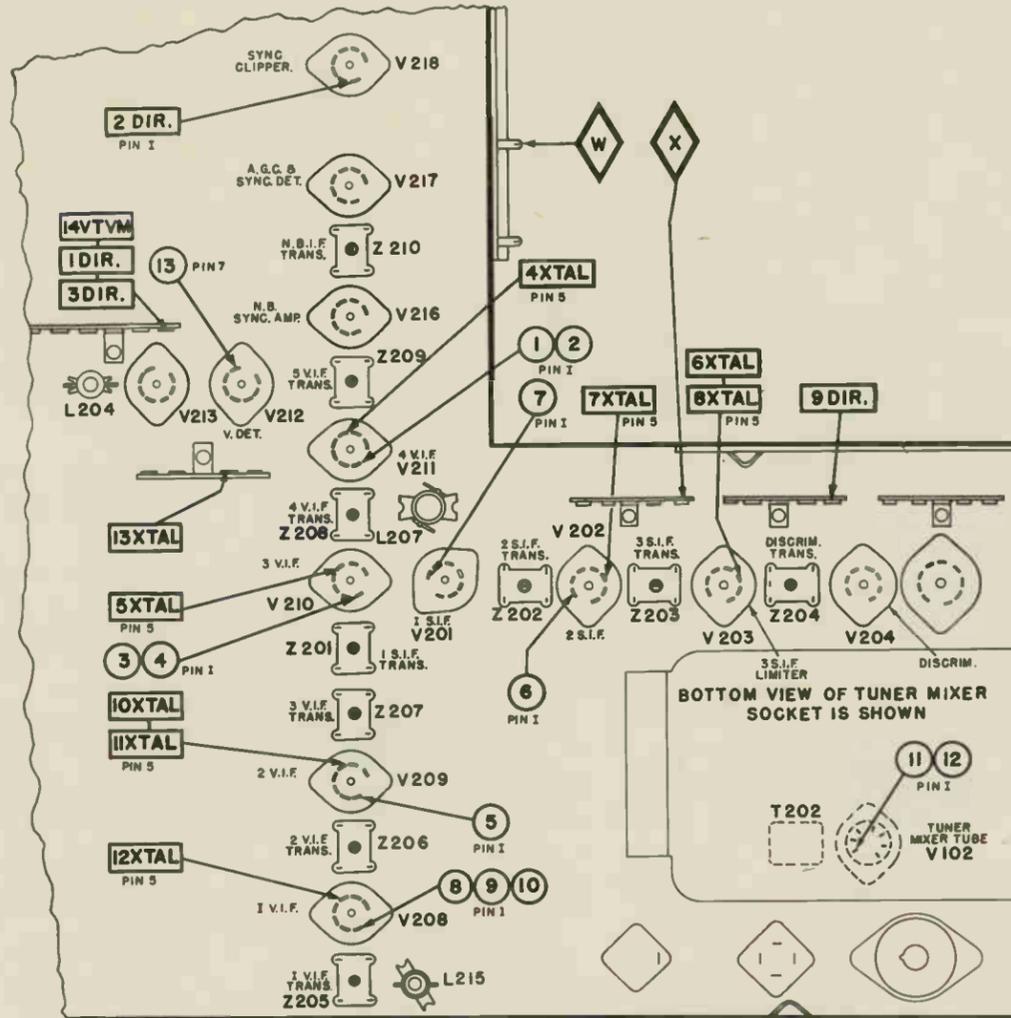

- Value of C306, R275 correct when Z210 is 20 005 251. Value of C306-20 mmf, R275-27K when Z210 is 20 006 231.
- Compensating network used only with Webster type cartridge.
- Removal of jumper eliminates horizontal pull and improves horizontal sync stability. Adding jumper improves sync noise immunity. Jumper consists of 3" piece of #12 solid wire. Amplitude of waveform at grid of V218 will change when jumper is added or removed.
- Amplitude of waveforms and voltages is affected by setting of a-g-c pot. R278.
- Amplitude of waveform depends on setting of contrast control R253.
- Voltage, resistance and waveform measurements
  - Instrument used RCA WV-97A Volt Ohmyst (for voltage and resistance). Variations of ±20 are not abnormal.
  - Voltage measurements taken to ground, no signal input.
  - Voltage measurements made with switch in TV position, lights on.
  - All coils readings taken with coils disconnected.
- Switch sections viewed from front end of switch. Rotor in extreme CCW (AM) position. Switch positions: 1. AM 2. Phono. 3 FM 4. TV, light on; 5. TV, light off. Switch has variable stop to include or exclude AM position.

RA-109A AM TUNER

ALIGNMENT TABLE — RA-109A — RA-116A — RA-119A — RA-133A

Remove the following tubes: Tuner Oscillator V103 (6AB4), Audio Amplifier V207 (6V6GT — Disregard for RA-116A) and Horizontal Oscillator V226 (6AK6). Remove F202 Deflection Amplifier Protection Fuse. Adjust AGC control (R278) fully counter-clockwise. Turn Selector Switch in TV position.

Step	Signal Generator		Oscillograph	Adjust	Waveform	Remarks
	Frequency	Connect To				
1	24 mc. center frequency 10 mc. deviation	Pin 1-V211 4th V.I.F. Amp. (1)	Junction of L301 L302 and R257 (1DIR.)	Z208—Top and bottom slugs and bandpass cap.		Use two alignment tools simultaneously. Push bandpass cap. wire in to increase bandpass and pull out to decrease.
2	28 mc. center frequency 5 mc. deviation	As above (2)	Pin 1-V218 1st Sync Clipper (2DIR.)	Z210—Top and bottom slugs		Remove V218. Use 6AU6 with pin 3 clipped and lead tied to pin 1 for scope connection.
3	21.75 mc. 400 cps AM No Sweep	Pin 1-V210 3rd V.I.F. Amp. (3)	Junction of L301 L302 and R257 (3DIR.)	L207	Minimum scope indication.	Use high generator output and high scope gain. Be careful to avoid overload.
4	24 mc. center frequency 10 mc. deviation	As above (4)	Pin 5-V211 4th V.I.F. Amp. (4XTAL)	Z208—Top and bottom slugs		L207 adjustment affects waveform's low frequency side.
5	As above (5)	Pin 1-V209 2nd V.I.F. Amp. (5XTAL)	Pin 5-V210 3rd V.I.F. Amp. (5XTAL)	Z207—Top and bottom slugs and bandpass cap.		As above
6	22 mc. center frequency 2 mc. deviation	Pin 1-V202 2nd S.I.F. Amp. (6XTAL)	Pin 5-V203 3rd S.I.F. Limiter (6XTAL)	Z203—Top and bottom slugs		Selector Switch in FM position.
7	As above (7)	Pin 1-V201 1st S.I.F. Amp. (7XTAL)	Pin 5-V202 2nd S.I.F. Amp. (7XTAL)	Z202—Top and bottom slugs	As above	As above
8	As above (8)	Pin 1-V208 1st V.I.F. Amp. (8XTAL)	Pin 5-V203 3rd S.I.F. Limiter (8XTAL)	Z201—Top and bottom slugs		Connect 100K pot between "W" and ground, arm to "X". Adjust for -5 volts bias.
9	As above (9)	As above (9)	Junction of R214 and C215 (9DIR.)	Z204—Top slug for waveform, bottom slug for maximum amplitude.		As above
10	24 mc. center frequency 10 mc. deviation (10)	As above (10)	Pin 5-V209 2nd V.I.F. Amp. (10XTAL)	Z206—Top and bottom slugs and bandpass cap. Z201—Top slug		Selector Switch in TV position. Z201 top slug affects the 21.75 mc. dip.
11	27.75 mc. 400 cps AM No Sweep (11)	Pin 1-V102 Mixer (11XTAL)	As above (11XTAL)	Z205 and T202—Top slugs	Minimum scope indication.	Use V102 with lead tied to pin 1 for signal injection. Adjust T202 with special alignment tool #89 000 230.
12	24 mc. center frequency 10 mc. deviation (12)	As above (12)	Pin 5-V208 1st V.I.F. Amp. (12XTAL)	Z205 and T202—bottom slugs and L215		As above. L215 affects bandpass. Set below serial #0220978 do not have L215. An adjustable loop in T202 controls bandpass.
13	4.5 mc. 400 cps AM (13)	Pin 7-V212 Video Detector (13XTAL)	Junction of R234 R236 and R238 (13XTAL)	L204	Minimum scope indication.	Frequency must be accurate. Use crystal oscillator or crystal calibrated signal.
14	TV Station transmitting test pattern.	Connect a VTVM to the junction of L301, L302 and R257 (14VTVM)	As above (14VTVM)	R278 AGC control for a 3 volt DC reading.	As above	Adjust R278 on strongest station to prevent overload.
15	As above	As above	As above	Z205 bottom slug, 1 turn. Z208 bottom slug 1/2 turn. Z208 top slug, 1/2 turn. Z208 top slug, 1/2 turn.		To correct for smear in the picture. To correct for ringing in the picture.

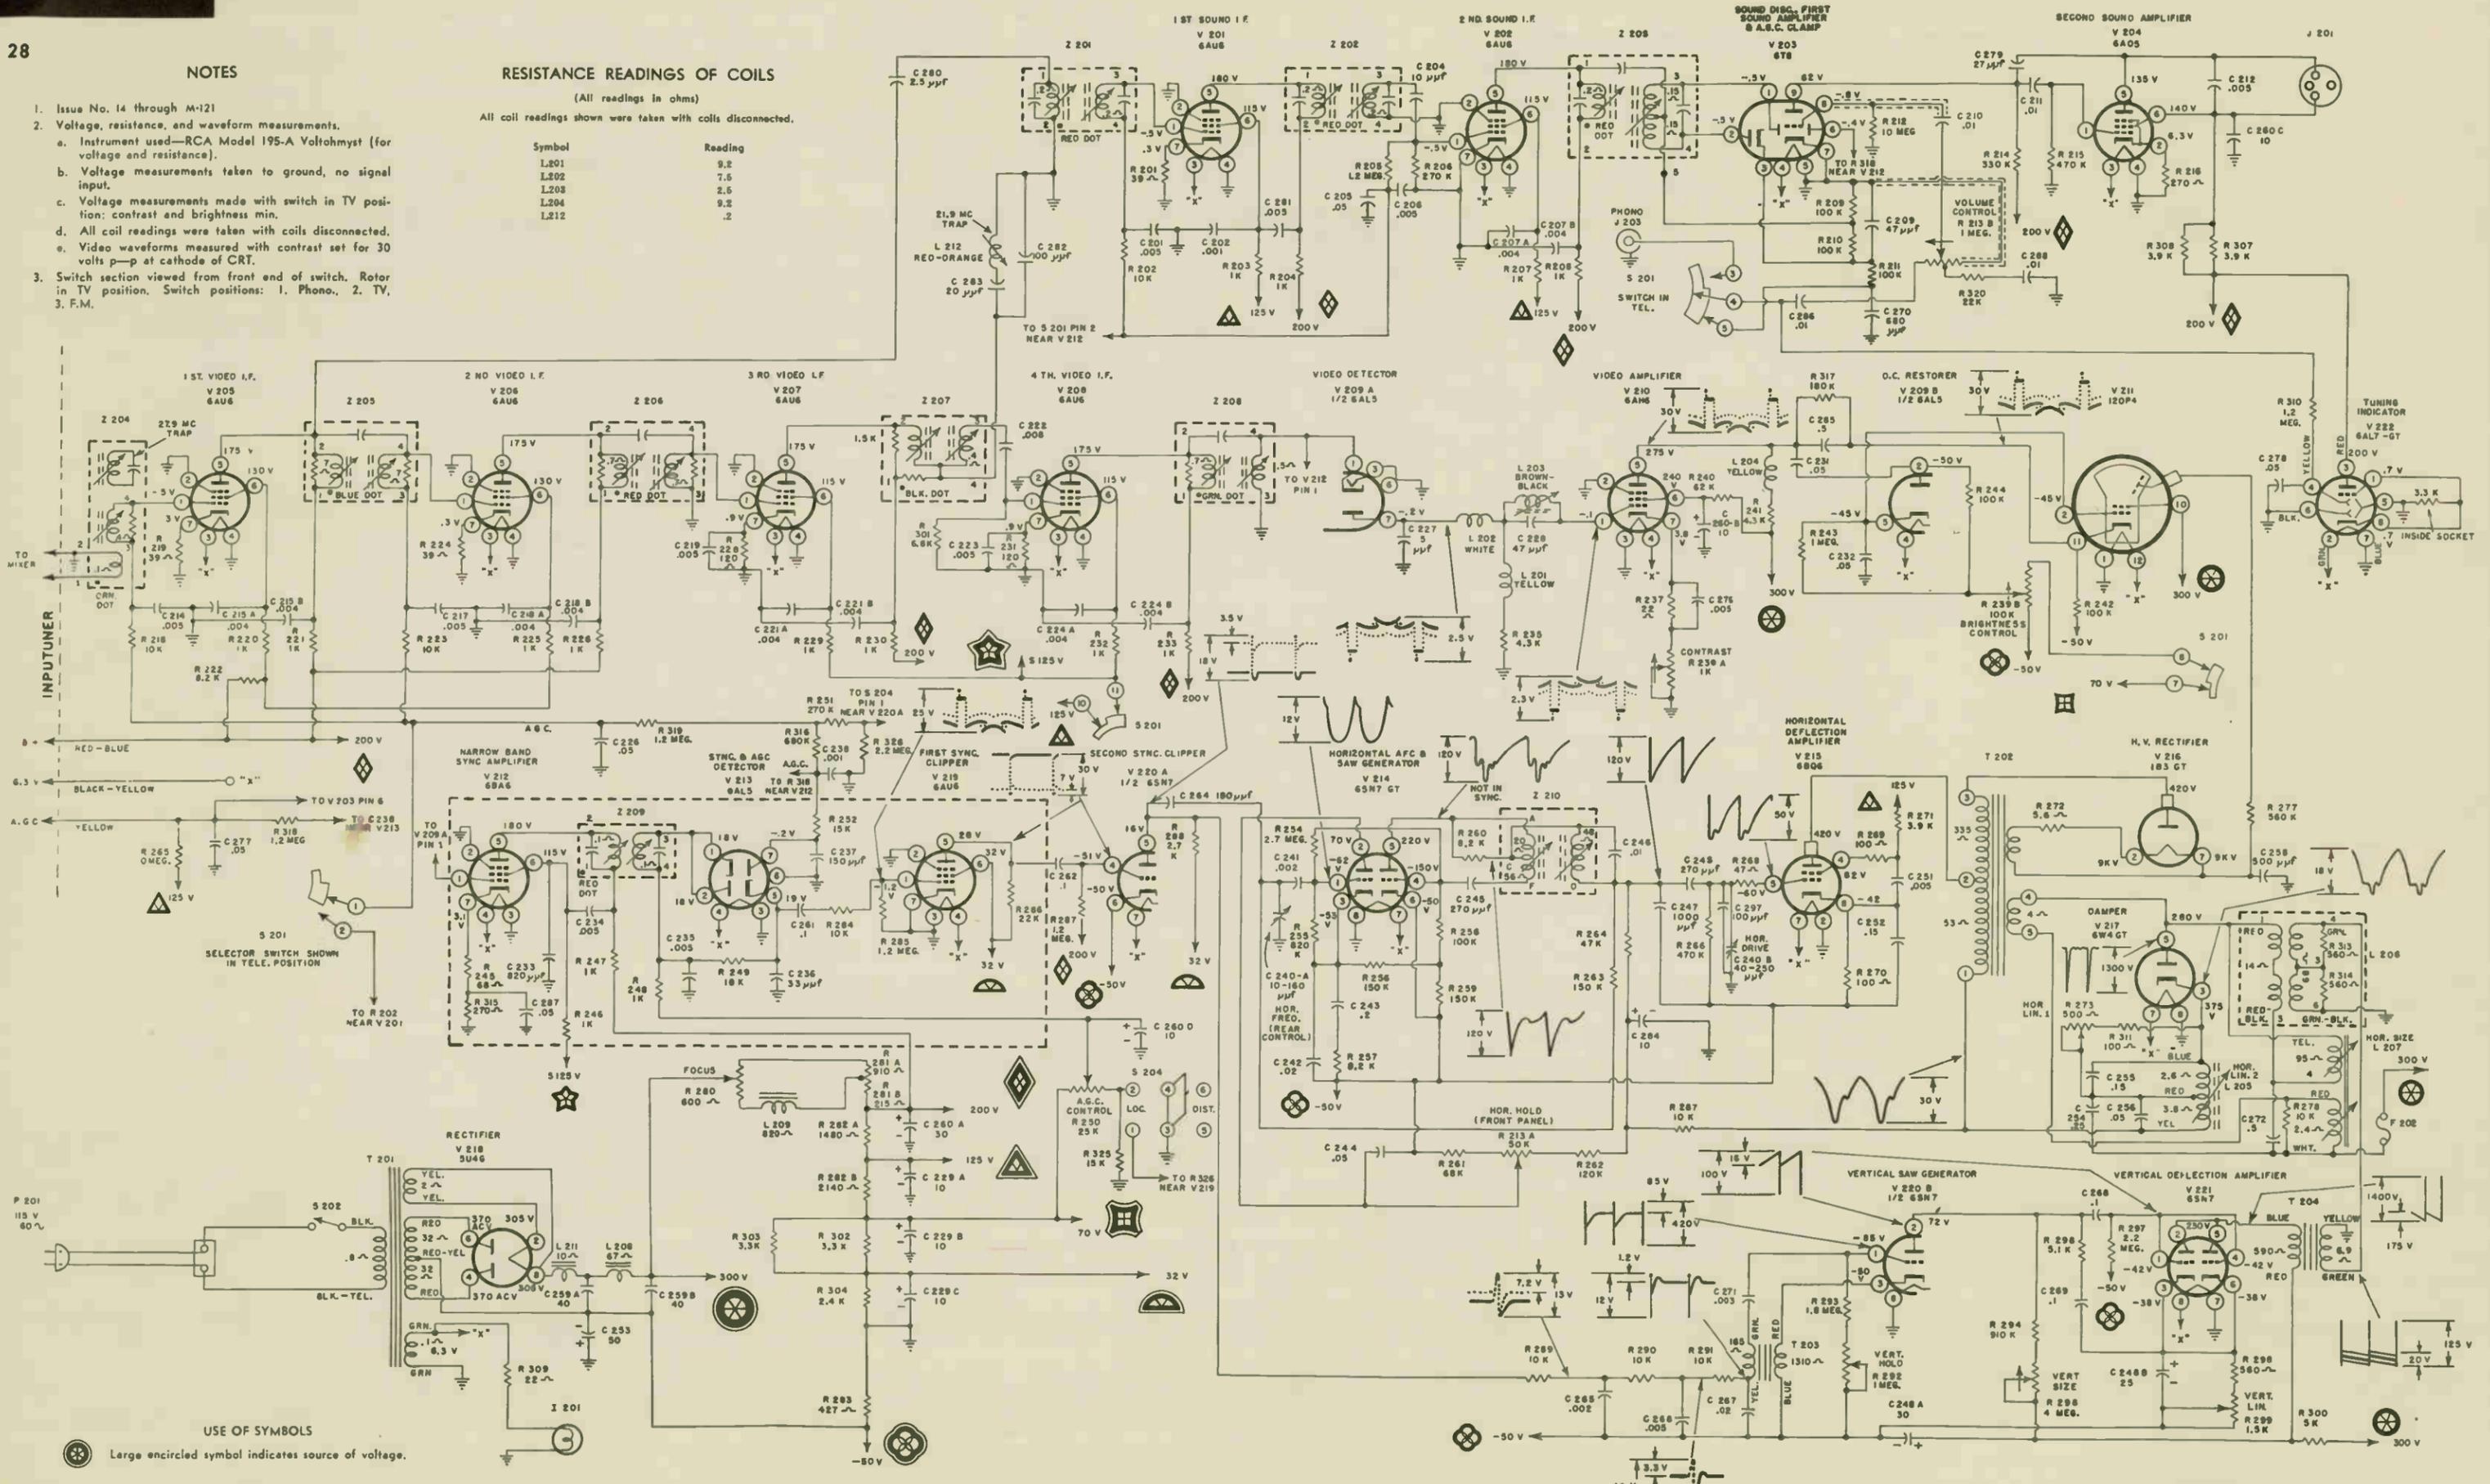

### NOTES

1. Issue No. 14 through M-121
2. Voltage, resistance, and waveform measurements.
  - a. Instrument used—RCA Model 195-A Volt-hmyst (for voltage and resistance).
  - b. Voltage measurements taken to ground, no signal input.
  - c. Voltage measurements made with switch in TV position; contrast and brightness min.
  - d. All coil readings were taken with coils disconnected.
  - e. Video waveforms measured with contrast set for 30 volts p-p at cathode of CRT.
3. Switch section viewed from front end of switch. Rotor in TV position. Switch positions: 1. Phono, 2. TV, 3. F.M.

### RESISTANCE READINGS OF COILS

(All readings in ohms)  
All coil readings shown were taken with coils disconnected.

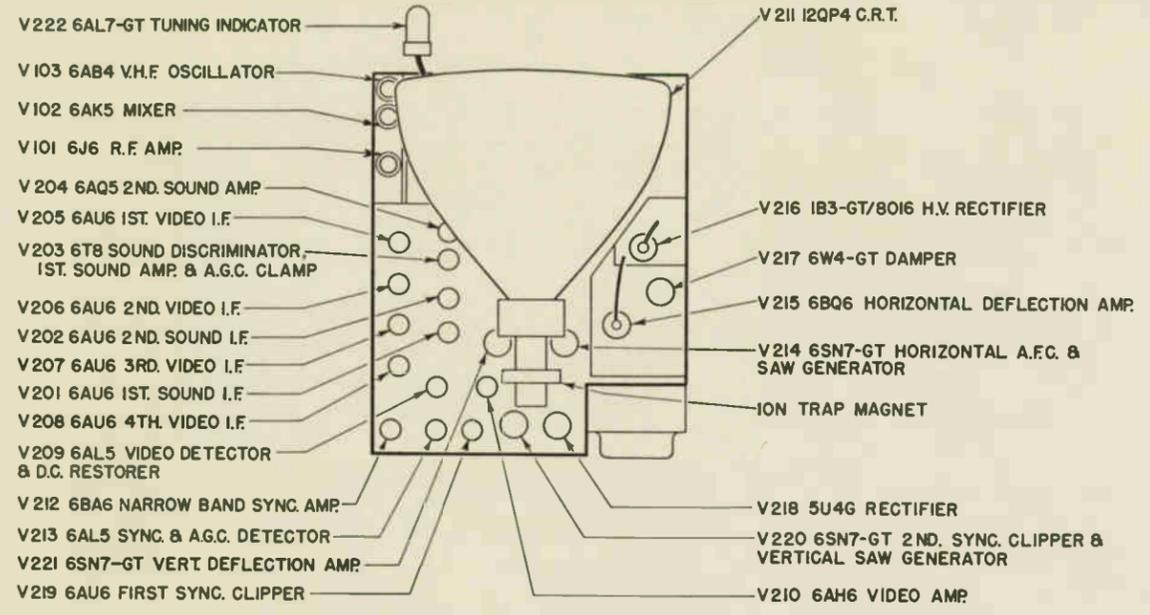

Symbol	Reading
L201	9.2
L202	7.5
L203	2.5
L204	9.2
L212	.2

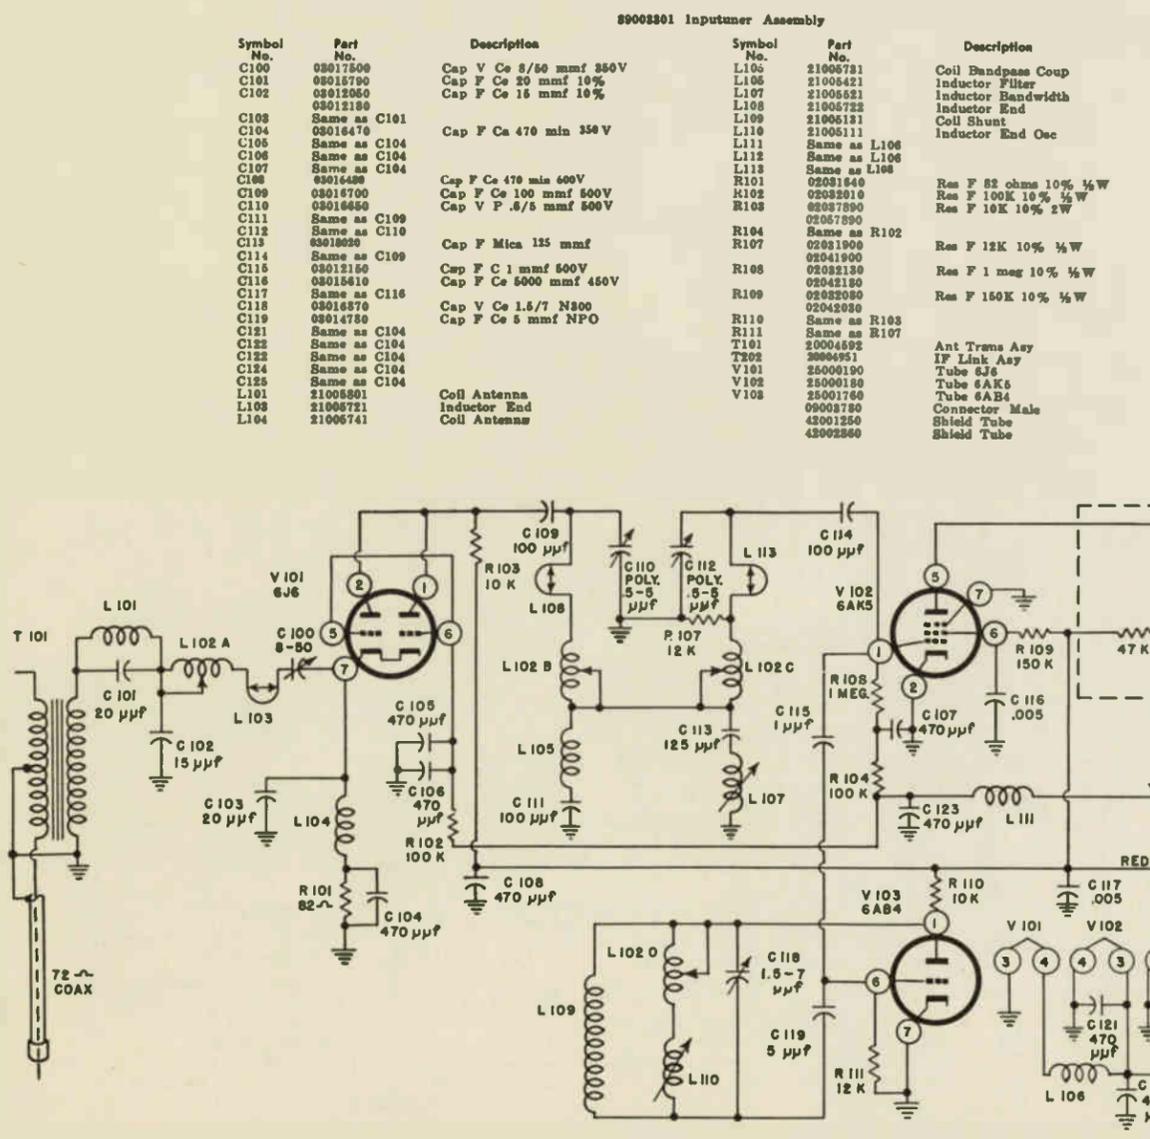

### USE OF SYMBOLS

- Large circled symbol indicates source of voltage.
- Small unencircled symbol indicates point to which voltage is applied.

TUBE LOCATION RA-111A

RF TUNING ASSEMBLY PARTS LIST

R.F. ASSEMBLY (FOUR CIRCUIT BOTTOM COUPLED INPUTUNER)

RESISTANCE MEASUREMENTS — ALL READINGS TO GROUND

Table with columns for Tube No., 1, 2, 3, 4, 5, 6, 7, 8. Rows list tube types and their resistance values in ohms, kilohms, and megohms. Includes a summary row at the bottom for tubes 9 through 12.

Selector switch in 'Television' position. Instrument Used — RCA Model 195-A Voltchymyst (for voltage and resistance). All readings in ohms K= thousand M= million Two readings for a given point indicate an adjustable resistance is in the measured circuit.

MISCELLANEOUS PARTS LIST

Putnam and Guilford Telesets RA-111A

Table listing miscellaneous parts for Putnam and Guilford Telesets RA-111A, including part numbers, descriptions, and quantities.

Putnam Only

Table listing miscellaneous parts for Putnam only, including part numbers, descriptions, and quantities.

Guilford Only

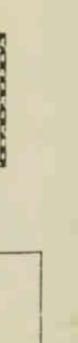

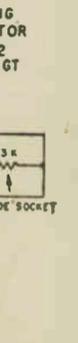

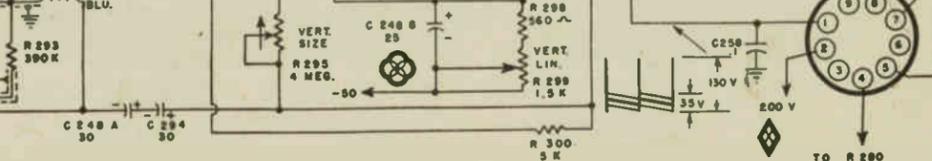

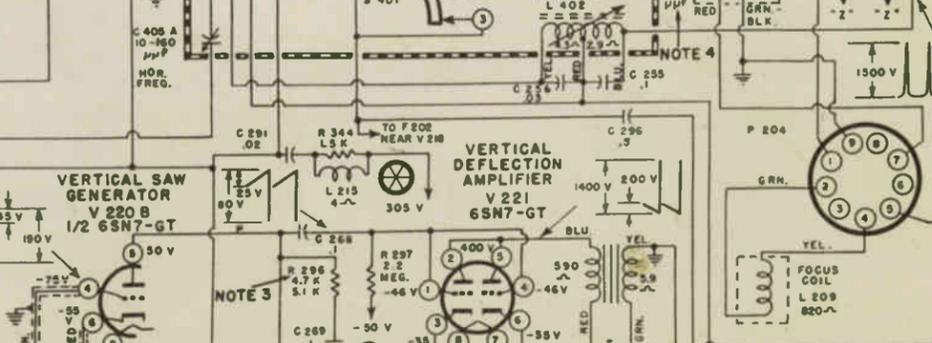

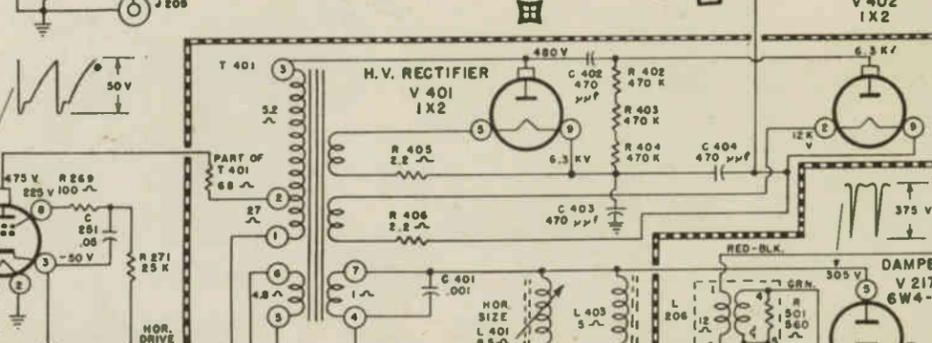

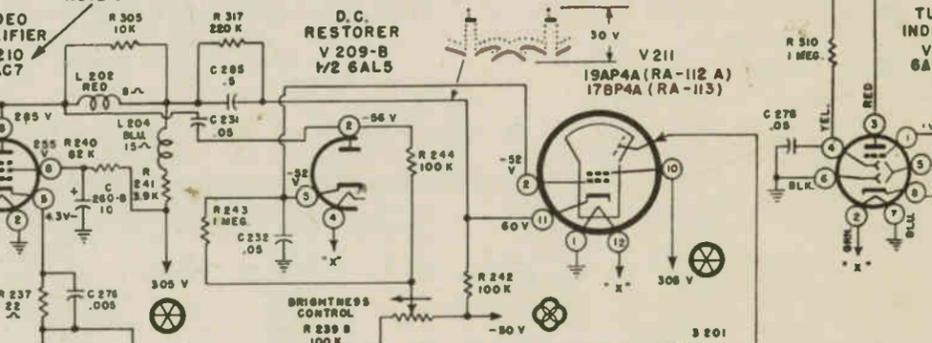

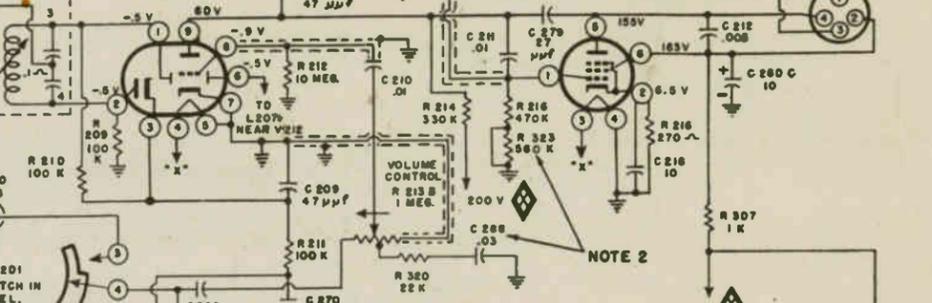

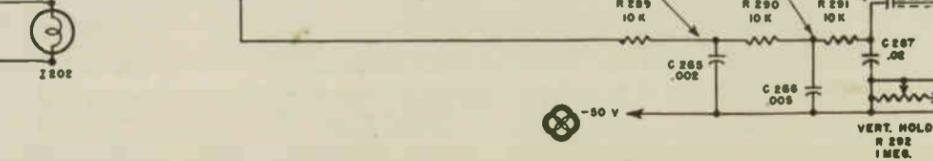

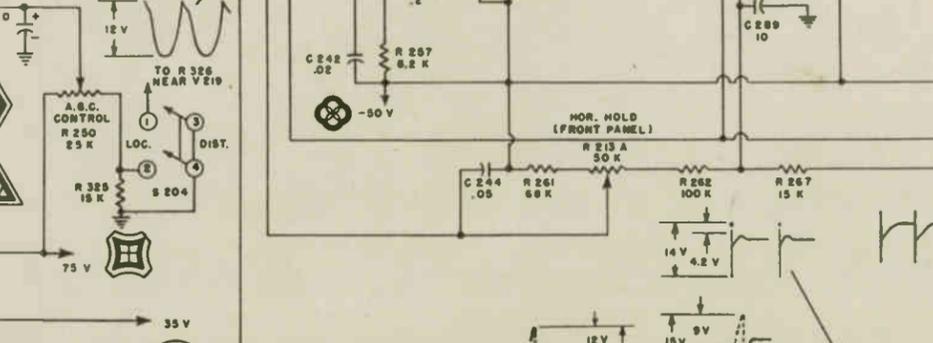

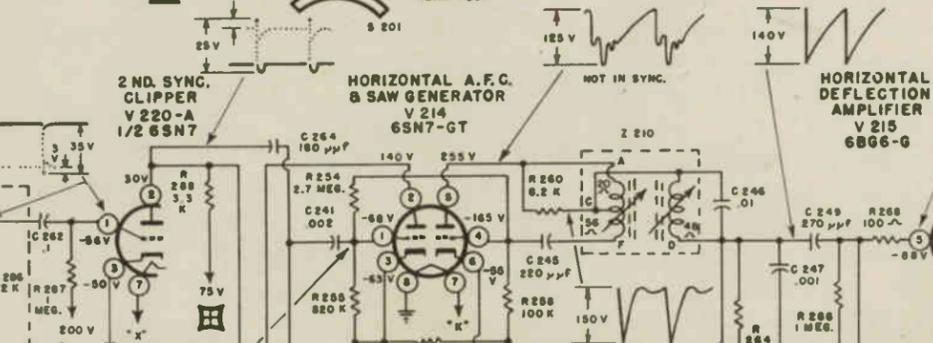

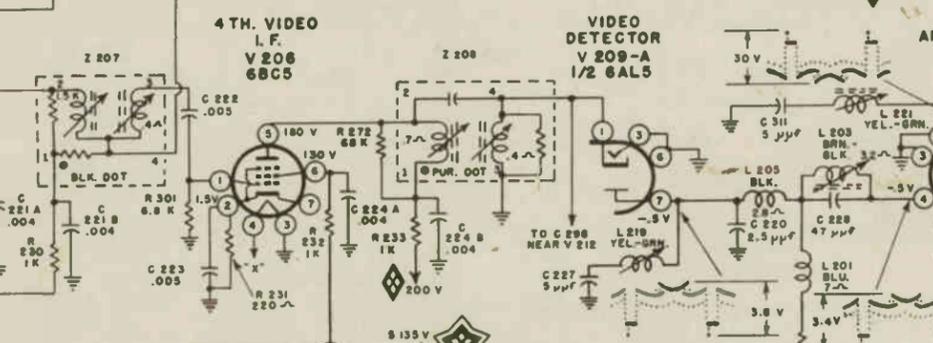

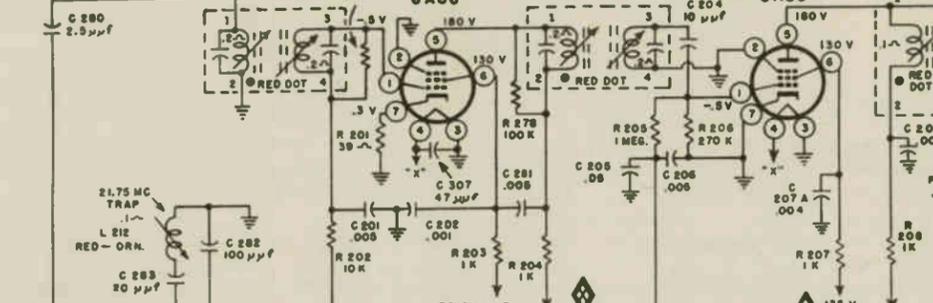

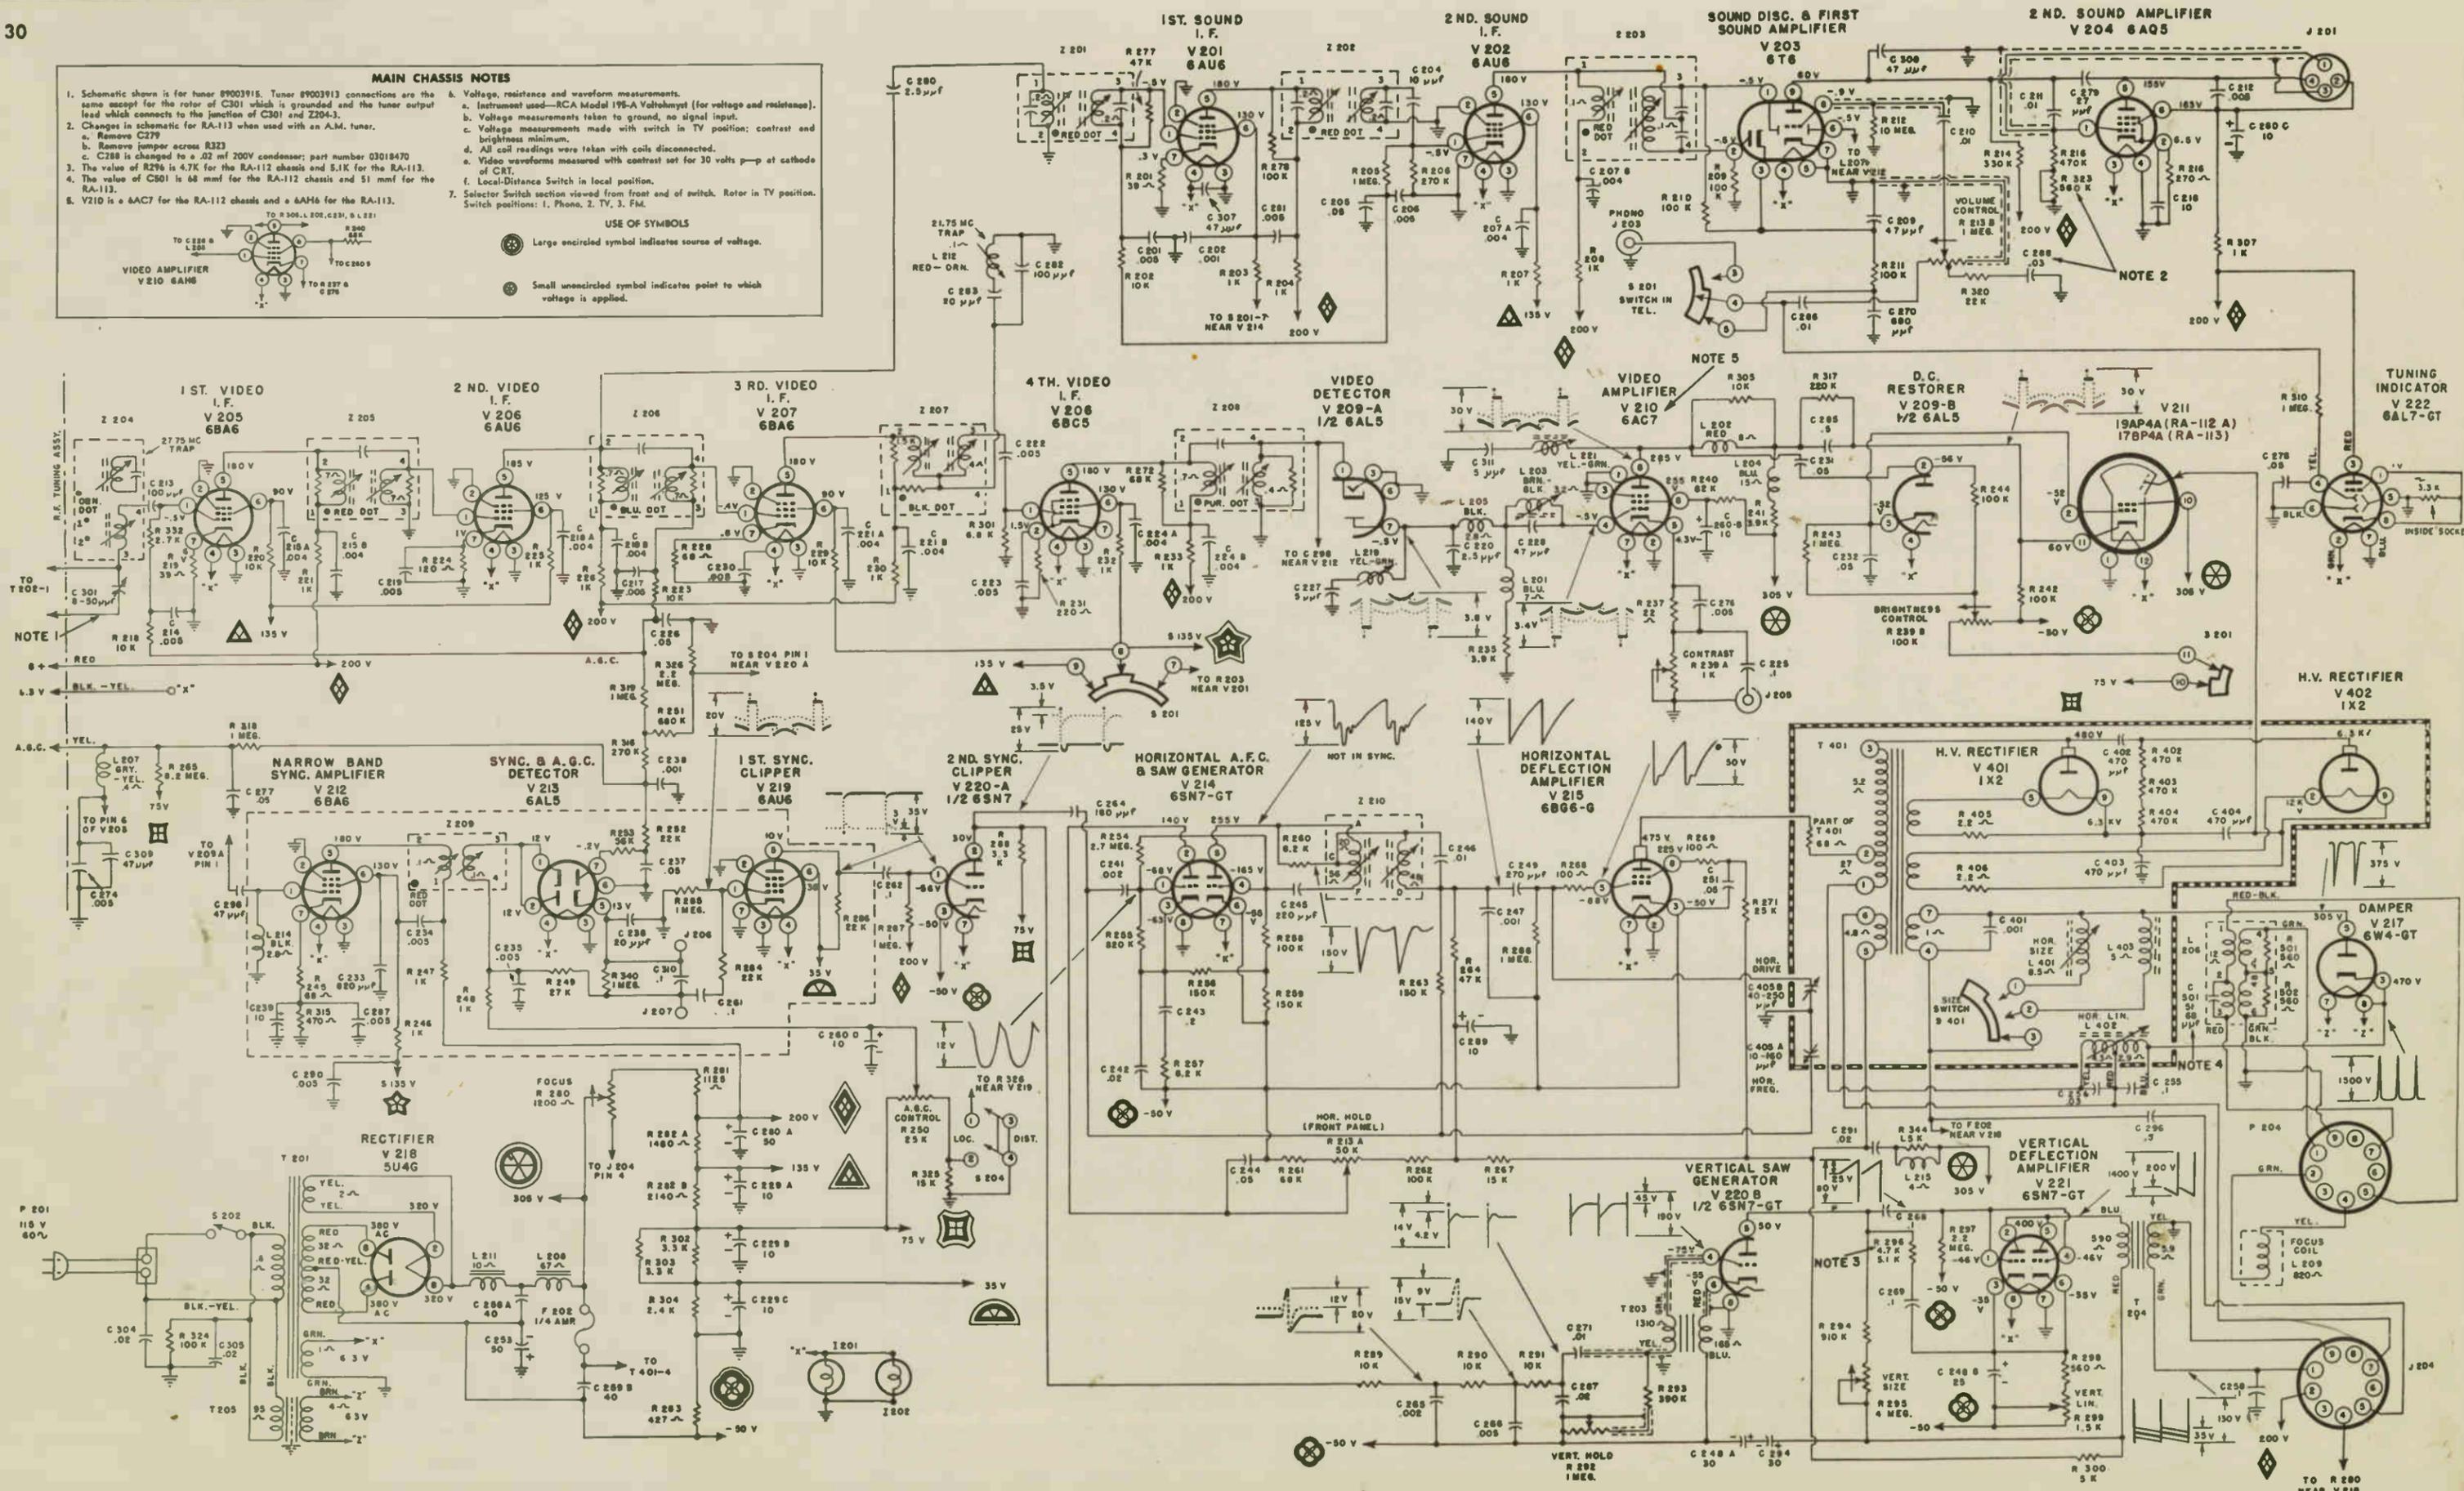

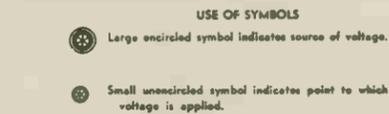

Table listing miscellaneous parts for Guilford only, including part numbers, descriptions, and quantities.

RECEIVER PARTS LIST RA-111 A

Large table listing receiver parts for RA-111 A, including part numbers, descriptions, and quantities. Includes a legend for abbreviations and a note about tolerance values.

MAIN CHASSIS NOTES

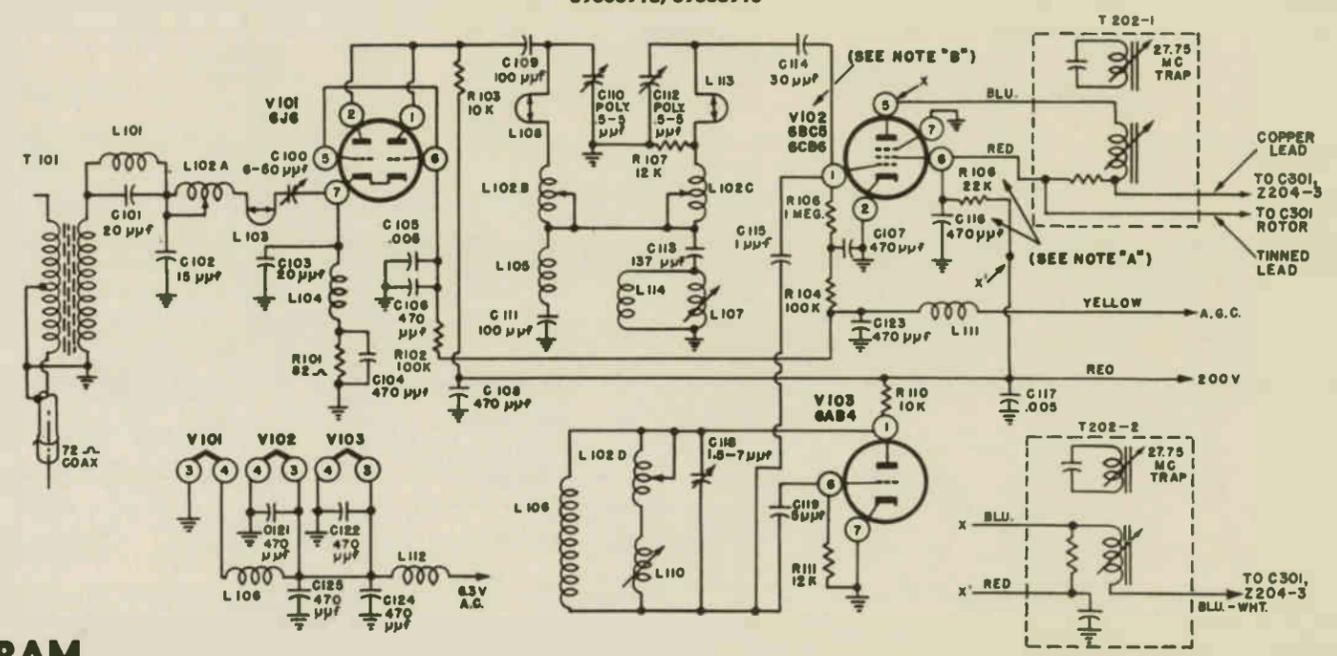

- Schematic shown is for tuner 89003915. Tuner 89003913 connections are the same except for the rotor of C301 which is grounded and the tuner output lead which connects to the junction of C301 and Z204-3.
- Changes in schematic for RA-113 when used with an A.M. tuner.
  - Remove C279
  - Remove jumper across R323
  - C288 is changed to a .02 mfd 200V condenser; part number 03018470
  - The value of R296 is 4.7K for the RA-112 chassis and 5.1K for the RA-113.
  - The value of C501 is 68 mfd for the RA-112 chassis and 51 mfd for the RA-113.
- V210 is a 6AC7 for the RA-112 chassis and a 6AH6 for the RA-113.

**ALIGNMENT DIAGRAM**

Curves for 21.9 MC sound IF for all RA-111A's and RA-112A below 12702, RA-113 below 13580.

Curves for 21.75 MC sound IF for RA-112A above 12702, RA-113 above 13580.

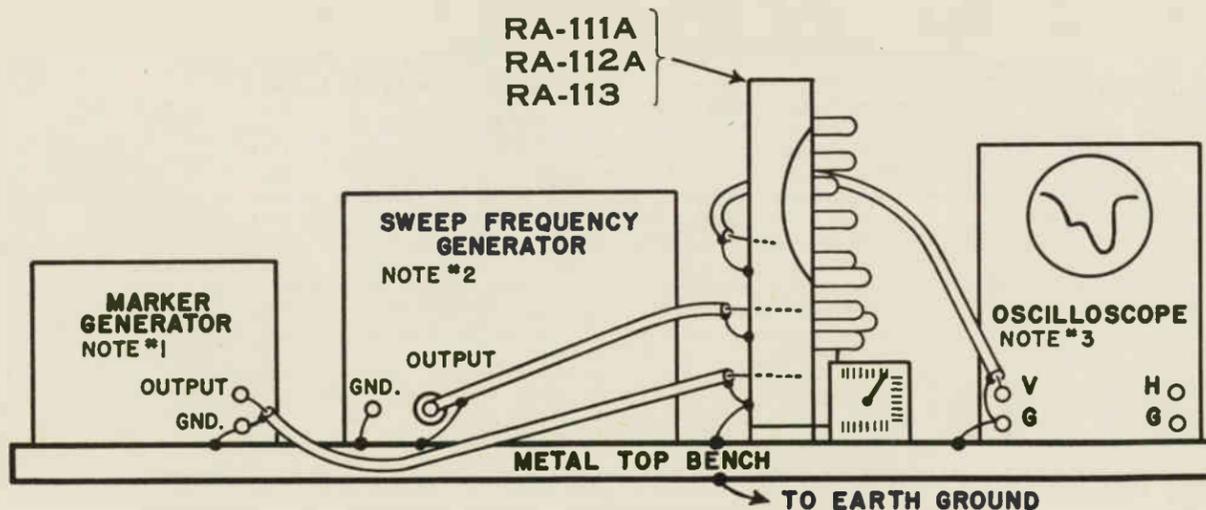

ALIGNMENT TABLE

Step No.	Connect Signal Generator (Note 3, 6)	Sweep Gen. Approx. Center Freq. (mc.)	Connect Oscilloscope To:	Adjust	Remarks
1	Pin 1 V208	24 mc. 8 mc. dev. min.	Junction L201, L202, L203 Direct [1 DIR]	Z208	Adjust for curve shown. Note 7
2	Pin 1 V207	Not used	Pin 5 V208 thru crystal probe [2 CP]	L212	Adjust for minimum scope indication. Use AM marker generator at sound IF. (21.75 or 21.9) Note 8
3	As above	24 mc. 8 mc. dev. min.	As above	Z207	Adjust for curve shown.
4	Pin 1 V205	Not used	As above	Top Z201	Adjust for minimum scope indication. Use AM marker generator at sound IF. (21.75 or 21.9)
5	Pin 1 V206	22 mc. 1 mc. dev. min.	Pin 5 V201 thru crystal probe [4 CP]	Bottom Z201	Adjust for curve shown.
6	As above	24 mc. 8 mc. dev. min.	Pin 5 V207 thru crystal probe [3 CP]	Z206	Adjust for curve shown. Note 7, 11
7	Pin 1 V205	As above	Pin 5 V206 thru crystal probe [5 CP]	Z205	Adjust for curve shown. Note 7, 11
8	Pin 1 V102	Not used	Pin 5 V205 thru crystal probe [6 CP]	Top Z204 Top T202	Adjust for minimum scope indication. Use AM marker generator at adj. channel sound IF. (27.75 or 27.9). Note 4, 12
9	As above	24 mc. 8 mc. dev. min.	As above	Bottom Z204 & T202, L213	Adjust for curve shown. Note 5
10	Pin 1 V201	21.75 mc. 1 mc. dev. min.	Pin 5 V202 thru crystal probe [7 CP]	Z202	Adjust for curve shown. Note 9
11	As above	As above	Junction R211 and C270 direct [8 DIR]	Z203	Adjust for curve shown.
12	Pin 1 V208	24 mc. 2 mc. dev. min.	Pin 1 V219, direct. Note 2 [9 DIR]	Z209	Adjust for curve shown. Note 2
13	Pin 7 V209	Not used	CRT cathode thru crystal probe [10 CP]	L203	Adjust for minimum scope indication. Use AM signal generator at 4.5 mc.
14	Replace original tubes.				
15	Adjust AGC control, R250. Note 9				
16	Phase correction. Note 10				

CP indicates that oscillograph is connected through crystal probe. DIR indicates that oscillograph is connected directly. Refer to top and bottom photos on reverse side of this sheet for reference points.

ALIGNMENT SET-UP

1. Keep all coax cables as short and as well shielded as possible.
2. Ground metal bench to a good earth ground.
3. To test set-up feed signal into grid of mixer thru a 100 mmf condenser. If placing hand on any chassis or adding additional grounds at any point affects waveform or if Teleset has a tendency to oscillate, grounding must be added until these effects disappear.

NOTES:

1. Unmodulated and amplitude modulated RF should cover 20 to 30 mc range. Also 4.5 mc. Not necessary if marker is built into sweep frequency generator.
2. Should have center frequency range from 20 to 30 mc. Sweep should be adjustable up to 6 mc at least.
3. We recommend use of internal saw-tooth sweep. Waveforms shown were taken using this sweep. External sweep from sweep frequency generator may be used if preferred.

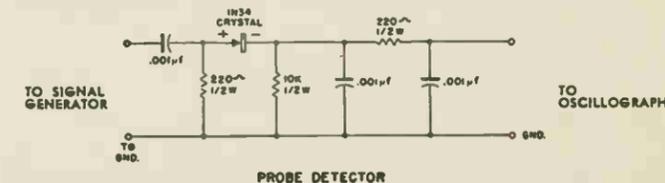

PRELIMINARY STEPS

CAUTION: IT IS IMPORTANT THAT ALL NOTES BE READ IN CONJUNCTION WITH ALIGNMENT.

The following preliminary steps should be followed:  
Remove 6W4 (V217) damper, 6AK5 (V102) mixer, 6AB4 (V103) oscillator, 6AQ5 (V204) AF output (note 1) and 6AU6 (V219) first sync clipper.  
Adjust AGC control (R250) fully counter-clockwise. Turn selector switch to tele. position.

ALIGNMENT NOTES

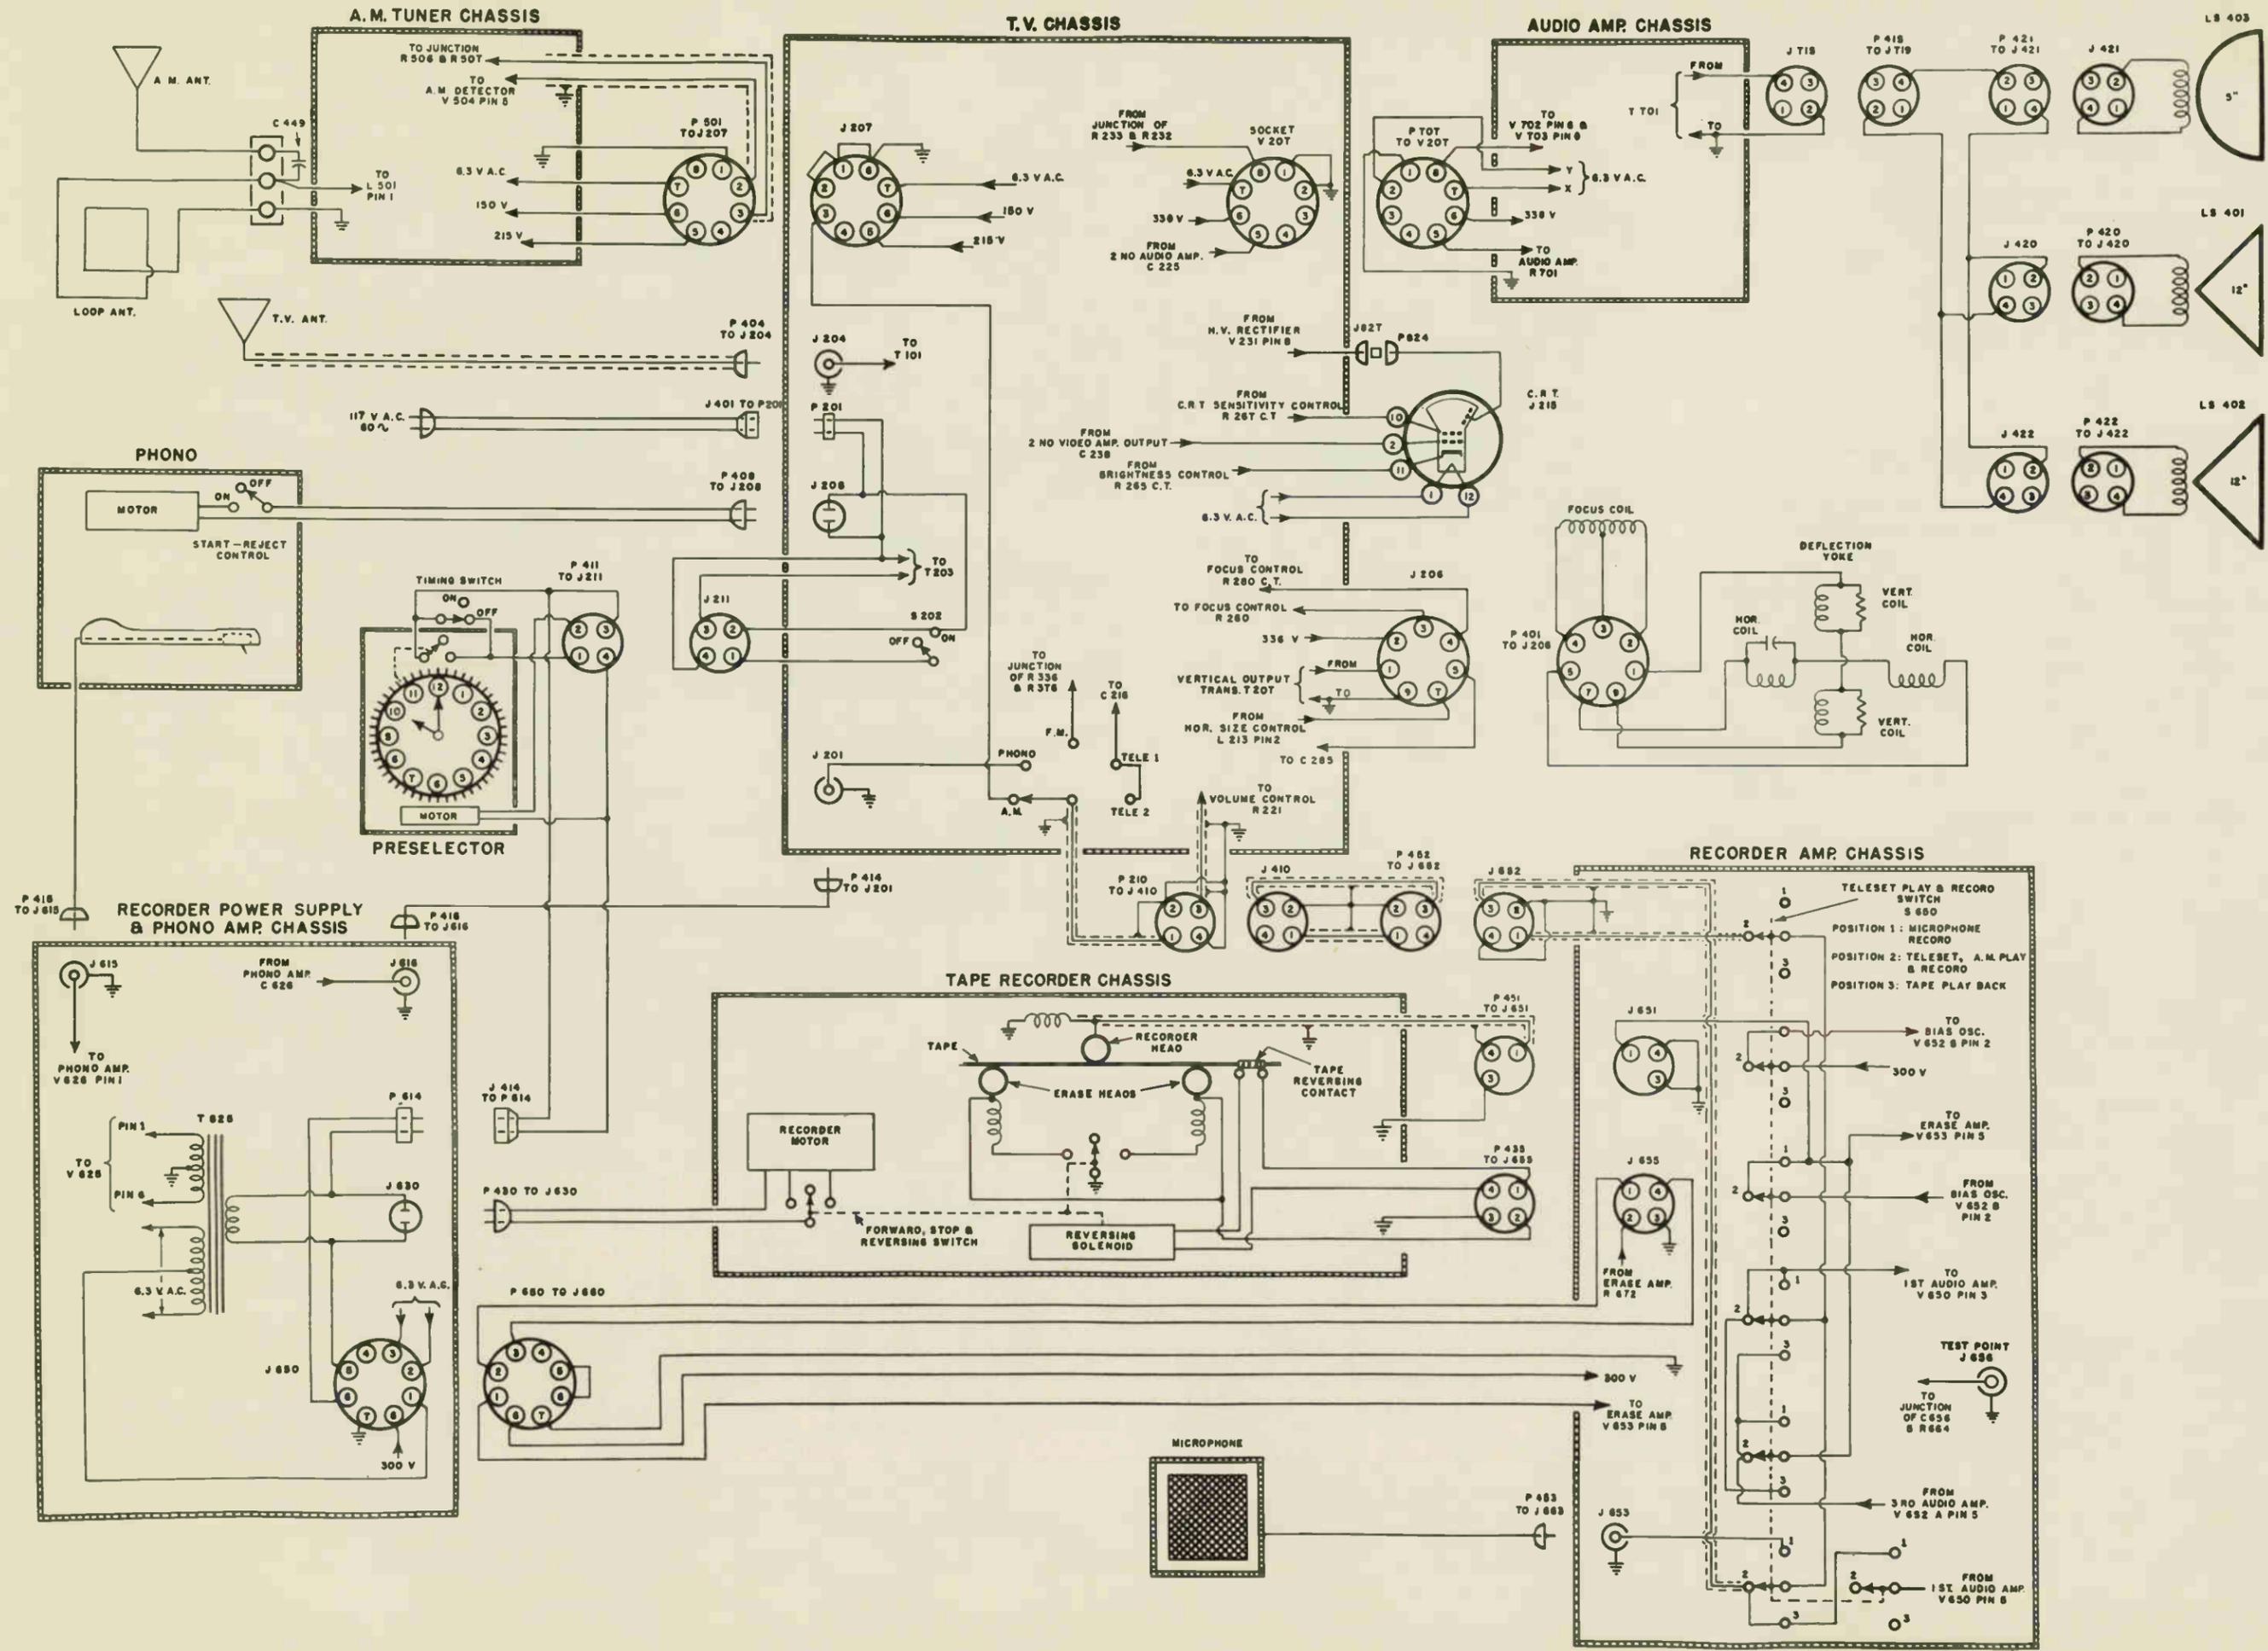

1. 6AQ5 (V204) may be left in position only if speaker is connected.
2. Insert 6AU6 adapter at V219. This is a 6AU6 with pins 3 & 4 clipped off and an extension attached to pin 1. (Pin 1 is not clipped.)
3. If the sweep generator has no internal marker, a signal generator may be connected to the output cable of the sweep generator through a 100 mmf condenser to act as a marker generator.
4. Insert 6AK5 adapter at the mixer, V102. This adapter is a 6AK5 with pin 1 clipped off and an extension attached to the remainder of pin 1, as shown.
5. Inputuner should be tuned to channel 7, or higher. L213 adjusts the coupling. The bottom adjustment of T202 is reached through top of can with hex head alignment tool. Whenever tuner is replaced step 8 and 9 must be performed. All RA-111A's, RA-112A's, below 122696, and RA-113's, below 132212, do not contain L213 and the following pertains: Bandwidth of first stage of video IF is controlled by a link coupling in T202. This is adjusted and sealed in position at the factory and should not be touched. To obtain curve for step 9 in these early sets, adjust top of T202 and bottom of Z204. In case of Inputuner replacement, link coupling may also have to be adjusted. After adjustment, seal link in place with Miracle Adhesive C2M55 (obtainable from Du Mont Spare Parts Sales).
6. Maximum possible output of the sweep generator should be used, checking for overload.
7. If bandwidth is not correct, heat wire protruding from bottom of transformer with a soldering iron to soften adhesive. Then slide wire into sleeve for increased bandwidth and vice versa. Seal wire in place with C2M55.
8. Reference is made in the Alignment Table to the use of a crystal probe. This device is merely a crystal rectifier with the necessary filter. The polarity of the curve will be reversed if the terminals of the 1N34 crystal are reversed. This will cause no difficulty. The circuit of the crystal probe detector is as follows:

9. Tune by tuning eye to the strongest station. Turn AGC control fully clockwise. Then turn this control counter-clockwise until the picture brightens. Finally, turn slowly clockwise to point where picture just starts to dim.
10. Even though the alignment has been performed properly, it is usually necessary to correct the phase response of the video IF strip in order to remove smearing and ringing from the picture. This is done in the factory by applying a 61.25 mc signal modulated by a 100 kc square wave to the front end of the Teleset and displaying the detected square wave (which has passed through the video strip) on an oscillograph after amplifying it by means of a special wideband amplifier. The alignment is checked by observation of the square wave and SLIGHTLY re-adjusted, if necessary. If slight re-adjustment does not correct the square waveform, the chassis is completely re-aligned. A practical approach to this method in the shop (after completing the alignment procedure) is to tune in a strong test pattern known to be of good quality and ghost-free (by observation on several normal Telesets). If smearing or ringing is observed, the following adjustments are recommended. No other adjustments should be made. Limit adjustments only to those absolutely necessary.  
SMEAR: Re-adjust Z204 bottom slug not more than 1 turn.  
Re-adjust Z208 bottom slug not more than 1/2 turn.  
RING: Re-adjust Z205 top slug not more than 1/2 turn.  
Re-adjust Z207 top slug not more than 1/2 turn.
11. For early RA-112A, RA-113 and all RA-111A Telesets which have sound take-off point at plate of V205 instead of V206, interchange curves for steps 6 and 7.
12. Adjust only top of Z204 in the early sets referred to in Note 5.

PROBABLE FAULT LOCATION CHART

Symptom*	Probable Location of Fault
No TV, FM, AM, or Phono Sound and cannot record these services	1. Service Selector Switch 2. Connection P210 to J410 to P452 to J652 3. Teleset Play and Record Switch
No TV, FM, AM, or Phono Record	1. Teleset Play and Record Switch
No TV, FM Sound and cannot record these services	1. Sound IF strip on Main Chassis
No AM Sound or AM Record	1. AM Chassis 2. Cable between AM or TV chassis 3. Selector switch
No FM play, No FM Record	1. Selector switch
No Phono play, No Phono Record	1. Record Player 2. Connections between Record Player and Recorder Power Supply chassis or between Recorder Power Supply chassis and TV chassis. 3. Phono amplifier on Recorder Power Supply chassis. 4. Selector switch
No Microphone Record	1. Microphone 2. Microphone cord, plug, and jack on Recorder Amplifier chassis. 3. Teleset Play and Record Switch
No Tape Playback	1. Teleset Play and Record Switch
No Record or Playback	1. Tape Recorder or Recorder Amplifier
No Record, Playback or Phono Play	1. Recorder Power Supply chassis 2. A-c connection between Recorder Power Supply and TV chassis
No Sound in any Service, but Phono Record and Mike Record OK	1. Blown fuse in TV chassis

\* In each of the cases given, it has been assumed that all other services are functioning properly.

RA-116A Section SWITCH POSITIONS FOR SELECTING SERVICE

Service	Timing Switch	Teleset Play Record Switch (on Tape Recorder)	Teleset Off-On-Vol.	Selector Switch	Start-Reject Control (on Phono)
TV Reception	Off	Teleset Play and Record	On	Tel. (either)	Off
AM Reception	Off	"	On	AM	Off
FM Reception	Off	"	On	FM	Off
3 Speed Record Player †	Off	"	On	Phono	On
Microphone Record	Off	Microphone Record	On	Phono	Off
Teleset Record	Off	Teleset Play and Record	On	Tel. (either)	Off
FM Record	Off	"	On	FM	Off
AM Record	Off	"	On	AM	Off
Phono Record	Off	"	On	Phono	On
Tape Playback	Off	Tape Playback	On	Phono	Off
Preselector *	On	Set to Desired Service	On	Set to Desired Service	Off

\*To turn the Teleset on and off with the Preselector Clock, place the controls in the positions indicated in the chart, setting the Teleset Play-Record and the Selector Switch to the desired Service.

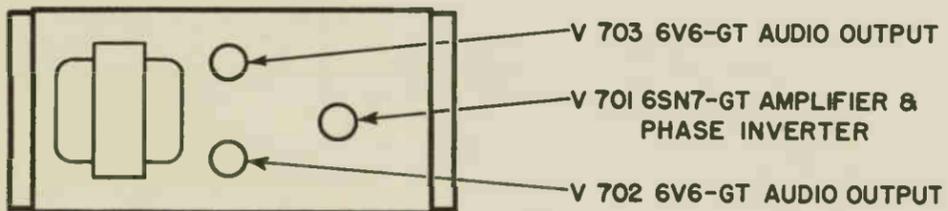

Note: The phono motor is independent of the Preselector Clock and therefore preselection of this service is not possible.

†The reminder to set the Timing switch A, and Recorder switch R, to their normal Teleset operating positions is not repeated in the Phonograph Operation section (page 6) of the Operating Handbook. These settings should be made, however, (as indicated by step 1 on page 5) when operation of the Record Player is desired.

NOTES:

- Issue #12 through ECN 4624.
- Voltage, resistance and waveform measurements.
  - Instrument used — RCA Model 195-A Voltmyst (for voltage and resistance readings.)
  - Voltage measurements taken to ground, no signal input.
  - Voltage measurements made with Phono-TV Switch (S201) in TV position; contrast and brightness minimum.
  - All coil readings were made with the coils disconnected.
  - Video waveforms measured with contrast set for 30 volts, peak-to-peak at CRT, pin 11.
  - Local-Distant switch (S204) in local position.

USE OF SYMBOLS

Large encircled symbol indicates source of voltage.

Small unencircled symbol indicates point to which voltage is applied.

MAIN CHASSIS

PARTS LIST

Table with columns: Symbol, Part No., Description, Part No., Description. Lists various electronic components like capacitors, resistors, and tubes.

Table with columns: Part No., Description, Part No., Description. Continues the list of electronic components.

HIGH VOLTAGE CHASSIS PARTS LIST

Table with columns: Symbol, Part No., Description, Part No., Description. Lists high voltage chassis parts like capacitors and resistors.

CUP BACK PANEL

Table with columns: Part No., Description. Lists parts for the cup back panel.

Table with columns: Part No., Description. Lists various electronic components.

RF TUNER 89 003 024

Table with columns: Symbol, Part No., Description. Lists RF tuner components.

LOW VOLTAGE SUPPLY CHASSIS

Table with columns: Symbol, Part No., Description. Lists low voltage supply chassis parts.

CABINET PARTS LIST

Table with columns: Part No., Description. Lists cabinet parts like levers and connectors.

**NOTES**

- Opening S203 eliminates horizontal pull and improves horizontal sync stability. Closing S203 improves sync noise immunity. Amplitude of waveform at grid of V218 will change when S203 is opened or closed.
- Amplitude of waveforms and voltages is affected by setting of a-g-c pot. R278.
- Amplitude of waveform depends on setting of contrast control R253.
- Voltage, resistance and waveform measurements
  - Instrument used RCA WV-97A Volt-hyst (for voltage and resistance). Variations of  $\pm 20\%$  are not abnormal.
  - Voltage measurements taken to ground, no signal input.
  - Voltage measurements made with switch in TV position, lights on.
  - All coil readings taken with coils disconnected.
- Switch sections viewed from front end of switch. Rotor in extreme CW (TV) Position 4. Switch positions: 1. Phono. 2. FM 3. TV, light on; 4. TV, light off. Switch has variable stop to exclude AM position.
- Chassis with Serial No. 19326 and higher have separately mounted low voltage power supplies.

Selector switch in "Television Light On" position.  
Instrument Used — RCA Model WV97A VoltOhmyst (for voltage and resistance)  
All readings in ohms K = thousand M = million  
Two readings for a given point indicate an adjustable resistance is in the measured circuit.

INPUT TUNER

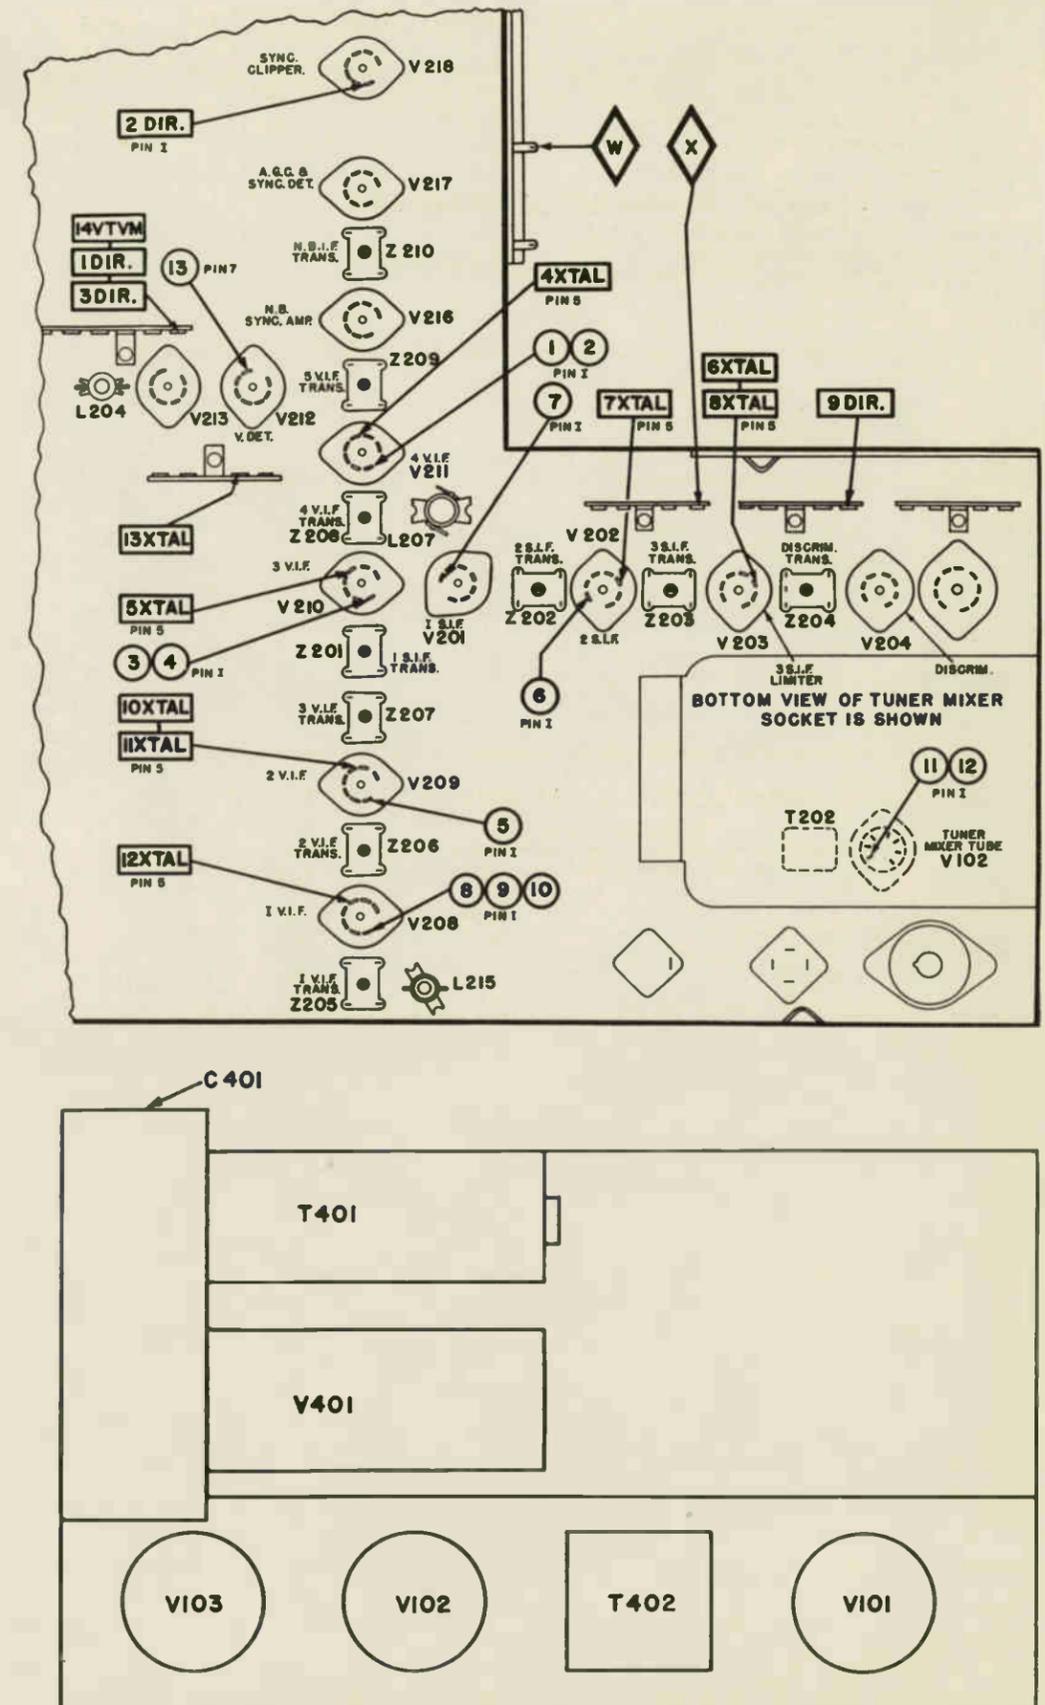

89003041

**ALIGNMENT TABLE RA-109A FAS — RA-130A**

Remove the following tubes: Tuner Oscillator V103 (6J6), Audio Amplifier V207 (6V6GT) and Horizontal Oscillator V226 (6AK6). Remove F202 deflection amplifier protection fuse. Adjust AGC control (R278) fully counter-clockwise. Turn Selector Switch in TV position.

Step	Signal Generator		Oscillograph	Adjust	Waveform	Remarks
	Frequency	Connect to				
1	24 mc. center frequency 10 mc. deviation	Pin 1-V211 4th V.I.F. Amp. ①	Junction of L201 L202 and R257 IDIR.	Z209—Top and bottom slugs and bandpass cap.		Use two alignment tools simultaneously. Push bandpass cap. wire in to increase bandpass and pull out to decrease.
2	28 mc. center frequency 5 mc. deviation	As above ②	Pin 1-V218 1st Sync Clipper 2DIR.	Z210—Top and bottom slugs		Remove V218. Use 6AU6 with pin 3 clipped and lead tied to pin 1 for scope connection.
3	21.75 mc. 400 cps AM No Sweep	Pin 1-V210 3rd V.I.F. Amp. ③	Junction of L201 L202 and R257 3DIR.	L207	Minimum scope indication.	Use high generator output and high scope gain. Be careful to avoid overload.
4	24 mc. center frequency 10 mc. deviation	As above ④	Pin 5-V211 4th V.I.F. Amp. 4XTAL	Z208—Top and bottom slugs		L207 adjustment affects waveform's low frequency side.
5	As above	Pin 1-V209 2nd V.I.F. Amp. ⑤	Pin 5-V210 3rd V.I.F. Amp. 5XTAL	Z207—Top and bottom slugs and bandpass cap.		
6	22 mc. center frequency 2 mc. deviation	Pin 1-V202 2nd S.I.F. Amp. ⑥	Pin 5-V203 3rd S.I.F. Limiter 6XTAL	Z203—Top and bottom slugs		Selector Switch in FM position.
7	As above	Pin 1-V201 1st S.I.F. Amp. ⑦	Pin 5-V202 2nd S.I.F. Amp. 7XTAL	Z202—Top and bottom slugs	As above	As above
8	As above	Pin 1-V208 1st V.I.F. Amp. ⑧	Pin 5-V203 3rd S.I.F. Limiter 8XTAL	Z201—Top and bottom slugs		Connect 100K pot between "W" and ground, arm to "X". Adjust for -5 volts bias.
9	As above	As above ⑨	Junction of R214 and C215 9DIR.	Z204—Top slug for waveform, bottom slug for maximum amplitude.		As above
10	24 mc. center frequency 10 mc. deviation	As above ⑩	Pin 5-V209 2nd V.I.F. Amp. 10XTAL	Z206—Top and bottom slugs and bandpass cap. Z201 Top slug		Selector switch in TV position. Dip in curve may be eliminated by removing V401. Z201 Top slug affects the 21.75 mc dip.
11	27.75 mc. 400 cps AM No Sweep	Pin 1-V401 IF. Amp. See Figure 1 ⑪	As above 11XTAL	T401 and Z205 Top slugs	Minimum scope indication.	Use V401 with lead tied to pin 1 for signal injection. Adjust T401 with special alignment tool #69000230.
12	24 mc. center frequency 10 mc. deviation	As above ⑫	Pin 5-V208 1st V.I.F. Amp. 12XTAL	T401 and Z205 bottom slugs and C401		As above C401 affects bandpass.
12A	As above	Pin 1-V102 Mixer ⑬	As above 12XTAL	T402 bottom slug		Use V102 with lead tied to pin 1 for signal injection. Adjust T402 with special alignment tool #69000230.
13	4.5 mc. 400 cps AM	Pin 7-V212 Video Detector ⑭	Junction of R264 R266 and C238 13XTAL	L204	Minimum scope indication.	Frequency must be accurate. Use crystal oscillator or crystal calibrated signal.
14	TV Station transmitting test pattern.		Connect a VTVM to the junction of L201, L202 and R257 14VTVM	R278 AGC control for 3 volt DC reading.		Adjust R278 on strongest station to prevent overload.
15	As above			C401 Z205 bottom slug, 1/2 turn. Z209 bottom slug, 1/2 turn.		To correct for smear in the picture.

**FIGURE 1**  
Top View of the RA109A FAS and RA130A Tuner.

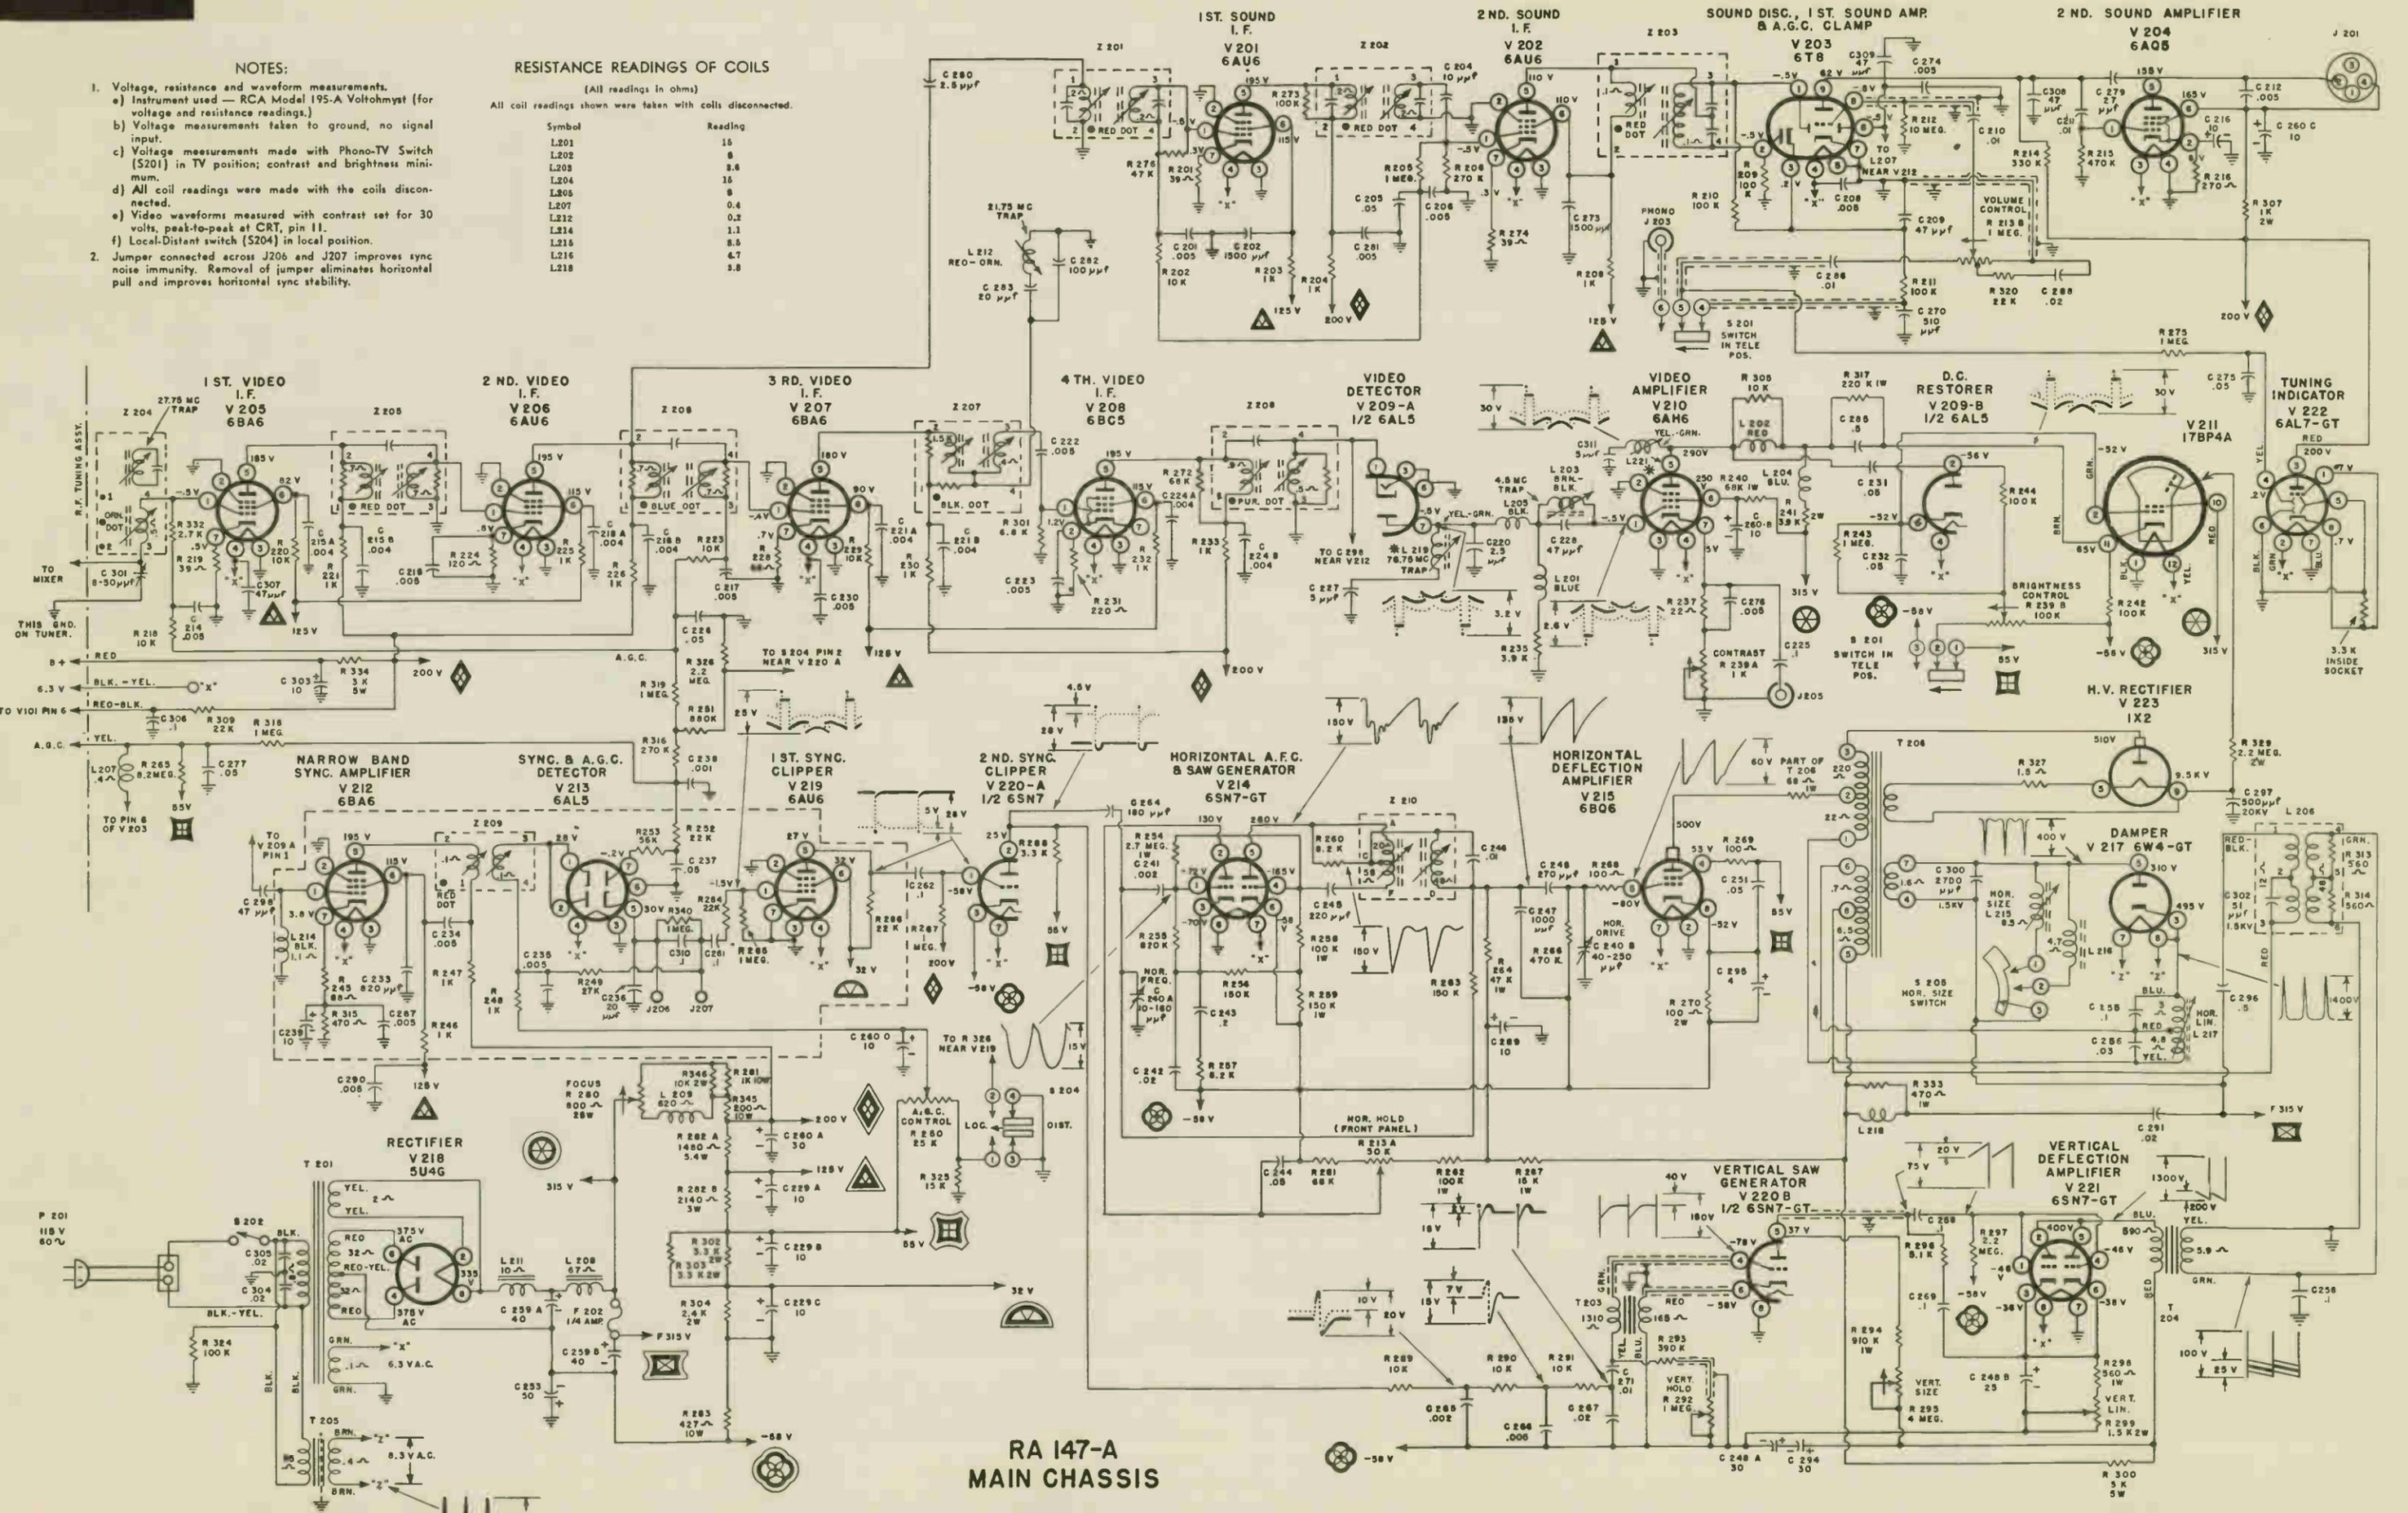

NOTES:

- 1. Voltage, resistance and waveform measurements.
  - e) Instrument used — RCA Model 195-A Voltmyst (for voltage and resistance readings.)
  - b) Voltage measurements taken to ground, no signal input.
  - c) Voltage measurements made with Phono-TV Switch (S201) in TV position; contrast and brightness minimum.
  - d) All coil readings were made with the coils disconnected.
  - e) Video waveforms measured with contrast set for 30 volts, peak-to-peak at CRT, pin 11.
  - f) Local-Distant switch (S204) in local position.
2. Jumper connected across J206 and J207 improves sync noise immunity. Removal of jumper eliminates horizontal pull and improves horizontal sync stability.

## RA-160 RA-162 RA-162B SWEEP CHASSIS

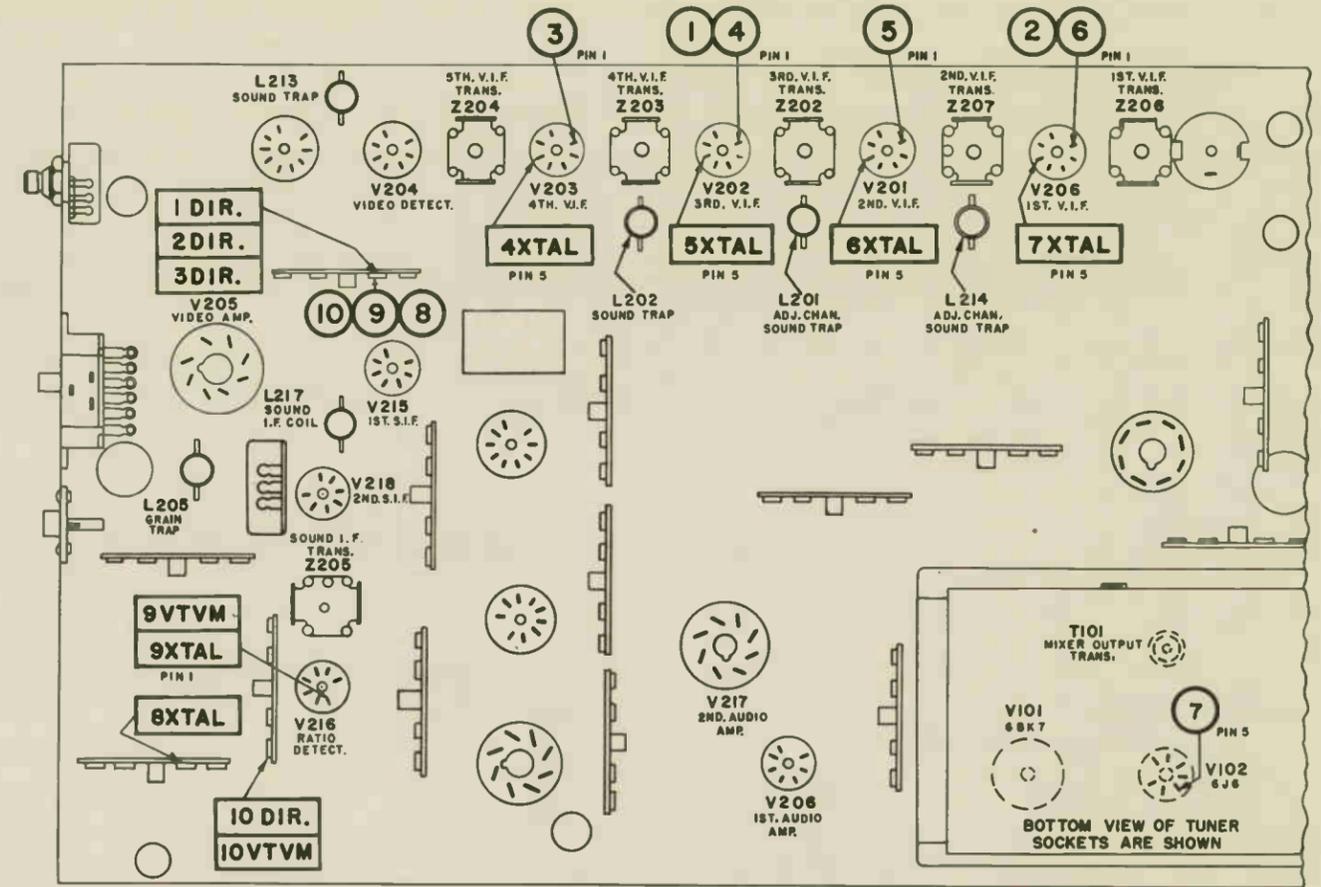

VIDEO IF ALIGNMENT RA-160 - RA-162

Before beginning alignment, remove the high-voltage fuse F301 on Sweep Chassis and the Mixer-Oscillator Tube V102 (6J6) on Tuner.

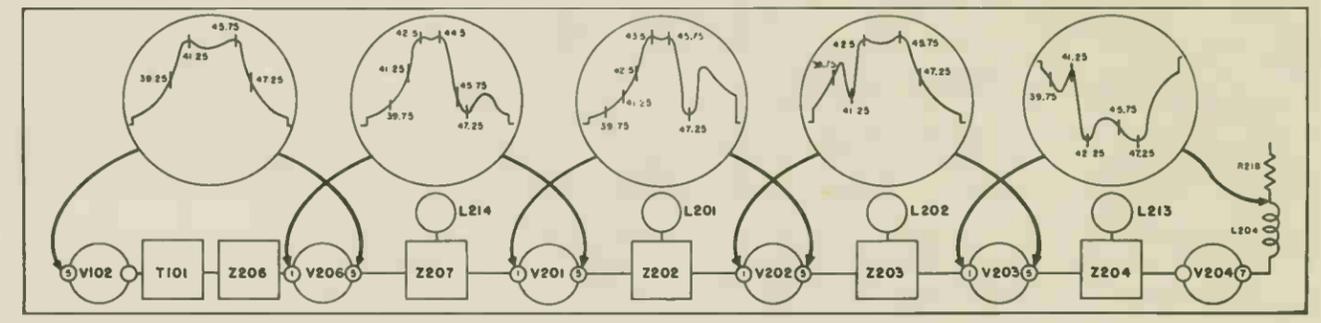

Step	Signal Generator		Oscillograph	Adjust	Waveform	Remarks
	Frequency	Connect to				
1	41.25 mc. 400 cps AM No sweep	Pin 1 - V202 ①	Junction L204 and R218 1DIR.	L202 L213	Minimum scope indication	Use high generator output and low scope gain. Be careful to avoid overload.
2	47.25 mc. 400 cps AM No sweep	Pin 1 - V206 ②	Junction L204 and R218 2DIR.	L201 L214	As above	As above
3	43.5 mc. center frequency 10 mc. deviation (min.)	Pin 1 - V203 ③	Junction L204 and R218 3DIR.	Z204 - top and bottom slugs, and bandpass cap.		Use high scope gain and reduce generator output. Recheck L213 (41.25 mc. dip in curve).
4	As above	Pin 1 - V202 ④	Pin 5 - V203 4XTAL	Z203 - top and bottom slugs and bandpass cap.		Recheck L202 (41.25 mc. dip in curve).
5	As above	Pin 1 - V201 ⑤	Pin 5 - V202 5XTAL	Z202 - top and bottom slugs and bandpass cap.		Recheck L201 (47.25 mc. dip in curve).
6	As above	Pin 1 - V206 ⑥	Pin 5 - V201 6XTAL	Z207 - top and bottom slugs and bandpass cap.		Remove V202. Recheck L214 (47.25 mc. dip in curve).
7	As above	Pin 5 - V102 ⑦	Pin 5 - V206 7XTAL	Z206 - bottom slug, T101 on tuner. Z206 top for bandpass		Remove V201. Replace original 6J6 (V102) with lead tied to pin 5 for signal injection. Remove one oscillator strip from tuner and tune to this channel.
8	4.5 mc. 400 cps AM	Junction of R204 & R218 ⑧	Junction of R223 & R222 8XTAL	L205	Minimum scope indication	Frequency must be accurate. Use crystal oscillator or crystal calibrated signal.

SOUND ALIGNMENT

9	4.5 mc. approx. 1/2 mc. sweep	Junction L204 & R218 ⑨	Pin 1 - V216 9XTAL	Z205 - bottom slug, L217		Avoid overload.
10	As above	Junction L204 & R218 ⑩	Junction of R283 & C248 10DIR.	Z205 - top slug		As above.

SPEED ALIGNMENT CHART

ALTERNATE SOUND ALIGNMENT METHOD USING TV SIGNAL				
Step	Signal Source	VTVM	Adjust	Remarks
9	TV Signal	Pin 1 - V216 9VTVM	Z205 - bottom slug and L217 for max. positive voltage indication	Teleset must be tuned to a TV station.
10	TV Signal	Junction of R283 & C248 10VTVM	Z205 - top slug for zero voltage indication	As above.

ALIGNMENT NOTES

- The chassis and instruments should be bonded together and connected to a common ground.
- Terminate the generator output cable with the resistance recommended by the manufacturer of the instrument.
- Use the full gain of the oscillograph and the lowest generator output which will give a satisfactory curve, except when adjusting traps. When adjusting a trap use the highest generator output which does not cause overload and set the oscillograph for satisfactory response.
- Do not adjust the bandpass capacitors until the frequency of each curve has been correctly set using the slug adjustments.
- Use two alignment tools simultaneously (one for the top slug, the other for the bottom slug) to save time.

The above resistance readings were taken with an RCA Model WV97A VTVM. All readings are in ohms, K = 1000, M = million. When the reading is affected by a control two readings are given. These readings indicate the variation produced by the control.

### ION TRAP MAGNET ADJUSTMENT.

—A small magnetic shunt is clipped on the ion-trap magnet at the factory. This shunt should NOT be removed. The ion-trap should be adjusted as follows:

1. Place the magnet on the neck of the CRT as shown in figure 1.
- NOTE: When the magnet is properly positioned the spring is below the tube neck and the part number stamped on the magnet is on the left, viewed from the rear.

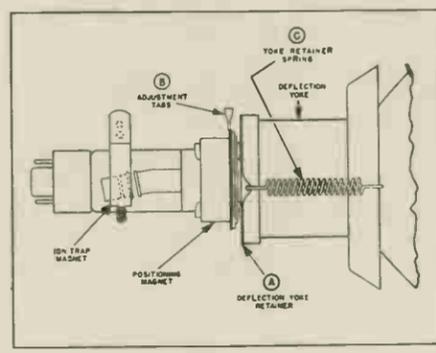

Figure 1

2. Turn the set on and allow 30 seconds for warm-up.

Set the contrast control at the middle of its range and set the brightness so that a raster is just visible on the screen.

NOTE: Do not operate the Teleset with the ion-trap magnet improperly positioned, except when making the above adjustment.

3. Slide the magnet slowly back and forth along the neck of the tube; at the same time rotating it slightly clockwise and counter-clockwise around the tube. As the raster on the screen becomes brighter, turn down the brightness control until there is just enough brightness to permit the adjustment to be made. Locate the magnet position that gives maximum brightness and optimum focus. Now turn up the brightness control until the raster begins to increase in size. Then adjust the ion-trap magnet again until maximum brightness and optimum focus are obtained.

Optimum focus can be determined by observing the horizontal scanning lines. The scanning lines should be as thin and sharp as possible.

### TUNER OSCILLATOR ADJUSTMENT.

—Tune the Teleset to the channel on which the oscillator is to be adjusted. Remove the fine-tuning knob and the dial. The oscillator slug is accessible through a hole approximately 3/4 inch to the right of tuning shaft. Set the fine tuning control at the center of its mechanical range. Using an insulated alignment tool, adjust the slug so that proper sound and picture are obtained.

### FRINGE BLOCK SWITCH ADJUSTMENT

—A Fringe Block switch is provided to improve reception in noisy fringe areas. The switch should be placed in the Fringe position for the reception of weak signals, where high level noise conditions affect the sync noise immunity.

## ADJUSTMENTS

The Normal position of the switch is used for all other reception conditions.

Note: This Teleset will not operate properly on strong signals unless the switch is in the Normal position.

### ADJUSTING THE A-F-C CIRCUITS.

1. Turn the set on and allow it to warm up for 15 minutes.
  2. Set the front panel Horizontal-Hold control at the center of its mechanical range.
  3. Short the a-f-c test point to ground with a short length of wire.
  4. Adjust the Horizontal-Stabilizer control, L213 (on rear of chassis) until the picture holds sync momentarily.
- NOTE: With the a-f-c test point shorted the a-f-c circuits are not functioning and the picture will not continue to hold sync.
5. Remove the short from the a-f-c test point.

### HORIZONTAL-DRIVE CONTROL ADJUSTMENT.

—The presence of a bright vertical line near the center of the picture indicates the need for readjustment of the horizontal drive control. To adjust the control, rotate it until the bright line disappears. The proper setting is just beyond the point at which the line is no longer visible.

If the range of the control is not great enough to eliminate the bright line, remove the jumper across R277 and readjust the control.

### A-G-C ADJUSTMENT.

—The a-g-c control is properly adjusted at the factory and normally does not require readjustment in the field. However, in some cases better results can be obtained by adjusting the control to suit the conditions at a particular location. If any of the following conditions are encountered, the

a-g-c control should be readjusted.

1. Insufficient contrast.
  2. Poor horizontal or vertical noise immunity.
  3. Sync huzz.
  4. Overloading; as indicated by picture distortion or loss of vertical hold, due to sync compression.
- To remedy these conditions, tune the receiver to the channel affected and rotate the a-g-c control until the difficulty is eliminated.

In areas where strong or a combination of strong and weak signals are received, set the Fringe Block switch in the Normal position and readjust the a-g-c control to prevent overloading on the strongest station.

When adjusting the a-g-c to prevent overload by a strong signal the following procedure should be used:

1. Set the front panel horizontal-hold control for minimum whip (straight vertical wedge on test pattern) at the top of the picture.
2. Adjust the a-g-c control until the overload is eliminated.
3. Switch the Station Selector on and off the channel in question. Under some conditions this will cause the overload to reappear.
4. If this occurs, reset the a-g-c control and again rotate the Station Selector until the overload does not reappear when switching on and off the channel.

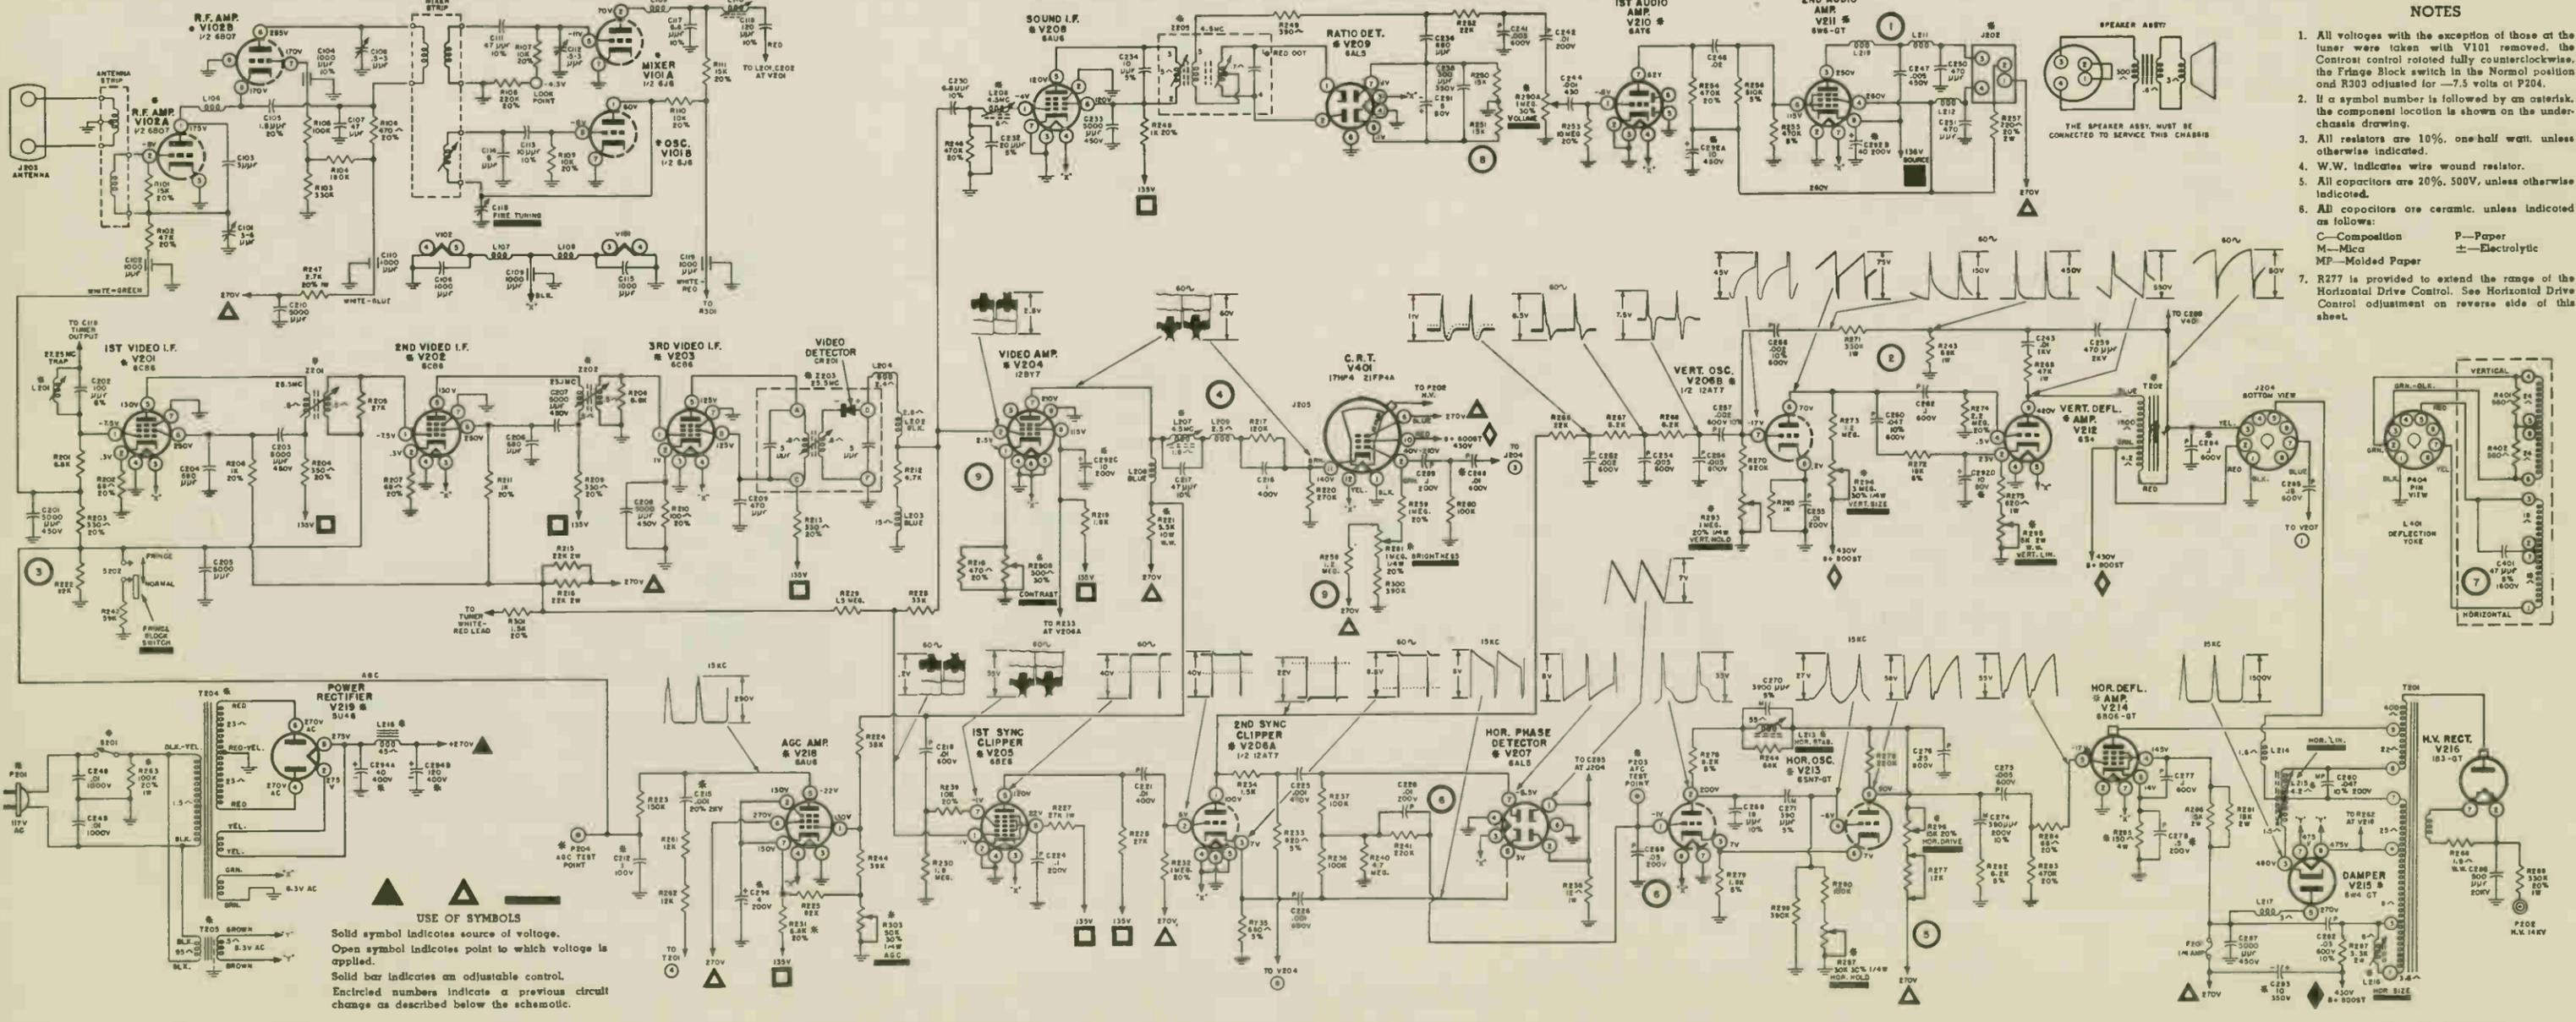

An a-g-c test point is provided on the top of the chassis to aid in checking the performance of the receiver. When the receiver is tuned to a moderately strong signal the a-g-c control can be adjusted to produce approximately 6.5 volts maximum at the test point.

In areas where only weak signals are received, the a-g-c control should be adjusted for optimum reception with the Fringe Block switch in the Fringe position.

## NOTES

1. All voltages with the exception of those at the tuner were taken with V101 removed. The Contrast control rotated fully counterclockwise, the Fringe Block switch in the Normal position and R303 adjusted for -7.5 volts at P204.
2. If a symbol number is followed by an asterisk, the component location is shown on the under-chassis drawing.
3. All resistors are 10%, one-half watt, unless otherwise indicated.
4. W.W. indicates wire wound resistor.
5. All capacitors are 20%, 500V, unless otherwise indicated.
6. All capacitors are ceramic, unless indicated as follows:
  - C—Composition
  - P—Paper
  - M—Mica
  - MP—Molded Paper
  - ±—Electrolytic
7. R277 is provided to extend the range of the Horizontal Drive Control. See Horizontal Drive Control adjustment on reverse side of this sheet.

## RA-164 RA-165 CHASSIS

**USE OF SYMBOLS**

Solid symbol indicates source of voltage.  
 Open symbol indicates point to which voltage is applied.  
 Solid bar indicates an adjustable control.  
 Encircled numbers indicate a previous circuit change as described below the schematic.

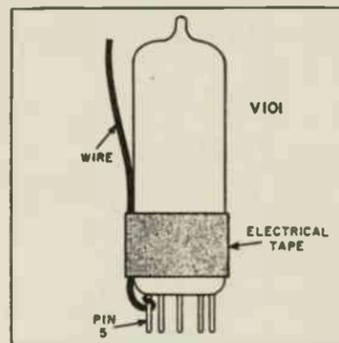

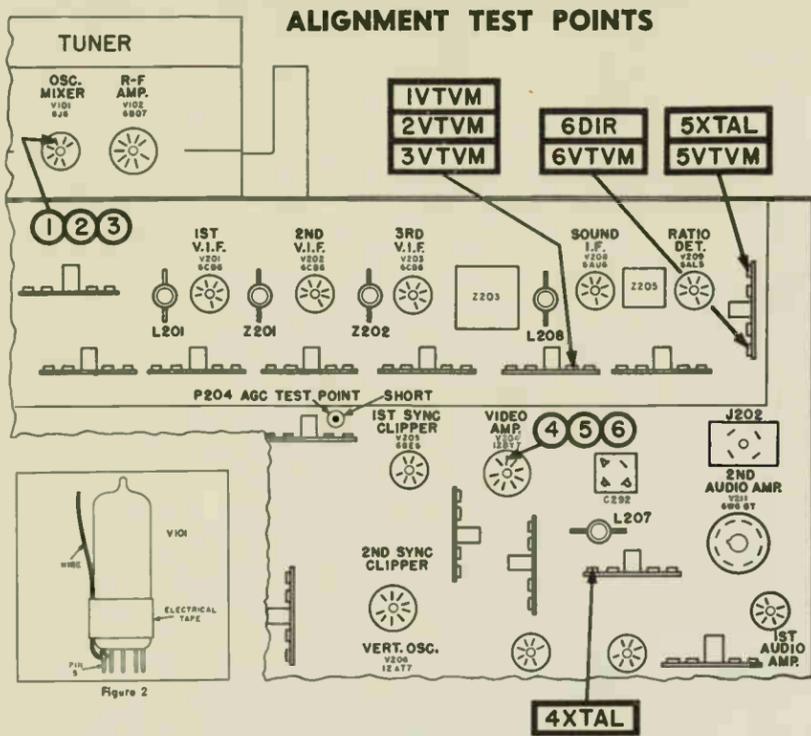

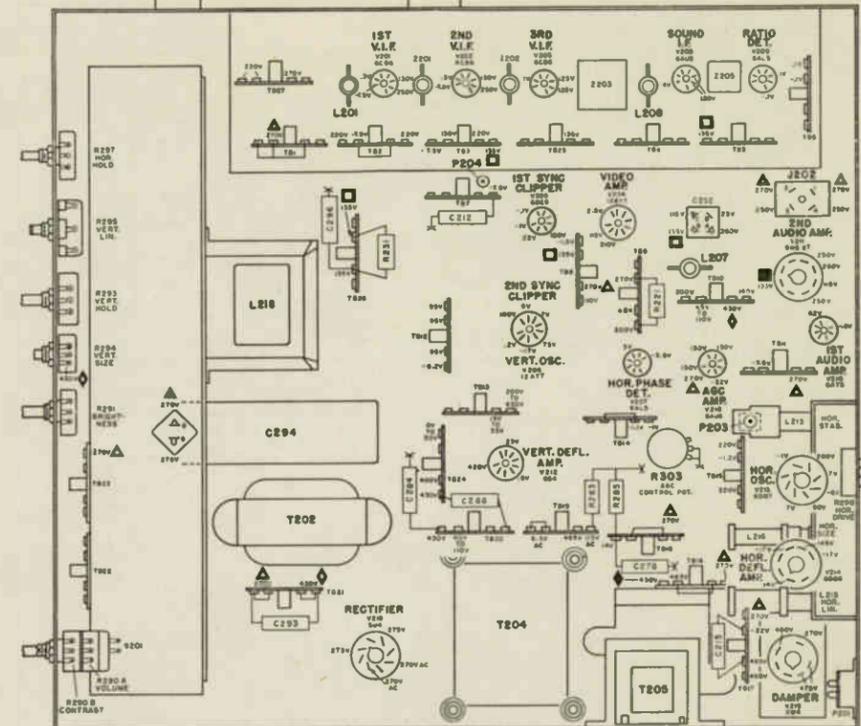

Figure 2

**VIDEO IF ALIGNMENT RA-164 - RA-165**

Short the a-g-c test point to ground. Place the STATION SELECTOR between channels to disable the oscillator. Connect a short length of wire to pin 5 of V101 (see Figure 2 above). Use the lowest VTVM range for all steps.

Step	Signal Generator		Output Indicator	Connect to	Adjust	Remarks
	Frequency	Connect to				
1	25.5 mc No Sweep	Pin 5 V101 ①	VTVM	Junction R212 and Pin 2 V204 [IVTVM]	Z203, and Z201 for maximum reading.	Set Signal Generator output to maintain reading on lowest range of VTVM.
2	27.25 mc No Sweep	As above ②	VTVM	As above [2VTVM]	L201 for minimum.	Increase Signal Generator output to obtain reading on VTVM.
3	23.1 mc No Sweep	③ As above	VTVM	As above [3VTVM]	Z202 and Mixer-Trans. for maximum.	Set Signal Generator output to maintain reading on lowest range of VTVM.
4	4.5 mc 400 CPS AM	Pin 2 V204 ④	Oscilloscope thru XTAL	Junction L207 and R217 [4XTAL]	L207 for minimum.	

**SOUND IF ALIGNMENT**

5	4.5 mc approx. 1 mc sweep	Pin 2 V204 ⑤	Oscilloscope thru XTAL	Pin 5 V209 [5XTAL]	L208 and Z205 bottom	Adjust for waveform below. 
6	As above	As above ⑥	Oscilloscope Direct	Junction R252, C241 [6DIR]	Z205 top	Adjust for waveform below. 

**ALTERNATE SOUND IF ALIGNMENT — USING TV SIGNAL**

Step	Signal Source	Output Indicator	Connect to	Adjust	Remarks
5	TV Signal	VTVM	Pin 5 V209 [5VTVM]	L208 and Z205 bottom for maximum	Teletext must be tuned for best picture.
6	As above	VTVM	Junction R252, C241 [6VTVM]	Z205 top for zero	As above

**PHASING**

When the alignment procedure has been completed, the phasing of the video IF strip should be checked, and corrected if required.

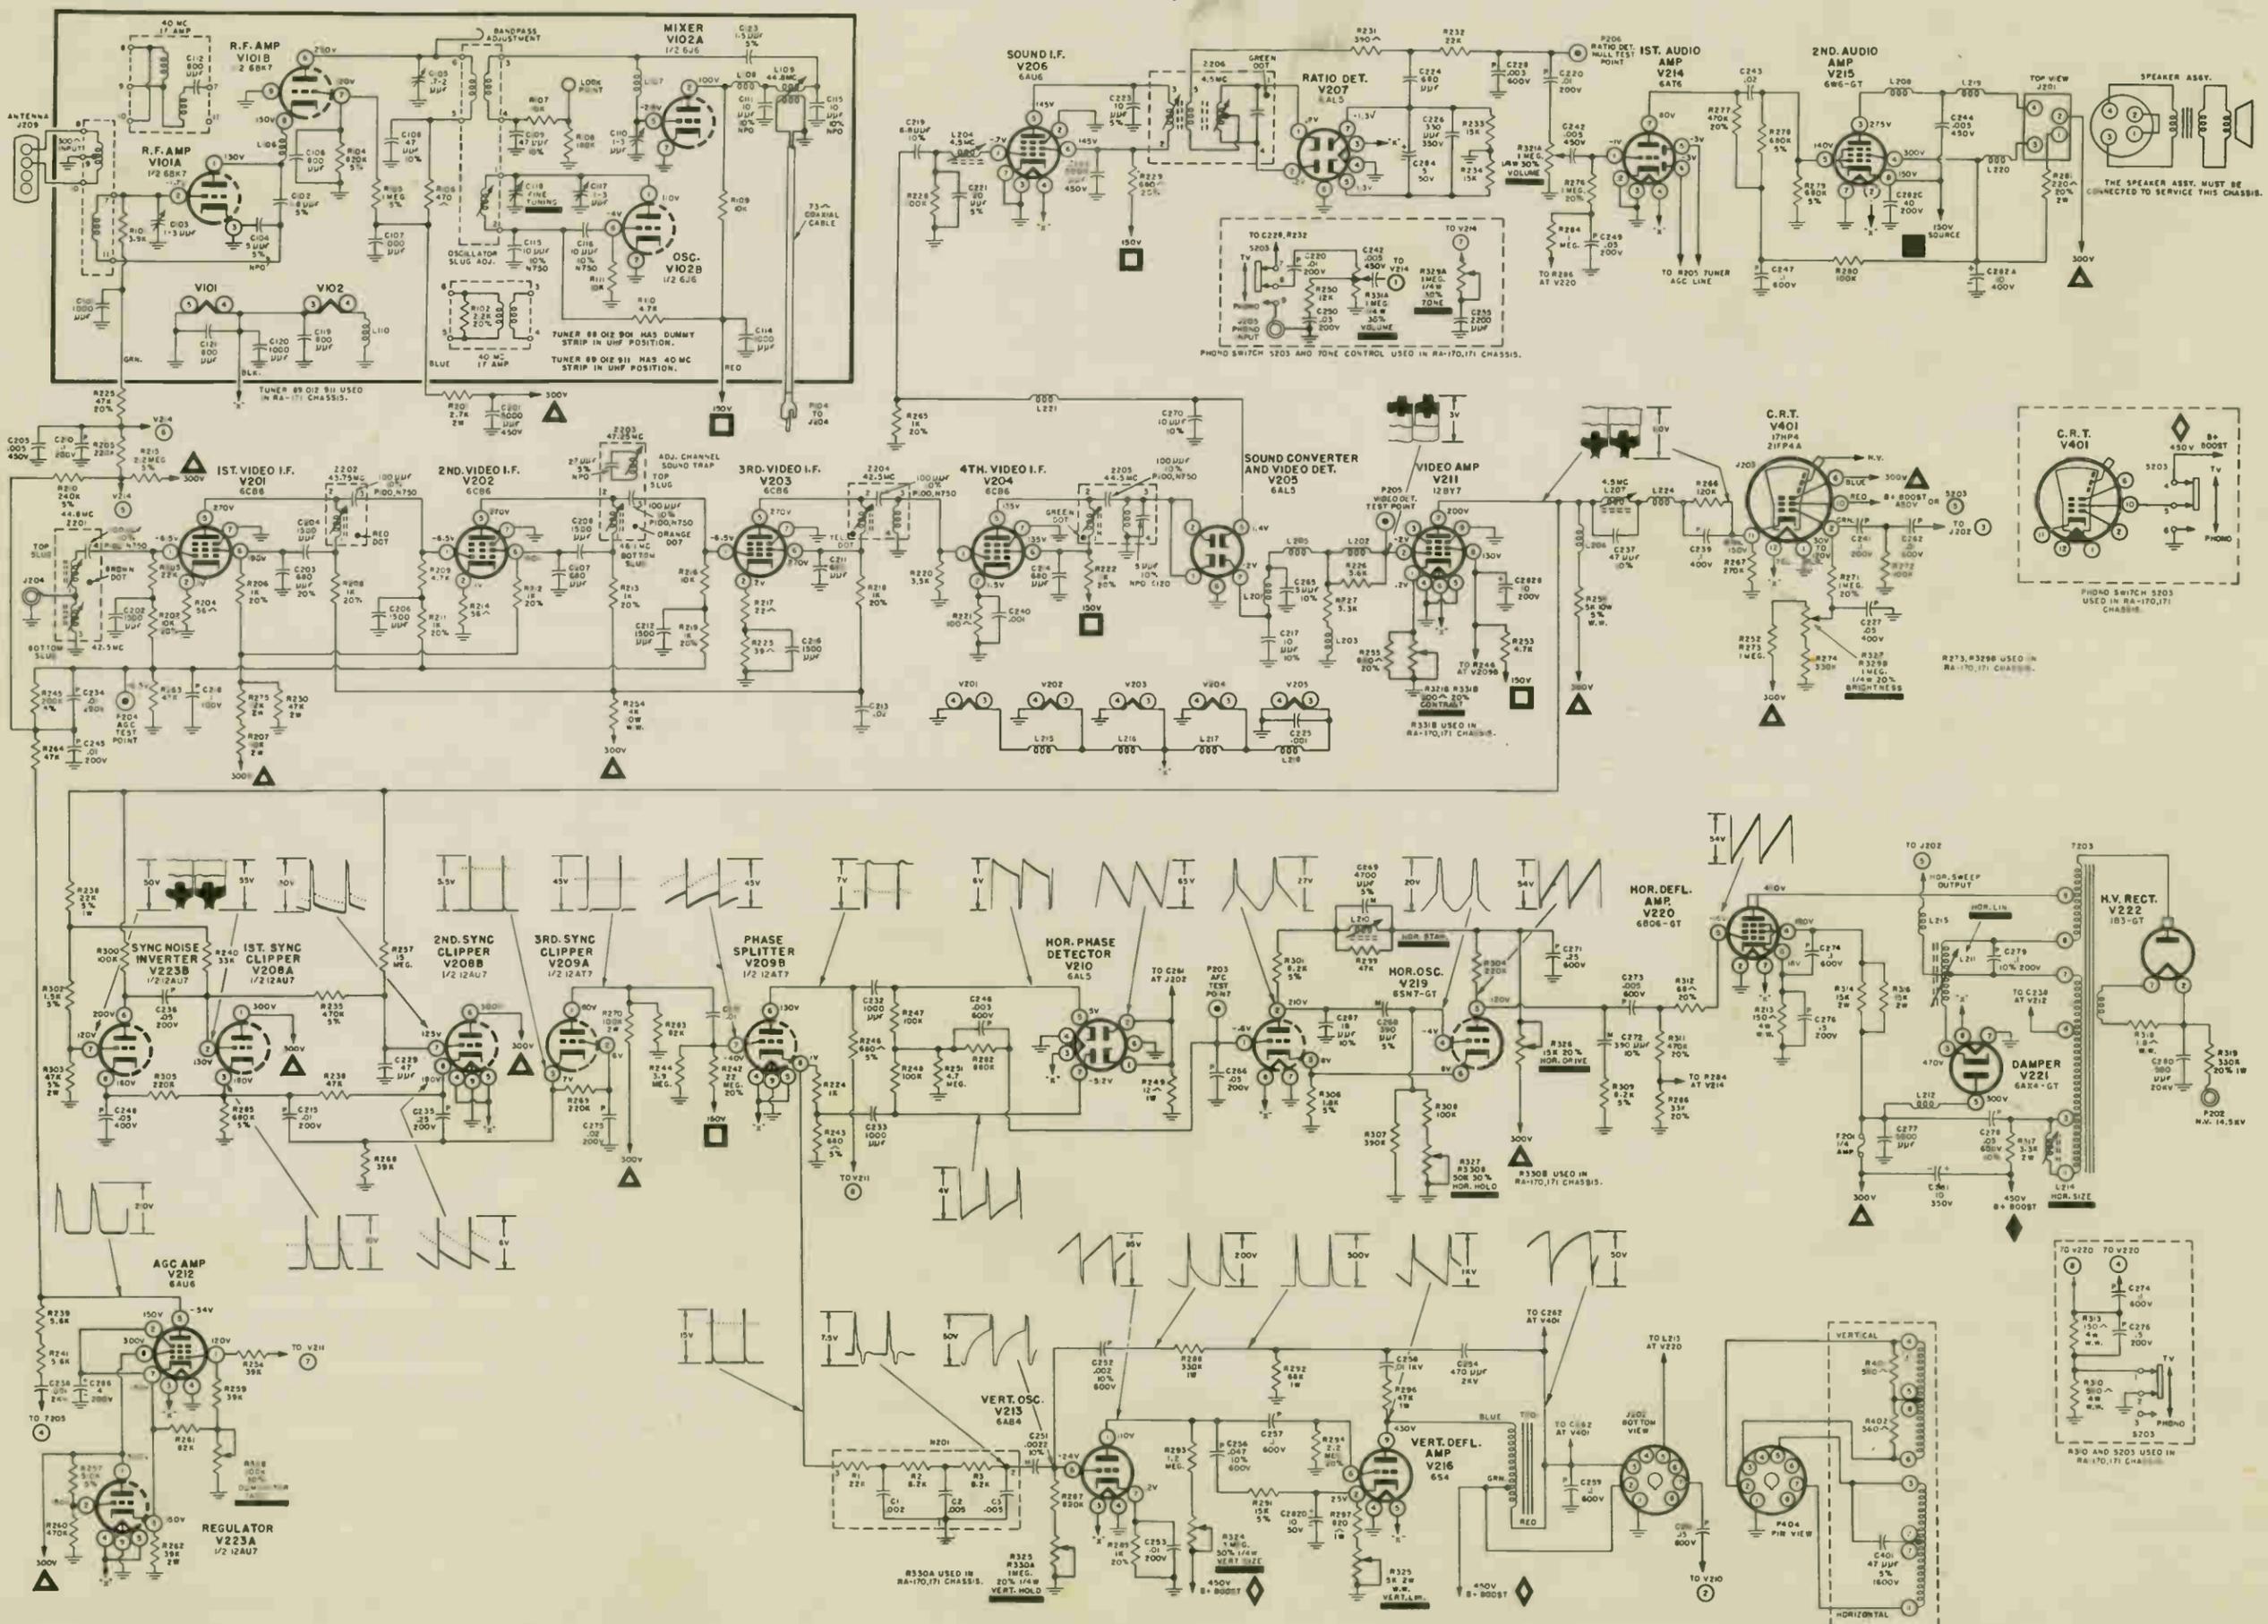

1. Tune the receiver to the best available signal, preferably a station transmitting a test pattern.
2. Turn the Fine Tuning control fully counter-clockwise. If sound bars DO NOT appear in the picture, adjust the oscillator slug to produce a slight amount of sound in the picture.

3. Turn the Fine Tuning control clockwise until the sound in the picture is eliminated.
4. Carefully examine the picture for the presence of spurious black response (smear) following black elements of the picture, or trailing whites.
5. If either of these conditions is encountered, proceed as follows: for smear, turn Z201 counter-clockwise not more than 1/4 turn; for trailing whites, turn Z201 clockwise not more than 1/4 turn.

RA-166/167, 170/171 CHASSIS

## VIDEO IF ALIGNMENT RA-166/167, 170/171

Place **STATION SELECTOR** between channels to disable oscillator. Remove fuse, F201. Connect a short length of wire to pin 5 of V101 (see Figure 1). Use the lowest VTVM range for all steps.

Step	Signal Generator		Output Indicator	Connect to	Adjust	Remarks
	Frequency	Connect to				
1	44.5 mc No Sweep	Pin 5 V101 ①	VTVM	Pin 2. V211 <b>1VTVM</b>	Z205 for maximum reading	Set signal generator output to maintain reading on lowest range of VTVM.
2	42.5 mc No Sweep	As Above ②	VTVM	As Above <b>2VTVM</b>	Z204 for maximum reading	Same
3	46.1 mc No Sweep	As Above ③	VTVM	As Above <b>3VTVM</b>	Z203 (bottom) for maximum reading	Same
4	43.75 mc No Sweep	As Above ④	VTVM	As Above <b>4VTVM</b>	Z202 for maximum reading	Same
5	47.25 mc	As Above ⑤	VTVM	As Above <b>5VTVM</b>	Z203 (top) for minimum reading	Increase signal generator output to obtain reading on VTVM.
6	43.5 mc center freq. 10 mc deviation (min.)	As Above ⑥	Oscilloscope through XTAL	Pin 5 V201 <b>6XTAL</b>	Mixer Plate Coil (L109) and Z201 (top) for 44.8 mc marker on one peak Z201 (bottom) for 42.5 mc marker on other peak.	Adjust for waveform below. 
7	4.5 mc 400 CPS AM	Pin 2 V211 ⑦	Oscilloscope through XTAL	Junction R266, R267, and C239 <b>7XTAL</b>	L207 for minimum reading	

## SOUND IF ALIGNMENT

Step	Signal Source	Output Indicator	Connect to	Adjust	Remarks
8	4.5 mc Approx. 1 MC sweep	Pin 5 V205B ⑧	Oscilloscope through XTAL <b>8XTAL</b>	L204 and Z206 (bottom)	Adjust for waveform below. 
9	As Above	As Above ⑨	Oscilloscope Direct <b>9DIR</b>	Junction R232, C228 Z206 top	Adjust for waveform below. 

## ALTERNATE SOUND IF ALIGNMENT — USING TV SIGNAL

Step	Signal Source	Output Indicator	Connect to	Adjust	Remarks
8	TV Signal	VTVM	Pin 7. V207 <b>8XTAL</b>	L204 Z206 (bot.) for maximum reading	Teleset must be tuned for best picture.
9	As Above	VTVM	Ratio Del. Test Point P206	Z206 Top for zero reading	As Above

## PHASING

- When the alignment procedure has been completed, the phasing of the video IF strip should be checked and corrected if required.
1. Tune the receiver to the best signal available, preferably a station transmitting a test pattern.
  2. Adjust the Fine Tuning control until the sound in the picture is eliminated.
  3. Carefully examine the picture for trailing whites, or the presence of spurious black response (smear) following black elements of the picture.
  4. If either of these conditions is encountered, adjust the top slug of Z201 not more than 1/2 turn to eliminate the condition.

## RESISTANCE MEASUREMENTS

The above resistance readings were taken with an RCA Model WV97A VTVM. All readings are in ohms, K=1000, M=million. When the reading is affected by a control two readings are given. These readings indicate the variation produced by the control.
