(57) **ABSTRACT**

A method and apparatus are provided for building an intelligent automated assistant. Embodiments of the present invention rely on the concept of “active ontologies” (e.g., execution environments constructed in an ontology-like manner) to build and run applications for use by intelligent automated assistants. In one specific embodiment, a method for building an automated assistant includes interfacing a service-oriented architecture that includes a plurality of remote services to an active ontology, where the active ontology includes at least one active processing element that models a domain. At least one of the remote services is then registered for use in the domain.

METHOD AND APPARATUS FOR BUILDING AN INTELLIGENT AUTOMATED ASSISTANT

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. application Ser. No. 14/141,261, filed Dec. 26, 2013, entitled "METHOD AND APPARATUS FOR BUILDING AN INTELLIGENT AUTOMATED ASSISTANT," which is a continuation of U.S. application Ser. No. 11/518,292, filed Sep. 8, 2006, entitled "METHOD AND APPARATUS FOR BUILDING AN INTELLIGENT AUTOMATED ASSISTANT," (now U.S. Pat. No. 8,677,377, issued on Mar. 18, 2014), which claims the benefit of U.S. Provisional Patent Application Ser. No. 60/715,324, filed Sep. 8, 2005, entitled "METHOD AND APPARATUS FOR BUILDING AN INTELLIGENT AUTOMATED ASSISTANT." All above applications which are herein incorporated by reference in their entirety for all purposes.

FIELD OF THE INVENTION

The invention relates generally to intelligent systems and relates more specifically to tools for building classes of applications for intelligent automated assistants.

BACKGROUND OF THE DISCLOSURE

Intelligent systems, such as intelligent automated assistants, that are capable of interacting with humans (e.g., by observing user behavior, communicating with users, understanding observed situations, anticipating what a user may need and acting to produce useful behavior) are valuable in a variety of situations. For example, such systems may assist individuals who are impaired in some way (e.g., visually, auditorially, physically, cognitively, etc.), including elderly people (who may be stricken by one or more ailments), surgeons (whose eyes, hands and brains are constantly busy/when performing operations) and business executives (who may have numerous tasks to accomplish), among others.

To accomplish all of these objectives, intelligent automated assistants integrate a variety of capabilities provided by different software components (e.g., for supporting natural language recognition, multimodal input, managing distributed services, etc.). Development of a system incorporating these different software components typically requires knowledge of numerous different programming languages and artificial intelligence-based methods. Thus, the development of an intelligent automated assistant is a complex task that typically requires contribution from a plurality of highly skilled individuals each having expertise in different aspects of programming; it is nearly impossible for a lone software developer to build an intelligent automated assistant due to the breadth and variety of expertise that is required to build the system. The typical development process for building intelligent automated assistants is therefore relatively inefficient in terms of time, cost and manpower.

Thus, there is a need in the art for a method and apparatus for building an intelligent automated assistant.

SUMMARY OF THE INVENTION

A method and apparatus are provided for building an intelligent automated assistant. Embodiments of the present

invention rely on the concept of "active ontologies" (e.g., execution environments constructed in an ontology-like manner) to build and run applications for use by intelligent automated assistants. In one specific embodiment, a method for building an automated assistant includes interfacing a service-oriented architecture that includes a plurality of remote services to an active ontology, where the active ontology includes at least one active processing element that models a domain. At least one of the remote services is then registered for use in the domain.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a schematic diagram illustrating one embodiment of an active ontology execution environment according to the present invention;

FIG. 2 is a schematic diagram illustrating one embodiment of an exemplary active ontology that is configured as an autominder for reminding a user to take medicine after meals (e.g., configured for activity and/or time recognition);

FIG. 3 is a flow diagram illustrating one embodiment of a method for processing facts in accordance with an active ontology (e.g., configured in a manner similar to the active ontology of FIG. 1) according to the present invention;

FIG. 4 is a schematic diagram illustrating one embodiment of an open standard-based system for developing and managing an intelligent system using active ontologies;

FIG. 5 is a schematic diagram illustrating one embodiment of a framework for dynamically registering and coordinating distributed services using active ontologies; and

FIG. 6 is a high level block diagram of the present intelligent system building method that is implemented using a general purpose computing device.

DETAILED DESCRIPTION

In one embodiment, the present invention is a method and apparatus for building an intelligent automated assistant. Embodiments of the present invention rely on a developer-friendly unified framework, referred to as an "active ontology", which integrates multiple system-building capabilities in a single tool. An "ontology", generally, is a passive data structure that represents domain knowledge, where distinct classes, attributes and relations among classes are defined. A separate engine may operate or reason on this data structure to produce certain results. Within the context of the present invention, an "active ontology" may be thought of as an execution environment in which distinct processing elements are arranged in an ontology-like manner (e.g., having distinct attributes and relations with other processing elements). These processing elements carry out at least some of the typical tasks of an intelligent automated assistant. Although described within the context of an intelligent automated assistant, it will be understood that the concepts of the present invention may be implemented in accordance with any application that involves interaction with software.

FIG. 1 is a schematic diagram illustrating one embodiment of an active ontology execution environment **100** according to the present invention. The execution environment comprises an active ontology **102** that is adapted to receive one or more input facts or events **104** and process these inputs **104** to produce useful actions **106**. In one embodiment, the active ontology **102** is tailored to a specific context. For example, the active ontology **102** may be adapted to remind a user to take medication after meals, where at least some of the input facts **104** relate to events collected from the user's surrounding environment (e.g.,

“the user is in the kitchen”, “the user is eating”, “the time is 8:00 AM”, etc.) and at least one of the actions **106** is produced in response to these facts (e.g., prompting the user to take the medication at the appropriate time).

To this end, the active ontology **102** comprises at least one active processing element or concept **108₁-108_n**, (hereinafter collectively referred to as “concepts **108**”). The concepts **108** may be thought of as the basic building block of the active ontology **102**; concepts **108** both represent a sub-part of the execution environment **100** and perform computations or actions (e.g., natural language understanding, task execution, etc.) related to the sub-part. Concepts **108** are adapted to match to specific types of facts in order to perform these actions, and may be specifically configured to manage temporal constraints, service brokering strategies, fusion strategies, or other tasks.

In one embodiment, the concepts **108** are prioritized such that the input facts **104** are processed against the concepts **108** starting with a highest-ranked concept **108** and proceeding in descending order to a lowest-ranked concept **108**. In one embodiment, at least two of the concepts **108** are communicatively coupled by a channel **110₁-110_n**, (hereinafter collectively referred to as “channels **110**”) that allows the concepts **108** to communicate and to share information. For example, concepts **108** may share all or part of their respective computation results with other concepts **108** over these channels **110**. In this case, information propagated using the channels **110** may be weighted or associated with a probability such that joining concepts **108** may use these weights or probabilities when determining how further results derived from incoming information should be propagated.

In one embodiment, channels **110** possess properties **111₁-111_n**, (hereinafter referred to as “properties **111**”) that configure the relationship expressed between connected concepts. For example, a property “Mandatory” associated with a channel that connects a first concept and a second concept may express that the first concept cannot be valid if the second concept is not satisfied. Thus, for instance, if the first concept represents “MovieListing”, and the second concept represents “GeographicalArea”, the “Mandatory” property expresses that a user cannot request a MovieListing (e.g., “Find action movies starring actor X”) without also supplying a geographical location (“e.g., near San Francisco”).

Each concept **108** comprises a template including at least one rule **112₁-112_n**, (hereinafter collectively referred to as “rules **112**”) or rule set **114** (comprising multiple rules **112**). Each rule **112** comprises a condition and an associated action. If an input fact matches a rule’s condition, the associated action is triggered. In one embodiment, conditions may be evaluated as Java Script Boolean expressions (e.g., comprising slots), while associated actions are executed as Java Script programs. In further embodiment, rules **112** are prioritized within each concept **108** so that the rules are processed in an order of descending priority. Prioritization of rules allows for applications including activity recognition and action validation to share a common ontology structure. For example, a decision tree may be traversed in one direction for action execution, and then traversed in the opposite direction for action validation.

Among other advantages, active ontologies such as those described above can enable a simplified, efficient development scheme for intelligent automated assistants. Such a framework can be implemented to tie together multiple different programming applications, including applications capable of processing multimodal input, generating adapt-

able presentations, producing natural language dialogues, performing reactive planning, performing activity recognition and/or scheduling, and brokering, registering and coordinating distributed services, in a unified, visual framework. Thus, a single software developer may quickly and easily build an intelligent automated assistant using such a unified, developer-friendly development scheme.

As described in further detail with respect to FIG. 3, an active ontology such as the active ontology **102** may be built to process facts in order to achieve any one of a number of goals, including activity recognition (e.g., natural language processing, human activity, recognition, etc.), reactive activity execution (e.g., pseudo-reactive planning, rule-based planning, etc.) and management of temporal constraints (e.g., for activity execution times), among others. A plurality of individual active ontologies may be built to execute a plurality of different goals, and these individual active ontologies may be integrated into a single processing unit such as an intelligent automated assistant. As described further below, these active ontologies may be managed in a manner that is significantly simpler than the traditional development process for intelligent automated assistants.

FIG. 2 is a schematic diagram illustrating one embodiment of an exemplary active ontology **200** that is configured as an assistant for reminding a user to take medicine after meals (e.g., configured for activity and/or time recognition). As illustrated, the active ontology **200** comprises at least one target task **202** (e.g., “take medicine after breakfast”) and a plurality of concepts **204₁-204_n**, (hereinafter collectively referred to as “concepts **204**”) representing potential user actions related to the target task **202** and to the modeled domain in which these actions are likely to occur (e.g., the user’s home). The concepts **204** are communicatively coupled to other concepts **204** via a plurality of channels **210₁-210_n**, (hereinafter collectively referred to as “channels **210**”).

The active ontology **200** is also in communication with a plurality of sensors **206₁-206_n**, (hereinafter collectively referred to as “sensors **206**”) that are distributed throughout the modeled domain and are adapted to convey observed facts relating to the user’s behavior (e.g., “the user is in the kitchen”; “the user is in the dining room”; “the user is in the bathroom”; etc.) to the higher-level concepts **204** for appropriate processing. Concepts **204** also communicate processing results (or at least partial processing results) to other concepts for further processing (e.g., if concept **204₈** verifies that the user is in the kitchen, concept **204₈** may convey this information to concept **204₃**, which is configured to determine whether the user is getting food). In addition, a clock **208** may also be in communication with the concepts **204** to enable the management of temporal constraints (e.g., the user is expected to sit at the table for approximately twenty-five minutes while eating breakfast; the user should take his/her medicine approximately thirty minutes after finishing breakfast; etc.).

Thus, if the target task **202** is not observed as being executed (e.g., the active ontology **200** does not determine that the user has taken the medicine after a meal or within a predefined period of time after finishing a meal), one or more of the processing elements (concepts **204**) may generate a reminder to prompt the user to perform the target task **202**. Although the active ontology **200** illustrated in FIG. 2 is configured to manage activity and time recognition tasks, those skilled in the art will appreciate that similarly constructed active ontologies may be built for natural language recognition, task automation and other useful tasks. In

general, the same structure or rule or set of rules can be used both to observe and understand the surrounding world and to act on such observations.

FIG. 3 is a flow diagram illustrating one embodiment of a method 300 for processing facts in accordance with an active ontology (e.g., configured in a manner similar to the active ontology 102 of FIG. 1) according to the present invention. The method 300 may be executed at, for example, an intelligent automated assistant that interacts with a user in accordance with an active ontology.

The method 300 is initialized at step 302 and proceeds to step 304, where the method 300 collects at least one fact from the operating environment. In one embodiment, facts may be received via sensors (e.g., cameras, motion sensors, environmental and/or physical monitoring devices, etc.) distributed through the operating environment or from other multimodal user interfaces (e.g., a natural language interface, a graphical user interface, etc.). In one embodiment, collected facts are “tagged” upon receipt to identify an associated context and evaluation pass of the method 300.

In step 306, the method 300 processes the collected facts in accordance with at least one concept rule to identify valid conditions. In one embodiment, only facts that are associated (or “tagged”) with the current execution pass are processed in step 306. In one embodiment, concepts are processed in accordance with a predefined order of priority, and rules for each concept are likewise processed in accordance with a predefined order of priority. Thus, step 306 begins by processing relevant facts against the highest priority rule of the highest priority concept, and then processes the facts against the second-highest priority rule of the highest priority concept, and so on until all rules of the highest priority concept have been processed. Step 306 then moves on to the next-highest priority concept and proceeds in a likewise manner.

In one embodiment, processing of facts in accordance with step 306 also includes the sharing of information among concepts (e.g., via channels as described above). The processing priority order described above ensures that higher priority concepts are evaluated first while lower priority concepts are still executable within a common execution pass of the method 300.

In step 308, the method 300 executes the corresponding action for each valid condition that is identified in accordance with 306. The method 300 then proceeds to step 310 and waits for the next execution pass. In one embodiment, the execution passes of the method 300 are predefined such that the method 300 automatically executes at a given pace (e.g., once every x seconds). At the next execution pass, the method 300 returns to step 304 and proceeds as described above to evaluate a new set of facts.

FIG. 4 is a schematic diagram illustrating one embodiment of an open standard-based system 400 for developing and managing an intelligent system using active ontologies. In one embodiment, the system 400 includes an editor 402, a console 404 and a server 406. In one embodiment, the editor 402 and the console 404 communicate with the server 506 using SOAP-based communications.

The server 406 is adapted to store a plurality of individual active ontologies 408₁-408_n (hereinafter collectively referred to as “active ontologies 408”) and to run selected (deployed) active ontologies 408 in an application domain. In one embodiment, the server 406 also stores observed facts for processing in accordance with an active ontology such as one of the stored or deployed active ontologies 408. Specifically, these facts may be used to stimulate currently

deployed active ontologies 408. In one embodiment, the server 406 is a stand-alone application (e.g., a Java stand-alone application).

The editor 402 is interfaced to the server 406 and is adapted to retrieve active ontologies 408 from the server 406 for editing. Specifically, the editor 402 is adapted to edit the concepts and/or rules embodied in the active ontologies 408 and to deploy or remove active ontologies 408 from use. To this end, the editor 402 comprises a plurality of editing tools 410, for example embodied in a graphical user interface such as a task bar. In further embodiments, the editor 402 is also adapted to receive feedback directly from deployed active ontologies 408. In one embodiment, the editor 402 is a stand-alone application (e.g., a Java (Swing) stand-alone application).

The console 404 is also interfaced to the server 406 and is adapted to graphically model the application domain as an active ontology (e.g., by enabling the dragging and dropping and linking of objects and tasks) and to construct user queries (e.g., service requests) to be posed to the server 406, for example using a graphical user interface. Active ontologies constructed using the console 404 are stored at the server 406. The console 404 is further adapted to receive and display query results (e.g., specific stored active ontologies 408) sent by the server 406. In further embodiments, the console 404 is also adapted to stimulate deployed active ontologies 408 by sending new observed facts to the server 406. In one embodiment, the console 404 is a stand-alone application (e.g., a Java (Swing) stand-alone application).

FIG. 5 is a schematic diagram illustrating one embodiment of a framework 500 for dynamically registering and coordinating distributed services using active ontologies. Specifically, the framework 500 uses active ontologies to register remote services 508₁-508_n (e.g., information services such as those for hotels, movies, etc., hereinafter collectively referred to as “services 508”) from a service-oriented architecture 502 (e.g., Web Services). These services 508 may then be implemented by an intelligent automated assistant, “on the fly”, to accomplish one or more tasks. Service-oriented architectures such as Web Services allow the standardized integration of web-based applications using the extensible markup language (XML), simple object access protocol (SOAP), web service definition language (WSDL) and universal description, discovery and integration (UDDI) open standards over an Internet Protocol (IP) backbone.

Thus, the framework 500 includes at least one active ontology 504 interfaced to a service-oriented architecture 502 via a service broker 506. As described above, the active ontology 504 graphically models a relevant domain (e.g., the objects in the relevant environment and the associated tasks to be accomplished) using a plurality of concepts or active processing elements 510₁-510_n (used, for example, for service registration, language recognition, activity and/or time recognition, task automation, etc.) that communicate through message passing.

The service broker 506 is adapted to communicate asynchronously with the remote service-oriented architecture 502 and with the active processing elements 510 to select specific services 508 (e.g., based on meta-data about the services 508, including, for example, the service’s call patterns or quality across various dimensions such as time, cost and completeness), to delegate tasks, queries and updates, and to monitor requests for services.

A service 508 registers with the active ontology 504 by specifying the active processing elements 510 that the

service **508** can or cannot accept. Thus, the active ontology **504** is used to filter service requests to the appropriate services **508**.

The framework **500** enables the rapid development of a system having capabilities similar to an open agent architecture framework (e.g., the framework **500** can dynamically, broker, register and coordinate distributed services to resolve user queries and perform requested tasks). Moreover, the framework **500** enables better follow-ups and dialogues with users, flexible definition of timing constraints and task execution and recognition, and can adapt a user interface to the level of a specific user.

FIG. **6** is a high level block diagram of the present intelligent system building method that is implemented using a general purpose computing device **600**. In one embodiment, a general purpose computing device **600** comprises a processor **602**, a memory **604**, an intelligent system building module **605** and various input/output (I/O) devices **606** such as a display, a keyboard, a mouse, a modem, and the like. In one embodiment, at least one I/O device is a storage device (e.g., a disk drive, an optical disk drive, a floppy disk drive). It should be understood that the intelligent system building module **605** can be implemented as a physical device or subsystem that is coupled to a processor through a communication channel.

Alternatively, the intelligent system building module **605** can be represented by one or more software applications (or even a combination of software and hardware, e.g., using Application Specific Integrated Circuits (ASIC)), where the software is loaded from a storage medium (e.g., **110** devices **606**) and operated by the processor **602** in the memory **604** of the general purpose computing device **600**. Thus, in one embodiment, the intelligent system building module **605** for building intelligent systems described herein with reference to the preceding Figures can be stored on a computer readable medium or carrier (e.g., RAM, magnetic or optical drive or diskette, and the like).

Thus, the present invention represents a significant advancement in the field of intelligent systems. The methods and apparatuses of the present invention enable intelligent systems, such as intelligent automated assistants, to be quickly and efficiently developed an “average” programmer (e.g., programmers who are not extensively versed in all necessary fields of technology). Capabilities including natural language interpretation and dialog, multimodal input, adaptable presentation (output), reactive planning, activity recognition/scheduling and coordination of distributed services, among others, can be integrated using a single, visual, unified framework. The manner in which software is built can thus be greatly simplified for many industries, including those which develop or rely on intelligent systems.

While foregoing is directed to the preferred embodiment of the present invention, other and further embodiments of the invention may be devised without departing from the basic scope thereof, and the scope thereof is determined by the claims that follow.

What is claimed is:

1. An electronic device, comprising:
one or more processors;
memory; and

one or more programs, wherein the one or more programs are stored in the memory and configured to be executed by the one or more processors, the one or more programs including instructions for:

receiving, at a processor, at least one request for services, the request for services being in natural language form;

determining, at the processor, one or more active processing elements of an active ontology that are associated with the request for services, each active processing element associated with the request for services with a probability greater than zero; and
prioritizing, by the processor, the one or more active processing elements associated with the active ontology;

wherein:

the active ontology is configured to perform natural language processing on user input, the natural language processing performed in response to the request for services, and

the active ontology comprises a plurality of active processing elements adapted to match specific types of facts.

2. The electronic device of claim **1**, further comprising:
determining the one or more active processing elements using facts relating to events collected from a user's environment.

3. The electronic device of claim **1**, wherein each of the one or more active processing elements specifies one or more request for services that the one or more active processing elements can accept.

4. The electronic device of claim **1**, further comprising:
filtering the one or more active processing elements by the associated probability.

5. The electronic device of claim **1**, further comprising:
selecting an active processing element.

6. The electronic device of claim **5**, further comprising:
selecting the active processing element with a highest associated probability.

7. The electronic device of claim **6**, further comprising:
performing the request for services in accordance with the selected active processing element.

8. The electronic device of claim **7**, wherein the active ontology models a domain, and wherein each active processing element of the active processing elements represents at least one of: an object in the domain and an associated task to be accomplished.

9. The electronic device of claim **7**, wherein at least two of the active processing elements communicate information via a channel.

10. The electronic device of claim **9**, wherein the information communicated via the channel comprises processing results generated by at least one of the at least two of the active processing elements.

11. The electronic device of claim **10**, further comprising:
determining the probability associated with the information communicated via the channel;

determining, based on the probability associated with the information, the propagation of additional processing results generated by one or more of the at least two of the plurality of active processing elements.

12. The electronic device of claim **9**, wherein the channel is associated with one or more properties.

13. The electronic device of claim **12**, further comprising configuring a relationship between at least two active processing elements based on the one or more properties, wherein the at least two active processing elements are communicatively coupled.

14. The electronic device of claim **1**, wherein at least one of the active processing elements comprises at least one rule.

15. The electronic device of claim **14**, wherein the at least one rule comprises a condition and an associated action, wherein the associated action is executed upon matching of the condition to at least one of the input facts.

16. The electronic device of claim 14, wherein the at least one rule comprises a plurality of prioritized rules.

17. The electronic device of claim 1, wherein the active ontology is further configured to perform at least one of: activity recognition; activity execution; and management of temporal constraints associated with activity execution.

18. The electronic device of claim 1, further comprising interfacing the active ontology to a service-oriented architecture via a service broker.

19. The electronic device of claim 18, wherein the service broker is configured to perform at least one of:

- selecting at least one service,
- delegating at least one task,
- issuing at least one query,
- providing at least one update, and
- monitoring service requests.

20. The electronic device of claim 1, wherein each of the services is invoked to accomplish one or more tasks.

21. The electronic device of claim 1, wherein at least one of the active processing elements is configured to send at least one fact to at least one other active processing element.

22. The electronic device of claim 1, wherein at least one of the active processing elements is configured to receive at least one fact from at least one other active processing element.

23. The electronic device of claim 1, wherein the active ontology communicates with one or more sensors adapted to convey facts associated with a user's behavior to at least one of the active processing elements.

24. A or building an automated assistant, the method comprising:

- receiving, at a processor, at least one request for services, the request for services being in natural language form;
- determining, at the processor, one or more active processing elements of an active ontology that are associated with the request for services; each active processing element associated with the request for services with a probability greater than zero; and
- prioritizing, by the processor, the one or more active processing elements associated with the active ontology;

wherein:

- the active ontology is configured to perform natural language processing on user input, the natural language processing performed in response to the request for services, and
- the active ontology comprises a plurality of active processing elements adapted to match specific types of facts.

25. The method of claim 24, further comprising: determining the one or more active processing elements using facts relating to events collected from a user's environment.

26. The method of claim 24, wherein each of the one or more active processing elements specifies one or more request for services that the one or more active processing elements can accept.

27. The method of claim 24, further comprising: filtering the one or more active processing elements by the associated probability.

28. The method of claim 24, further comprising: selecting the active processing element with a highest associated probability; and performing the request for services in accordance with the selected active processing element.

29. The method of claim 24, wherein the active ontology models a domain, and wherein each active processing element of the active processing elements represents at least one of: an object in the domain and an associated task to be accomplished.

30. The method of claim 24, wherein at least two of the active processing elements communicate information via a channel.

31. The method of claim 30, wherein the information communicated via the channel comprises processing results generated by at least one of the at least two of the active processing elements.

32. The method of claim 31, further comprising:

- determining the probability associated with the information communicated via the channel;
- determining, based on the probability associated with the information, the propagation of additional processing results generated by one or more of the at least two of the plurality of active processing elements.

33. The method of claim 30, wherein the channel is associated with one or more properties.

34. The method of claim 33, further comprising, configuring a relationship between at least two active processing elements based on the one or more properties, wherein the at least two active processing elements are communicatively coupled.

35. The method of claim 24, wherein at least one of the active processing elements comprises at least one rule.

36. The method of claim 35, wherein the at least one rule comprises a condition and an associated action, wherein the associated action is executed upon matching of the condition to at least one of the input facts.

37. The method of claim 35, wherein the at least one rule comprises a plurality of prioritized rules.

38. The method of claim 24, wherein the active ontology is further configured to perform at least one of:

- activity recognition;
- activity execution; and
- management of temporal constraints associated with activity execution.

39. The method of claim 24, further comprising, interfacing the active ontology to a service-oriented architecture via a service broker.

40. The method of claim 39, wherein the service broker is configured to perform at least one of:

- selecting at least one service,
- delegating at least one task,
- issuing at least one query,
- providing at least one update, and
- monitoring service requests.

41. The method of claim 24, wherein at least one of the active processing elements is configured to send at least one fact to at least one other active processing element.

42. The method of claim 24, wherein at least one of the active processing elements is configured to receive at least one fact from at least one other active processing element.

43. The method of claim 24, wherein the active ontology communicates with one or more sensors adapted to convey facts associated with a user's behavior to at least one of the active processing elements.

44. A non-transitory computer readable storage medium storing one or more programs, the one or more programs comprising instructions, which when executed by an electronic device, cause the device to:

- receive, at a processor, at least one request for services, the request for services being in natural language form;

11

determine, at the processor, one or more active processing elements of an active ontology that are associated with the request for services; each active processing element associated with the request for services with a probability greater than zero; and

prioritize, by the processor, the one or more active processing elements associated with the active ontology; wherein:

the active ontology is configured to perform natural language processing on user input, the natural language processing performed in response to the request for services, and

the active ontology comprises a plurality of active processing elements adapted to match specific types of facts.

45. The electronic device of claim 1 further comprising: determining the request for services from a natural language input.

46. The computer readable storage medium of claim 44, further comprising:

determining the one or more active processing elements using facts relating to events collected from a user's environment.

47. The computer readable storage medium of claim 44, wherein each of the one or more active processing elements specifies one or more request for services that the one or more active processing elements can accept.

48. The computer readable storage medium of claim 44, further comprising:

filtering the one or more active processing elements by the associated probability.

49. The computer readable storage medium of claim 44, further comprising:

selecting the active processing element with a highest associated probability; and

performing the request for services in accordance with the selected active processing element.

50. The computer readable storage medium of claim 44, wherein the active ontology models a domain, and wherein each active processing element of the active processing elements represents at least one of: an object in the domain and an associated task to be accomplished.

51. The computer readable storage medium of claim 44, wherein at least two of the active processing elements communicate information via a channel.

52. The computer readable storage medium of claim 51, wherein the information communicated via the channel comprises processing results generated by at least one of the at least two of the active processing elements.

53. The computer readable storage medium of claim 52, further comprising:

determining the probability associated with the information communicated via the channel;

12

determining, based on the probability associated with the information, the propagation of additional processing results generated by one or more of the at least two of the plurality of active processing elements.

54. The computer readable storage medium of claim 51, wherein the channel is associated with one or more properties.

55. The computer readable storage medium of claim 54, further comprising, configuring a relationship between at least two active processing elements based on the one or more properties, wherein the at least two active processing elements are communicatively coupled.

56. The computer readable storage medium of claim 44, wherein at least one of the active processing elements comprises at least one rule.

57. The computer readable storage medium of claim 56, wherein the at least one rule comprises a condition and an associated action, wherein the associated action is executed upon matching of the condition to at least one of the input facts.

58. The computer readable storage medium of claim 56, wherein the at least one rule comprises a plurality of prioritized rules.

59. The computer readable storage medium of claim 44, wherein the active ontology is further configured to perform at least one of:

activity recognition;
activity execution; and
management of temporal constraints associated with activity execution.

60. The computer readable storage medium of claim 44, further comprising, interfacing the active ontology to a service-oriented architecture via a service broker.

61. The computer readable storage medium of claim 60, wherein the service broker is configured to perform at least one of:

selecting at least one service,
delegating at least one task,
issuing at least one query,
providing at least one update, and
monitoring service requests.

62. The computer readable storage medium of claim 44, wherein at least one of the active processing elements is configured to send at least one fact to at least one other active processing element.

63. The computer readable storage medium of claim 44, wherein at least one of the active processing elements is configured to receive at least one fact from at least one other active processing element.

64. The computer readable storage medium of claim 44, wherein the active ontology communicates with one or more sensors adapted to convey facts associated with a user's behavior to at least one of the active processing elements.

UNITED STATES PATENT AND TRADEMARK OFFICE
CERTIFICATE OF CORRECTION

PATENT NO. : 10,318,871 B2
APPLICATION NO. : 15/299264
DATED : June 11, 2019
INVENTOR(S) : Adam Cheyer et al.

Page 1 of 1

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

In the Claims

In Claim 8, at Column 8, Line 36, delete “claim 7,” and insert -- claim 1, --, therefor.

In Claim 9, at Column 8, Line 41, delete “claim 7,” and insert -- claim 1, --, therefor.

In Claim 24, at Column 9, Line 32, delete “A or building” and insert -- A method for building --, therefor.

In Claim 24, at Column 9, Line 38, delete “services;” and insert -- services, --, therefor.

In Claim 44, at Column 11, Line 3, delete “services;” and insert -- services, --, therefor.

Signed and Sealed this
Sixth Day of August, 2019
