## Legal note

The information contained in this manual is as complete, accurate and up-to-date as possible. Provided legally permissible, we shall accept no liability for consequential damage in connection with the use of this manual. Otherwise, we shall only be liable for intent or gross negligence. We make no guarantee that alterations to the software programs and devices of other manufacturers referred to in this manual will not affect the usability of the information contained in this manual.

The author reserves all rights. The manual may not be duplicated completely or in part in whatever form without the consent of the author.

The content of this manual is subject to alteration without notice.
Please also read the information following the table of contents.

## Guidance through the manual

The first part of this manual is directed largely at users who have no or very little technical knowledge. Experienced users, suppliers and technicians will find additional technical information in the "Programming" part and in the appendices.
There are three ways of accessing the information in this manual:

- You can read the text in the order in which the manual is arranged.
- You can find the passages you are looking for under the headings below or the table of contents.
- The index in appendix F will guide you to the passages in the manual relating to specific printer terms and messages.

## Safety advice

Your printer has been developed with the utmost care to ensure safe, reliable operation over many years. Like all electrical devices, there are a few basic precautions you need to observe. These precautions are necessary in the first instance for your own safety but also protect the printer against any damage. Please read through the manual carefully and keep it handy.

Make sure...

- the printer is standing on a stable, flat surface. To prevent overheating, there should be free space all around the printer; openings should not be covered. Never place the printer directly next to a radiator or the air outlet of an air-conditioning system. Do not expose the printer to direct sunlight;
- the printer does not come into direct contact with liquids.
- no objects are pushed into the ventilation slots of the printer as you run the risk of an electrical shock or could cause a fire;
- you only perform the routine maintenance on the printer described in the manual. Opening the case can result in an electrical shock or other harm. Make sure you always remove the plug from the mains socket before opening the printer case. Do not alter the printer in any way not described in the manual - this may cause damage to the printer and result in repairs for which you will be liable.

Like all electronic devices, the printer can be damaged by electrostatic charges. Static charges can form when walking on unsuitable floor coverings, for example, and are then transferred to the device by touching the case. Bear this in mind when choosing the location for the printer.

Setting up the printer

## Power supply Ensure yourself ..

- that the ratings of the power supply match the ratings shown on the back of the printer. If in doubt, ask your supplier;
- that the printer is connected to an earthed mains socket with the cable supplied;
- when using an extension cable or multiple socket that you do not exceed the maximum electrical load for this;
- all reasonable precautions have been taken to prevent damage to the power cable. Do not place objects on the cable and make sure it is routed so that nobody walks on it or trips over it;
- that a damaged cable is replaced immediately;
- before cleaning the printer or the case, that the power cable is removed from the power supply. Use only a clean cloth for cleaning. Do not use liquids or aerosol cleaners;
- you have removed the plug from the mains outlet to ensure complete isolation from the mains supply. The mains outlet you are using must be located close to the printer and be easily accessible.

Cable wiring The three wires of the power cable are colour coded. The earth wire is yellow-green, the neutral wire is blue and the live current is on the brown wire.

## Servicing / maintenance

Any servicing work on the machine that goes beyond the maintenance described in the manual should be carried out by an authorised supplier. We are not liable for damage arising due to unauthorised servicing or through improper maintenance by unauthorised personnel.

## Advice and warning symbols

Observe all warnings and instructions stated on the product itself and in the accompanying documentation. At particularly important points in the manual, warnings are marked with appropriate symbols.

NOTE: text passages marked thus contain supplementary information or instructions.

WARNING - damage: this symbol indicates a possible cause of damage. Follow all instructions to prevent damage.

CAUTION - risk of injury: this symbol indicates a possible source of danger. Follow all instructions to prevent injury.

CAUTION - electricity: this symbol indicates a possible source of danger. Follow all instructions to prevent injury through an electrical shock.

CAUTION - hot: this symbol indicates a possible source of danger. Follow all instructions to prevent injury through heat.

Should you wish to replace the ribbon, do not touch the print head until it has stopped moving and has cooled down.

Printhead is HOT!

## Meaning of text styles in the manual

To emphasise important passages in the text or differentiate between the meaning of a printer function and a printer message, the following text styles or emphases are used in the manual:

- BOLD BLOCK CAPITALS represent the display lamps of the control panel.
- Bold letters indicate the groups, positions and settings of the printer menu.
- BLOCK CAPITALS indicate the mode of the printer.
- Italic BLOCK CAPITALS indicate the buttons of the control panel.
- »Brackets« highlight a printer function.

## Consumables / accessories

To ensure that the printer operates perfectly and provides the proper print quality, we recommend you use only original ribbons or accessories supplied by us. We accept no liability for damage resulting from the use of non-original ribbons or accessories which would have been avoided by using original ribbons or accessories.

Original ribbons and accessories can be purchased from your supplier.

To ensure good printing results, make sure you keep ribbons and printing materials (paper, transparencies, etc.) for the shortest time possible. Materials should be kept no longer than one year.

## Machine-readable fonts

The perfect readability of fonts such as OCR-A, OCR-B or bar codes (EAN, UPC, Zip) by machines is affected by ...

- the printing technique (resolution, edge sharpness);
- the technical state of the printer;
- the quality of the printing medium (toner, ink ribbon);
- the state of the print material (glossiness, smoothness, coating, age, reflection, surface uniformity);
- the technical state of the reading device.

## Further information

- Leave your printer components in their packing until the manual expressly describes when and how to install them.
- Do not fit or use the serial and parallel interface cables at the same time.
- Only use a clean cloth to clean the control panel and case.
- The oiling and greasing of moving parts by the user is unnecessary.
- If the machine is damaged, switch it off and remove the plug from the outlet socket. Immediately arrange for it to be repaired.
- Before contacting your supplier's customer service department, read the notes in Chapter 6. You may incur costs even during the warranty period if you call on customer service when the customer is expected to remedy the fault or defect himself as described in Chapter 6.
- When sending off the machine, the carrier or insurer will not accept responsibility for damage due to unsuitable packing.

## Chapter 1: Assembling and setting up

## Unpacking the printer

The printer is supplied in separate parts in a cardboard box.

1. Take the printer and components out of the box.
2. Remove the packing material. Keep the original packing so that you can transport the printer safely should the need arise later on.

Check that the individual items supplied are complete and undamaged. Supplied with the printer are:

Narrow printer model

- Paper support
- Platen knob
- Power cable
- Ribbon cassette
- Interference filter (depending on model)

In addition, you will need a Centronics interface cable to connect the printer to the computer. Ask your supplier for one of these.

Checking the items supplied

Printer parts

## Assembling the printer

Location

Make sure ...

- the printer is standing on a stable, flat surface. To prevent overheating, make sure there is free space all around the printer; openings should not be covered. Never place the printer directly next to a radiator or the air outlet of an airconditioning system. Do not expose the printer to direct sunlight;
- the printer does not come into direct contact with liquids;
- no objects are pushed into the ventilation slots of the printer as you run the risk of an electric shock, or other injury or causing damage to the printer;
- you only perform routine maintenance on the printer as described in the manual. Opening the case can result in an electric shock or other harm. Make sure you always remove the plug from the power socket before opening the case. Do not alter the printer in any way not described in the manual as this may cause damage to the printer and result in repairs for which you will be liable.
Like all electrical devices, the printer can be damaged by electrostatic charges. Static charges can form when walking on unsuitable floor coverings, for example, and are then transferred to the device by touching the case. Bear this in mind when choosing the location for the printer.

Ensure yourself ...

- that the ratings of the power supply match the ratings shown on the back of the printer. If in doubt, ask your supplier;
- that the printer is connected to an earthed mains socket by means of the power cable supplied;
- when using an extension cable or multiple socket that you do not exceed the maximum electrical load for this;
- all reasonable precautions have been taken to prevent damage to the power cable. Do not place objects on the cable and make sure it is routed so that nobody walks on it or trips over it;
- that a damaged cable is replaced immediately;
- you have removed the mains plug from the socket to ensure complete isolation from the power supply. The socket provided for this must be located close to the printer and easily accessible.

## Setting up the printer

## Removing the transport packing

1. If a clear protective film is attached to the cover of the printer, you can remove this.

2. Open the cover of the printer and remove the transport packing. Make sure you keep this with the other packing material in case you have to transport the printer later on.

## Inserting the ribbon cassette

Original ribbon cassettes are specially developed for your printer. Among other things, this concerns the ink, which contains lubricants, and the fabric of the ribbon.

## $\triangle$ <br> Warning!

The use of non-original ribbons can result in damage to the print head. Use only the manufacturer's original ribbons.

A transparent ribbon guard is fitted to the front of the cassette. Do not remove it!

1. Take the ribbon out of the plastic wrapping.
2. Open the printer cover and move the print head to the middle of the platen.

3. Place the cassette onto the cassette holder with the cutouts fitting onto the pins.

Insert ribbon cassette here
4. Tilt the cassette carefully down over the print head until you feel it click into place.
5. Turn the blue transport knob of the cassette in the direction of the arrow to tension the ribbon.
6. Close the cover of the printer.

Tilt down the cassette and tension ribbon

## The paper support

The paper support with its guide rails enables the paper to be fed precisely into the printer.

1. Hold the support horizontally with the pegs on the support precisely aligned with the cutouts $(\mathbf{L} / \stackrel{)}{ }$ in the case of the printer.

Fitting the paper support
2. Press the support downwards on both sides until you feel it click into position.

Raising the paper support

1. Slightly raise the paper support at the back.

2. Pull the support forwards and slide it at this angle to its end position.

3. Align the guide rails so that they just touch the edges of the paper. A mark is provided on the left side of the paper support against which you align the left edge of the paper.

To move the paper support back into its horizontal position, raise it slightly and fold it down towards the back.

The paper support must be removed to fit accessories such as the cut sheet feeder or roll paper stand.

1. Move the paper support into the horizontal home position.

2. Press the paper support downwards at the back. This will disengage it from its catching arrangement.

The paper support must be refitted after removing the accessory.

## The paper separator

The paper separator prevents paper being drawn back into the printer once it has been printed.
The paper separator has to be removed when you are using a tractor feed or cut sheet feeder (accessory). If the printer is to be used without either of these accessories, the separator must be replaced.

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands.
Switch the printer OFF LINE and wait until the print head stops moving.

Removing the paper support

## $\triangle$ <br> Caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

Removing the paper separator

Fitting the paper separator

Remove the paper separator by holding it on both sides and pulling it gently towards the front of the printer. Finally, fully remove the separator.

1. When you wish to refit the separator, fit the catches on both sides of the separator onto the platen axle.
2. Now press the separator downwards until the you hear the catches snap into place on both sides.

## Connecting the printer to the computer

It is important to read the safety instructions on the first pages of this manual. Before you can use the printer, you have to connect it to your computer and to the power supply.
Your printer is supplied with a parallel Centronics interface as standard. A serial interface can be installed as an additional facility. This is described in Chapter 7; data on interfacing can be found in Appendix D.

Some printer models have an interference filter supplied with them. This square cable sleeve suppresses undesirable electromagnetic interference from other electrical sources by means of its ferrite core.

1. Open the cable sleeve of the filter and fit it on the interface cable close to the connector at the printer end.

2. Snap the sleeve shut to close it; the cable now has interference suppression.

## [fos Note!

The parallel and serial interface cables must not be installed or used at the same time as this may cause malfunctions.

Fitting interface cable

1. Plug the printer end of the parallel interface cable into the socket on the back of the printer. Secure the cable by means of the two clips.
2. Connect the other end of the interface cable to the corresponding socket of your computer. Refer to the relevant instructions in your computer manual.

Parallel interface cable

## Connecting the printer to the power supply

## A caution!

There is electricity is present and therefore a risk of an electric shock. Switch off the printer.

1. Plug the power cable into the power socket on the back of the printer. Make sure the printer is switched off (POWER OFF) when doing this.

2. Plug the other end of the cable into an earthed mains outlet socket.
3. Switch on the printer and the computer by means of the respective power switches.

Your printer is now ready for operation.

## Emulation / printer drivers

In the chapter "Printer drivers" you will find information on how you can best match the emulation (language) of your printer to the driver of your application program in order to make full use the functions of the printer.
How to choose the emulation by means of the printer menu is described in the chapter "Printer menu settings ".

## Chapter 2: A guided tour of the printer

## The printer and its components

The operator panel indicators inform you of the operating status of the printer. You can also use it to enter settings and test the printer.
The platen knob enables you to advance the paper when the printer is SWITCHED OFF.

The paper support enables precise feeding of cut sheets of paper.
The printer cover consists of two sections and protects the printer mechanism from dirt and reduces the printing noise.

The print head is the part of the printer that contains the printing pins.

The original ribbon cassette contains the high-quality ink necessary for perfect printing.

The platen advances the paper during the printing process.
The paper separator prevents paper that has just been ejected from being drawn back into the printer.

The printer and computer are connected by means of the interface socket. The parallel Centronics interface or a serial interface (accessory) are provided for this purpose.
The socket panel must be broken out in order to fit a serial interface.

Power is supplied to the printer by plugging the power cable into the power socket.

The printer is switched on or off by means of the power switch.
The paper feed is adjusted by means of the paper lever.

## The operator panel

The operator panel allows you to control the printer and change settings. The indicator lamps show the current status of the printer. The meaning and function of the buttons depends on the current operating mode of the printer.

## The indicator lamps

POWER: The printer is switched on.
ALARM: An error is present which is preventing normal printing operation (paper jam, end of paper).

SEL: The printer is ready (ON LINE) to receive data from the computer. If this lamp is not lit, the printer is in OFF LINE mode and not ready to receive data. If the lamp is blinking, the printer is in print suppress mode and is ignoring all data sent to it until this mode is cancelled.

MENU: The menu mode is activated. In this mode, you can alter printer settings as you wish and permanently store these settings. The menu mode is described in detail in Chapter 4. The MENU lamp blinks if the temperature control mechanism has reduced the printing speed in order to prevent overheating of the print head.

## The buttons

Micro Feed Down: The paper is transported backwards in steps of 1/180 inch (downwards). Simultaneously press the SHIFT and Down buttons to be able to use the »Micro Feed Down« function.

Micro Feed Up: The paper is transported forwards in steps of $1 / 180$ inch (upwards). Simultaneously press the SHIFT and Up buttons to be able to use the »Micro Feed Up« function.

SHIFT: To be able to use the bottom button functions such as MENU and TOF, simultaneously press the SHIFT button and the corresponding button.

SEL: Switches the printer ON LINE or OFF LINE as you wish. The associated indicator lamp is switched on or off. Pressing the $S E L$ button also cancels a currently running self test, which is described in Chapter 6.

The assignment of the buttons mentioned below is independent of the operating status of the printer. If the printer is in ON LINE or OFF LINE mode, the functions named at the top of the buttons are effective.

Button functions in ON LINE / OFF LINE mode

$L F$ : Pressing this button (Line Feed) causes the printer to feed the paper forwards by one line. If a cut sheet feeder is fitted (accessory) and there is no paper in contact with the platen, pressing this button will cause a new sheet of paper to be fed from the current paper tray to the first printable line on the paper.

FF/LOAD: Pressing this button (FF, Form Feed) causes the printer to transport the next sheet of paper to the top of the page and eject the previous one. If a cut sheet feeder is in use, a new sheet of paper is fed in as far as the top of the page. If continuous paper is in use and being fed from the back or below, the paper is advanced to the next top of form position.

TEAR: The top edge of the sheet is transported beyond the top of the page to the form tear-off position so that continuous paper already printed can be torn off. How to change the tear-off position is described further on.

PARK: You can use this button when continuous paper is inserted to change over to cut sheet feed temporarily without having to remove the continuous paper from the printer. Pressing this button causes continuous paper that is being fed from the back or below to be pulled back to the park position in order to free the paper path for cut sheets. The »Park« function is described further on.

QUIET: In quiet mode, the printing noise typical for matrix printers is alleviated by reducing the printing speed. You activate or deactivate quiet mode by pressing this button. When quiet mode is activated, the associated indicator lamp lights.

TOF: This button is used to set the first printable line or top of page (Top Of Form, TOF) for continuous paper. If there is no sheet in the paper path, the Top Of Form is reset to the standard setting ( 8.9 mm or $1 / 3$ inch).

In this mode, you can adjust the printer to your individual requirements. The functions you select are automatically activated when you switch on the printer.

The alterations you make in the printer menu are stored in the printer and consequently become standard settings. They can however be changed again by software commands, via the operator panel or by resetting the menu.
The menu options and how to use the menu are described in detail in Chapter 4.

## Print functions

Basic print functions can be adjusted by means of the function buttons described below. To do this, press the appropriate button until the required indicator lamp lights. You can change the functions in both ON LINE and OFF LINE mode.

In order to change a print function such as »Print Quality« (font type) or »Character Pitch« (character width), press the corresponding button until the setting you require is lit.
This part of the operator panel always indicates the current printer
This part of the operator panel always indicates the current printer
stan is affected by a programming command, the associated display is also changed.

Button functions in menu mode

## PRINT QUALITY

Further information on printing speed and print quality is to be found in "Appendix A: Technical Data".

## CHARACTER PITCH

The PRINT QUALITY button enables you to determine the print quality and the font you require for the document to be printed. An indicator lamp shows the currently activated font and print quality.

There are two print qualities available:

- LQ, Letter Quality: in letter quality, text is printed out with the highest resolution. The fonts listed below are available in this quality. Use one of these fonts when you wish to print highquality documents.

| Courier | $>$ COURIER is lit |
| :--- | :--- |
| Prestige | $>$ PRESTIGE is lit |
| Roman | $>$ COURIER and GOTHIC are lit |
| Swiss | $>$ PRESTIGE and BOLD are lit |
| Swiss Bold | $>$ BOLD is lit |
| Gothic | $>$ GOTHIC is lit |

- UTILITY: In data processing quality, printing is faster, but the resolution is not as good as letter quality. In data processing quality, there is no choice of fonts.

You can print a list of the available fonts and their appearance. This is described in Chapter 8.

These settings determine the width of a character in characters per inch (cpi). The settings 10, 12, 15, $\mathbf{1 7 . 1}$ and $\mathbf{2 0}$ cpi are available. The setting, also known as pitch is normally 10 or 12 cpi for standard texts. However, should you wish to print more information on one page, in sheets of calculations for example, it is advisable to use a character pitch of 15,17 or 20 cpi. Proportional spacing (PROP) makes the text more readable and gives it a typeset-like appearance.

Remember that the printing speed is reduced for fonts of higher quality.

The »Print Quality« and »Character Pitch« functions can also be controlled by means of the software.

To reset the printer to the settings selected in the menu, switch the printer OFF LINE and simultaneously press the buttons SHIFT and

## Chapter 3: Paper handling

This chapter explains the different ways the printer handles paper (feeding, setting of printing position, changing between different types of paper).

## Notes on paper types

- Always use good quality standard paper!

|  | Feeding from ... | Weight |
| :--- | :--- | :--- |
| Cut sheets | Top | $52-90 \mathrm{~g} / \mathrm{m}^{2}$ |
| Continuous paper | Rear/bottom |  |
| Single-part |  | $45-90 \mathrm{~g} / \mathrm{m}^{2}$ |
| Multi-part, NCR paper (sheet) | $38-41 \mathrm{~g} / \mathrm{m}^{2}$ |  |
| Multi-part with carbon paper (sheet) | $38-45 \mathrm{~g} / \mathrm{m}^{2}$ |  |
| Labels | Bottom | $34-41 \mathrm{~g} / \mathrm{m}^{2}$ |
| Transparencies | Top | $\leq 0.1 \mathrm{~mm}$ |

- The printer will also handle heavier weight paper sheets, multipart paper, paper stickers on backing paper, etc.
- Recycled paper can also be used provided it matches the general paper specification. There may be a slight loss of quality due to the generally rougher quality of the paper.
- Do not use damaged sheets as the paper may be fed in incorrectly or may cause a jam.
- Unopened packets of paper should be kept flat in a cool, dry room until used. As soon as a packet is opened, the unused paper should be kept in a plastic bag. This will protect the paper against ambient moisture.
- In order to ensure fault-free handling and the best print quality, it is best to carry out one or more trial prints before performing large print runs.

Please also read the notes in Appendices $A$ and $E$.

## Paper lever

Move the paper lever on the right side of the printer to the position that is appropriate to the feed path for the paper.

Continuous paper feeding: for continuous paper which is fed via the bottom or pull tractor feed, the lever must be in the BOT (bottom) position.

Cut sheet feeding: for feeding cut sheets via either the paper support
 or the cut sheet feeder, the lever must be in the TOP position.

Continuous paper feeding: if continuous paper is being fed from the back via the push or pull tractor feed, move the lever to REAR.

## Adjusting for the paper thickness

Print head lever
The gap between the print head and platen is adjusted to the paper thickness or multi-part paper by means of the blue, fiveposition print head lever on the left side of the ribbon drive.

Paper thickness

## Lever position

$0.08 \mathrm{~mm} \quad 1$
$0.15 \mathrm{~mm} \quad 2$
$0.22 \mathrm{~mm} \quad 3$
$0.29 \mathrm{~mm} \quad 4$
0.36 mm 5

Should you wish to print on thick types of paper, the gap between print head and platen must be increased:

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands.
Switch the printer OFF LINE and wait until the print head stops moving.

## Caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

1. Switch off the printer and open the printer cover.
2. Remove the ribbon cassette from the holder (see also Chapter 6).

Adjusting the print head gap
3. Release the locking plate of the print head by moving the plate upwards and sideways.
4. Remove the locking plate and place it to one side.

5. Remove the print head from its slot.

6. Take out the spacing plate.

7. Insert the plate in front of the print head holder, making sure that the plate fits evenly.

8. Replace the print head in the slot of the print head carriage.

9. Place the locking plate onto the print head holder, making sure that the pin on the left of the holder properly fits into the hole in the locking plate.

10. Pivot the locking plate down thus securing the print head.

11. Replace the ribbon cassette.
12. Close the cover of the printer and switch on the printer.

By repositioning the distance plate, the gap between the print head and the platen is increased. You are now able to print onto materials of the following thickness:

Paper thickness
0.48 mm

Lever position1
0.55 mm ..... 2
0.62 mm ..... 3
0.69 mm ..... 4
0.76 mm ..... 5

## Paper feed: cut sheets

The paper support ensures precise automatic feeding of cut sheets.

1. Move the paper lever on the right of the printer to the TOP position (cut sheet).
2. Switch the printer on.

3. Raise the paper support by lifting it at the back and sliding it into its locking position

$\triangle$

## Warning!

Direct pressure on the platen can cause damage to the print head and pins.
Make sure the paper guide is correctly adjusted.
4. Insert a sheet of paper into the paper support and adjust the rails of the paper guide so that they just touch the edges of the paper. Start by aligning the left edge of the paper to the mark provided. The paper is automatically fed into the printer after the time set in the menu.

## 10 <br> Note!

The left edge of the paper must be no more than 1.2 cm from the end of the platen.
5. Redefine the top of form if necessary by means of the »Top Of Form« function as described further on.

## Paper feed: continuous paper

Long lists and large printing jobs are typical applications for continuous paper, which can be fed in from the bottom or rear of the printer as required.

Feeding continuous paper from the rear (internal tractor)

1. Move the paper lever on the right of the printer to the »Continuous paper, REAR" position.

2. Press downwards on the back of the paper support. This will release it from its catch. Remove it from the printer and place it to one side.

## $\triangle$ <br> Warning!

Direct pressure on the platen can cause damage to the print head and pins.
Make sure the paper guide is correctly adjusted.
3. Release the catch lever of the left sprocket drive, adjust this to the required position and fasten the sprocket drive again.

4. Open the top part of the cover.

5. Place the continuous paper onto the first sprocket pins and close the cover again.

6. Adjust the right sprocket drive to suit the width of paper as described above. Open the cover of the right sprocket drive, place the continuous paper onto the first sprocket pins and close the cover.
7. Replace the paper support and switch the printer on. The print head will move to the left end of the platen, the active lamps of the operator panel will light. The ALARM lamp that lights in this case indicates that there is no paper at the printing position.
8. Press the $F F / L O A D$ button,
 the paper is now transported to the initial printing position.
9. Set the top of form if necessary with the »Top Of Form« function.

This is described later in the manual.

If the tractor feed is installed, you can also feed continuous paper from the bottom. This option is available if you have a printer stand or table with a slot which allows continuous paper to be fed in from below.

Installation of the tractor feed and paper handling is described in the chapter »Accessories«.

An additional bottom tractor feed gives you the means of feeding continuous paper from the bottom. In order to be able to use this function, you first have to fit the bottom tractor feed to allow the printer to be placed on the built-in supports.
Installation of the bottom tractor feed and paper handling is described in the chapter»Accessories«.

## Switching between continuous paper and cut sheets (Park)

Your printer will allow you to switch without difficulty between printing on continuous paper and cut sheets. The continuous paper is removed from the paper path at the press of a button. You can then insert a cut sheet of paper which the printer will then draw in automatically.

## [帠 Note! <br> [帠 Note!

Do not use the PARK function in conjunction with the pull
tractor feed otherwise the continuous paper will run completely
Do not use the PARK function in conjunction with the pull
tractor feed otherwise the continuous paper will run completely out of the tractor guide.

Feeding continuous paper from the bottom (tractor feed, accessory)

Feeding continuous paper from the bottom (tractor feed, accessory)

## Changing from continuous paper to cut sheets

Do not forward paper to the PARK position by using the platen knob.

Changing from cut sheets to continuous paper

Do not forward paper to the PARK position by using the platen knob.

If continuous paper is being fed from the rear and you wish to change to cut sheets, proceed as follows:

1. Part the already printed pages along the perforation.
2. In ON LINE mode, press the PARK button. The continuous paper is transported backwards but remains held in the tractor feed.
3. Move the paper lever on the right of the printer to the middle position. The symbol for cut sheet handling (TOP) shows you the correct lever position.
4. Raise the paper support.
5. Place a sheet of paper on the paper support. Adjust the paper guide to the correct width. Start by aligning the left edge of the paper to the mark provided.
6. The paper is automatically fed in after the time set in the menu. If necessary, reset the top of form.

Should you wish to go back to continuous paper when you have finished printing, proceed as follows:

1. Press the $F F / L O A D$ button to eject the cut sheet still in the printer. Do not use the platen knob to do this otherwise you will lose the top of form position you have set.
2. Move forwards the paper release lever on the right side of the printer; the symbol for continuous paper (REAR) shows you the correct position for the lever.
3. Press the $F F / L O A D$ button again. The continuous paper previously removed from the paper path is drawn around the platen again.

This function is also available when you use an automatic cut sheet feeder (accessory).

## Setting the top of page (Top Of Form)

With the »Top Of Form« function, you can set the line where printing is to start, the so-called top of form.

A clear paper guard is fitted at the front on the print head carriage. The red line (arrow) is the position on the current line at which the characters are printed. This line is very useful when setting the top of form position and during general printer operation.

## Note!

If you are using the "Form Tear-Off" function, you first have to switch this off in the printer menu.

Should you wish to change the start of printing in the vertical direction (top of form), proceed as follows:

1. Transport the continuous paper to the next top of form or insert a cut sheet and let the printer automatically draw it in. Both occur on pressing the FF/LOAD button.
2. Switch the printer OFF LINE by pressing the SEL button; the SEL lamp lights.
3. Set the top of form by holding down the SHIFT button and simultaneously pressing one of the Micro Feed buttons. This will cause the paper to be transported $U p$ or Down in steps of $1 / 180$ inch.
4. The top of form chosen is stored once you have released the buttons. Switch the printer ON LINE again by pressing the SEL button.

## Changing Top of Form

If you are using, for example, a text processing program which automatically sets a top margin, the top edge of the paper is to be set as the top of form.

Do not forward paper to the new top of form position by using the platen knob.

## N- Note!

To set the top of form to the standard setting, simultaneously press the SHIFT and TOF buttons. There must be no paper in the print path when doing this.
5. The top of form can be set differently for each type of paper feed, irrespective of whether you are feeding cut sheets manually, using the cut sheet feeder (CSF) or using continuous paper.

## Indicating or changing the print position

The current print position is indicated by the » M « above the red line located on the clear paper guard of the print head carriage.

Should you wish to find out where the next printing position will be, simultaneously press the SHIFT and PRINT QUALITY buttons. The print head carriage will then move automatically to the new printing position.

If, when printing on pre-printed forms it is necessary to correct the current printing position in a horizontal direction or change to the next printing position,
 proceed as follows:

1. Make sure that the printer is ON LINE; the SEL lamp lights.
2. Simultaneously press the SHIFT and TEAR buttons and the print head will move to the left. On pressing the SHIFT and PARK buttons, the print head will move to the right.

The distance the print head moves between the individual printing positions corresponds to the setting displayed under CHARACTER PITCH.

## Automatic advance to Form Tear-Off position

If this function is active, printed pages of continuous paper are transported from the TOF position to the Form Tear-Off position to allow you to tear them off there. To do this, the continuous paper must be fed from the rear or via the additional bottom tractor feed (accessory) from below.

## Note!

Do not use the »Form Tear-Off« function in conjunction with continuous labels on backing paper or with multi-layer forms as this can cause a paper jam.

Activate this function after setting the top of form position by means of the menu item Form Tear-Off for the paper path Rear Feed (rear of printer) or Bottom Feed (bottom tractor feed) by changing it from Off to the required time pause. After a 500 ms , one or two second pause without any further print data, the paper is transported to the tear-off position. You can then tear off the paper if you wish.

The serrated tear-off edge, which you can use when the top part of the printer cover is folded forwards, is provided for this purpose.
If further data is sent to the printer, the page is pulled back to the current printing position or top of form.

Use of the printer menu is described in Chapter 4.

## Checking the top of form

Changing the tearoff position

Do not forward paper to the tear-off position by using the platen knob.

With the »Form Tear-Off« function activated, you can check and set the top of form by pressing the TEAR button in OFF LINE mode; the paper is drawn back to the top of form. Reset the top of form by pressing the Micro Feed Up/Down buttons with the SHIFT button pressed. The paper is transported to the tear-off position after making this setting.

Should you wish to change the setting of the tear-off position, switch the printer OFF LINE with the Form Tear-Off function activated. Make sure the paper is at the tear-off position. Change the tear-off position by pressing the Micro Feed Up/Down buttons with the SHIFT button pressed.

When using graphics programmes, there may due to the amount of processing to be performed by the computer be pauses in the sending of data which cause the paper to be fed to the tear-off position. The unnecessary transporting of the paper can impair accurate registration of the graphics. In this situation, switch off the »Form Tear-Off« function.

## Chapter 4: Printer menu settings

## The printer menu

The printer menu is used to adjust your printer to suit the application. Thus, you can use the printer menu to choose the emulation. You can adjust the page length for continuous paper or cut sheets, change the font and make other settings. The changes made in the menu are stored in the printer and retained even after the printer is switched off. These settings can be changed by software commands from your application or by means of the operator panel. After switching the printer on or off, the values set in the menu come into force again. Changes to the printer menu are also retained if the mains power supply is disconnected from the printer.

The printer menu is structured as follows: at the top level, the functions are divided into so-called menu groups (GROUP). Within each group are to be found several menu items (ITEM). To each menu item in turn can be assigned a menu value (SET).

In order to change the value of a menu item, you must first call menu mode. To do this, hold down the SHIFT button and press the MENU button while the printer is in ON LINE mode. The menu mode can also be activated by holding down the MENU button when switching on the printer. This second option is still open to you when the operator panel is blocked by means of the Operator Panel Function. The menu mode is activated when the indicator lamp MENU is lit. The functions beneath the buttons are then activated.

Should you wish to print out the current menu settings, insert a sheet of paper in the printer and press the PRINT button. The menu will be printed out in data processing quality. If, in menu mode, the printing reaches the end of the paper, insert a new sheet and switch the printer ON LINE again. The print-out is immediately recommenced.

Activate menu mode
There must be paper in the printer.

Print menu settings

Changing the menu settings

- On pressing the GROUP button, the next group and the first menu item associated with it are output. If you simultaneously press the SHIFT button, the preceding menu group is selected.
- By means of the ITEM button, you can switch to the next menu item within a group. If you simultaneously press the SHIFT button, the preceding menu item is selected.
- Pressing the SET button causes the current setting of a menu item to be changed by displaying and activating the next available value. If you simultaneously press the SHIFT button, the preceding value is printed and activated.
- After setting the required value, you can select the next ITEM or next GROUP in order to make changes to the values there.
- After changing all the items you require, you can end menu mode by pressing the EXIT button when holding down the SHIFT button and the changes become effective.
- In order to reset the menu to its factory default, hold down the two buttons $L F$ and $S E L$ when switching the printer on.

## 128 <br> Note!

Within menu mode, you can print out by means of the PRINT button a complete list of menu items with the current settings.

## Example

Ex factory, the printer is set to character pitch $10 \mathbf{c p i}$. In order to create a wide table you wish to use character pitch 17.1 cpi. Proceed as follows:

1. The printer is in ON LINE mode. First press the SHIFT button, hold this down and then press the MENU button.
2. Press the GROUP button to switch from the first group Printer Control to the next group Font.
3. Press the ITEM button to switch from the first menu item Print Mode to the next menu item Pitch.
4. You can select a value for Pitch. Since the first value is $\mathbf{1 0} \mathbf{~ c p i}$, you need to press the $S E T$ button three times until the value $\mathbf{1 7 . 1}$ cpi appears.

Hold down the SHIFT button and press the EXIT button. The val-
End menu mode ues last selected now become effective and the printer returns to print mode.

Below are summarised the functions for buttons in menu mode:

| Button | Function |
| :--- | :--- |
| SHIFT/MENU | Pressing both buttons in ON LINE <br> status activates menu mode. |
| GROUP | Calls the next group. |
| SHIFT/GROUP | Calls the previous group. <br> Displays the next menu item within the <br> current group. |
| SHIFT/ITEM | Displays the previous menu item within <br> the current group. |
| SHIFT/SET | Displays the next value of the current <br> item. |
| PRINT | Displays the preceding value of the <br> current item. |
| SHIFT/EXIT | Prints out all menu items and the asso- <br> ciated settings. |
|  | Ends menu mode. |

The factory defaults for menu items are printed in bold.

## GROUP ITEM SET

| Font | Print Mode | LQ Courier, LQ Roman, LQ Swiss, LQ Swiss Bold, LQ Orator, LQ Gothic, LQ Prestige, Utility |
| :---: | :---: | :---: |
|  | Pitch | $\begin{aligned} & 10 \text { CPI, } 12 \text { CPI, } 15 \text { CPI, } \\ & \text { 17.1 CPI, } 20 \text { CPI } \end{aligned}$ |
|  | Proportional Spacing | No, Yes |
|  | Style | Normal, Italics |
|  | Size | Single, Double |

The menu item Page Width appears only for wide printer models.

The menu item Page Width appears only for wide printer models.

The тепи item Page Width appears only for wide printer models.

## Chapter 4: Printer menu settings

Auto CR appears only when IBM emulation is selected.

CSF Bin Select appears only when cut sheet feeder is installed with two trays.

SI Select Pitch (10/12 cpi) appears only when IBM emulation is selected.

MODE2 appears only for wide printer models. CSF Type appears only for wide printer models.

| GROUP |  | SET |
| :---: | :---: | :---: |
| Parallel I/F |  | Buffer Print, <br> Buffer Clear, Invalid |
|  |  | I-Prime <br> Pin 18 <br> Auto Feed XT Open |
|  |  |  |

The menu items of the group Serial I/F only appear when a serial interface is installed. The installation is described in the »Accessories« chapter, further technical information on interfaces is to be found in the «Interface Data« appendix.

Page Width appears only for wide printer model.

The menu items of group CSF Bin 1 listed below appear only when a cut sheet feeder is installed. The menu items of the group CSF Bin 2 accordingly appear only when a cut sheet feeder is installed with two trays.

GROUP ITEM SET

## Explanation of menu items

Emulation Mode: You use this item to define the command set. The emulations available to you are Epson LQ, IBM ProPrinter and IBM AGM. The Alternative Graphics Mode (AGM) includes partial compatibility with the Epson LQ series which is largely limited to graphics and line feed commands. The commands available in AGM are indicated in the appropriate chapters.

Print Mode: You can select here the required font for the document.
Pitch: You set here the character width in characters per inch (cpi).
Proportional Spacing: The fonts in letter quality can optionally be printed with proportional spacing.

Style: You select normal or italic characters.
Size: You can switch between single font size and combination of expanded horizontal and vertical font.

Character Set: You can select here between IBM character sets Set I and Set II. In Epson emulation, Set II corresponds to an extension of the printable characters.

Language Set: When you select a national character set, this replaces some characters with the special characters of the respective language.

Zero Character: Select Slashed if you wish zero to have a slash through it in order to better differentiate it from capital O .

Code Page: A code page is a character set that contains country specific characters. In IBM emulation it can be used as character set I and II or as a fully printable character set. In Epson emulation, all characters can be made available via the "Extension of printable characters". In addition, certain characters in the lower range can be replaced by choosing a national character set (Language Set).

Slashed Letter O: The characters $\not \subset(155)$ and $¥$ (157) are replaced by $\varnothing$ and $\varnothing$ when Yes is selected.

Printer Control

Font

## Symbol Sets

A table of all the character sets and code pages is to be found in Chapters 10, 14 and Appendix B.

## Rear Feed, Bottom Feed

Page Length Control: Where cut sheets are being fed from above (Top Feed), the page length can be set via the menu or program commands (by Menu Setting). If, however, you set the value by Actual Page Length, the page length is automatically detected by means of the end of page sensor.

Graphics: Select Uni-directional (from left to right only) to achieve more precise registration of graphics. With Bi-directional, the printing speed is increased.

Receive Buffer Size: Selects the volume of the receive buffer. If you set a large size for the receive buffer, the system can send greater volumes of data to the printer which then stores it in the buffer; the printer is ready to receive data for a longer period and the transfer of data from the computer is therefore not interrupted. If the receive buffer becomes full, however, the printer is not ready to receive for a longer period because of the large volume of data in the buffer which it has to process. If your system issues an error message when the buffer is set to a large size (e.g. unit error through timeout), you need to set a smaller buffer. The result is that the time intervals during which the printer is not ready to receive are shorter. Your system is consequently able to send data to the printer at shorter intervals.

In general, it is advisable to set the receive buffer as small as possible where the computer places the print data in temporary storage (»spooling«) by means of a print manager, for example. This applies to large and medium-sized data processing systems and when the printer is used in a network.

Paper Out Override: If the paper end sensor detects that there is less than 1 inch $(2.54 \mathrm{~cm})$ of paper left in the printer, it stops a current print job. If you set Yes, the sensor is deactivated thus enabling you to print to the bottom edge of the page when using cut sheets of paper. Make sure when setting Yes that the printer does not print on the platen.

Print Registration: Use this item during bi-directional printing in order to improve the horizontal registration. Normally, the appropriate value is 0 , although by setting another value you can alleviate possible registration problems when printing graphic data.

Auto CR applies only to IBM emulation.

CSF Bin Select appears only when an optional cut sheet feeder with two trays is installed.

SI Select Pitch (10 cpi) and SI Select Pitch (12 cpi) apply only to IBM emulation.

Operator Panel Functions: Normally, all the buttons of the operator panel are active, but if you choose Limited Operation, the buttons PRINT QUALITY, CHARACTER PITCH and menu mode are blocked. The corresponding functions can then only be controlled by the software. This function is particularly suitable for printers being used by one or more persons where the changing of settings is undesirable. Hold down the MENU button when switching on to call the menu in Limited Operation mode.

Reset Inhibit: Select Yes if you wish to suppress the initialisation command sent by the software or system. This initialisation command resets all the functions to the values you have set in the menu.

Print Suppress Effective: If the value Yes is selected in this menu item, the commands for print suppression are active in all emulations. If the value No is selected, the commands for print suppression are ignored.

Auto LF: After selecting Yes, the printer automatically adds a line feed each time it receives a carriage return command. Check whether your computer also adds a line feed. If your print-outs always have double-line spacing, you should select No. If lines are printed on top of each other, Yes is the correct value.

Auto CR: If you wish the printer to perform a carriage return automatically each time it receives the line feed command, select Yes at this position.

CSF Bin Select: If you are using a cut sheet feeder with two bins, you can use this menu item to select one of these two bins as the standard bin and set different positions for the initial print line (top of form) for both bins. After quitting the menu, you can change the top of form position for the bin selected in the menu.

SI Select Pitch (10 cpi): You can define here whether the command SI in IBM emulation selects a character pitch of 17.1 cpi or 20 cpi when 10 cpi is used.
SI Select Pitch (12 cpi): You can define here whether the command $S I$ in IBM emulation selects a character pitch of 20 cpi or retains 12 срі.

Time Out Print: If this function is activated and the printer receives no data for 150 ms , the data in the printer buffer is printed out.

Auto Select: If a sheet of paper has been fed automatically from the paper support when the setting is No, the printer stays in the OFF LINE status. If Yes is selected, the printer switches to ON LINE when a sheet of paper is fed and the SEL lamp lights.

Graphics Speed: By means of this menu item, the printing speed for graphics of a lower resolution can be increased by selecting High.

Centering Position: This menu item is used to set the preferred position of the print head to suit the width of the paper format to be printed. The resultant reduction in print head movement optimises penetration, and over-saturation of the ribbon is largely avoided.

Refer to the table below to choose the recommended menu settings for the width of the paper format to be printed. Depending on the type of paper, it may be that the MODE1 and MODE2 settings can be used with paper widths larger than stated in the table. With heavier paper that is wider than A4, the DEFAULT setting may be necessary.

| paper | narrower <br> than $\mathbf{1 2 . 5} \mathbf{~ c m}$ | $\mathbf{1 2 . 5}$ to <br> $\mathbf{2 0 . 9} \mathbf{~ c m}$ | $\mathbf{2 1 . 0} \mathbf{~ c m}$ <br> (A4 portrait) | wider <br> than $\mathbf{2 1 . 0} \mathbf{~ c m}$ |
| :--- | :---: | :---: | :---: | :---: |
| narrow <br> model | MODE1 | MODE1 | DEFAULT | --- |
| wide <br> model | MODE1 | MODE2 | MODE2 | DEFAULT |

The diagram shows the preferred position of the print head in relation to the selected тепи item. The print head is driven from this position to the next print position, with the shortest possible path being chosen.

## Parallel I/F

This menu item applies only to Epson emulation.

CSF Type: The menu item CSF Type only appears for wide printer models. If you are working with a wide cut sheet feeder, the value must be set to Wide. If you are using a narrow cut sheet feeder with a wide printer, set the value to Narrow.

I-Prime: the signal on the I-Prime line of the parallel interface can either be ignored (Invalid), cause printing out of the current buffer (Buffer Print) or erase the print buffer (Buffer Clear).

Pin 18: pin 18 of the parallel interface can be switched to 5 volts or open if required.

Auto Feed XT: In essence, no line feed ( $L F$ ) is performed after a carriage return ( $C R$ ) if Auto LF is set to No. If, however, in Epson mode Auto LF is set to No and Auto Feed XT to Valid, a line feed is performed when an external Auto Feed Signal (Centronics pin 14) is issued. This special case can be necessary for certain combinations of hardware and software.

In the case of serial data transmission, the data bits of a byte are sent one after the other via a line to the printer. For correct transmission, it may be necessary to change the interface settings so that they match the settings of your computer. If there is a serial interface installed and this has been activated in the menu, the menu items described below appear.

Parity: Selects the parity. For each byte of data, a start bit with logical value 1 is transmitted, followed by the 7 or 8 bits of data according to the data length defined. If required, a parity bit can follow for the purpose of data checking.

Serial data 7/8 bits: Defines the data format. It is necessary to differentiate between the data format ( 7 or 8 bits) and the transmission format (data bits plus parity bit set or not set).

Protocol: Selects the interface protocol. There are two protocols that can determine the sending and receiving of data. In the case of the Ready/Busy protocol, the DTR, RTS or SSD line indicates the printer's readiness to receive by means of the voltage level. In the case of the X-ON/X-OFF protocol, sending/receiving is controlled (handshake) via special characters transmitted on the data line.

Diagnostic Test: Activates a diagnostic test of the interface. For further information, please refer to Appendix D.

Busy Line: Defines the line to be used for the busy signal.
Baud Rate: Defines the speed of data transmission.
DSR Signal: Activates or deactivates the DSR signal (data set ready).

DTR Signal: Defines the status of the DTR signal (data terminal ready).

Busy Time: Selects the duration of the busy signal.

## Chapter 5: Printer Control

## Emulation

An emulation is a »copy« of the functions of a specified device. That means your printer is capable in a certain emulation of executing the commands and functions of this particular device. In addition, extra functions are in most cases provided that go beyond the performance specification of the emulated device.
To be able to use your printer with as many applications as possible, it is provided with the emulations IBM ProPrinter, IBM ProPrinter AGM and Epson LQ.

## Printer drivers

In order to be able to write application programs not designed for specific output devices such as a screen or printer, they are mostly provided with exchangeable program parts responsible for outputting the data, so-called drivers. A driver receives generally required outputting instructions from its own program and translates these into the special commands and functions of the printer for which the driver was written. When installing or setting up printer drivers, you should always refer to the manual for the respective program, as the programs may be available in versions written both at different times and for different countries. For that reason, the notes given here may not always be applicable to your program but are to be taken as generally applicable.
You will obtain the best support for your printer if you use a printer driver which precisely matches the name of your printer.

If there is no matching driver in your program, choose a driver for one of the emulations named below. Make sure that the printer driver agrees with the emulation you set in the menu of the printer.
To select another suitable printer driver, go through the following list from top to bottom and select the driver that most closely matches the name of your printer.

The IBM ProPrinter function "Load down user-defined characters into the printer, DLL" is not supported by this printer model.

## Nag Note!

The lower the printer driver appears in the list, the fewer the functions supported.

| Epson-Emulation | IBM-Emulation |

| Epson LQ |  |

Some software packages permit modification of the printer driver. Such a modification, however, requires an intensive study of the program and the control commands of the printer. A list of the available functions and the associated control commands is to be found in Chapters 10 and 14 of this manual. Please refer to the manual of your application program for more detailed notes on installation and modification of the printer driver. If in doubt, contact your software manufacturer or supplier.

## Characters and control characters

The print data is transmitted by character. Every character is represented by 8 bits and thus expresses a certain position within the character set currently selected.

Most character sets are based on ASCII code (American Standard Code for Information Interchange).

There are different national variations for this character set. The socalled control characters are common to all the character sets. These are to be found at decimal positions 0 to 31 and effect functions such as page feed, line feed or carriage return. Some of these control characters modify character widths and are described in the appropriate chapters.

The so-called Escape character has a special significance among the control characters and is located at decimal position 27 (hexadecimal 1B). This control character introduces most commands for printers. One or more ASCII characters follow which in conjunction with the Escape character activate or deactivate print functions. At positions 32 to 255 are normally to be found printable characters. It is often possible to obtain special printable characters at the positions of the control characters by triggering them with an appropriate command.

The commands are listed in ASCII, decimal and hexadecimal form. If you are using a programming language, refer to your programming manual for the transfer of characters and control characters to the printer.

## Printing under DOS

Most IBM PC and compatible PCs use MS-DOS, PC-DOS, DR-DOS or similar as the operating system. Although DOS has no print functions, like a text processing or graphics program, direct printing of ASCII or print files is nevertheless possible under DOS. In the examples listed below, it is assumed that the printer is connected to parallel interface LPT1 of the PC. If a different interface to LPT1 is used (e.g. LPT2, LPT3, COM1, COM2), the address in the examples must be correspondingly altered. Further details on the serial interface are to be found later in the manual.

## TYPE

It is possible to print an ASCII or print file by using the TYPE command and diverting the output to the LPT1 device.

## Example:

TYPE C: \AUTOEXEC.BAT > LPT1:
TYPE C: \TEXTS $\mathrm{CLETTER} . \mathrm{TXT}>\mathrm{LPT1:}$
In the first instance, the file AUTOEXEC.BAT is printed from the root directory and in the second case the file LETTER.TXT is printed from the TEXTS subdirectory.

Files are copied between diskettes and hard disk and other devices by means of the COPY command. Thus, files can also be transmitted to the printer by means of COPY. When using the COPY command, the option »/B« should be activated so that binary and graphics files can also be copied without any limitations.

## Example:

COPY /B C:\AUTOEXEC.BAT LPT1:
COPY /B C:\TEXTS\LETTER.TXT LPT1:

Similarly, one can also copy characters directly from the keyboard to the printer by means of the COPY command.

## Example:

COPY CON: LPT1
THIS IS A SMALL TEST Ctrl-Z or F6

After entering the control character CTRL-P (hold down the CONTROL key and press the P key), texts output to the screen are simultaneously output to the current printer output device and printed out there. If, for example, the command DIR is entered via the keyboard, the file names of the current subdirectory are output not only to the screen but also to the printer.

For more detailed information on printing under DOS and the commands mentioned above, please refer to the manual for the operating system.

Entering the control character CTRL-P once again switches off printing of the screen data on the printer.

## Printing under DOS with a serial interface (RS-232C)

When printing under DOS, make sure only the transmission protocol Ready/Busy (hardware handshake) is supported. Printing with the transmission protocol X-ON/X-OFF (software handshake) is only possible with software for remote data transfer such as Telix, ProCom or MS-Windows Terminal.

Remote data transfer programs of this kind are good for testing interface because it is easy to change or adjust the parameters.

Note also the following points:

- The settings for the serial interface in the menu of the printer must agree with the settings for the serial interface in the PC.
- The interface cable must be wired in accordance with the menu options.

## Example:

The serial interface options in the printer are set at the factory as follows:

| Parity | None |
| :--- | :--- |
| Serial data | 8 bits |
| Protocol | Ready / Busy |
| Diagnostic Test | No |
| Busy Line | SSD- |
| Baud Rate | 9.600 bps |
| DSR Signal | Valid |
| DTR Signal | Ready on Power up |
| Busy Time | 200 ms |

- The serial interface settings in the computer are defined with the MODE command as follows:

MODE COM1: $9600, \mathrm{n}, 8,1, \mathrm{p}$
Please refer to the DOS manual for more information on the MODE command.

- Notes and further information on the serial interface (wiring, pin assignment, etc.) are to be found in the Interface Data appendix.

## Troubleshooting

Should your printer not print under DOS when using a serial connection, go through the following checklist:

1. Check whether there is a technical fault on the serial interface (RS-232C). To do this, perform the test described in Appendix D.
2. Check the settings of the items in the printer menu which relate to the serial interface. These settings must agree with the settings in your system.
3. Make sure the serial interface is correctly set up under DOS.
4. Check the interface cable. With the multitude of cables available, it is often difficult to find a cable suitable for your particular requirements. The interface cable described in Appendix D can be used both for transmission protocol X-ON/X-OFF and Ready/ Busy (Busy Line DTR).

## Chapter 6: Consumables and cleaning

## Changing the ribbon cassette

If the contrast of the printed characters is deteriorating, the ribbon needs to be changed. To do this, proceed as follows:

## Caution!

The print head moves and can cause injury to the hands. Switch the printer OFF LINE and wait until the print head stops moving.

1. Switch the printer OFF LINE by pressing the SEL button; the SEL lamp is extinguished.
2. Open the printer cover.

## Caution!

The print head may be hot and can burn your hands.
Wait until the print head has cooled down.
3. Move the print head to the middle of the platen.

4. Hold the used ribbon cassette at the top and carefully lift it over the print head.

Lift cassette over the print head

Inserting a new ribbon cassette

The original ribbon cassettes of the manufacturer's are specially developed for your printer. Among other things, this concerns the ink, which contains lubricants, and the fabric of the ribbon.

## $\triangle$ Waming!

Non-original ribbons can damage the print head. Use only the original ribbons of the manufacturer.

A clear ribbon guard is fitted to the front of the cassette. Do NOT remove it!

1. Take the ribbon out of its plastic packing.
2. Place the cassette with the cutout sections onto the pins of the cassette holder.

3. Tilt the cassette carefully down over the print head until you feel it click into place.
4. Turn the blue transport knob of the cassette in the direction of the arrow to tension the ribbon.
5. Close the printer cover and switch the printer ON LINE again by means of the SEL button.

Tilt cassette down over print head

## Cleaning

To ensure constant problem-free printing, clean the printer every six months (or after 300 hours of operation).

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands. Switch the printer OFF LINE and wait until the print head stops moving.

## Caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

- Before carrying out any cleaning, remove all accessories from the printer such as the cut sheet feeder or tractor feed.
- Clean the area around the axle of the print head carriage and the platen with a clean, dry cloth.
- Remove paper dust only with a soft brush such as a paint brush.
- Do not grease or oil any parts within the printer, this can cause damage.
- Do not use any solvents or aggressive cleaning agents on the case or in the machine, this can cause damage.

## Chapter 7: Accessories

The accessories described in this chapter extend the range of functions provided by your printer. For your safety, and to avoid damage to the machine:

- ... switch the printer off before installing accessories,
- ... remove the plug from the power supply.

Make sure you also read the safety information at the beginning of this manual.

## Cut sheet feeder

A cut sheet feeder feeds single sheets of paper to the printer thus saving the operator having to feed paper manually sheet by sheet during large print jobs (multiple copies of letters, etc.). The printed pages are ejected onto the output tray.

The cut sheet feeder is available in different versions:

- Narrow sheet feeder with one paper tray
- Narrow sheet feeder with two paper trays (double tray)
- Wide sheet feeder with one paper tray
- Wide sheet feeder with two paper trays (double tray)

Checking the items supplied

Check that the individual items supplied are complete and undamaged. You should have received:

- 1 feed rail
- 1 front paper stand
- 1 to 4 rear paper stands

Remove the packing material. Keep the original packing material safe so that you can transport the sheet feeder safely at a later date if necessary.

The metal paper feed rail enables you to fit a narrow cut sheet feeder onto a wide printer. All that is required is to adjust the feed rail to the wide platen.

1. Undo and remove the screws on the top of the feed rail.

2. Lay the extension piece of the rail next to the appropriate holes so that they align on the right hand side.

3. Align the holes of the extension precisely to the holes of the rail.
4. Fasten the screws once again.

Extended in this way, the paper feed rail will now fit the wide printer. If, on the other hand, you are using the narrow printer, the rail must not be extended.

Install the feed rail as follows:

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands. Switch the printer OFF LINE and wait until the print head stops moving.

## Caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

Installing the feed rail

1. Switch the printer off and open the printer cover.
2. Remove the paper support (see also Chapter 1).

3. Remove the ribbed paper separator by first pulling it forwards and then removing it from its catch arrangement (see also Chapter 1).

4. Fit the feed rail with its mounting brackets at both ends of the platen. You should hear it click into place.

5. Gently tilt the rail backwards.

6. Install the cut sheet feeder with its mounting brackets onto both ends of the platen shaft so that it is firmly seated.

Installing the cut sheet feeder
2. Turn the platen knob so that the gearwheel on the left end of the sheet feeder engages with the gearwheel of the platen.
3. Close the printer cover.

5. Fit the rear paper stand or stands as the case may be onto the rail of the paper guide.

6. Now insert the front paper stand.

7. To ensure that the machine feeds and handles the paper perfectly, the paper lever at the right end of the printer must point to the cut sheet symbol (middle position, TOP).
8. Switch the printer on.

The paper tray of the cut sheet feeder has a maximum capacity of 100 sheets $\left(90 \mathrm{~g} / \mathrm{m}^{2}\right)$ or 170 sheets $\left(60 \mathrm{~g} / \mathrm{m}^{2}\right)$ of standard paper. A mark on the left guide rail indicates the maximum amount of paper. Read also the further notes on paper in Chapter 3.

1. Set the paper set lever at the right end of the cut sheet feeder upwards to the RESET position. The paper tray will open towards the back.

## $\triangle$ <br> Warning!

Direct pressure on the platen can cause damage to the print head and pins. Make sure the paper guide is correctly adjusted.
2. Take a stack of paper, fan it to part the sheets and insert it into the sheet feeder. Make sure the stack of paper is lying on the bottom of the tray.
3. Make sure the rear paper stands are positioned equally between the paper guides.

4. Adjust the right paper guide so that the right side of the guide is flush with the right edge of the sheet of paper. Do not force the uprights together. The guide rail can be released and locked again by moving the locking lever to the appropriate position (RELEASE, LOCK).

5. Move the paper set lever of the sheet feeder to the SET position. If it is left released, the friction rollers cannot grip the paper and if printing is performed without paper, the print head and platen can be damaged.

Automatic paper feed

1. Make sure the setting of the menu item Page Length matches the paper format you are using. Further information on this is to be found in »Chapter 4: Printer menu settings«.
2. In ON LINE mode, feed the first sheet of paper with the $L F$ or FF/LOAD button.
3. If necessary, redefine the top of form. This is described in »Chapter 3: Paper handling".
4. To eject a sheet of paper, press the $F F / L O A D$ button again. Do not use the platen knob.

Cut sheets can also be fed into the printer when the cut sheet feeder is installed. It is essential, however, that there is no paper in the normal paper path of the printer. There are two possible modes for manual feeding:

## Feeding cut sheets

If the printer is ON LINE while paper is placed into the manual feed slot, it becomes the priority tray for a cut sheet. In the event of a multi-page print job, the printer will merely take the first sheet from the manual feed slot. All other sheets will be taken automatically from the current paper tray of the cut sheet feeder.

## Changing over to the manual feed slot

If the printer is OFF LINE while paper is placed into the manual feed slot, it serves as the manual feed tray. The sheet you have infeed slot, it serves as the manual feed tray. The sheet you have in-
serted is drawn in automatically after the time set in the Wait Time menu.

If the Auto Select menu item is set to No, it will be necessary to press the $S E L$ button after each automatic feed operation. If the Auto Select menu item is set to Yes, printing begins directly after the automatic feed operation.

For the subsequent pages of a print job, the printer waits for a further sheet of paper from the feed slot after the first sheet has been printed and ejected. At the same time, the ALARM lamp is lit and the SEL lamp is extinguished. Single sheets have to be inserted in the manual feed slot right to the end of the print job.

## Changing over to normal printing operation

To change back to normal printing operation, you merely need to
switch the printer back to ON LINE mode once the print job has
finished. After this, the printer will take the next sheet to be printed
To change back to normal printing operation, you merely need to
switch the printer back to ON LINE mode once the print job has
finished. After this, the printer will take the next sheet to be printed
To change back to normal printing operation, you merely need to
switch the printer back to ON LINE mode once the print job has
finished. After this, the printer will take the next sheet to be printed from the current tray of the cut sheet feeder.

Feeding cut sheets and continuous paper

## Printing area

Selecting the paper tray

If you are using single-part continuous paper, you can leave the cut sheet feeder on the printer and alternately feed and process continuous paper and cut sheets from the sheet feeder. To do this, transport the continuous paper into the PARK position as described in Chapter 3. It is not possible to process multi-part forms with the cut sheet feeder installed. Use the tractor feed to process multi-part forms (accessory).

Even though the cut sheet feeder permits printing of cut sheets from the top of the page, it is advisable to leave a top margin of $1 / 3$ inch $(0.85 \mathrm{~cm})$ and a bottom margin of 1 inch $(2.54 \mathrm{~cm})$ as the print quality cannot be guaranteed in this area, and there are likely to be a greater number of paper jams.

The bottom limit of printing is defined by the menu item Bottom Margin. If Bottom Margin is set to Valid, a bottom margin of $1 / 2$ inch ( 13 mm ) is preset. If, on the other hand, this menu item is set to Invalid, the bottom margin depends on the page length set in the menu. The smallest possible bottom margin can be 0.5 mm . In this case, make sure the page length is correctly set.

If you have installed a cut sheet feeder with two paper trays, you can feed paper from either the front or rear tray as required. In many application programs, the choice of tray can be set in the software.

In the printer menu, it is possible to select the tray that is to be active as default on switching on the printer. Please refer to "Chapter 4: Printer menu settings" for this.

In addition, there are programming commands for choosing the tray in the respective emulations.

Remove the cut sheet feeder from the switched-off printer by repeating the installation steps in the reverse order. The paper feed rail must also be removed. Now refit the paper separator and paper support as described in Chapter 1.

Should you wish to fit a narrow cut sheet feeder onto a wide printer, you will have to fit the mounting bracket for the wide roller as described below. You will need a cross-head screwdriver for this purpose.

1. Undo and remove screw (A) on the inside of the output tray.
2. Turn the cut sheet feeder over and place it on a steady, level surface. The two screws (B) are now accessible.

3. Undo and remove the screws (B) at both ends of the mounting
bracket.
4. Carefully remove both parts of the mounting bracket from the cut sheet feeder.
5. Move the left bracket rail approximately 5 mm to the left. Align the fixing hole preciseAlign the fixing hole precise-
ly to the pin and the threaded hole on the cut sheet feeder and screw the left screw (B) in again. bracket.

Adjusting the mounting bracket
6. Move the right bracket rail approximately 15 cm to the right; the mounting bracket is now extended to approximately 45 cm wide. Align the fixing hole precisely to the pin and the threaded hole on the cut sheet feeder and refit the right hand screw (B).
7. Turn the cut sheet feeder over and fasten the screw (A) to the inside right of the output tray. Replace the cut sheet feeder on the printer as described further on.

## The pull tractor feed

You feed continuous paper from the bottom when you wish to print types of paper that are not suitable for feeding around the platen. Such types of paper are multi-part forms, adhesive labels on backing paper and other special papers. You will need to use a pull tractor feed for this.

Checking the items supplied

Check that the individual items supplied are complete and undamaged. You should have received, depending on the model:

- 1 tractor feed (narrow or wide)
- 1 acoustic cover
 (narrow or wide)

Remove the packing material. Keep the original packing material safe so that you can transport the tractor feed safely at a later date if necessary.

To install the tractor feed, proceed as follows:
Installation

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands.
Switch the printer OFF LINE and wait until the print head stops moving.

$\triangle$

## Caution!

The print head may be hot and can burn your hands.
Wait until the print head has cooled down.

1. Switch the printer off and open the printer cover.

2. Remove the ribbed paper separator by first pulling it forwards and then removing from its retainer (see also Chapter 1).

3. Remove the paper support by pressing it downwards at the back. This will release it from its catch (see also Chapter 1).

4. Fit the tractor feed onto the printer. When doing this, fit the slots at each end of the tractor onto the pins of the holder on the printer (arrow).

5. Tilt the tractor feed forwards. Pull the hooks on the outside of both ends of the tractor until you can hear it click into place on the platen at both ends.
6. Replace the printer cover with the acoustic cover supplied with the tractor feed
 and close it.
7. Refit the paper support (see Chapter 1).
8. Switch the printer on.

Note!

Do not use the "Park" function in conjunction with the tractor feed otherwise the continuous paper will run completely out of the tractor guide.

With the tractor feed fitted, you can feed continuous paper from below the printer and print on it. Before doing this, place the printer on a printer table provided with a feed slot. The stack of continuous paper is placed under the table.

1. Switch the printer off.
2. Move the paper lever at the right side of the printer forwards to the continuous paper position (REAR); the symbol on the cover shows the correct position for the lever.
3. Feed the continuous paper through the feed slot in the
 bottom of the printer and up to the level of the platen. From above, pull the paper upwards beyond the tractor feed.

## $\triangle$ <br> Warning!

Direct pressure on the platen can cause damage to the print head and pins. Make sure the paper guide is correctly adjusted.

Feeding continuous paper
4. Release the locking lever for the left sprocket feed and move this to the required position. Fasten the left roller again with the locking lever.

5. Open the cover of the left sprocket feed, fit the continuous paper onto the first two sprocket pins.

6. Close the cover again.

7. Now position the right hand sprocket feed in the same way to suit the width of paper. Make sure that the paper is slightly tensioned.

8. Switch the printer on. The print head will move to the left end of the platen and the active indicators on the operator panel will light.
9. Fit the new acoustic cover.

You can set the values for paper handling as you wish by means
 of the printer menu in the Bottom Feed group.

Remove the tractor feed from the switched-off printer by repeating the installation steps in the reverse order. The paper feed rail must also be removed. Now refit the paper separator and paper support as described in Chapter 1.

Removing the tractor feed

## The bottom tractor feed

The bottom tractor feed gives you an additional means of feeding continuous paper from beneath the printer. For this purpose, the printer is raised up on the two feet supplied with the feeder.

Checking the items supplied

Check that the individual items supplied are complete and undamaged. You should have received, depending on the model:

- 1 bottom tractor feed (narrow or wide)
- 2 tractor feed feet

Remove the packing material. Keep the original packing material safe so that you can transport the tractor feed safely at a later date if necessary.

Fitting the bottom tractor feet

Before the tractor feed can be installed, the support feet for the tractor feed must be fitted:

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands.
Switch the printer OFF LINE and wait until the print head stops moving.

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

1. Switch off the printer.
2. In order to fit the feet, set the printer on its left side with the platen knob pointing upwards. The right support foot is to be fitted first.
3. Hook the corners of the support foot into the cutouts provided for this in the bottom of the printer.
4. Press the foot carefully in the direction of the arrow towards the bottom of the printer so that its edges line up with those of the printer.

Cutouts

Installing the tractor feed
6. Once the two feet are fitted, you need to fold them out to allow you to install the tractor feed. As a result, the printer will tilt backwards. Replace the platen knob.

To install the tractor feed, you need firstly to fold out the two support feet. Then proceed as described below:

$\triangle$

## Caution!

The print head moves and can cause injury to the hands. Switch the printer OFF LINE and wait until the print head stops moving.

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

1. Place the tractor feed with the cutouts at both ends onto the retaining pins on the bottom of the printer (arrow).

2. Gently push the tractor feed towards the front of the printer.

3. The mounting hooks of the tractor must click audibly into place.

4. Place the printer back onto its support feet.
5. Switch the printer on.

Feeding continuous paper

1. Move the paper lever on the right of the printer back to the continuous paper position (REAR). The symbol on the cover for cut sheet handling (TOP) shows you the correct lever position.

Direct pressure on the platen can cause damage to the print head and pins.
Make sure the paper guide is correctly adjusted.
2. Place a stack of continuous paper underneath the printer or feed the continuous paper from below through the feed slot of a printer table.
3. Open the cover of the left hand sprocket feed, place the continuous paper onto the first two sprocket pins and close the cover again.

4. To adjust the left sprocket feed to suit the width of the paper, release the locking lever (pull forwards). Move the feed unit to the required position and lock it with the lever again.
5. Now adjust the right hand sprocket feed in the same way to suit the paper width. Open the cover of the right sprocket drive, place the continuous paper onto the first two sprocket pins and close the cover again. Lock the feed again with the lever.
6. Make sure the paper is slightly tensioned. Fold the support feet back in again.
7. Switch the printer on. The print head will move to the left end of the platen and the active indicators on the operator panel will light. The ALARM indicator which will also light indicates in this case that there is no paper at the print position yet.
8. The paper can now be transported to the print position by pressing the $F F / L O A D$ button. Redefine the top of form position if necessary by means of the »Top Of Form" function. This is described in »Chapter 3: Paper handling".

Changing between different formats of continuous paper

You can set the values for paper handling as you wish by means of the printer menu in the Bottom Feed group.

If you are feeding continuous paper from the rear and wish to use continuous paper from the bottom tractor feed, proceed as follows:

1. Part the printed pages along the perforation.
2. In ON LINE mode, press the PARK button. The continuous paper is transported backwards but remains held in the bottom tractor feed.
3. Move the paper release lever on the right side of the printer towards the back; the symbol for continuous paper handling from below shows the correct setting for the lever.
4. Press the $F F / L O A D$ button. The continuous paper held in the bottom tractor feed is fed in. Redefine the top of form if necessary.

If the print job is finished and you wish to use the continuous paper from the bottom tractor feed, proceed as follows:
5. Part the printed pages along the perforation. Press the PARK button. The continuous paper is transported backwards but remains held in the bottom tractor feed.
6. Pull the paper release lever on the right side of the printer towards the front; the symbol for continuous paper handling from the rear shows the correct setting for the lever.
7. Press the $F F / L O A D$ button. The continuous paper is again fed to the platen from the rear of the printer.

## The roll paper stand

The roll paper stand permits you to use telex roll paper or special paper for specific applications.

Check that the individual items supplied are complete and undamaged. You should have received, depending on the model:

- 1 roll paper stand (only narrow)
- 1 paper support

Checking the items supplied

Installation
Remove the packing material. Keep the original packing material safe so that you can transport the roll paper stand safely at a later date if necessary.

To install the roll paper stand, proceed as follows:

## $\triangle$ <br> Caution!

The print head moves and can cause injury to the hands.
Switch the printer OFF LINE and wait until the print head stops moving.

## Caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

1. Replace the old support with the new paper support provided with the roll paper stand. The paper support is installed as described in Chapter 1.

2. Place the hooks of the roll paper stand precisely in the cutouts of the paper support and tilt the support backwards. The connecting cable will point to the back when this is done.

3. Connect the cable plug of the roll paper stand to the socket on the back of the printer. The arrow on the plug shows the correct way to plug it in.

Insert the roll paper as described below:

1. Insert the roll shaft into the core of the paper roll and open the paper guide of the roll paper stand. Insert the shaft into the roll paper stand so that the slotted end of the shaft engages in the slot of the left holder and the paper runs off from the bottom.
2. Slip the paper beneath the platen from the back with the edges of the paper lying against the platen. Now turn the platen knob to feed the paper around the platen.

$\triangle$

## Warning!

Direct pressure on the platen can cause damage to the print head and pins.
Make sure the paper guide is correctly adjusted.
3. Set the paper lever to the rear position. Align the left and right edges of the paper with the edges of the paper fed in from the back. When the roll paper is aligned properly, return the paper lever to the middle position.
4. Switch on the printer. The
 print head will move to the left end of the platen and the active indicators on the operator panel will light.
5. The paper can now be transported to the initial printing position by pressing the $F F / L O A D$ button.

Note that you require special continuous paper in order to use the roll paper stand.

## Installation

Technical details on these interfaces such as pin assignment, configuration by means of the printer menu and interface diagnostics are to be found in »Appendix D: Interface data«.

## Interface cards

In addition to the built-in parallel interface, three other different serial interface cards are available:

- RS-232C
- RS-232C/Current Loop
- RS-422A

This section explains how to install the interface card.

## \& Caution!

There is electricity present and therefore a risk of an electric shock. Switch off the printer and remove the plug from the power socket.

## © Warning!

Static charges can damage the interface. Leave the interface card in its protective packing until the instructions describe when to install it.

1. Switch off the printer and remove the parallel interface cable.
2. Remove the panel on the right, rear side of the printer by breaking it out with a slot-head screwdriver or by cutting it out with a knife.
3. Take the card out of its packing and slide the card along the guide slot as far as the stop inside the case until you can feel it make contact. It will automatically engage there.
4. Plug the printer end of the interface cable into the socket on the back of the printer. Secure the cable with the two screws.

A clip may be enclosed which is not required for this model.

## Ing Note!

Make sure that the parallel and serial interface cables are not installed or used at the same time as this can result in malfunction.
5. Connect the other end of the interface cable to the appropriate socket of your computer. Read the corresponding instructions in your computer manual.
6. Switch on the printer again.

## Chapter 8: Troubleshooting

Most printing problems are easy to solve. Before calling customer service, check the possible causes of faults below. Small malfunctions are usually very easy and quick to remedy yourself.

## Possible faults

This summary covers both the fault and possible remedies. Ascertain in which part of the machine the malfunction is located and read the advice described. If you are not able to remedy a fault, contact your supplier.

## What do I do if ... <br> ... nothing happens when I turn on the printer?

The printer may not be connected to the power supply. Check whether the power cable is connected to both the printer and an earthed mains socket.

## ...the ALARM lamp lights?

The stock of paper may be used up or the paper release lever is not set to the type of paper presently being used (continuous paper or cut sheets). Once you have remedied the reason for the fault, turn the printer off and then on again in order to extinguish the ALARM lamp.

## ...the ALARM lamp is blinking?

There is an internal fault. Contact your supplier.

## ...the MENU lamp is blinking?

The temperature sensor in the print head has detected that the temperature is too high. The printer automatically reduces its throughput to allow the print head to cool down. Printing then continues at normal speed with no loss of data.

Further information on ALARM messages is to be found at the end of the chapter.
...nothing is being printed although the computer is sending data?

The printer may be switched OFF LINE. If the SEL lamp is not lit, press the $S E L$ button. Check that the interface cable is correctly connected to your printer and computer.

## ...a paper jam occurs?

Paper jams rarely occur even if continuous paper and cut sheets are being alternately processed. Therefore, make sure the following points in particular are properly dealt with before printing:

- Continuous paper was not properly inserted in the transport sprockets of the pull or bottom tractor feed.
- You may have used unsuitable paper. Refer to the notes on paper in Chapter 3.

If you are still experiencing paper jams, proceed as follows:

- Switch off the printer.
- Open the printer cover.

## $\triangle$ caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.

- If you are using continuous paper, tear off the paper already printed.
- If the paper jam occurred at the ribbon guard, carefully move the print head to the side. Do not undo the screws of the ribbon carriage otherwise this will put the print head out of adjustment. Make sure there is no more paper between the ribbon guard and platen. Turn the platen knob to eject the paper carefully. Now remove all small pieces of paper from the printer.

The printer is now ready for operation again.

## ...individual dots of the print-out are missing?

The print head may be damaged. Contact your supplier.

## ...the print-out appears faint?

Replace the ribbon cassette with a new one as described in Chapter 6 and adjust the paper thickness correctly. If there is no marked improvement in the printing, contact your supplier.
...text processing files are printed differently to the settings defined in the printer menu or operator panel?
Many application programs send control commands to the printer at the start of and during data transmission. This »initialisation string« contains control characters and commands that set up the printer for the subsequent print job. These commands have priority over the settings selected via the operator panel or menu. Check in the associated manual whether you can alter the initialisation string. If this is the case, delete the unwanted commands.

## ...the menu and print function buttons are inoperative?

The function of the buttons can be deactivated by means of the menu item Operator Panel Functions of the printer menu. If the printer is part of a network or is shared by several people, the respective system administrator has probably used this option to prevent the printer settings being altered indiscriminately. Hold down the MENU button when switching on to be able to alter this item.

## ...if I wish to check the data sent by the computer to the printer?

Use the hex dump mode. To activate this mode, hold down the FF/ $L O A D$ button and the $S E L$ button when switching on the printer. All data sent to the printer including text and printer commands will then be printed in hexadecimal form and ASCII format. When you wish to return to normal print mode, switch the printer off an then on again.

## Fault tables

Malfunctions are indicated by the blinking of the ALARM lamp. The other lamps show the type of fault.

Faults that can be remedied by the user

- status of the indicator lamp unchanged
- indicator lamp is lit

X indicator lamp is blinking

The messages listed point to faults that can generally be remedied by the user. If the fault message appears again after you have undertaken the remedy described, contact your supplier.

| ALARM | SEL | MENU | $\mathbf{1 0} \mathbf{c p i}$ | $\mathbf{1 5} \mathbf{c p i}$ | Description |
| :---: | :---: | :---: | :---: | :---: | :--- |
| $\bullet$ | - | - | - | - | $\begin{array}{l}\text { The stock of paper has run out. Top } \\ \text { up with new paper. }\end{array}$ |
| $\bullet$ |  | - | x |  | $\begin{array}{l}\text { The paper lever is set to the cut sheet } \\ \text { symbol (TOP) although continuous } \\ \text { paper is being used. Transport the } \\ \text { continuous paper to the PARK } \\ \text { position or choose another means of } \\ \text { feeding the continuous paper. }\end{array}$ |
| - | - | x | - | - | x |
| A paper jam has occurred. Remove |  |  |  |  |  |
| the paper and make sure the paper |  |  |  |  |  |
| path is free. Press the SEL button. |  |  |  |  |  |
| The print head, the LF or space |  |  |  |  |  |$]$| motor became too hot, the printer |
| :--- |
| automatically reduced its through- |
| put. |

Should the ALARM indicator lamp start blinking, refer to the following table.

If the remedies described are not successfull, contact your supplier.

| UTL | PRES | 10 cpi | $\mathbf{1 2}$ cpi | 20 cpi | PROP | Description |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\bullet$ |  |  |  | $\bullet$ |  | The serial interface card is incorrect- <br> ly installed. Remove the card and re- <br> install it. |

Any other messages refer to more serious faults; see also the following table.

## Major faults

The following fault messages are unlikely to be displayed in normal use. They are listed here for the sake of completeness. Should any of these faults occur, contact your supplier.
The ALARM lamp also blinks when these faults occur; the following lamps light permanently in addition.

| 10 cpi | 15 cpi | 17 cpi | 20 cpi | PROP | UTL | PRES | BOLD | Cause |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| - |  |  |  |  |  |  |  | MPU, internal RAM |

|  |  |  |  | - | - |  |  | Head positioning |
|  |  |  |  | - |  | - |  | Print head gap |
| - |  |  |  | - |  |  |  | Print head contact |
| - |  |  |  | - | - |  |  | LF/space motor, driver |

## Testing options

The printer is provided with a number of simple means for testing that it is functioning correctly. Use one of the available tests when you wish to check whether the printer is working properly. Details on the program version and emulation of your printer are contained in the header above the following test print-outs. Keep this information handy in case you need to contact the service department.

This test can be used to check both the print quality and the paper handling. Pay particular attention to problems with paper feeding and ejection and irregularities with the print-out.

- ASCII test on a cut sheet

Should you wish to print out a continuous ASCII alphabet, hold down the QUIET/TOF button when switching on the printer. Either insert a sheet of paper or press the FF/LOAD button to have a sheet fed from the cut sheet feeder (CSF).

- ASCII test on continuous paper

First mount the continuous paper in the tractor feed. Notes on the use of continuous paper are to be found in the chapter »Paper handling«. Press the QUIET/TOF button when switching on the printer.

The continuous test runs for several pages until terminated by pressing the SEL button. The continuous ASCII sample is printed over the entire printable area of the platen, so make sure with the wide model that appropriate paper is inserted.

Continuous ASCII sample

## Available fonts

Hex dump mode

This test will help you to check the current print quality and the available fonts. The print-out of available fonts covers one page and ends automatically, but can also be cancelled prematurely by pressing the $S E L$ button.

- Font test on a cut sheet

You can obtain a print-out of all available fonts by holding down the $L F$ button when switching on the printer. Either insert a cut sheet or press the $F F / L O A D$ button to have a sheet fed from the cut sheet feeder (CSF).

- Font test on continuous paper

First mount the continuous paper in the tractor feed. Notes on the use of continuous paper are to be found in the chapter »Paper handling«. Hold down the $L F$ button when switching on the printer.

Should you wish to check the data being sent by the computer to the printer, use the hexadecimal output. All data sent to the printer including text and printer commands will then be printed in hexadecimal form and ASCII format, with all codes that are non-printable in ASCII format shown as dots.

To activate this mode, hold down the $F F / L O A D$ button and the $S E L$ button when switching on the printer. For this test too, you can use the different methods described for feeding cut sheets and continuous paper.

The line of BASIC:

```
10 LPRINT CHR$(27); "0"; CHR$(30); This is an example of a
    hexadecimal dump!"
```

would be printed as follows:

```
Hex Data Dump
1B 30 1E 54 68 69 73 20 69 73 20 61 6E 20 65 78 .0.This is an ex
61 6D 70 6C 65 20 6F 66 20 61 20 68 65 78 61 64 ample of a hexad
6563 69 6D 61 6C 20 64 75 6D 70 2E OD OA ecimal dump!..
```

Should you wish to return to normal print mode, switch the printer off and on again.

## Chapter 9: Packing the printer for transportation

Should you need to send off or transport the printer (dispatch, change of location, repairs), follow the instructions below to ensure the secure packing of your machine. Printers not packed in accordance with these instructions could be damaged during transportation. Any guarantee for dot matrix printers will invalidate if these are not packed as described. You will be responsible for cleaning work and repairs in this case. Use all of the original packing material for transportation.

1. Switch off the printer. Remove the power cable and interface cable.
2. Accessories must be packed separately.

## Caution!

The print head may be hot and can burn your hands. Wait until the print head has cooled down.
3. Remove the ribbon cassette. Move the print head to the left end of the platen and secure the print head with the transport packing material.
4. Pack the printer in the plastic bag supplied. Secure the printer in the box using the polystyrene packing material.

5. Close the box and stick it down.

## Chapter 10: IBM - Standard Functions

This chapter contains the commands for controlling IBM ProPrinter X24/XL24 emulation printer functions. The individual commands are listed within the function groups such as print quality, page formatting, etc.

The functions of the individual control commands are explained below. The commands are listed at the start of each section in decimal (Dec.), hexadecimal (Hex.) and in ASCII format.

## Print quality

This command allows you to select a font. »Courier« is the most usual standard font, while »Gothic« gives your documents an attractive appearance. If you need a machine-readable font for special applications, then select»OCR-B«. You can also use the menu mode or the PRINT QUALITY button on the printer's control panel to select a typeface.

The OCR-B consists of the 14 characters 0123456789 $+-><$. All other characters are available in Courier.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select typeface | 279173 | $1 B 5 B 49$ | ESC [ I |
|  | 50 | 0500 | ENQ NUL |
|  | $\mathrm{m}_{1} \mathrm{~m}_{2} \mathrm{p}_{1} \mathrm{p}_{2}$ | $\mathrm{~m}_{1} \mathrm{~m}_{2} \mathrm{p}_{1} \mathrm{p}_{2}$ | $\mathrm{~m}_{1} \mathrm{~m}_{2} \mathrm{p}_{1} \mathrm{p}_{2}$ |
|  | $\mathrm{r}_{1}$ | $\mathrm{r}_{1}$ | $\mathrm{r}_{1}$ |

In this command the Font-ID $m_{1}$ and $m_{2}$ is defined by the following sequence:

$$
\begin{aligned}
& \mathrm{m}_{1}=\text { integer value }(\text { Font-ID/256) } \\
& \mathrm{m}_{2}=\text { Font-ID }-\left(\mathrm{m}_{1}^{*} 256\right)
\end{aligned}
$$

Following values for $\mathrm{m}_{1}$ and $\mathrm{m}_{2}$ are fixed:

| $\mathbf{m}_{\mathbf{1}}$ | $\mathbf{m}_{\mathbf{2}}$ | Typeface |
| ---: | ---: | :--- |
| 0 | 0 | no change |
| 0 | 8 | Courier |
| 0 | 11 | Courier |
| 0 | 18 | Courier |
| 0 | 49 | Courier |
| 0 | 85 | Courier |
| 0 | 92 | Courier |
| 0 | 98 | Courier |
| 0 | 171 | Courier |
| 0 | 223 | Courier |
| 0 | 226 | Courier |
| 0 | 12 | Prestige Elite |
| 0 | 80 | Prestige Elite |
| 0 | 86 | Prestige Elite |
| 0 | 100 | Prestige Elite |
| 0 | 164 | Prestige Elite |
| 0 | 221 | Prestige Elite |
| 0 | 155 | Roman |
| 0 | 159 | Roman |
| 0 | 166 | Roman |
| 0 | 167 | Roman |
| 0 | 87 | Letter Gothic |
| 0 | 222 | Letter Gothic |
| 0 | 255 | Letter Gothic |
| 0 | 3 | OCR-B |

The parameters $p_{1}$ and $p_{2}$ define the character space (cpi) in increments of $1 / 1440$ inch. This calculation corresponds to the one of $m_{1}$ and $\mathrm{m}_{2}$. Therefore, 10 cpi have the following value: $\mathrm{p}_{1}=0, \mathrm{p}_{2}=144$. If $p_{1}$ and $p_{2}$ both equal 0 , the actual character pitch is kept.

Following values for $p_{1}$ and $p_{2}$ are defined:

| $\mathbf{p}_{1}$ | $\mathbf{p}_{2}$ | Character pitch |
| :--- | ---: | :--- |
| 0 | 0 | no change |
| 0 | 72 | 20 cpi |
| 0 | 84 | 17 cpi |
| 0 | 96 | 15 cpi |
| 0 | 120 | 12 cpi |
| 0 | 144 | 10 cpi |

$r_{1}$ defines whether the proportional typeface is selected. In this case $r_{1}$ has the value 2 . Is $r_{1}=1$ a non proportional typeface, it is selected. Is $r_{1}=0$ the last selected item (proportional or non proportional), it is kept.

## Print modes

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start 10 cpi | 18 | 12 | DC2 |
| Start 12 cpi | 2758 | 1B 3A | ESC : |
| Start 15 cpi | 27103 | 1B 67 | ESC g |
| Start 15/17.1 cpi | 15 | 0F | SI |
| Start 20 cpi | 2715 | 1B 0F | ESC SI |

Character pitch

The pitch is usually measured in characters per inch (cpi). For example, with 10 cpi 10 characters can be printed per inch ( 2.54 cm ). Each character then occupies $1 / 10$ of an inch. The pitch can also be defined via a multifunction command.

The function of the command SI for condensed printing mode depends on the menu items SI Select Pitch (10 CPI) and SI Select Pitch (12 CPI). Starting from a pitch of 10 cpi a pitch of 15 or 17.1 can be selected with the command SI which can be defined in the menu item SI Select Pitch (10 CPI). Starting from a pitch of 12 cpi a pitch of 20 cpi can be selected with the command SI if the value 20 cpi is set in the menu item SI Select Pitch (12 CPI). If the value 12 CPI is selected in the menu, the command SI will be ignored if starting from 12 cpi . The following table shows the possible pitches when using the command for double width printing.

The pitch can also be defined via the CHARACTER PITCH menu item or via the control panel. The spacing can also be defined via a multifunction command.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start double width | 278749 | 1B 57 31 | ESC W 1 |
| Stop double width | 278748 | 1B 57 30 | ESC W 0 |
| Start double width | 14 or | 0E or | SO |
| Stop double width <br> before end of the line | 20 | 14 | DC4 |

With these commands you can extend characters to double their normal width. If the actual character width is, for example, 12 cpi , the printer will print at 6 cpi after a command for double width printing. The following table shows all possible combinations.

The command Double width printing for one line is especially suitable for titles and headings, as the function is automatically deactivated at the end of the line. If a double width printing command is to be cancelled before the end of a line, you must send a DC4 or ESC W 0 command.

If double width printing is permanently activated via the command $E S C W 1$, this function can only be cancelled by entering ESC W 0; in this case $D C 4$ has no effect.

| Pitch | Double width printing |
| :---: | :---: |
| 10 cpi | 5 cpi |
| 12 cpi | 6 cpi |
| 15 cpi | 7.5 cpi |
| 17.1 cpi | 8.5 cpi |
| 20 cpi | 10 cpi |

If proportional spacing is activated, the use of double width printing gives double width proportional printing. As this does not have a fixed pitch, it is not shown in the table.

For certain applications the maximum number of characters in a line has to be indicated. This depends on the pitch selected. The following table shows the maximum number of characters per line.

| Pitch N | Characters per line |  |  | Proportional spacing |
| :---: | :---: | :---: | :---: | :---: |
|  | ow print |  | Wide printer |  |
| 5 cpi | 40 |  | 68 |  |
| 6 cpi | 48 |  | 81 |  |
| 7.5 срi | 60 |  | 102 |  |
| 8.5 срi | 68 |  | 116 |  |
| 10 cpi | 80 |  | 136 |  |
| 12 cpi | 96 |  | 163 |  |
| 15 cpi | 120 |  | 204 |  |
| 17.1 cpi | 137 |  | 233 |  |
| 20 cpi | 160 |  | 272 |  |
| Function | Dec. | Hex. | ASCII |  |
| Start proportional spacing | 278049 | 1B 5031 | ESC P 1 |  |
| Stop proportional spacing | 278048 | 1B5030 | ESC P 0 |  |
| With proportional spacing the spacing between the individual letters varies according to the respective character width. With a fixed pitch all characters are created within a matrix of the same width. Proportional spacing, however, gives wide characters such as »W《 or »M« more space and narrow characters such as »I« or »f« less space. The result is an attractive and more legible print image than with a fixed pitch. |  |  |  |  |
| Because of the different character widths proportional fonts do not have a fixed pitch. Precise margin settings in the case of full justified text, for example, is only possible if the word processing program supports proportional spacing. |  |  |  |  |
| This function can also be activated via the Proportional Spacing menu item or via the control panel. Proportional spacing is also available via multifunction commands. |  |  |  |  |

Proportional spacing

## Print attributes

Emphasized /
enhanced

| Function | Dec. | Hex. | ASCII |
| :--- | :---: | :--- | :--- |
| Start emphasized | 2769 | 1B 45 | ESC E |
| Stop emphasized | 2770 | 1B 46 | ESC F |
| Start enhanced | 2771 | 1B 47 | ESC G |
| Stop enhanced | 2772 | 1B 48 | ESC H |

With emphasized, the dot patterns of the characters are printed horizontally offset with enhanced, they are vertically offset. Emphasized and enhanced are not available in near-letter quality.

Emphasized and enhanced can be combined to particularly highlight selected text.

Overscoring

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start underline | 274549 | 1B 2D 31 | ESC - 1 |
| Stop underline | 274548 | 1B 2D 30 | ESC - 0 |

This command causes all printable characters including spaces to be underlined. Graphics and spaces skipped by a horizontal tabulator are not underlined.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start overscoring | 279549 | 1B 5F 31 | ESC_1 |
| Stop overscoring | 279548 | 1B 5F 30 | ESC_0 |

This command causes all printable characters including spaces to be overscored. Graphics and spaces skipped by a horizontal tabulator are not overscored.

Superscript /
Subscript

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start superscript | 278348 | 1B 53 30 | ESC S 0 |
| Start subscript | 278349 | 1B 53 31 | ESC S 1 |
| Stop super/subscript | 2784 | 1B 54 | ESC T |

Superscript characters are printed above the base line and are used for exponents ( $\mathrm{x}^{2}$ ) and other typographical effects. Subscript is particularly suitable for chemical formulae $\left(\mathrm{H}_{2} \mathrm{O}\right)$. Superscript and subscript characters are represented in all pitches in half character height and normal character width.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start italics | 273771 | 1B 2547 | ESC \% G |
| Stop italics | 253772 | 1B 25 48 | ESC \% H |

Italic characters are printed sloping slightly to the right and particularly highlight individual words, sentences or whole paragraphs. You can also activate this function via the menu to print a complete document in italics.

## Multifunction commands

Different print functions can be combined in a single escape sequence with multifunction commands.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select print quality, <br> pitch and font | 2733 n | 1B 49 n | ESC I n |

The parameter $n$ defines here the combination of print quality, pitch and font in accordance with the following table. Insert a value from the following table for $n$.

The following print qualities and pitches can also be selected via the control panel or the menu.

| n | Print mode | Pitch | Font |
| :--- | :--- | :--- | :--- |
| 0 | Data Processing Quality | 10 cpi | resident |
| 2 | Letter Quality | 10 cpi | resident |
| 3 | Letter Quality | proportional | resident |
| 4 | Data Processing Quality | 10 cpi | resident |
| 6 | Letter Quality | 10 cpi | resident |
| 7 | Letter Quality | proportional | resident |

Print quality, character pitch and typeface

| $\mathbf{n}$ | Print mode | Pitch | Font |
| ---: | :--- | :--- | :--- |
| 8 | Data Processing Quality | 12 cpi | resident |
| 10 | Letter Quality | 12 cpi | resident |
| 12 | Data Processing Quality | 12 cpi | resident |
| 14 | Letter Quality | 12 cpi | resident |
| 16 | Data Processing Quality | $17,1 \mathrm{cpi}$ | resident |
| 18 | Letter Quality | $17,1 \mathrm{cpi}$ | resident |
| 20 | Data Processing Quality | $17,1 \mathrm{cpi}$ | resident |
| 22 | Letter Quality | $17,1 \mathrm{cpi}$ | resident |
| 24 | Data Processing Quality | 15 cpi | resident |
| 26 | Letter Quality | 15 cpi | resident |
| 32 | Data Processing Quality | 20 cpi | resident |
| 34 | Letter Quality | 20 cpi | resident |
| DLL | Down Line Loadable Font generator |  |  |

The printer gives you two different print qualities: In data processing quality (UTL) a print speed of 260 characters per second (cps) at 10 cpi is reached, printing being bidirectional, i.e. one line from left to right, the next line from right to left, etc. This quality is suitable in particular for extensive lists and drafts.
Letter-quality (LQ), which reaches a speed of 87 cps at 10 cpi , should be used to create correspondence or documents. With this print quality the characters are printed in a high dot pattern resolution. This enables the creation of attractive documents when using a word processor.
These print qualities can be selected via the menu item Print Mode or the control panel.

| Character size / | Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- | :--- |
| Line spacing | Character size / | 279164 | 1 B 5 B 40 | ESC [ @ |
|  | Line spacing | 40 | 0400 | EOT NUL |
|  |  | 00 | 0000 | NUL NUL |
|  |  | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ |

When using double height, characters are extended to double their normal height. This function can be combined with double width and emphasized into a variety of print attributes. When using double height, you should increase the line spacing accordingly.

With this command, in addition to the character height you can also define the character width and the line spacing. The different combinations of these three functions result from the values for the variables $\mathrm{n}_{1}$ and $\mathrm{n}_{2} ; \mathrm{n}_{1}$ defines the character height and line spacing, and $n_{2}$ defines the character width.
$\mathrm{n}_{1} \quad$ Result

0 Current line spacing, current character height
1 Current line spacing, normal character height
2 Current line spacing, double character height
16 Single line spacing, current character height
17 Single line spacing, normal character height
18 Single line spacing, double character height
32 Double line spacing, current character height
33 Double line spacing, normal character height
34 Double line spacing, double character height
$\mathrm{n}_{2} \quad$ Result
0 Current character width
1 Standard character width
2 Double character width

## Example:

If you want to print double height characters with double line spacing without changing the character width, you must enter the following BASIC instruction:

```
LPRINT CHR$(27);"[@";CHR$(4);CHR$(0);CHR$(0);
    CHR$ (0); CHR$ (34); CHR$ (0)
```

The parameters $n_{1}$ and $n_{2}$ are to be taken from the table.

## Tabulators

| Horizontal <br> tabulators | Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- | :--- |
|  | Skip to next horizontal <br> tab | 9 | 09 | HT |
|  | Set horizontal tabs | $2768 n_{1}$ <br> $\ldots n_{k} 00$ <br> $n=1$ to 255 <br> $\mathrm{k}=1$ to 28 | $\ldots \mathrm{n}_{\mathrm{k}} 00$ | $\ldots \mathrm{n}_{\mathrm{k}}$ NUL |
|  | Clear horizontal tabs | 27680 | $1 B 4400$ | ESC D NUL |

When the printer is switched on tabulators are set automatically every eight columns starting with the ninth column. If a tabulator character (HT) is transmitted, the print head moves to the next set tab position before printing the following character.

The set tabulator position relates to the extreme left print column and not the set left margin (absolute reference). The actual position of a tab depends on the actual pitch at the time when loading the horizontal tab. When the pitch is changed, the tab position moves (relative position). It is mandatory to enter the tab positions in ascending order. The parameter $\mathrm{n}_{1}$ indicates the column position of the first tab, $\mathrm{n}_{2}$ to $\mathrm{n}_{\mathrm{k}}$ accordingly the column positions of the other tabs to be set. Up to $28\left(\mathrm{n}_{1} \ldots \mathrm{n}_{28}\right)$ tabs can be defined. The position of a horizontal tab relates absolutely to the character column zero, i.e. to the physical left margin. The command sequence must be ended with a NUL character.

The command ESC D NUL clears all horizontal tabs, including the standard tabs. If the printer is switched off and on, the standard tabs are available again. If no other tab is set up to the end of line, the tab jump command is ignored.

The command ESC $R$ cancels any tab stops you have set and returns to the printer's defaults. This means that horizontal tab stops will occur every eight columns, and that there will be no vertical stops. A $V T$ command will just produce a single line feed.

The maximum permissible values for tab positions can be seen from the following table.

| Pitch | Max. tabulator position |  |  |
| :---: | :---: | :---: | :---: |
|  | Narrow printe |  | Wide printer |
| 10 cpi | 79 |  | 135 |
| 12 cpi | 95 |  | 162 |
| 15 cpi | 119 |  | 203 |
| 17.1 cpi | 136 |  | 232 |
| 20 cpi | 159 |  | 255 |
| Function | Dec. | Hex. | ASCII |
| Skip to next vertical tab | 11 | 0B | VT |
| Set vertical tabs | $\begin{aligned} & 2766 \\ & \mathrm{n}_{1} \ldots \mathrm{n}_{\mathrm{k}} 0 \end{aligned}$ | $\begin{aligned} & \text { 1B } 42 \\ & \mathrm{n}_{1} \ldots \mathrm{n}_{\mathrm{k}} 00 \end{aligned}$ | $\begin{aligned} & \text { ESC B } \\ & \mathrm{n}_{1} \ldots \mathrm{n}_{\mathrm{k}} \mathrm{NUL} \end{aligned}$ |
|  | $\begin{aligned} & \mathrm{k}=1 \text { to } 16 \\ & \mathrm{n}=1 \text { to } 255 \end{aligned}$ |  |  |

## Vertical tabulators

No vertical tabs are set when switching on the printer. Up to 16 vertical tabulator positions can be set, the positions being defined as a line number. They must be entered in ascending order and end with a NUL character. The parameter $\mathrm{n}_{1}$ indicates the line number of the first tab, $n_{2}$ to $n_{k}$ accordingly the line numbers of the other tabs to be set. Up to 64 vertical tabs can be defined $\left(\mathrm{n}_{1} \ldots \mathrm{n}_{64}\right)$. ESC B NUL deletes all vertical tabs. If the command $V T$ is entered without any tab positions being defined, a line feed is executed.
The actual position of a tab mark depends on the actual line spacing when loading the vertical tabs and does not move when line spacing is changed (absolute position). With the skip command for the vertical tabulator the paper is transported to the next tab position. If a skip command is entered without further vertical tab positions being set, a line feed is executed.

| Function | Dez. | Hex. | ASCII | Reset tabs to <br> default |
| :--- | :--- | :--- | :--- | :--- |
| Reset horizontal/ <br> vertical tabs to default | 2782 | 1B 52 | ESC R |  |

Use this command to cancel any tab stops you have set and return to the printer's defaults. This means that horizontal tab stops will occur every eight columns, and that there will be no vertical tab stops. A $V T$ command will just produce a single line feed.

## Positioning

Relative dot
positioning

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Relative horiz. | 27100 | 1 B 64 | ESC d |
| dot position to the right | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ |
| Relative horiz. | 27101 | 1 B 65 | ESC e |
| dot position to the left | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ |

With these commands you can indent a line, for example at the beginning of a paragraph, where the spacing is measured in relative dot columns. A dot-column is the space from the centre of one point to the centre to another point within a character pattern. This space is irrespective of the character space and comes to $1 / 120$ inch.

With the variables $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ in this command a specific dot position can be defined at which the printout is to start. The values of the variables can be calculated using the following table:

$$
\begin{aligned}
& \mathrm{n}_{1}=\operatorname{dot} \text { position }-\left(\mathrm{n}_{2}^{*} 256\right) \\
& \mathrm{n}_{2}=\text { integer value (relative dot position/256) }
\end{aligned}
$$

If you want to move the current print position for less than 256 point positions, you must replace $n_{1}$ by the corresponding number of dot columns and $n_{1}$ by the value 0 . If you want to move the current print position for more than 256 point positions, you have to devide the number of dot columns by 256. Take the result for the values $n_{1}$ and $\mathrm{n}_{2}$ and calculate according to above mentioned table. Is this command send, the print head position is moved by $\mathrm{n}_{1}+\left(\mathrm{n}_{2} \times 256\right)$ point positions to the left or to the right side.
Have you chosen an indention beyond the left or right margin this command is ignored. For an indention of 80 dot columns to the left, type the following formula:

LPRINT CHR\$ (27); "e"; CHR\$ (80); CHR\$ (0)
For an indention of 600 dot columns to the right, type the following formula:

LPRINT CHR\$ (27); "d"; CHR\$ (88); CHR\$ (2)
(600:256 $=2$, remainder 88)

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start indication | 271051 | 1B 6901 | ESC i SOH |
| Stop indication | 271050 | 1B 6900 | ESC i NUL |

With this command you can switch on and off the mode which enables indication of the next print position. The next print position is indicated by the character $» \mathrm{M}$ « on the red line which is on the transparent paper protector at the front on the print head carriage.

This mode can also be switched on and off via the control panel by simultaneously pressing the SHIFT and PRINT QUALITY keys. If this mode is activated, the data in the printer memory are printed out. With this mode switched on the following commands cause indication of the next print position by the above-mentioned marking: space with print head positioning ( 255 dec., FF hex.), backspace (BS), horizontal tab (HT), carriage return (CR), line feed commands, form feed (FF), commands for defining the next print position, delete buffer (CAN), delete character (DEL).

If the functions Underline or Overscore are switched on, then spaces with positioning, i.e. spaces skipped by horizontal tab or positioning commands, are underlined or overscored; the next print position is then not displayed.

## Page formatting

| Function | Dec. | Hex. | ASCII | Set page length |
| :--- | :--- | :--- | :--- | :--- |
| Page length in lines | 2767 n <br> $\mathrm{n}=0$ to 50 | 1B 43 n | ESC C n |  |
| Page length in inches | 27670 n <br> $\mathrm{n}=1$ to 255 | 1B 4300 n | ESC C NUL n |  |

By selecting page length you can inform the printer of the size of the paper used.

When the printer is switched on, the current position of the print head is registered as Top of Form, i.e. as the first print line on the page. When printing forms it is important that the page length is set to the dimensions of the form so that not only the first but also all following form sets are printed in the right position.

Indicate next print position

When printing cut sheets with cut sheet feeder (CSF) this command has no effect.

Normally a standard length can be set in the Page Length menu item, though the page length can also be defined by one of the above commands in inches or in the number of lines. If Page Length Control is set to by MENU Setting, the start position for the sheet is not reset.

Defining the page length in lines is done as a function of the current line spacing. However, any subsequent change of line spacing does not change the page length. When using these two commands to change the page length the form start position is reset, a Skip over Perforation defined by command is deactivated and the value for the skip over perforation selected in the menu item is used. Set vertical tabs are deleted.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set current print head <br> position as Top of Form | 2752 | 1 B 34 | ESC 4 |

When entering this command the new TOF (Top of Form) is set at the respective position of the print head. However, the Top of Form can also be defined via the control panel. This is described in Chapter 2. If Page Length Control is set to by MENU Setting this command is ignored for cut sheets.

## Skip over

Perforation

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Activate Skip over <br> Perforation | 2778 n | $1 B 4 \mathrm{E} \mathrm{n}$ | ESC N n |
| Deactivate Skip over <br> Perforation | 2779 | 1B 4F | ESC O |

With this function the lower area of a page can be skipped automatically. There is a Form Feed to the start of the next page (Top of Form).

The parameter »n« designates the number of lines to be skipped to the start of the next page. The lower margin actually to be skipped depends on the current line spacing. Subsequent changes of line spacing have no effect on the margin to be skipped. All line feed commands which place the print position in the area to be skipped cause a jump to the start of the next page.

If Skip Over Perforation is set at Yes in the printer menu, a bottom area of one inch $(2.54 \mathrm{~cm})$ is skipped to the next Top of Form. The number of lines to be skipped can be selected with the above Skip command. The command ESC O switches off the Skip over Perforation function.

The commands for setting page length similarly switch off Skip over Perforation. The actual menu setting for the function Skip Over Perforation is selected. If page formatting is taken over by the software, e.g. a word processing program, you should switch off Skip over Perforation by setting Skip Over Perforation in the printer menu to No. If the value for Page Length Control is set to by MENU Setting, no skip over perforation is executed with cut sheets.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set left and right | 2788 | $1 B 58$ | ESC X |
| margins | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ |
|  | $\mathrm{n}_{1}:$ left margin $(0$ to 254$)$ |  |  |
|  | $\mathrm{n}_{2}:$ right margin $(0$ to 255$)$ |  |  |

In this command the parameters $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ define the left and right margins. The margin values are entered in character columns. The margin positions depend on the actual current pitch. Once the margins are set the positions are retained even after changing the pitch, provided the margins have not been expressly reset (absolute position). If you only want to change one margin position, just enter the value 0 for the margin not to be changed.
Note that the value for the right margin must be larger than the left margin by the number of character columns given in the table. The right margin must not exceed the maximum values given below (see table below).

| Pitch | Narrow printer |  | Wide printer |  |
| :--- | ---: | ---: | :--- | :--- |
|  | left $\mathbf{n}_{1}$ | right $\mathbf{n}_{2}$ | left n, $_{1}$ | right $\mathbf{n}_{2}$ |
| $10 \mathrm{cpi} /$ proportional | $0-70$ | $10-80$ | $0-126$ | $10-136$ |
| 12 cpi | $0-84$ | $12-96$ | $0-151$ | $12-163$ |
| 15 cpi | $0-105$ | $15-120$ | $0-189$ | $15-204$ |
| 17.1 cpi | $0-119$ | $18-137$ | $0-215$ | $18-233$ |
| $20 \mathrm{cpi} /$ proportional | $0-140$ | $20-160$ | $0-252$ | $20-255$ |

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set top and bottom | 279183 | 1B 5B 53 | ESC [ S |
| margin | 40 | 0400 | EOT NUL |
|  | $\mathrm{m}_{1} \mathrm{~m}_{2} \mathrm{p}_{1} \mathrm{p}_{2}$ | $\mathrm{~m}_{1} \mathrm{~m}_{2} \mathrm{p}_{1} \mathrm{p}_{2}$ | $\mathrm{~m}_{1} \mathrm{~m}_{2} \mathrm{p}_{1} \mathrm{p}_{2}$ |

In this command the parameters $m_{1}$ and $m_{2}$ define the top margin distance from the top of form to the top edge of the first line. The unit is $\mathrm{n} / 1440$ inch. Calculate the values for $\mathrm{m}_{1}$ and $\mathrm{m}_{2}$ according to the following formula:
$\mathrm{m}_{1}=$ integer value (top margin in $1 / 1400$ inch
increments $/ 256)$
$\mathrm{m}_{2}=$ top margin in $1 / 1400$ inch increments $-\left(\mathrm{m}_{1}^{*} 256\right)$

The parameters $p_{1}$ and $p_{2}$ defines the bottom margin distance from the top of form to the top edge of the bottom margin. The unit is $n /$ 1440 inch. The calculation follows the above listed formula. The bottom margin is the distance from the top of form to the bottom edge of the last line.

## Line spacing

Variable line
spacing
Usual line spacings for text are 6 or 8 lines per inch (lpi).

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| $1 / 8$ inch line spacing | 2748 | 1B 30 | ESC 0 |
| $7 / 72$ inch line spacing | 2749 | 1B 31 | ESC 1 |
| Menu defined line spacing <br> (without ESC A n) | 2750 | 1B 32 | ESC 2 |
| $1 / 6$ inch line spacing <br> (AGM) | 2750 | 1B 32 | ESC 2 |
| Select variable line <br> spacing (n/72 inch) <br> Select variable line <br> spacing (n/60 inch, AGM) <br> Deactivate ESC A n <br> line spacing <br> n=1 to 255 | 2750 | 1B 32 n | 1B 41 n |
| n=1 to 255 | ESC A n | ESC 2 |  |

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set variable line <br> spacing (n/216 inch) | 2751 n | 1B 33 n | ESC 3 n |
| n=1 to 255 |  |  |  |
| Set variable line <br> spacing (n/180 inch, AGM) | 2751 n <br> $\mathrm{n}=1$ to 255 | 1B 33 n | ESC 3 n |
| Set variable line <br> spacing ( $\mathrm{n} / 360$ inch) | 273756 n <br> $\mathrm{n}=1$ to 255 | 1B 25 38 n | ESC \% 8 n |
|  |  |  |  |

With the variable spacing commands you can define the line spacings via the parameter »n« in multiples of $1 / 72$ inch, $1 / 216$ inch or $1 / 360$ inch. These commands do not execute a line feed, but only set the line spacing which is used by a following line feed command.

The command ESC A $n$ for a variable line spacing of $n / 72$ inch assigns the desired value to the line spacing variable. The newly selected line spacing only becomes valid when it is activated by the command ESC 2. If ESC 2 is sent without the line spacing having been changed by the preceding command $E S C A$, the printer resets the line spacing to the value which was selected in the menu under Line Spacing.

## Alternate Graphics Mode (AGM)

This mode can be activated in the menu mode. AGM contains commands compatible with the Epson LQ printer series that are limited to Graphic- and Line feed commands. The commands available in AGM are marked.

If the Alternate Graphics Mode is selected in the menu ESC A $n$ line spacing steps will change to $n / 60$ inch and the ESC $3 n$ to $n / 180$ inch.

## Paper feed

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Line feed | 10 | $0 A$ | LF |
| Reverse line feed | 2793 | 1B 5D | ESC ] |
| Variable line feed | 2774 n | 1B 4A n | ESC J n |
| (n/216 inch) | $\mathrm{n}=0$ to 255 |  |  |
| Variable line feed | 2774 n | 1B 4A n | ESC J n |
| (n/180 inch, AGM) | $\mathrm{n}=0$ to 255 |  |  |
| Variable line feed | 273752 n | 1B 25 34 n | ESC \% 4 n |
| (n/360 inch) | $\mathrm{n}=0$ to 255 |  |  |
| Set line spacing units | 2791924 | $1 B 5 B 5 C$ 04 | ESC [ $\backslash$ EOT |
|  | $0 m_{1} m_{2}$ | $00 m_{1} m_{2}$ | NUL m m m |
|  | $\mathrm{p}_{1} \mathrm{p}_{2}$ | $\mathrm{p}_{1} \mathrm{p}_{2}$ | $\mathrm{p}_{1} \mathrm{p}_{2}$ |

A line feed $(L F)$ command causes the printer to print the data in the line buffer and then to move the print position down by the selected line spacing. If in the printer menu Auto CR is set at Yes, a carriage return is executed and the print position is set the the left margin. With a variable line feed of $n / 360$ inch no carriage return is executed, despite the settings of the printer menu. If 0 is set for the parameter n in this command, no line feed is executed.

If the Alternate Graphics Mode is activated in the menu line feed by ESC $J n$ is $n / 180$ inch.

The command ESC [ $\backslash E O T$ NUL $m_{1} m_{2} p_{1} p_{2}$ sets the basis for line spacing is set in increments of $1 / \mathrm{n}$ inch for the commands ESC $A$, ESC 3 and ESC J.

- The parameters $m_{1}$ and $m_{2}$ define the basis for line spacing for the command ESC $A$.

$$
\begin{aligned}
& \mathrm{m}_{2}=\text { integer value }(\mathrm{n} / 256) \\
& \mathrm{m}_{1}=\mathrm{n}-\left(\mathrm{m}_{2}^{*} 256\right)
\end{aligned}
$$

When the printer is turned on the basis for line spacing for ESC $A$ is set to $1 / 72$ inch, in AGM mode to $1 / 60$ inch.

- The parameters $p_{1}$ and $p_{2}$ define the basis for line spacing for the commands ESC 3 (variable line spacing) and ESC J (variable line feed).

$$
\begin{aligned}
& p_{2}=\text { integer value }(\mathrm{n} / 256) \\
& \mathrm{p}_{1}=\mathrm{n}-\left(\mathrm{p}_{2} * 256\right)
\end{aligned}
$$

When the printer is turned on the basis for line spacing for ESC 3 and ESC J is set to $1 / 216$ inch, in AGM mode to $1 / 180$ inch.

The following table shows the permissible values for the parameters $\mathrm{m}_{1}, \mathrm{~m}_{2}$ and $\mathrm{p}_{1}, \mathrm{p}_{2}$. Values that are not listed in the table will be ignored.

| $\mathrm{m}_{1}, \mathrm{p}_{1}$ | $\mathrm{m}_{2}, \mathrm{p}_{2}$ | Funct |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 00 | 00 | no ch |  |  |
| 48 | 00 | Basis | 8 inch |  |
| 72 | 00 | Basis | 2 inch |  |
| 96 | 00 | Basis | 6 inch |  |
| 120 | 00 | Basis | 20 inch |  |
| 144 | 00 | Basis | 44 inch |  |
| 180 | 00 | Basis | 80 inch |  |
| 216 | 00 | Basis | 16 inch |  |
| 240 | 00 | Basis | 40 inch |  |
| 160 | 05 | Basis | 440 inch |  |
| Function | Dec. | Hex. | ASCII | Form feed |
| Form feed | 12 | 0C | FF |  |
| If a form feed $(F F)$ command is sent, the printer prints all data in the line buffer and sets the current print position at the start of the next page. You can also advance a page to the start of the next page by pressing the FF key on the control panel. |  |  |  |  |

## Control of the Cut Sheet Feeder

Printing cut sheets

## Bin selection

These commands are only effective when using a dual bin Cut Sheet Feeder (CSF) available as an accessory.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Insert single sheet | 272573 | 1B 19 49 | ESC EM I |
| Eject single sheet | 272582 | 1B 1952 | ESC EM R |

A line feed command feeds a sheet of paper from the Cut Sheet Feeder (CSF) to the set Top of Form. Any sheet of paper already in the printer is ejected before a new one is fed in.

The eject command causes data in the printer buffer to be printed and the sheet to be ejected. If the page end or the area to be skipped at the page end is reached, the sheet is ejected and a new sheet is automatically fed in and advanced to the print position. Any defined Top of Form position, however, is disregarded. Therefore, when a Cut Sheet Feeder is installed the page change in the case of multipage documents must be done with the form feed command.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select bin 1 | 272549 | 1B 19 31 | ESC EM 1 |
| Select bin 2 | 272550 | 1B 19 32 | ESC EM 2 |

With the two bin selection commands you can, when using a dual bin Cut Sheet Feeder, define from which bin paper is to be fed.

When using the dual-bin feeder Top of Form positions can be set for each bin. You can select the priority bin in the printer menu with CSF Bin Select in the SET UP group. You can then define via the control panel the Top of Form position for the paper from the bin selected via the menu. You can, for example, feed a form with preprinted letterhead from one bin, with a Top of Form position at a large distance from the top edge of the sheet, followed by single sheets from the other bin with a Top of Form position near to the top edge of the sheet.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select Cut Sheet Feeder | 279170 | 1B 5B 46 | ESC [ F |
|  | 30 | 0300 | ETX NUL |
|  | $\mathrm{m}_{1} \mathrm{~m}_{2} \mathrm{~m}_{3}$ | $\mathrm{~m}_{1} \mathrm{~m}_{2} \mathrm{~m}_{3}$ | $\mathrm{~m}_{1} \mathrm{~m}_{2} \mathrm{~m}_{3}$ |

Cut Sheet Feeder

The parameter $\mathrm{m}_{1}$ defines the paper feed: $\mathrm{m}_{1}=1$ means manual paper feed. With $\mathrm{m}_{1}=3$ the current bin is selected again. The parameter $m_{2}$ is reserved and must be at 0 or 1 . The parameter $m_{3}$ selects a bin when a Cut Sheet Feeder with two bins is installed: $\mathrm{m}_{3}=1$ selects bin 1, with $\mathrm{m}_{3}=2$ the next sheet is taken from bin 2 .

## Character sets

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| IBM character set I | 2755 | 1B 37 | ESC 7 |
| IBM character set II | 2754 | 1B 36 | ESC 6 |

The IBM character sets are constructed as 8 -bit character sets, i.e. a character is assigned to each bit combination of a byte, with control commands being assigned to some values in the range from 0 to 31 . The standard ASCII characters are assigned to the range from decimal 32 to 127. In IBM character set I, the range from decimal 128 to 159 is identical with that from decimal 0 to 31, while in IBM character set II special characters are to be found in this range. The range from decimal 160 to 255 is identical for IBM character sets I and II and contains the IBM graphic symbols and other special characters.

In the two following representations the non-printable ranges are marked grey. If there are printable characters in these ranges, you can print these out with the command All character set.

IBM character sets

With these commands control characters from the ranges decimal 0 to 31 of IBM character sets I and II and 128 to 159 of IBM character set I can be addressed as printable characters. This all character set is called IBM character set III or All Character Set. If only one character is being printed from the control range, $E S C \wedge{ }^{\wedge} \mathrm{n}$ is to be used, where $n$ has the value of the character to be printed.

With ESC $\backslash n_{1} n_{2}$ the total number of the characters to be printed from the control range must be defined with the parameters $n_{1}$ and $n_{2}$ :

$$
\begin{aligned}
& \left.\mathrm{n}_{2}=\text { integer value (total number of characters } / 256\right) \\
& \mathrm{n}_{1}=\text { total number of characters }-\left(\mathrm{n}_{2} * 256\right)
\end{aligned}
$$

If you want to print fewer than 256 characters, you must replace $n_{1}$ with the respective number of characters and enter the value 0 for $\mathrm{n}_{2}$. If more than 256 characters are to be printed, you must divide the number of characters to be printed by 256 . Then insert the integer value for $n_{2}$ and the remainder for $n_{1}$.
If this command is sent, the next $n_{1}+\left(n_{2} \times 256\right)$ characters will be printed from the all character sets shown in Appendix B.
If you want to take the 80 characters from the all character set, you must enter the following BASIC instruction:

LPRINT CHR\$ (27);" ${ }^{\prime \prime \prime}$; CHR\$ (80) ; CHR\$ (0)
To print the next 600 characters in this character set you must use the following instruction:

LPRINT CHR\$ (27);" ${ }^{\prime \prime \prime}$; CHR\$ (88) ; CHR\$ (2)
(600: $256=2$, remainder 88.)

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select national | 2733 n | 1B 21 n | ESC ! n | character set

With this command you can replace some characters with national special characters. If you want to activate one of these character sets, you must insert the corresponding value from the table of national character sets for the parameter n .

Two different ASCII character sets are supported in which the numeric character is represented with or without slash respectively and 16 other national character sets. A zero with slash is particularly suitable for documents in which it is important to distinguish between zero and upper case O..
Character set ..... n
ASCII (Ø) ..... 64
ASCII (0) ..... 65
British ..... 66
German ..... 67
French ..... 68
Swedish I ..... 69

| Character set | n |
| :--- | :---: |
| ASCII (Ø) | 64 |
| ASCII (0) | 65 |

| Swedish III | 77 |
| Swedish IV | 78 |
| Turkish | 79 |
| Swiss I | 80 |
| Swiss II | 81 |
| Legal/Publisher | 90 |

A table with the national character sets is shown in Chapter 13.

| Select Code Page | Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- | :--- |
|  | Select Code Pages | 279184 | $1 \mathrm{~B} \mathrm{5B} \mathrm{54}$ | ESC [ T |
|  | 50 | 0500 | ENQ NUL |  |
|  | 00 | 0000 | NUL NUL |  |
|  |  | $\mathrm{n}_{1} \mathrm{n}_{2} 0$ | $\mathrm{n}_{1} \mathrm{n}_{2} 00$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ NUL |

Code Pages are national variants of the IBM character set. Unlike national character sets the differences are in the range 0 to 255 . The Code Pages are available as IBM Character Sets I and II and as an all character set. With the above command the Code Pages can be selected via their ID numbers.

The parameters $n_{1}$ and $n_{2}$ determine the ID number of the Code Page to be selected in accordance with the following formula:

$$
\begin{aligned}
& \left.\mathrm{n}_{1}=\text { integer value (ID number } / 256\right) \\
& \mathrm{n}_{2}=\text { ID number }-\left(\mathrm{n}_{1} * 256\right)
\end{aligned}
$$

The overview shows the available Code Pages and their ID numbers. You will find the Code Pages shown in a following chapter.

| ID | Code Page | $\mathbf{n}_{\mathbf{1}}$ | $\mathbf{n}_{\mathbf{2}}$ |
| :--- | :--- | :---: | :---: |
| 437 | USA | 1 | 181 |
| 774 | Baltic - 774 | 3 | 6 |
| 850 | Multilingual | 3 | 82 |
| 852 | East Europe Latin II | 3 | 84 |
| 855 | Cyrillic I - 855 | 3 | 87 |
| 857 | Turkish 857 | 3 | 89 |
| 860 | Portugal | 3 | 92 |
| 863 | French Canadian | 3 | 95 |
| 865 | Norwegian | 3 | 97 |
| 866 | Cyrillic II - 866 | 3 | 98 |
| 869 | Greek 869 | 3 | 101 |
| 895 | Kamenicky (MJK) | 3 | 127 |
| 1008 | Greek 437 | 3 | 240 |
| 1009 | Greek 928 | 3 | 241 |
| 1011 | Greek 437 Cyprus | 3 | 243 |
| 1012 | Turkish | 3 | 244 |
| 1014 | Polish Mazovia | 3 | 246 |
| 1015 | ISO Latin 2 | 3 | 247 |
| 1016 | Serbocroat I | 3 | 248 |
| 1017 | Serbocroat II | 3 | 249 |
| 1018 | ECMA-94 | 3 | 250 |
| 1019 | Windows East Europe | 3 | 251 |
| 1020 | Windows Greek | 3 | 252 |
| 1021 | Latin 5 (Windows Turkish) | 3 | 253 |
| 1022 | Windows Cyrillic | 3 | 254 |
| 1024 | Hungarian CWI | 4 | 0 |
| 1027 | Ukrainian | 4 | 3 |
| 1029 | ISO Latin 6 | 4 | 5 |
| 1030 | Hebrew NC - 862 | 4 | 6 |
| 1031 | Hebrew OC | 4 | 7 |
| 1032 | Windows Hebrew | 4 | 8 |
| 1034 | Windows Baltic | 4 | 10 |
| 1072 | Bulgarian | 4 | 48 |
|  |  |  |  |
|  |  | 3 | 3 |

The following BASIC line selects Code Page 437:

```
LPRINT CHR$ (27);CHR$(91);CHR$(84);CHR$(5);
    CHR$ (0); CHR$ (0);CHR$ (0);CHR$ (1);
    CHR$(181);CHR$(0);
```

The Code Pages can also be selected via the printer menu by changing the values in the Code Page menu item for example from USA to Multilingual. The available Code Pages are shown in Appendix B.

Code Pages are used as tables of printable characters. The character columns 2 to 7 and A to F are available in IBM Character Set I. The IBM Character Set II enables you to have access to character colums 8 and 9, whereas IBM's All Printable Character Set gives you access to all 256 printable characters as described in the previous "IBM Character Set" section.

## Other commands

Carriage return

Backspace

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Carriage return | 13 | 0D | CR |

If this command is entered, all data in the line buffer are printed and the next print position is set at the left margin. For short line seeking, the print head does not make these movements immediately; the print position is only logically set at the left margin. If Auto LF is set to Yes after each carriage return the printer executes a line feed command. This command deactivates double width printing for one line.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Backspace | 8 | 08 | BS |

With this command the print position is set to the last received printable character. This command is only executed if a printable character or a print command then follows.

The actual width of a backspace depends on the current pitch. When using proportional spacing the backspace command moves the print position $1 / 10$ inch to the left. If the print position is reset to a superscript character, a reverse line feed is executed to the position of the character in question and the next character is printed superscript; however, the alignment may not be quite exact.

If the print position is to be reset by several characters, a backspace command must be entered for each character to be overprinted.

However, the print position cannot be reset beyond the left margin. With this command specially composed symbols which are not available in the character set used can be printed.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Delete buffer | 24 | 18 | CAN |

This command deletes all printable characters in the line buffer. Functions set by commands are not reset, nor is the receive buffer deleted.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Activate automatic <br> line feed | 275349 | 1B 3531 | ESC 51 |
| Deactivate automatic <br> line feed | 275348 | 1B 35 30 | ESC 5 0 |

If automatic line feed is activated, the printer also executes a line feed when a carriage return command is received. This function can also be controlled via the menu item Auto LF.

| Function | Dec. | Hex. | ASCII | Unidirectional <br> printing |
| :--- | :--- | :--- | :--- | :--- |
| Start unidirectional <br> printing | 278549 | 1B 55 31 | ESC U 1 |  |
| Stop unidirectional <br> printing | 278540 | 1B 55 30 | ESC U 0 |  |

To optimize throughput, printing of lines normally takes place alternately forwards (from left to right) and backwards (short line seeking, bidirectional printing).

In order to improve the alignment of lines lying underneath one another you can stipulate with this function that each line be printed starting from the left margin (unidirectional printing). You should use this option when precise vertical alignment of the individual lines is desired (bit image graphics, IBM graphic characters, tables).

Delete buffer

Automatic line feed

## Unidirectional printing

Print suppress

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start print <br> suppress | 2781 n | 1 B 51 n | ESC Q n |
|  | $\mathrm{n}=36$ or \# for narrow printers <br> $\mathrm{n}=35$ or $\$$ for wide printers |  |  |
| Stop print suppress | 17 | 11 | DC1 |
| Printer OFF LINE | 27106 | 1B 6A | ESC $j$ |

After receiving an ESC Q $n$ the printer ignores all further data except for the command to end print suppress. The SEL lamp blinks in print suppress mode. After ending print suppress the SEL lamp is lit constantly and the printer is in ON LINE mode. With print suppress activated data can continue to be sent to the printer without being stored or printed, these data being suppressed. In OFF LINE status in contrast data can be transferred to the printer until the receive buffer is full. The printer then signals to the system that it cannot accept any more data. The data are thus retained.

| End of paper <br> sensor | Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- | :--- |
| Deactivate end of paper <br> sensor | 2756 | 1B 38 | ESC 8 |  |
| Activate end of paper <br> sensor | 2757 | 1B 39 | ESC 9 |  |

With end of paper sensor activated the ALARM lamp lights when less than 0.5 inch remains to the end of the paper. The printer goes into OFF LINE status. At each press of the SEL key a single line is printed and a line feed executed. If printing is to be to the lower margin of a sheet, the end of paper sensor can be deactivated by the above command. The printer then takes the page length set in the menu or by a command to establish an end of paper. The end of paper sensor can be reactivated with ESC 9. The function can also be activated and deactivated with Paper out Override.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select font via pitch / | 271670 | 1 B 1046 | ESC DLE F |
| point size | $\mathrm{Pn}_{0} \mathrm{Pn}$ | Pn 9 Pn | Pn Pn |
|  | Lp Hp | Lp Hp | Lp Hp |
|  | $\mathrm{Pn}_{0}=0$ to 255 (MSB ignored) |  |  |
|  | $\mathrm{Pn}=0$ to 255 (MSB ignored) |  |  |
|  | $\mathrm{Lp}=0$ to 255 |  |  |
|  | $\mathrm{Hp}=0$ to 255 (MSB ignored) |  |  |

Select font via pitch/ point size

With this command a previously selected font can be scaled within limited ranges by defining the pitch and the point size.

- The parameter $\mathrm{Pn}_{0}$ sets the number of parameters which follow this parameter. In this command the parameter $\mathrm{Pn}_{0}$ must be set to 3 . For values of $\mathrm{Pn}_{0}<3$ this command is ignored. For values of $\mathrm{Pn}_{0}>3$, $\mathrm{Pn}_{0}-3$ data bytes are ignored which follow the parameter Hp .
- The parameter Pn defines the pitch and parameters Lp and Hp the point size of the font.
- Values from 0 to 255 are permitted for Pn, the most significant bit however being disregarded.
- For values $2<\mathrm{Pn}<4$ this command is ignored.
- For values $>4$ the pitch of $\mathrm{Pn} / 360$ inch is assigned to the font.
- The value $\mathrm{Pn}=0$ does not alter the current pitch and $\mathrm{Pn}=1$ selects proportional spacing.
- The following relation between pitch and point size applies to proportional spacing:
Pitch $=360 /$ INT (Point size * standard width $/ 10.5+0.5$ ) cpi
- Point size is the size entered with parameters Lp and Hp. Standard width is the proportional width with a font size of 10.5 points.

The following relation applies to super/subscript with proportional spacing.

## Point size Character space

| 8-13 |  | character space same as 8 points |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10.5 |  | character space same as $10.5 * 2 / 3$ points |  |  |  |
| 14-64 |  | character space in relation to point size as following |  |  |  |
| Pitch $=360 /$ INT <br> (Point size * $2 / 3$ * standard width $/ 10.5+0.5$ ) cpi |  |  |  |  |  |
| selected point size | normal size | super-/ subscript | selected point size | normal size | super-/ subscript |
| 8 | 8 | 8 | 36 | 36 | 24 |
| 9 | 9 | 8 | 37 | 37 | 24 |
| 10 | 10 | 8 | 38 | 38 | 25 |
| 10.5 | 10.5 | $10.5 * 2 / 3$ | 39 | 39 | 26 |
| 11 | 11 | 8 | 40 | 40 | 26 |
| 12 | 12 | 8 | 41 | 41 | 27 |
| 13 | 13 | 8 | 42 | 42 | 28 |
| 14 | 14 | 9 | 43 | 43 | 28 |
| 15 | 15 | 10 | 44 | 44 | 29 |
| 16 | 16 | 10 | 45 | 45 | 30 |
| 17 | 17 | 11 | 46 | 46 | 30 |
| 18 | 18 | 12 | 47 | 47 | 31 |
| 19 | 19 | 12 | 48 | 48 | 32 |
| 20 | 20 | 13 | 49 | 49 | 32 |
| 21 | 21 | 14 | 50 | 50 | 33 |
| 22 | 22 | 14 | 51 | 51 | 34 |
| 23 | 23 | 15 | 52 | 52 | 34 |
| 24 | 24 | 16 | 53 | 53 | 35 |
| 25 | 25 | 16 | 54 | 54 | 36 |
| 26 | 26 | 17 | 55 | 55 | 36 |
| 27 | 27 | 18 | 56 | 56 | 37 |
| 28 | 28 | 18 | 57 | 57 | 38 |
| 29 | 29 | 19 | 58 | 58 | 38 |
| 30 | 30 | 20 | 59 | 59 | 39 |
| 31 | 31 | 20 | 60 | 60 | 40 |
| 32 | 32 | 21 | 61 | 61 | 40 |
| 33 | 33 | 22 | 62 | 62 | 41 |
| 34 | 34 | 22 | 63 | 63 | 42 |
| 35 | 35 | 23 | 64 | 64 | 42 |

The point size is defined with the parameters Lp and Hp:

$$
\begin{aligned}
& \mathrm{Np}=\mathrm{Lp}+\mathrm{Hp}{ }^{*} 256 \\
& \text { Point size }=\mathrm{Np} * 0.5
\end{aligned}
$$

| size <br> of $\mathbf{~ N p}$ | Point size <br> (points) | rounded <br> size of $\mathbf{N p}$ |
| :---: | :---: | :---: |
| 0 | $1)$ | 0 |
| $1 \leq \mathrm{Np} \leq 17$ | 8 | 16 |
| $18 \leq \mathrm{Np} \leq 19^{2)}$ | $9^{2)}$ | 18 |
| $\mathrm{~Np}=20$ | 10 | 20 |
| $\mathrm{~Np}=21$ | 10,5 | 21 |
| $22 \leq \mathrm{Np} \leq 23$ | 11 | 22 |
| $24 \leq \mathrm{Np} \leq 25$ | 12 | 24 |
| $26 \leq \mathrm{Np} \leq 125$ | $13-62$ | $26-124$ |
|  |  | (all even digits) |
| $126 \leq \mathrm{Np} \leq 127$ | 63 | 126 |
| $128 \leq \mathrm{Np} \leq 32767$ |  | 128 |

1) no change: If the point size assignment of a preceding font scaling command is still valid, this point size is used. If the point assignment is deleted, i.e. no point size is selected, the font is printed in the currently valid font size and current pitch (cpi).
2) The size of a font scaled to 9 points has the same appearance as that to a scaled font to 8 points.

The following table shows the reference of a selected character space (Pn) to a bitmapped font used by the printer if it is not scalable.

| point- <br> space <br> (Pn) | $\quad$8,9 <br> Bitmap Print <br> (cpi) <br> 8 ( |  | 10 |  | 10,5 |  | 21 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $\begin{aligned} & \text { Bitma } \\ & \text { (cpi) } \end{aligned}$ |  | $\begin{aligned} & \text { Bitma } \\ & \text { (cpi) } \end{aligned}$ | Print | $\begin{aligned} & \text { Bitma } \\ & \text { (cpi) } \end{aligned}$ | Print |
| 1 | 8 prop. |  | prop. |  | prop. |  | prop. | dbl. hight, dbl. width |
| 5-21 | 8 | comp. | 12 | comp. | 12 | comp. | 12 | comp., dbl. hight |
| 22-24 | 8 |  | 10 | comp. | 10 | comp. | 10 | comp., dbl. hight |
| 25-30 | 8 |  | 12 |  | 12 |  | 12 | dbl. hight |
| 31-36 | 8 |  | 10 |  | 10 |  | 10 | dbl. hight |
| 37-42 | 8 | bold | 10 | bold | 10 | bold | 10 | dbl. hight, bold |
| 43-48 | 8 | dbl. width | 10 | comp., dbl. width | 10 | comp., dbl. width | 10 | comp., dbl. width dbl. hight |
| 49-60 | 8 | dbl. width | 12 | dbl. width | 12 | dbl. width | 12 | dbl. hight, dbl. width |
| 61-127 | 8 | dbl. width | 10 | dbl. width | 10 | dbl. width | 10 | dbl. hight, dbl. width |

Following table shows the relation between selected font and the font used by the printer.

|  | selected font | font used by printer |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 8,9 | 10/10.5 | 11-20 | 21 | 22-64 |
|  | Courier | Courier | Courier | Courier | Courier | Courier |
|  | Roman | Roman | Roman | Roman | Roman | Roman |
|  | Swiss | Swiss | Swiss | Swiss | Swiss | Swiss |
| ${ }^{1}$ ) Courier is used every time if a font is selected that is not | Prestige | Roman | Prestige | Courier ${ }^{1)}$ | Prestige | Courier ${ }^{11}$ |
| scalable. With the pitches of | Orator | Swiss | Orator | Courier ${ }^{1)}$ | Orator | Courier ${ }^{1)}$ |
| 8,9,10 and 10.5 points the | Swiss Bold | Swiss | Swiss Bold | Courier ${ }^{1)}$ | Swiss Bold | Courier ${ }^{1)}$ |
| fonts are printed as bitmap fonts. | Gothic | Swiss | Gothic | Courier ${ }^{1)}$ | Gothic | Courier ${ }^{1)}$ |

## Special cases

- Point size is set to $\mathrm{Np}=42$ (21 points). Proportional or fixed point size $\mathrm{Pn} \geq 33$.
- If a font other than Courier, Roman or Swiss is selected, the character ( $\mathrm{Np}=42,21$ points) is double width and double hight in reference to point size $\mathrm{Np}=21$ (10.5 points)
- Fixed character pitch: $5 \leq \operatorname{Pn} \leq 33$
- A character for $\mathrm{Np}=42$ (21 points) is double hight in reference to point size Np $=21$ (10.5 points)

The following commands use the pitch set by this command:
ESC X: Set left and right margins
BS: Backspace
ESC D: Set horizontal tabs
If proportional spacing is selected, the pitch is calculated from the following formula for these commands:

Pitch $=360 /$ INT (point size * $36 / 10.5+0.5$ ) cpi

## Printing in UTILITY

If a proportional font selected $(\mathrm{Pn}=1)$, the printer substitutes the Utility font by the chosen font via menu in letter quality. Is UTILITY selected in the printer menu it is substituted by Courier.
If a fixed pitch is selected, the pitches and point sizes are used given in the table of bitmapped character sets above.
If no point size is entered in this command ( $\mathrm{Lp}=\mathrm{Hp}=0$ ), the point size is selected which was defined previously with this command. If the point size is deleted or not set, printing takes place with a size of 10.5 points.

The following commands are suppressed when this command is used for scaling fonts:

ESC W: double width printing
ESC [ @: character size/line spacing
SI: condensed printing
SO, DC4: double width printing for one line
If a fixed pitch or proportional spacing is selected with this command, the PROP lamp lights in the CHARACTER PITCH indicator panel on the control panel.

This command is deleted by selecting a pitch with the commands DC2, ESC :, ESC g, ESC SI, ESC P Pn and ESC I Pn.

If the printer is reset, this command is similarly deleted and the step widths for the basic settings apply again.

## Chapter 11: IBM - Graphics

## Bit image graphics

One of the merits of dot matrix printing technology is its flexibility when printing dot patterns. Since you can address every dot within the printable area, all kinds of graphic objects can be portrayed in the graphics resolution you choose provided by the printer. Even the photos in a newspaper, when examined closer, consist of thousands of tiny dots.

The programming of dot patterns is a complex task. Even a simple graphic image can contain several hundred dots and designing readable characters is frequently associated with trial and error and considerable programming effort. For this reason, you should use one of the popular application programs for graphics or poster printing which supports one of the emulations available with this printer. These programs make possible, depending on the complexity, the creation on screen of drawings, images or poster type, permit the storing of sketches, merging of several images or objects and, of course, printing out in different graphic densities, whereby the program converts the graphics on the screen into graphics data which the printer can interpret.

Should you wish to write your own programs for graphics and individual characters, you should first acquaint yourself in detail with the way bit image graphics work. Irrespective of whether you are printing an image or designing downloadable characters and loading them into the printer, your program always has to define the pattern of the dots to be printed.
Physically, the print head of your printer is constructed with two vertically arranged columns each of 12 pins. The graphics data for these 24 pins are, on the other hand, structured into 3 columns lying one below the other each with 8 dot lines. The data are sent to the printer as a sequence of bytes each of 8 bits. To each of the eight bits of these three bytes is assigned a pin of the print head and can accept the value 1 or 0 . With a value of 1 , the corresponding pin is used to print. If a bit has the value 0 , the associated pin is not used. Following an 8-bit graphic is defined.

Picture a byte as a column of 8 dots each corresponding to a bit. With bit image graphics, data in columns of this kind are printed next to each other. If you are writing your own program, you must convert the bit-by-bit dot pattern into a decimal or hexadecimal format and send it byte-by-byte to the printer.

The following diagram shows how you determine the decimal value of a certain pin pattern.

## Position value Binary value

| 128 | $2^{7}$ |
| ---: | ---: |
| +64 | $2^{6}$ |
| 32 | $2^{5}$ |
| +16 | $2^{4}$ |
| +8 | $2^{3}$ |
| +4 | $2^{2}$ |
| 2 | $2^{1}$ |
| +1 | $2^{0}$ |

93 entered as CHR\$ (93)
In the diagram, the positions with the values $64,16,8,4$ and 1 are intended to be printable dots. Only these figures are added together to determine the value for this byte.
Your printer is capable of representing 8-dot graphics in order also to be able to print graphics which have been created for 9-pin dot matrix printers. For this is used a technique in which two pins together correspond to one pin of the 9-pin dot matrix printer in order to achieve a comparable and distortion-free image.

Since the 8-pin modes correspond to the more common standards, they are especially suitable for graphics programs which do not support 24-pin dot matrix printers.

24-pin graphics consist of columns each of 3 data bytes which together yield 24 printable graphic dots. The individual bytes are calculated in the same way as with 8 -dot graphics.

|  | 128 | $\bigcirc$ | $128 \times 1=128$ |  |

# Graphics of high resolution 

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| High resolution graphics | 2791103 | $1 B 5 B 67$ | ESC $[g$ |
|  | $n_{1} n_{2} m$ | $n_{1} n_{2} m$ | $n_{1} n_{2} m$ |

The command shown above defines the graphic resolution and the mode 24-pin or quasi 8-pin graphics. The values $\mathrm{n}_{1}, \mathrm{n}_{2}$ and m are explained in the text below.

Alternative Graphics Mode (IBM AGM)

Graphic modes

In the field »Width« the maximum number of dot columns for the narrow/wide printer model is given .

This mode can be activated in the menu. It contains partial compatibility to the Epson LQ series but is principally restricted to graphics and line feed commands. The commands available in AGM or commands with another meaning are identified accordingly.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| High resolution graphics <br> (only AGM) | 2742 m | 1 B 2 Am | ESC $^{*} \mathrm{~m}$ |
|  | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ | $\mathrm{n}_{1} \mathrm{n}_{2}$ |

See the table below for the value $m$ for the two high resolution. Under »IBM«, you will see the value for the command ESC [ $g n_{1} n_{2} m$ »AGM« gives the value for $m$ should you use the command ESC * $m$ in Alternative Graphics Mode.

| Density | Mode <br> (pins) | Resolution <br> (dpi) | Width | IBM | AGM |
| :--- | :---: | :---: | ---: | :---: | :---: |
| Single Density | 8 | 60 | $480 / 816$ | 0 | 0 |
| Double Density | 8 | 120 | $960 / 1632$ | 1 | 1 |
| High Speed, |  |  |  |  |  |
| Double Density | 8 | 120 | $960 / 1632$ | 2 | 2 |
| Quadruple Density | 8 | 240 | $1920 / 3264$ | 3 | 3 |
| CRT I | 8 | 80 | $640 / 1088$ | - | 4 |
| CRT II | 8 | 90 | $720 / 1224$ | - | 6 |
| Single Density | 24 | 60 | $480 / 816$ | 8 | 32 |
| Double Density | 24 | 20 | $960 / 1632$ | 9 | 33 |
| CRT III | 24 | 90 | $720 / 1224$ | - | 38 |
| Triple Density | 24 | 180 | $1440 / 2448$ | 11 | 39 |
| Sexuple Density | 24 | 360 | $2880 / 4896$ | 12 | 40 |

You are properly using the performance of your printer if you choose one of the 24 -pin modes. After selecting the required density, you can design your graphic and convert it step by step into data for the printer. Make sure that 24-pin graphics consist of a number of columns each composing 3 bytes.

The variables $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ communicate to the printer the total number of bytes including attribute and graphics data which follow the command sequence ESC [ $g n_{1} n_{2}$. The total number of data bytes consists of a mode byte $m$ and the number of graphic bytes sent to the printer. In the case of 24-pin graphics, the parameters $n_{1}$ and $n_{2}$ must take account of the number of graphic bytes determined from the number of graphic columns times 3 and the attribute byte.
The second command $E S C^{*} m n_{1} n_{2}$ is only valid in Alternative Graphics Mode (AGM). It corresponds precisely to the Epson command for high resolution graphics. A description of this command and an example are to be found in Chapter 12.

Our example composes 48 columns. If the triangle is to be printed six times one after the other, the total number of columns is given by $6 \times 48$, i.e. 288.

Since each graphic column consists of 3 graphic bytes, the values for $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ in the example graphic with 288 columns are:
1 (mode byte) +288 (columns) * 3 (graphic bytes per column) $=865$ bytes.

From this are computed $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ as follows:
$\mathrm{n}_{2}=$ integer component (number of bytes/256), in the example: $\mathrm{n}_{2}=3$
$n_{1}=$ number of bytes $-n_{2} \times 256$, in the example: $n_{1}=97$

## Programming graphics

When entering the program lines beginning with REM can be left out and the DATA instructions compiled in longer lines.

When programming graphics, do not add superfluous line feed commands. If you enter a semicolon after the data transferred in an LPRINT instruction, the print head will remain in the respective line.

Remember in addition that BASIC assigns to all printers a maximum line length of 80 characters. After receiving the data of 80 data bytes, a carriage return with line feed is sent automatically to the printer. Since graphics normally consist of a large number of bytes, this limit is soon exceeded and the image in question is printed out incorrectly. You can get around this problem by setting the line length to the maximum permissible value of 255 . To do this, enter one of the following instructions at the beginning of your program:
For parallel printers:

```
WIDTH "LPT1:",255
```

For printers with serial interface which have been opened as \#1:
WIDTH \#1,255

## Example:

```
10 REM 24-pin graphics demo program IBM
    ProPrinter X(L) 24
    20 OPEN "lpt1:bin" FOR OUTPUT AS #1:
    WIDTH "lpt1:", 255: REM Prepare for output
30 FOR MODE = 1 TO 4
40 IF MODE = 1 THEN PRINT #1, "24 pin single
    density"; CHR$(13); CHR$(10); CHR$(10); : D = 8:
    GOTO 80
50 IF MODE = 2 THEN PRINT #1, "24 pin double
    density"; CHR$(13); CHR$(10); CHR$(10); : D = 9:
    GOTO 80
60 IF MODE = 3 THEN PRINT #1, "24 pin triple
    density"; CHR$(13); CHR$(10); CHR$(10); : D = 11:
    GOTO 80
    IF MODE = 4 THEN PRINT #1, "24 pin sextuple
    density"; CHR$(13); CHR$(10); CHR$(10); : D = 12:
80 PRINT #1, CHR$(27); "[g"; CHR$(96); CHR$(3);
    CHR$ (D);
    REM CHR$(27); is the density defined in lines 32,
    33, 34, 35 & 40
```

```
100 REM CHR$(96) and CHR$(3) state the number of
    graphic bytes: 6*48**3 = 864 = 96 + (3*256)
110 FOR I = 1 TO 6: REM Repeat triangle pattern 6
    times
120 FOR J + 1 TO 48: REM Triangle consists of 48
    columns
130 READ A, B, C: REM 3 bytes for each column
140 PRINT #1, CHR$(A); CHR$(B); CHR$(C); : REM Send to
    printer
150 NEXT J
160 RESTORE
170 NEXT I: PRINT #1, CHR$(13); CHR$(10); CHR$(10); :
    REM Next triangle
180 NEXT MODE
190 DATA 0, 0, 1, 0, 0, 3, 0, 0, 7, 0, 0, 15

300 DATA 0, 0, 15, 0, 0, 7, 0, 0, 3, 0, 0, 1
310 END
```

The program outputs to the printer 4 lines each of 6 triangles in the different graphic densities.

## Graphics of low resolution

This relates to 8-pin modes which are supported by most graphics programs running under DOS. With these graphics, it is first necessary to choose the reproduction ratio which defines the assignment of graphic bits to the pins of the print head and thus also the graphic resolution for the graphics modes.

| Function | Dec. | Hex. | ASCII |
| :---: | :---: | :---: | :---: |
| Activate single density graphics | $\begin{aligned} & 2775 \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ | $\begin{aligned} & 1 \mathrm{~B} 4 \mathrm{~B} \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ | $\begin{aligned} & \text { ESC K } \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ |
| Activate double density graphics and half print speed | $\begin{aligned} & 2776 \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ | $\begin{aligned} & 1 \mathrm{~B} 4 \mathrm{C} \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ | $\begin{aligned} & \text { ESC L } \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ |
| Activate double density graphics | $\begin{aligned} & 2789 \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ | $\begin{aligned} & \text { 1B } 59 \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ | $\begin{aligned} & \text { ESC Y } \\ & \mathrm{n}_{1} \mathrm{n}_{2} \end{aligned}$ |
| Activate quadruple density graphics | $\begin{aligned} & 2790 \\ & \mathrm{n}_{1} \mathrm{n}_{2} \\ &= \text { total } \mathrm{n} \\ &= \text { total } \mathrm{n} \end{aligned}$ | $\begin{aligned} & \text { 1B 5A } \\ & \mathrm{n}_{1} \mathrm{n}_{2} \\ & -\left(\mathrm{n}_{2}^{*} 256\right) \\ & \text { graphic } \mathrm{c} \end{aligned}$ | $\begin{aligned} & \text { ESC Z } \\ & \mathrm{n}_{1} \mathrm{n}_{2} \\ & \mathrm{rs} / 256 \end{aligned}$ |

As with 24-pin graphics of high resolution, you also create a bit pattern in this case as a series of dot columns. In doing so, each graphic column is described in the 8-pin modes with one byte.

The variables $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ communicate to the printer how many bytes of graphic data will follow. Remember here that, in 8-pin mode, only one data byte is available per graphic column.

The resolution of the four graphic densities of low resolution depends on the item »Aspect ratio« described later. The initiating command sequence for graphic printing determines one of the four possible resolutions.

Applying to the graphics modes that can be activated with ESC $Y$ and ESC $Z$ is the restriction that, in the horizontal direction, no immediately adjacent dots may be set. The dots, however, lie in any case so close together that a line appears to be drawn through them.

Following the command for activating the graphics mode in the respective density are two parameters designated $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ which communicate to the printer the number of graphic columns to be printed. In order to determine the values of these numbers, you need to define the number of graphic columns per line to be printed and divide this by 256 . The value $n_{2}$ here is the integer component of the result, $\mathrm{n}_{1}$ the remainder printed out as a whole number.
If, for example, 400 graphic columns are to be printed, $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ are computed as follows:

$$
\begin{array}{ll}
\mathrm{n}_{2}=\text { integer }(400 / 256) & \text { in the example: } \mathrm{n}_{1}=1 \\
\mathrm{n}_{1}=400-256^{*} \mathrm{n}_{2} & \text { in the example: } \mathrm{n}_{2}=144
\end{array}
$$

The last part of a graphics instruction contains numerical data which contains the actual image information.

Each column is represented by a byte containing 8 bits in which a 1 corresponds to a dot to be printed. A 0 shows that no dot is to be printed at this position. The highest dot is the MSB (most significant bit), the lowest dot the LSB (least significant bit). To each column in a line is assigned a numerical value. Add the values of the column positions at which dots are to be printed, and insert the total sum for each column beginning from the left in your program. An example for the calculation of column sums is to be found on the previous pages.
After calculating the sums for each column ( $\mathrm{s}_{1}, \mathrm{~s}_{2}$, etc.), the complete instruction reads:

```
LPRINT CHR$(27); "K"; CHR$(144); CHR$(1);
CHRS ( }\mp@subsup{\textrm{S}}{1}{}\mathrm{ ); CHR$ ( }\mp@subsup{\textrm{S}}{1}{}); ...; CHR$ ( (S (400
```

The format is the same for all graphics. Merely the commands for opening the graphics in the respective resolutions and the maximum number of column bytes vary. The value in a column which portrays a certain dot pattern is always the same irrespective of the graphics resolution.

The number of dot columns specified by means of $n_{1}$ and $n_{2}$ must not exceed the maximum number of dot columns per line for the respective graphics density.

## Aspect ratio

Aspect ratio 5:6
(quasi 8-pin
graphics)

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set aspect ratio | 27110 m | 1B 6E m | ESC n m |

The aspect of 8-pin graphics on a 24 -pin dot matrix printer is achieved by grouping individual pins. When doing this, distortion of the image may occur.

The command ESC $n$ selects a ratio between the horizontal and vertical resolution, depending on the value m , for the 8-pin graphic modes ESC K, ESC L, ESC $Y$ and ESC Z. When $\mathrm{m}=0$ or 1, the ratio is $5: 6$, when $m=2$, it is fixed at 1:1. Values greater than 2 are ignored. The standard setting is the ratio $5: 6$, the different graphic modes are first explained with this ratio and later with the ratio set at 1:1.

Graphics of single density, with a reproduction ratio of 5:6, have a resolution of $60 \times 72$ dots per inch.

Graphics of double density and half speed, with a reproduction ratio of 5:6, have a quasi resolution of $120 \times 72$ dots per inch. Dots can be positioned with a horizontal accuracy of $1 / 120$ inch. Directly adjacent dots in the horizontal direction are not printed. If, therefore, a dot appears in a certain row, no dot may be set in the next column of the same row. Otherwise, every second dot is ignored. Vertically adjacent dots are not subject to any restrictions.

Graphics of quadruple density, with a reproduction ratio of 5:6, have a quasi resolution of $240 \times 72$ dots per inch. In this density, dot columns overlap by $3 / 4$ of the width of a dot whereby only every second dot in a row can be printed. If a dot appears in a certain row and a dot is likewise set in the next column of the same row, this is not printed. Vertically adjacent dots are not subject to any restrictions.

The assignment of the individual bits of a graphic byte with the reproduction ratio 5:6 for the four possible resolutions is portrayed in the following table.

| bit number of the graphic byte | assigned printer pins |
| :---: | :---: |
| $7(\mathrm{MSB})$ | 1 to 3 |
| 6 | 3 to 5 |
| 5 | 6 to 8 |
| 4 | 8 to 10 |
| 3 | 11 to 13 |
| 2 | 13 to 15 |
| 1 | 16 to 18 |
| $0(\mathrm{LSB})$ | 18 to 20 |

The initiating command sequence for printing the graphic determines one of the four resolutions.

When the aspect ratio $1: 1$ is chosen, the assignment of the bits of a graphic byte to the pins of the print head depends on the resolution selected.

Graphics of single density with a aspect ratio of 1:1 have a resolution of $60 \times 60$ dots per inch. The assignment of bits of a graphic byte to the pins of the print head is shown in the following table.

## bit number of the graphic byte assigned printer pins

| $7(\mathrm{MSB})$ | 1 to 3 |
| :--- | ---: |
| 6 | 4 to 6 |
| 5 | 9 to 9 |
| 4 | 10 to 12 |
| 3 | 13 to 15 |
| 2 | 16 to 18 |
| 1 | 19 to 21 |
| $0(\mathrm{LSB})$ | 22 to 24 |

Graphics of double density with normal or half speed at a aspect ratio of $1: 1$ have a resolution of $120 \times 60$ dots per inch. At this resolu-
tion, only 12 of the 24 pins of the print head are used per graphic tion, only 12 of the 24 pins of the print head are used per graphic byte.

In order to increase the throughput, the printer, under certain conditions, prints two graphic lines in one pass if this is possible.

The following table shows the assignment of pins when printing out a two-line graphic of double density in one pass. -

Aspect ratio 1:1

## bit number of the graphic byte assigned printer pins

| $7(\mathrm{MSB})$ | 1 and 2 |
| ---: | ---: |
| 6 | 2 and |
| 5 | 4 and |
| 4 | 5 and |
| 4 | 7 and |
| 3 | 8 and 9 |
| 2 | 10 and 11 |
| 1 | 11 and 12 |
| $0(\mathrm{LSB})$ |  |
| $(\mathrm{MSB})$ | 13 and 14 |
| 6 | 14 and 15 |
| 5 | 16 and 17 |
| 4 | 17 and 18 |
| 3 | 19 and 20 |
| 2 | 20 and 21 |
| 1 | 22 and 23 |
| $0(\mathrm{LSB})$ | 23 and 24 |

In order to guarantee the grouping of graphic lines described above, the following conditions must be fulfilled:

- The line spacing must be $8 / 120$ inch.
- The command sequences with ESC L or ESC $Y$ commands must be separated in each case by a carriage return $(C R)$ and a line feed ( $L F$ ).
- The length of the graphic lines may not go beyond the right margin of the page.
- The time pause between the two commands may be no longer than one second.

Graphics of quadruple density at a aspect ratio of 1:1 have a quasi resolution of $240 \times 60$ dots per inch. At this resolution, only 6 of the 24 pins of the print head are used per graphic byte. In order to increase the throughput, the printer, under certain conditions, prints four graphic lines in one pass if this is possible.

The following table shows the assignment of pins when printing out a four-line graphic of quadruple density in one pass.

| bit number of the graphic byte | assigned printer pins |
| :--- | :---: |
| 7 (MSB) | 1 |
| 6 or 5 | 2 |
| 4 | 3 |
| 3 | 4 |
| 2 or 1 | 5 |
| 0 (LSB) | 6 |
| 7 (MSB) | 7 |
| 6 or 5 | 8 |
| 4 | 9 |
| 3 | 10 |
| 2 or 1 | 11 |
| 0 (LSB) | 12 |
| 7 (MSB) | 13 |
| 6 or 5 | 14 |
| 4 | 15 |
| 3 | 16 |
| 2 or 1 | 17 |
| $0($ LSB $)$ | 18 |
| 7 (MSB) | 19 |
| 6 or 5 | 20 |
| 4 | 21 |
| 3 | 22 |
| 2 or 1 | 23 |
| 0 (LSB) | 24 |

In order to guarantee the grouping of graphic lines described above, the following conditions must be fulfilled:

- The line spacing must be $8 / 240$ inch.
- The command sequences with ESC Z commands must be separated in each case by a carriage return $(C R)$ and a line feed $(L F)$.
- The length of the graphic lines may not go beyond the right margin of the page.
- The time pause between the two commands may be no longer than one second.

Notes on graphic programming

Make sure you enter exactly the same amount of column bytes as specified by $n_{1}$ and $n_{2}$ in the LPRINT instruction, otherwise you will not obtain the required results. Only the number of columns can be printed which are the maximum permissible for the respective combination of printer model and graphic density. If an LPRINT instruction contains more data, this can result in unwanted effects.

Remember the restrictions which apply to double density and normal speed and to quadruple density in relation to dot placing. In these cases, miss out at least one dot position between two dots in the same dot line. Adjacent dots are not printed.

The various programming languages offer the experienced user virtually unlimited possibilities for graphic programming.

## Print alignment

If you place great store on vertical alignment over several graphic lines and can accept a low print speed, select the setting Unidirectional in the menu Graphics. With this setting, printing only takes place from left to right and this will avoid any horizontal offset in vertical lines which can arise with bidirectional printing. With the menu item Print Registration for bidirectional printing, you can adjust the vertical alignment of graphic lines to each other.

The standard setting for print alignment is 0 . If you are not satisfied with the alignment, you can set this value from 0.25 mm to the left to 0.25 mm to the right.

Value
0.25 mm Right 0.20 mm Right 0.15 mm Right 0.10 mm Right 0.05 mm Right 0
0.05 mm Left 0.10 mm Left
0.15 mm Left
0.20 mm Left
0.25 mm Left

## Shift

0.25 mm to the right
0.20 mm to the right
0.15 mm to the right
0.10 mm to the right
0.05 mm to the right no shift
0.05 mm to the left 0.10 mm to the left 0.15 mm to the left
0.20 mm to the left
0.25 mm to the left

## Chapter 13: IBM - Character Sets

This chapter contains the character sets available in IBM emulation. You can choose between two IBM character sets and numerous national character sets.

The code page command allows you to select character sets that replace some less frequently used characters with symbols used in a variety of European languages.

| Character Set | Select | IBM-Character Sets |
| :---: | :---: | :---: |
| Select IBM Character Set I | ESC 7 |  |
| Select IBM Character Set II | ESC 6 |  |
| Print 1 character in All Chracter Set | ESC $\wedge n$ |  |
| Select All Chracter Set | $\mathrm{ESC} \backslash \mathrm{n}_{1} \mathrm{n}_{2}$ |  |
| Character Set | Select | National |
| ASCII ( 0 ) | ESC! @ |  |
| ASCII (0) | ESC! A |  |
| British | ESC! B |  |

| Swiss I | ESC! P |  |
| Swiss II | ESC! Q |  |
| Legal / Publisher | ESC! Z |  |

## ASCII Character Set

The »American Standard Code for Information Interchange« is a standarized character set of printable characters (bold) and control codes. The name of the control codes result from their usage in communication and data transmission. Some characters are usedto activate printer functions as shown in the corresponding chapters. The entering of control codes may vary from program to program.

## Conversion table

The layout of this conversion table corresponds to the following character set tables. The row and the column headers show the hexadecimal value of the characters. The table contains decimal and octal values. Example: hexadecimal 23 (column 2, row 3) is equal to decimal 35.

## Chapter 14: Epson - Standard Functions

This chapter contains the commands for controlling Epson LQ emulation printer functions. The individual commands are listed within the function groups such as print quality, page formatting, etc.

The functions of the individual control commands are explained below. The commands are listed at the start of each section in decimal (Dec.), hexadecimal (Hex.) and in ASCII format.

## Print quality

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Data processing quality | 271200 | 1B 78 00 | ESC $x$ NUL |
| Letter quality | 271201 | 1B 7801 | ESC $x$ SOH |

The printer gives you two different print qualities: In data processing quality (UTL) a print speed of 260 characters per second (cps) is reached, printing being bidirectional, i.e. one line from left to right, the next line from right to left, etc. This quality is suitable in particular for extensive lists and drafts.
Letter-quality (LQ), which reaches a speed of 87 cps , should be used to create correspondence or documents. With this print quality the characters are printed in a high dot pattern resolution. This enables the creation of attractive documents when using a word processor.

These print qualities can be selected via the menu item Print Mode or the control panel.

## Print quality

Select font

The OCR-B consists of the 14 characters $0,1,2,3,4,5,6,7$, 8, 9, 0, +, -, >, <. All other characters are shown in Courier.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select font | $27107 \mathrm{n} \quad$ 1B 6B n | ESC k n |  |
|  | $\mathrm{n}=$ | $0:$ | Roman |
|  | $\mathrm{n}=$ | 1: | Swiss |
|  | $\mathrm{n}=$ | 2: | Courier |
|  | $\mathrm{n}=$ | $3:$ | Prestige |
|  | $\mathrm{n}=$ | $5:$ | OCR-B |
|  | $\mathrm{n}=$ | 7: |  |
|  | Orator |  |  |
|  | $\mathrm{n}=122:$ | Swiss Bold |  |
|  | $\mathrm{n}=124:$ | Gothic |  |
|  | $\mathrm{n}=126:$ | typeface according to menu |  |

This command allows you to select a font. »Courier« is the most usual standard font, while »Gothic« gives your documents an attractive appearance. If you need a machine-readable font for special applications, then select »OCR-B«.

You can also use the menu mode or the PRINT QUALITY button on the printer's control panel to select a typeface.

## Print modes

Character pitch

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start 10 cpi | 2780 | 1B 50 | ESC P |
| Start 12 cpi | 2777 | 1B 4D | ESC M |
| Start 15 cpi | 27103 | 1B 67 | ESC g |

The pitch is usually measured in characters per inch (cpi). For example, with 10 cpi 10 characters can be printed per inch ( 2.54 cm ). Each character then occupies $1 / 10$ of an inch.
The pitch can also be defined via the Pitch menu item or via the control panel. The spacing can also be defined via a multifunction command.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start condensed | 15 or | 0F or | SI or |
| printing | 2715 | 1B 0F | ESC SI |
| Stop condensed <br> printing | 18 | 12 | DC 2 |

The commands SI and ESC SI have identical functions. If the print pitch is 10 cpi , then 17.1 cpi is used in condensed printing. With a print pitch of 12 cpi condensed printing is at 20 cpi . If a $D C 2$ command is sent, the printer returns to the print pitch which applied before SI.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start double width | 278749 | 1B 57 31 | ESC W 1 |
| Stop double width | 278748 | 1B 57 30 | ESC W 0 |
| Start double width | 14 or | 0E or | SO or |
| for one line | 2714 | 1B 0E | ESC SO |
| Stop double width | 20 | 14 | DC 4 |

Double width printing

| Pitch | Double width | Condensed |
| ---: | :---: | :---: |
| 10 cpi | 5 cpi | 17.1 cpi |
| 12 cpi | 6 cpi | 20 cpi |
| 15 cpi | 7.5 cpi | not available |
| 17.1 cpi | 8.5 cpi | not available |
| 20 cpi | 10 cpi | not available |

If proportional spacing is activated, the use of double width printing gives double width proportional printing. As this does not have a fixed pitch, it is not shown in the table.

For certain applications the maximum number of characters in a line has to be indicated. This depends on the pitch selected. The following table shows the maximum number of characters per line.

| Pitch | Characters per line |  |
| :---: | :---: | :---: |
| Narrow printer | Wide printer |  |
| 5 cpi | 40 | 68 |
| 6 cpi | 48 | 81 |
| 7.5 cpi | 60 | 102 |
| 8.5 cpi | 68 | 116 |
| 10 cpi | 80 | 136 |
| 12 cpi | 96 | 163 |
| 15 cpi | 120 | 204 |
| 17.1 cpi | 137 | 233 |
| 20 cpi | 160 | 272 |

Double height
printing

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start double height | 2711949 | 1B 77 31 | ESC w 1 |
| or | 273149 | 1B 1F 31 | ESC US 1 |
| Stop double height | 2711948 | 1B 77 30 | ESC w 0 |
| or | 273148 | 1B 1F 30 | ESC US 0 |

With this command you can extend characters to double their normal height. Note that you must reset the line spacing according to the new character height.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start proportional spacing | 2711249 | 1B 70 31 | ESC p 1 |
| Stop proportional spacing | 2711248 | 1B 70 30 | ESC p 0 |

With proportional spacing the spacing between the individual letters varies according to the respective character width. With a fixed pitch all characters are created within a matrix of the same width. Proportional spacing, however, gives wide characters such as »W« or »M« more space and narrow characters such as »I« or »f«less space. The result is an attractive and more legible print image than with a fixed pitch.

Because of the different character widths proportional fonts do not have a fixed pitch. Precise margin settings in the case of full justified text, for example, is only possible if the word processing program supports proportional spacing. Proportional spacing is only available in letter quality

This function can also be activated via the Pitch menu item or via the control panel. Proportional spacing is also available via multifunction commands.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set character spacing | 2732 n | 1B 20 n | ESC SP n |
| Standard character spacing | 27320 | 1B 2000 | ESC SP NUL |
|  | $\mathrm{n}=1$ to 127 |  |  |

Proportional spacing

Character spacing

## Print attributes

| Emphasized | Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- | :--- |
|  | Start emphasized <br> Stop emphasized | 2769 | $1 B 45$ | ESC E |
| With emphasized, the dot patterns of the characters are printed ho- |  |  |  |  |
| rizontally offset. |  |  |  |  |

| $\mathbf{n}_{1}$ | Location | $\mathbf{n}_{2}$ | Style |
| :--- | :--- | :---: | :--- |
| 1 | underline | 0 | cancel scoring |
| 2 | strike-through | 1 | single line |
| 3 | overscore | 2 | double line |
|  |  | 5 | single, broken line |
|  |  | 6 | double, broken line |

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start superscript | 278348 | 1B 53 30 | ESC S 0 |
| Start subscript | 278349 | 1B 53 31 | ESC S 1 |
| Stop super/subscript | 2784 | 1B 54 | ESC T |

## Superscript / Subscript

## Italics

## Outline / Shadow

Outline and shadow printing commands can only be used for printing characters, they cannot be used to print line graphics.

## Multifunction commands

Print quality, pitch
and font

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select print quality, <br> pitch and font | 2733 n | 1B 21 n | ESC ! n |

With this command you can select different print functions by means of a single sequence. The parameter $n$ defines here the combination of print quality, pitch and font in accordance with the following table:

| Print function | Hexadecimal | Decimal |
| :--- | :---: | :---: |
| Underline | 80 | 128 |
| Italic | 40 | 64 |
| Double width | 20 | 32 |
| Enhanced | 10 | 16 |
| Emphasized | 08 | 8 |
| Condensed printing | 04 | 4 |
| Proportional printing | 02 | 2 |
| 12 cpi | 01 | 1 |
| 10 cpi | 00 | 0 |

If, for example, you want to print a section in a document underlined, double width, emphasized and enhanced, you would normally have to send four different control commands to the printer. When using a multifunction command you only need to read off the values for the individual functions from the following table:

Underline $=128$
Double width $=32$
Enhanced $=16$
Emphasized $=8$
Add up the values found and set the result for parameter n in the multifunction command.

$$
\mathrm{n}=128+32+16+8=164
$$

As soon as you send this command all nine of the above functions are activated or deactivated according to the parameter n. In order to determine which print attributes you can obtain with this com-
mand, you should run the following BASIC program which prints a sample of each of the possible combinations. As 256 combinations are available in total, it takes some time until all examples are printed out on about 12 pages.

```
1 0 \text { multifunction command EPSON LQ}
20 FOR i=0 TO 255
30 LPRINT: LPRINT
40 LPRINT CHR$(27);"!";CHR$(I);"ESC !";i;
    "selects this combination."
5 0 ~ N E X T ~ i ~
```

## Tabulators

| Function | Dec. | Hex. | ASCII | Horizontal |
| :---: | :---: | :---: | :---: | :---: |
| Skip to next horizontal tab | 9 | 09 | HT |  |
| Set horizontal tabs | $\begin{aligned} & 2768 n_{1} \\ & \ldots n_{k} 00 \\ & \mathrm{n}=1 \text { to } 255 \\ & \mathrm{k}=1 \text { to } 32 \end{aligned}$ | $\begin{aligned} & \text { 1B } 44 \mathrm{n}_{1} \\ & \ldots \mathrm{n}_{\mathrm{k}} 00 \end{aligned}$ | $\begin{aligned} & \text { ESC D } \\ & \ldots \mathrm{n}_{\mathrm{k}} \mathrm{~N} \end{aligned}$ |  |
| Clear horizontal tabs | 27680 | 1B 4400 | ESC D |  |
| When the printer is switched on, tabulators are set automatically every eight columns starting at the ninth column. If a tabulator character $(H T)$ is transmitted, the print head moves to the next set tab position before printing the following character. |  |  |  |  |
| The set tabulator position relates to the set left margin (relative reference). The actual position of a tab depends on the actual pitch at the time when loading the horizontal tab. When changing the pitch the tabulator position does not move (absolute position). |  |  |  |  |
| It is mandatory to enter the tab positions in ascending order. The parameter $n_{1}$ indicates the column position of the first tab, $n_{2}$ to $n_{k}$ accordingly the column positions of the other tabs to be set. Up to $32\left(\mathrm{n}_{1} \ldots \mathrm{n}_{32}\right)$ tabs can be defined. The position of a horizontal tab is relative to the set left margin. The command sequence must be ended with a NUL character. |  |  |  |  |

The command ESC D NUL clears all horizontal tabs, including the standard tabs. If the printer is switched off and on, the standard tabs are available again. If no other tab is set up to the end of line, the tab skip command is ignored. When the printer is switched on the left margin equals the most left position. If you change left margin the position of the tabulators will change accordingly.

The maximum permissible values for tab positions can be seen from the following table.

|  | tabulator position |  |
| :--- | :---: | :---: |
| Pitch | Narrow printer | Wide printer |
| $10 \mathrm{cpi} /$ Proportional | 79 | 135 |
| 12 cpi | 95 | 162 |
| 15 cpi | 119 | 203 |
| 17.1 cpi | 136 | 232 |
| 20 cpi | 159 | 255 |

Vertical tabulators

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Skip to next vertical tab | 11 | $0 B$ | VT |
| Set vertical tabs | 2766 | $1 B 42$ | ESC B |
|  | $\mathrm{n}_{1} \ldots \mathrm{n}_{\mathrm{k}} 0$ | $\mathrm{n}_{1} \ldots \mathrm{n}_{\mathrm{k}} 00$ | $\mathrm{n}_{1} \ldots \mathrm{n}_{\mathrm{k}}$ NUL |
|  | $\mathrm{n}=1$ to 16 |  |  |
| $\mathrm{n}=1$ to 255 |  |  |  |

No vertical tabs are set when the printer is switched on. Up to 16 vertical tab positions can be set; the positions are defined as line numbers.

They must be entered in ascending order and end with a NUL character. The parameter $\mathrm{n}_{1}$ indicates the line number of the first tab, $\mathrm{n}_{2}$ to $\mathrm{n}_{\mathrm{k}}$ accordingly the line numbers of the other tabs to be set.

Up to 16 vertical tabs can be defined ( $\mathrm{n}_{1} \ldots \mathrm{n}_{16}$ ). ESC B NUL deletes all vertical tabs.

If the command $V T$ is entered without any defined tab position, a line feed is executed.

The actual position of a tab mark depends on the actual line spacing when loading the vertical tabs and does not move when line spacing is changed (absolute position). With the skip command for the vertical tabulator the paper is transported to the next tab position.

If a skip command is entered without further vertical tab positions being set, a line feed is executed.

| Function | Dec. | Hex. | ASCII |  |
| :--- | :--- | :--- | :--- | :--- | | Vertical tabulator |
| :--- |
| channel |

You can set up to eight separate vertical tabulator groups - also called channels. The corresponding command ESC $b$ has the same format as ESC B. Tab positions must be defined in ascending order and ended with NUL. You must also define for which channel tabs are to be set, by inserting a value between 0 and 7 for the variable $n$. After setting the desired tabs in the respective channel being used you can move to a vertical tab by specifying a channel with ESC / and then sending a $V T$ command.

## Example:

The following BASIC program sets tabs in three channels and then jumps to several vertical tabs in the various channels:

```
10 REM Vertical tabulator channel
20 REM tabulator stop in channel 0: line 10,
    20, 30, 40, 50
30 LPRINT CHR$(27); "b"; CHR$(0); CHR$(10);
    CHR$(20); CHR$(30); CHR$(40); CHR$(50);
    CHR$ (0)
40 REM tabulator stop in channel 1: line 5, 15,
    35, 45, 55
50 LPRINT CHR$(27); "b"; CHR$(1); CHR$(5);
    CHR$(15); CHR$(35); CHR$(45); CHR$(55);
    CHR$ (0)
60 REM tabulator stop in channel 2: line 12,
    24, 48
```

```
70 LPRINT CHR$(27); "b"; CHR$(2); CHR$(12);
    CHR$(24); CHR$(48); CHR$(0)
80 LPRINT CHR$(27); "/"; CHR$(1); : REM select
    channel 1
90 LPRINT CHR$(11); "This is printed in line 5"
100 LPRINT CHR$(11); "This is printed in line
    35"
110 LPRINT CHR$(27); "/"; CHR$(2); : REM select
    channel 2
120 LPRINT CHR$(11); "This is printed in line
    48"
130 LPRINT CHR$(27); "/"; CHR$(0); : REM select
    channel O
140 LPRINT CHR$(11); "This is printed in line
    50"
```

Positioning

Horizontal dot position

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Absolute horizontal | 2736 | $1 B 24$ | ESC $\$$ |
| dot position | $n_{1} n_{2}$ | $n_{1} n_{2}$ | $n_{1} n_{2}$ |
|  | $n_{1}=0$ to $255, n_{2}=0$ to 3 |  |  |
| Relative horizontal | 2792 | $1 B 5 C$ | ESC $\backslash$ |
| dot position | $n_{1} n_{2}$ | $n_{1} n_{2}$ | $n_{1} n_{2}$ |
|  | $n_{1}, n_{2}=0$ to 255 |  |  |

Using these commands you can position text or graphics exactly on a page. (Vertical positioning can also be achieved by variable line feed and by line spacing commands). With the variables $n_{1}$ and $n_{2}$ in both commands a specific dot position can be defined at which the printout is to start. The variable values are ascertained as follows:

$$
\begin{aligned}
& \mathrm{n}_{2}=\text { integer value }(\text { dot position } / 256) \\
& \mathrm{n}_{1}=\operatorname{dot} \text { position }-\left(\mathrm{n}_{2} * 256\right)
\end{aligned}
$$

The command $E S C \$$ uses the default or set left margin as reference point and moves the respective print position in $1 / 60$ inch steps. For a narrow printer the maximum number of dots per ( 8 inches) is 480 , for a wide model ( 13.6 inches) it is 816 dots. With absolute positioning of 5 inches ( $300 / 60$ ) from the left margin the calculation of the parameters looks as follows:
$\mathrm{n}_{2}=$ integer value $(300 / 256)=1$
$\mathrm{n}_{1}=300-(1 * 256)=44$
The command in BASIC is therefore:
CHR\$ (27) ; "\$"; CHR\$ (44) ; CHR\$ (1) ;
With the command $E S C \backslash$ the current print position can be moved to right or left in steps of $1 / 120$ inches with Utility and $1 / 180$ inches with Letter Quality. The difference from absolute positioning is that the next print position in each case is calculated from the current print position. If the print position is to be moved to the right, you proceed as in the example shown above.

Moving the relative printing position to the left is a little more complicated. First determine the number of necessary dots and subtract this value from $65.536\left(2^{16}\right)$. Then calculate $n_{1}$ and $n_{2}$ using the above formula and enter the values as parameters in the command sequence.

If the respective dot position is outside the set margins, the commands for absolute or relative dot positioning are ignored. Therefore use the table below to find the maximum value in number of dots.
Print quality $\quad$ Narrow printer Wide printer

| UTL (120 dpi) | 960 | 1632 |
| :--- | ---: | ---: |
| LQ (180 dpi) | 1440 | 2448 |

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start indication | 271051 | 1B 6901 | ESC i SOH |
| Stop indication | 271050 | 1B 6900 | ESC i NUL |

With this command you can switch on and off the mode which enables indication of the next print position. The next print position is indicated by the character » M « on the red line which is on the transparent paper protector at the front on the print head carriage.

This mode can also be switched on and off via the control panel by simultaneously pressing the SHIFT and PRINT QUALITY keys. If this mode is activated, the data in the printer memory are printed out. With this mode switched on the following commands cause indication of the next print position by the above-mentioned marking:

Indicate next print position

Space with print head positioning ( 255 dec., FF hex.), Backspace (BS), Horizontal Tab (HT), Carriage Return (CR), Line Feed commands, Form Feed (FF), commands for defining the Next Print Position, Delete Buffer (CAN), Delete Character (DEL).
If the functions Underline or Overscore are switched on, then spaces with positioning, i.e. spaces skipped by horizontal tab or positioning commands, are underlined or overscored; the next print position is then not displayed.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Text alignment | 2797 n | 1B 61 n | ESC a n |
|  | $\mathrm{n}=0$ : Left justified |  |  |
|  | $\mathrm{n}=1$ : Centred |  |  |
|  | $\mathrm{n}=2:$ Right justified |  |  |
|  | $\mathrm{n}=3:$ Full justified |  |  |

With this command you define the alignment of text on a line:
The standard left justified function means that the text is aligned on the left margin, while it is ragged on the right.

With the centred function, the text is positioned in the centre between the left and right margins.
With the right justified function the text is aligned on the right margin, while it is ragged on the left.
With the full justification function the text is aligned flush between the left and right margins by inserting spaces between the words.

With centred, right and full justification a backspace cannot be executed. In fully justified a carriage return or line feed command can only be executed at the end of a paragraph, not after each line, i.e. the text must be sent to the printer as flowing text.

## Page formatting

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Page length in lines | 2767 n <br> $\mathrm{n}=1$ to 127 | 1B 43 n | ESC C n |
| Page length in inches | 27670 n <br> $\mathrm{n}=1$ to 22 | 1B 4300 n | ESC CNUL n |

Set page length

By selecting page length you can inform the printer of the size of the paper used. When is switched on the current position of the print head is registered as Top of Form, i.e. first print line on the page. When printing forms it is important that the page length is set to the dimensions of the form so that not only the first but also all following form sets are printed in the right position.

Normally a standard length can be set in the Page Length menu item, though the page length can also be defined by one of the above commands in inches or in the number of lines. For the latter it must nor exceed 50 inches. Otherwise the command will be ignored.

If Page Length Control is by MENU Setting, the start position for the sheet is not reset. Defining the page length in lines is done as a function of the current line spacing. However, any subsequent change of line spacing does not change the page length. When using these two commands to change the page length the form start position is reset, a »Skip over Perforation« defined by command is deactivated and the value for the skip over perforation selected in the menu item is used. Set vertical tabs are deleted.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Activate Skip over <br> Perforation | 2778 n <br> $\mathrm{n}=1$ to 127 | 1B 4E n | ESC N n |
| Deactivate Skip over <br> Perforation | 2779 | 1B 4F | ESC O |

Perforation

With this function the lower area of a page can be skipped automatically.

Skip over Perforation

There is a Form Feed to the start of the next page (Top of Form). The parameter »n« designates the lines to be skipped to the start of the next page. The lower margin actually to be skipped depends on the current line spacing. Subsequent changes of line spacing have no effect on the bottom margin to be skipped. All line feed commands which place the print position in the area to be skipped cause a jump to the start of the next page.

If Skip over Perforation is set at Yes in the printer menu, a bottom area of one inch $(2.54 \mathrm{~cm})$ is skipped to the next Top of Form. The number of lines to be skipped can be selected with the above Skip command. The command ESC O switches off the »Skip Over Perforation« function.

The commands for setting page length similarly switch off Skip over Perforation. The value for the function »Skip Over Perforation« selected as menu item is activated.

If page formatting is taken over by the software, e.g. a word processing program, you should switch off Skip over Perforation by setting Skip over Perforation in the printer menu to No.

Set margins

Margins should always be set at the start of a line.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set left margin | 27108 n <br> $\mathrm{n}=0$ to 255 | 1B 6C n | ESC 1 n |
| Set right margin | 2781 n <br> $\mathrm{n}=1$ to 255 | 1B 51 n | ESC Q n |

In these commands the parameter $n$ defines the left and right margins. The margin values are entered in character columns. The mar- gin positions depend on the actual current pitch. Once the margins are set the positions are retained even after changing the pitch, provided the margins have not been expressly reset (absolute position).

Note that the value for the right margin must be at least 1 inch larger than the left margin by the number of character columns given in the table. The right margin must not exceed the maximum values given below.

| Pitch | Narrow printer |  | Wide printer |  |
| :--- | ---: | :---: | :--- | :--- |
|  | left n $_{\mathbf{1}}$ | right $\mathbf{n}_{\mathbf{2}}$ | ${\text { left } \mathbf{n}_{\mathbf{1}}}^{\text {right } \mathbf{n}_{\mathbf{2}}}$ |  |
| $10 \mathrm{cpi} /$ proportional | $0-70$ | $10-80$ | $0-126$ | $10-136$ |
| 12 cpi | $0-84$ | $12-96$ | $0-151$ | $12-163$ |
| 15 cpi | $0-105$ | $15-120$ | $0-189$ | $15-204$ |
| 17.1 cpi | $0-119$ | $18-137$ | $0-215$ | $18-233$ |
| $20 \mathrm{cpi} /$ proportional | $0-140$ | $20-160$ | $0-252$ | $20-255$ |

## Line spacing

| Function | Dec. | Hex. | ASCII | Variable line |
| :---: | :---: | :---: | :---: | :---: |
| 1/8 inch line spacing | 2748 | 1B 30 | ESC 0 |  |
| Set $1 / 6$ inch line spacing | 2750 | 1B 32 | ESC 2 |  |
| Set variable line spacing ( $\mathrm{n} / 60 \mathrm{inch}$ ) | $\begin{aligned} & 2765 \mathrm{n} \\ & \mathrm{n}=1 \text { to } 255 \end{aligned}$ | 1B41 n | ESC A n |  |
| Set variable line spacing ( $\mathrm{n} / 180$ inch) | $\begin{aligned} & 2751 \mathrm{n} \\ & \mathrm{n}=1 \text { to } 255 \end{aligned}$ | 1B33 n | ESC 3 n |  |
| Set variable line spacing ( $\mathrm{n} / 360 \mathrm{inch}$ ) | $\begin{aligned} & 2791 \mathrm{n} \\ & \mathrm{n}=1 \text { to } 255 \end{aligned}$ | 1B 58 n | ESC [ n |  |
| Set variable line spacing ( $\mathrm{n} / 360$ inch) | $\begin{aligned} & 2743 \mathrm{n} \\ & \mathrm{n}=1 \text { to } 255 \end{aligned}$ | 1B2B n | $\mathrm{ESC}+\mathrm{n}$ |  |

Usual line spacings for text are 6 or 8 lines per inch (lpi).
With the variable spacing commands you can define the line spacings via the parameter n in multiples of $1 / 60$ inch, $1 / 180$ inch or $1 / 360$ inch. This has no effect on the character height, but only changes the spacing between the lines. These commands do not execute a line feed, but only set the line spacing which is used by a following line feed command.

## Paper feed

Line feed

Form feed

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Line feed | 10 | $0 A$ | LF |
| Variable line feed <br> (n/180 inch) | 2774 n <br> $\mathrm{n}=0$ to 255 | 1B 4A n | ESC J n |
| Variable line feed <br> (n/360 inch) | 2793 n <br> $\mathrm{n}=0$ to 255 | 1B 5D n | ESC ] n |
| Reverse line feed <br> (n/180 inch) | 27106 n | 1B 6A n | ESC j n |

A line feed command causes the printer to move the print position down. In contrast with a simple line feed command, with a variable line feed of $n / 180$ or $n / 360$ inch there is no carriage return, regardless of the settings in the printer menu. If 0 is set for the parameter $n$ in this command, no line feed is executed.

The preset smallest possible step for the paper feed due to the design of your printer is $1 / 180$ inch. Rounding errors are compensated for as far as possible.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Form feed | 12 | 0C | FF |

If a form feed command is sent, the printer prints all data in the line buffer and sets the current print position at the start of the next page. You can also advance a page to the start of the next page by pressing the FF/Load key on the control panel.

## Control of the Cut Sheet Feeder

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Insert single sheet | 272573 | 1B 19 49 | ESC EM I |
| Eject single sheet | 272582 | 1B 19 52 | ESC EM R |

The feed command feeds a sheet of paper from the Cut Sheet Feeder (CSF) to the set Top of Form. Any sheet of paper already in the printer is ejected before a new one is fed in.

The eject command causes data in the printer buffer to be printed and the sheet to be ejected. If the page end or the area to be skipped at the page end is reached, the sheet is ejected and a new sheet automatically fed and advanced to the print position. Any defined Top of Form position, however, is disregarded. Therefore, when a Cut Sheet Feeder is installed the page change in the case of multipage documents must be performed with the form feed command.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select bin 1 | 272549 | 1B 19 31 | ESC EM 1 |
| Select bin 2 | 272550 | 1B 19 32 | ESC EM 2 |

With the two bin selection commands you can define from which bin paper is to be fed when using a dual bin Cut Sheet Feeder.

When using the dual-bin feeder, different Top of Form positions can be set for each bin. You can select the priority bin in the printer menu with CSF Bin Select in the Set-Up group. You can then define via the control panel the Top of Form position for the paper from the bin selected via the menu. You can, for example, feed a form with preprinted letterhead from one bin with a Top of Form position a large distance from the top edge of the sheet, followed by single sheets from the other bin with a Top of Form position near to the top edge of the sheet.

## Character sets

Extension of
printable characters

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Activate extension of <br> printable characters | 2754 | 1B 36 | ESC 6 |
| Deactivate extension | 2755 | 1B 37 | ESC 7 |

The Epson Character Sets are constructed as 8 -bit character sets, i.e. a character is assigned to each bit combination of a byte, with control commands being assigned to some values in the range from 0 to 31. The standard ASCII characters are assigned to the range from decimal 32 to 126. The value 127 (DEL) in the Epson emulation has the function of deleting the last character in the line buffer. The range from decimal 127 to 159 in the standard Epson Character Set is identical with that from decimal 0 to 31, while with extension of printable characters activated special characters are to be found in this range. If the Epson character set is activated and the extension deactivated, the selected character set is the same as the IBM character set I . Are both Epson character set and extension activated the selected set is similar to IBM character set II.
Assign character
set

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Activate italic <br> character set | 271160 | 1 B 7400 | ESC t NUL |
| Activate character <br> set selected by menu | 271161 | $1 B 7401$ | ESC t SOH |
| Activate loadable <br> character set | 271162 | $1 B 7402$ | ESC t STX |
| Activate graphic <br> character set | 271163 | 1B 74 03 | ESC t ETX |
| With these commands in the Epson character set the range from <br> decimal 160 to 255 can be filled either with the characters from the <br> range from decimal 32 to 127 in italic or with graphic symbols and <br> special characters of the Code Page selected in the menu. With ESC <br> $t$ STX all characters from decimal 32 to 127 will be loaded into the <br> upper half of the character set's range 160 to 255 . |  |  |  |

| Function | Dec. | Hex. | ASCII | Select national <br> character sets and <br> Code Pages |
| :--- | :--- | :--- | :--- | :--- |
| Select national character <br> set and Code Pages | 2782 n | 1 B 52 n | ESC R n |  |

With this command you can access special characters of a certain language. If you want to activate one of these character sets, you must insert the corresponding value from the table of national character sets for the parameter $n$.

| n | Character set / Code Page |
| :--- | :--- |
| 0 | ASCII |
| 1 | French |
| 2 | German |
| 3 | British |
| 4 | Danish I |
| 5 | Swedish I |
| 6 | Italian |
| 7 | Spanish I |
| 8 | Japanese |
| 9 | Norwegian |
| 10 | Danish II |
| 11 | Spanish II |
| 12 | Latin American |
| 13 | French Canadian |
| 14 | Dutch |
| 15 | Swedish II |
| 16 | Swedish III |
| 17 | Swedish IV |
| 18 | Turkish |
| 19 | Swiss I |
| 20 | Swiss II |
| 22 | Polish Mazovia |
| 23 | ISO Latin 2 |
| 24 | Serbocroat I |
| 25 | Serbocroat II |
| 26 | Multilingual 850 |
| 27 | Norwegian 865 |
| 28 | Portugal 860 |
| 29 | Turkish |
| 38 | Greek 437 |
|  |  |

| n | Character set / Code Page |
| :--- | :--- |
| 39 | Greek 928 |
| 41 | Greek 437 Cyprus |
| 42 | ECMA-94 |
| 43 | French Canadian |
| 44 | Cyrillic I - 855 |
| 45 | Cyrillic II - 866 |
| 46 | East Europe Latin II - 852 |
| 47 | Greek 869 |
| 49 | Windows East Europe |
| 50 | Windows Greek |
| 51 | Latin 5 (Windows Turkish) |
| 52 | Windows Cyrillic |
| 54 | Hungarian CWI |
| 55 | Kamenicky (MJK) |
| 57 | Turkish 857 |
| 60 | Hebrew NC (862) |
| 61 | Hebrew OC |
| 62 | Windows Hebrew |
| 64 | Legal/Publisher |
| 66 | Ukrainian |
| 67 | ISO Latin 6 (8859-10) |
| 68 | Windows Baltic |
| 72 | Bulgarian |
| 74 | Baltic (774) |

Chapter 17 and Appendix B give you an overview of Code Pages and character sets.

## Other commands

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Carriage return | 13 | 0D | CR |

If this command is entered, the printer prints all data in the line buffer and sets the next print position at the left margin. For short line seeking, the print head does not make these movements immediately; the print position is only logically set at the left margin. If Auto LF is set to Yes after each carriage return, the printer executes
a line feed command. This command deactivates double width printing for one line.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Backspace | 8 | 08 | BS |

This command sets the print position at the last received printable character; it is executed if a printable character or a print command then follows.

The actual width of a backspace depends on the current pitch. When using proportional spacing the backspace command moves the print position for the first character to be overprinted to the left by the proportional width of that character. For all following $B S$ commands the print position will be set $1 / 10$ inch to the left. If the print position is reset to a superscript character, a reverse line feed is executed to the position of the character in question and the next character is printed superscript; however, the alignment may not be quite exact. If the print position is to be reset by several characters, a backspace command must be entered for each character to be overprinted. However, the print position cannot be reset beyond the left margin. With this command specially composed symbols can be printed which are not available in the character set used.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Delete buffer | 24 | 18 | CAN |

This command deletes all printable characters in the line buffer. Functions set by this command are not reset, nor is the receive buffer deleted.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Delete last character | 127 | $7 F$ | DEL |

This command deletes the last character entered into the print buffer. Spaces are also deleted by this command. If the last received character was a horizontal tab, one space only, but not the whole tabulator jump, is deleted. If the character to be deleted defines graphic data, the command is ignored.

## Backspace

## Delete Buffer

Delete last character

| Unidirectional <br> printing | Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- | :--- |
|  | Start unidirectional <br> printing | 278549 | 1 B 5531 | ESC U 1 |
| Stop unidirectional <br> printing | 278540 | 1B 55 30 | ESC U 0 |  |

To optimize throughput, printing of lines normally takes place alternately forwards (from left to right) and backwards (short line seeking, bidirectional printing). In order to improve the alignment of lines lying underneath one another you can stipulate with this function that each line be printed starting from the left margin (unidirectional printing). You should use this option when precise vertical alignment of the individual lines is desired (bit image graphics, IBM graphic characters, tables).

The print speed is somewhat reduced with unidirectional printing, as the print head after printing a line is reset to the left margin to start the next line there. This function can also be activated for printing bit image graphics via the Graphics menu item.

| Function | Dec. | Hex. | ASCII |
| :--- | :---: | :---: | :--- |
| Start unidirectional <br> printing for one line | 2760 | 1B 3C | ESC $<$ |
| This command resets the print head to the left margin (print start <br> position) to print the line following this command. The effect of the <br> command is unidirectional printing for one line. Printing then con- <br> tinues bidirectionally, unless unidirectional printing is selected. |  |  |  |

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Start print suppress | 19 | 13 | DC3 |
| Stop print suppress | 17 | 11 | DC1 |

## Print suppress

When using the parallel interface print suppress only functions if a high level is at pin 36.

| Function | Dec. | Hex. | ASCII | End of paper <br> sensor |
| :--- | :--- | :--- | :--- | :--- |
| Deactivate end of paper <br> sensor | 2756 | 1B 38 | ESC 8 |  |
| Activate end of paper <br> sensor | 2757 | 1B 39 | ESC 9 |  |

With the end of paper sensor activated the ALARM lamp lights when less than 0.5 inch remains to the end of the paper. The printer goes into OFF LINE status.

At each press of the $S E L$ key a single line is printed and a line feed executed.

If printing is to be to the lower margin of a sheet, the end of paper sensor can be deactivated by the above command. The printer then takes the page length set in the menu or by a command to establish an end of paper.

The end of paper sensor can be reactivated with ESC 9.
The function can also be controlled with Paper out Override.

| Print speed | Function | Dec. | Hex. | ASCII |
| :---: | :---: | :---: | :---: | :---: |
|  | Select print speed | $\begin{aligned} & 27115 \mathrm{n} \\ & \mathrm{n}=1: \text { start } \\ & \mathrm{n}=2: \text { start } \end{aligned}$ | 1B 73 n print speed nal print sp | ESC s n |
|  | With this command you can reduce the print speed to half, printing at half speed causing a lower noise level than printing at normal speed. |  |  |  |
| MSB default | Function | Dec. | Hex. | ASCII |
|  | Set most significant bit (MSB) to 1 | 2762 | 1B3E | ESC > |
|  | Set most significant bit (MSB) to 0 | 2761 | 1B 3D | ESC = |
|  | Delete MSB default | 2735 | 1B 23 | ESC \# |
|  | The command ESC > sets the most significant bit (MSB) of an ingoing 8-bit data word to 1 , while $E S C=$ sets it to 0 . |  |  |  |
|  | $E S C$ \# deactivates the MSB default selected with $E S C>$ or $E S C=$ so that all data are interpreted as sent by the system. |  |  |  |

## Additional ESC/P2 commands

ESC/P2 commands extend the scope of functions of the Epson emulation in the area of scalable fonts.

## Setting step size and character spacing

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Set horizontal basic | 2799 | 1B 63 | ESC c |
| step size (HMI) | Lp Hp | Lp Hp | Lp Hp |
|  | Lp 0 to 255 |  |  |
|  | Hp = 0 to 255 (MSB ignored) |  |  |

Setting the basic spacing

The basic step size is not valid for bit image graphics and bar codes.

$$
\begin{aligned}
& \mathrm{Hp}=\text { integer }(\text { basic step size } / 256) \\
& \mathrm{Lp}=\text { basic step size }-(\mathrm{Hn} * 256) \\
& \mathrm{HMI}=(\mathrm{Lp}+\mathrm{Hp} * 256) / 360
\end{aligned}
$$

If the parameters Lp and $\mathrm{Hp}=0$ are set, this command is ignored and the previously fixed basic step size remains valid. If the basic step size $(\mathrm{Lp}+\mathrm{Hp} * 256) / 360>3$ inches is set, it is fixed at $36 / 360$ $=1 / 10$ inch.

If the basic step size goes over the right margin, the printing is continued at the left margin of the next line. This command is also immediately valid within a line. The character spacing last set is the current one. The basic step size set with this command is overwritten by commands for setting character pitch and for selecting the font by means of character pitch and point size, if these commands are used after defining the basic step size.

The following commands use the basic step size defined with this command:

ESC I Pn, ESC Q Pn: Set left and right margin
ESC D: Setting of horizontal tabs
BS: Backspace

The set basic step size is deleted by the command for setting the character separation and the previously selected character pitch becomes valid again. A set character separation is in turn deleted by setting the basic step size.

If underlining is set, this is performed if this command is used.
The lamp display on the control panel is not altered by this command.

The commands for double-width font and for double-width font for one line and also the commands for condensed font are deleted by this command.

The basic step size is reset by the following commands and printed with the previously selected or newly set character pitch:

ESC P, ESC M, ESC g: commands for setting the character pitch,
SI, ESC SI: condensed font,
ESC W Pn: double-width font,
SO, ESC SO: double-width font for one line,
ESC w Pn, ESC US Pn: double-height font,
ESC p Pn: proportional font, (the character pitch set in the menu is valid)

ESC $x$ Pn Hp Lp: font defining by character pitch and point size

If the printer menu is called, the defined basic step size is deleted.
If the printer is reset by means of hardware, software or the control panel, the defined basic step size is deleted and the character pitch selected in the menu is valid.

| Function | Dec. | Hex. | ASCII |  |
| :--- | :--- | :--- | :--- | :--- | | Set page length in |
| :--- |
| basic step sizes |

This command defines the page length of the currently selected paper path. The parameters Ln and Hn specify the number of parameters following this:
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$
For this command, $\mathrm{Hn}=0$ and $\mathrm{Ln}=2$ must be set. With $\mathrm{Ln}+\mathrm{Hn}$ * $256<2$, this command is ignored. With $\mathrm{Ln}+\mathrm{Hn} * 256>2$, all $\mathrm{Ln}+$ Hn * 256 data following $\mathrm{Lp}, \mathrm{Hp}$ are ignored.

The parameters Lp and Hp define the page length in whole multiples of the current basic step size:
$\mathrm{Hp}=$ integer (page length in basic step sizes / 256)
$\mathrm{Lp}=$ page length in basic step sizes $-(\mathrm{Hp} * 256)$
Valid values for the basic step size are: $1 / 360,1 / 180,1 / 120,1 / 90$, $1 / 72$ and $1 / 60$ inch.

All page lengths in the range $1 / 360$ inch to 22 inches are valid. If, in this command, values of $\mathrm{Lp}=\mathrm{Hp}=0$ or $\mathrm{Lp}+\mathrm{Hp} * 256>22$ inches are used, this command is ignored and the previously set page length is retained.

This command is immediately valid in the current print line and the current print position becomes the top of page position. Where single cut sheets are being fed, the current print position does not become the top of page position if the menu item Page Length Control is set to the value by Menu Setting.

This command resets the perforation skip and the top and bottom non-printable margins. A previously selected top non-printable area is, however, taken into account from the next page on unless the top and bottom non-printable areas are re-defined immediately after this command.

A set-up vertical format unit and set vertical tabs are not reset by this command.

A defined page length is not affected if the basic step size is changed later on.

If the printer is reset, the page length in the initial setting becomes valid again.
Horizontal and
vertical basic step
size

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Setting of horizontal | 274085 | 1B 28 55 | ESC (U |
| and vertical basic step size | Ln Hn Pn | Ln Hn Pn | Ln Hn Pn |
|  | Ln =0 to 255 |  |  |
|  | Hn $=0$ to 255 (MSB ignored) |  |  |
|  | Pn = 0 to 255 (MSB ignored) |  |  |

With this command, the basic step sizes for the horizontal and vertical direction can be defined.

The parameters Ln and Hn specify the number of parameters which follow:
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$
For this command, $\mathrm{Hn}=0$ and $\mathrm{Ln}=1$ must be set. With $\mathrm{Ln}=\mathrm{Hn}=0$, this command is ignored. With $\mathrm{Ln}+\mathrm{Hn}^{*} 256>1$, all $\mathrm{Ln}+\mathrm{Hn}^{*} 256-1$ data following Pn are ignored. The parameter Pn specifies the basic step size $=$ Pn/360 inch. The following table gives the possible values:

| Value of Pn | Defined basic step size |
| :---: | :---: |
| $0 \leq \operatorname{Pn} \leq 9$ | no change |
| $10 \leq \operatorname{Pn} \leq 19$ | $1 / 360$ inch |
| $20 \leq \operatorname{Pn} \leq 29$ | $1 / 180$ inch |
| $30 \leq \operatorname{Pn} \leq 39$ | $1 / 120$ inch |
| $40 \leq \operatorname{Pn} \leq 49$ | $1 / 90$ inch |
| $50 \leq \operatorname{Pn} \leq 59$ | $1 / 72$ inch |
| $60 \leq \operatorname{Pn} \leq 69$ | $1 / 60$ inch |
| $70 \leq \operatorname{Pn} \leq 127$ | no change |

Commands which use the basic step sizes defined with this command and their standard setting:

ESC (c set page format, 1/360 inch
ESC (C set page length in basic step sizes, $1 / 360$ inch
ESC \$ absolute horizontal dot position, 1/60 inch
ESC $\backslash$ relative horizontal dot position, $1 / 80$ inch, LQ
$1 / 120$ inch, UTL
ESC (V absolute vertical print position, 1/360 inch

## Vertical print positioning

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Absolute vertical print | 274086 | 1B 28 56 | ESC ( V |
| positioning in units | Ln Hn | Ln Hn | Ln Hn |
| of the basic step size | Lp Hp | Lp Hp | Lp Hp |
|  | Ln $=0$ to 255 |  |  |
|  | $\mathrm{Hn}=0$ to 255 (MSB ignored) |  |  |
|  | Lp $=0$ to 255 |  |  |
|  | $\mathrm{Hp}=0$ to 255 (MSB ignored) |  |  |

With this command, the printing position is adjusted absolutely in the vertical direction to the current top of page or to a set top margin of the printing area in multiples of the current basic step size.

The parameters Ln and Hn specify the number of parameters following this:
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$
For this command, $\mathrm{Hn}=0$ and $\mathrm{Ln}=2$ must be set. With $\mathrm{Ln}+\mathrm{Hn}$ * $256<2$, this command is ignored. With $\mathrm{Ln}+\mathrm{Hn} * 256>2$, all Ln + Hn * 256-2 data following Pn are ignored.

The parameters Lp and Hp specify the absolute vertical distance of the print position from the current top of page position or a set top margin of the print area in multiples of the current basic step size $(1 / 360,1 / 180,1 / 120,1 / 90,1 / 72,1 / 60)$. The initial setting of the step size for this command is $1 / 360$ inch.

Absolute vertical print positioning
$\mathrm{Hp}=$ integer (absolute position / 256)
$\mathrm{Lp}=$ absolute position $-(\mathrm{Hn} * 256)$
This command is ignored if a position is specified which is more than 46.2 inches away from the current top of page position or a set top margin of the print area, or a position is specified which requires a feed backwards of more than 0.5 inch. By using this command several times, even a feed of more than 0.5 inch backwards can be achieved. The feed forwards takes place to no further than the next top of page position, backwards no further than the top of page position of the current page. If print areas are set, backwards feed takes place no further than the top margin of the print area. A feed into the bottom non-printable area, even due to a set perforation skip, causes a paper feed to the next top of page position.

If this command requires a backwards feed of the paper, it is ignored if the current line contains raster graphic commands.

The following table states the maximum values depending on the basic step size in inches:

| Step size | $\mathbf{1} / \mathbf{3 6 0}$ | $\mathbf{1} / \mathbf{1 8 0}$ | $\mathbf{1 / 1 2 0}$ | $\mathbf{1 / 9 0}$ | $\mathbf{1} / \mathbf{7 2}$ | $\mathbf{1 / 6 0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Range | 16639 | 8318 | 5546 | 4159 | 3327 | 2773 |

Absolute position $=$ step size ${ }^{*}(\mathrm{Lp}+\mathrm{Hp} * 256)$

Relative vertical print positioning

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Relative vertical print | 2740118 | 1B 28 76 | ESC ( v |
| positioning in units of | Ln Hn | Ln Hn | Ln Hn |
| the basic step size | Lp Hp | Lp Hp | Lp Hp |
|  | Ln $=0$ to 255 |  |  |
|  | Hn $=0$ to 255 (MSB ignored) |  |  |
|  | Lp $=0$ to 255 |  |  |
|  | Hp $=0$ to 255 (MSB ignored) |  |  |

With this command, the printing position is adjusted relatively in the vertical direction to the current print position in multiples of the current basic step size.

The parameters Ln and Hn specify the number of parameters following this:
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$
For this command, $\mathrm{Hn}=0$ and $\mathrm{Ln}=2$ must be set. With $\mathrm{Ln}+\mathrm{Hn}$ * $256<2$, this command is ignored. With $\mathrm{Ln}+\mathrm{Hn} * 256>2$, all $\mathrm{Ln}+$ Hn * 256-2 data following Pn are ignored.

The parameters Lp and Hp specify the relative vertical shift of the print position in multiples of the current basic step size.

## Printable area

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Setting of the page | 274099 | 1B 2863 | ESC (c |
| format in basic step sizes | Ln Hn | Ln Hn | Ln Hn |
|  | Lb Hb | Lb Hb | Lb Hb |
|  | $\mathrm{Ln}=0$ to 255 |  |  |
|  | $\mathrm{Hn}=0$ to 255 (MSB ignored) |  |  |
|  | $\mathrm{Lt}=0$ to 255 |  |  |
|  | $\mathrm{Ht}=0$ to 255 (MSB ignored) |  |  |
|  | $\mathrm{Lb}=0$ to 255 |  |  |
|  | $\mathrm{Hb}=0$ to 255 (MSB ignored) |  |  |

This command defines the top and bottom non-printable areas of the currently selected paper path.

The parameters Ln and Hn specify the number of parameters following this:
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$
For this command, $\mathrm{Hn}=0$ and $\mathrm{Ln}=4$ must be set. With $\mathrm{Ln}+\mathrm{Hn}$ * $256<4$, this command is ignored. With $\mathrm{Ln}+\mathrm{Hn} * 256>4$, all $\mathrm{Ln}+$ Hn * 256-4 data following Lp, Hp are ignored.

The parameters $\mathrm{Lt}, \mathrm{Ht}, \mathrm{Lb}$ and Hb define the top (TP) and bottom (BP) non-printable areas in whole multiples of the current basic step size, measured from the previously defined top of page position (TOF):

```
\(\mathrm{Ht}=\) integer (TP in basic step sizes / 256)
\(\mathrm{Lt}=\mathrm{TP}\) in basic step sizes \(-(\mathrm{Hp}\) * 256)
\(\mathrm{Hb}=\) integer (page length - BP in basic step sizes / 256)
\(\mathrm{Lb}=\) page length -BP in basic step sizes \(-\left(\mathrm{Hp}{ }^{*} 256\right)\)
```

Valid values for the basic step size are: $1 / 360,1 / 180,1 / 120,1 / 90$, $1 / 72$, and $1 / 60$ inch.

With the top margin limit, measured from the top of page position, is defined the top line of the printable area, with the parameter for the bottom margin limit, the bottom line of the printable area measured from the top of page position.

In the case of single sheets, from the automatic cut sheet feeder or the optional sheet guide, the areas of the top and bottom non-printable area are defined as follows when the menu item Page Length Control is set to the value by Menu Setting:

0 inch $<$ top area $<$ bottom area $<22$ inches.
If the areas are set to 0 inches or to values more than 22 inches, or these areas are set to invalid values, this command is ignored.

With continuous paper and cut sheets by means of a cut sheet feeder, the areas of the top and bottom non-printable areas are defined as follows if the menu position Page Length Control is set to by Actual Page Length:

0 inch $<$ top area $<$ bottom area $<$ page length.
If the areas are set to 0 inches or to values beyond the page length or these areas are set to invalid values, this command is ignored.

A set-up vertical format unit and set vertical tabs are not reset by this command.

A defined print area is not affected if the basic step size is changed later on.

If the printer is reset, the print area in the initial setting becomes valid again.

## Select font

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select font by means of | 2788 | 1B 58 | ESC X |
| character pitch and | Pn Lp Hp | Pn Lp Hp | Pn Lp Hp |
| point size | $\mathrm{Pn}=0$ to 255 (MSB ignored) |  |  |
|  | $\mathrm{Lp=0} \mathrm{to} \mathrm{255}$ |  |  |
|  | Hp = 0 to 255(MSB ignored) |  |  |

Select font

With his command, a previously selected font can be scaled in limited bounds when defining the character pitch and point size.

- The character pitch is defined by means of the parameter Pn, and by means of the parameters Lp and Hp , the point size of the font. For Pn, all values of 0 to 255 are permissible, the highest value bit, however, is not taken into account.
- With values $2 \leq \operatorname{Pn} \leq 4$, this command is ignored.
- For values greater than 4 , the character pitch Pn/360 inch is assigned to the font.
- The value $\mathrm{Pn}=0$ does not change the current character pitch and Pn = 1 selects proportional character pitch.
- In the case of proportional fonts, the following relation between character pitch and point size applies:

Character pitch $=360 /$ INT
(point size * standard width / $10.5+0.5$ ) cpi

- Point size: the size specified by means of the parameters Lp and Hp: proportional width for a font size of 10.5 point.

For superscripts/subscripts, the following relation applies for proportional fonts:

| Point size |  | Character pitch |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 8-13 |  | character pitch as with a size of 8 points |  |  |  |
| 10.5 |  | character pitch as with a size of $10.5^{*} 2 / 3$ points |  |  |  |
| 14-64 |  | character pitch in relation to point size as follows |  |  |  |
| Character pitch $=360 /$ INT <br> (Point size * $2 / 3^{*}$ standard width $/ 10.5+0.5$ ) cpi |  |  |  |  |  |
| Selected pointsize | Normal font | Super-/ Subscript | Selected pointsize | Normal font | Super-/ Subscript |
| 8 | 8 | 8 | 36 | 36 | 24 |
| 9 | 9 | 8 | 37 | 37 | 24 |
| 10 | 10 | 8 | 38 | 38 | 25 |
| 10,5 | 10,5 | 10,5*2/3 | 39 | 39 | 26 |
| 11 | 11 | 8 | 40 | 40 | 26 |
| 12 | 12 | 8 | 41 | 41 | 27 |
| 13 | 13 | 8 | 42 | 42 | 28 |
| 14 | 14 | 9 | 43 | 43 | 28 |
| 15 | 15 | 10 | 44 | 44 | 29 |
| 16 | 16 | 10 | 45 | 45 | 30 |
| 17 | 17 | 11 | 46 | 46 | 30 |
| 18 | 18 | 12 | 47 | 47 | 31 |
| 19 | 19 | 12 | 48 | 48 | 32 |
| 20 | 20 | 13 | 49 | 49 | 32 |
| 21 | 21 | 14 | 50 | 50 | 33 |
| 22 | 22 | 14 | 51 | 51 | 34 |
| 23 | 23 | 15 | 52 | 52 | 34 |
| 24 | 24 | 16 | 53 | 53 | 35 |
| 25 | 25 | 16 | 54 | 54 | 36 |
| 26 | 26 | 17 | 55 | 55 | 36 |
| 27 | 27 | 18 | 56 | 56 | 37 |
| 28 | 28 | 18 | 57 | 57 | 38 |
| 29 | 29 | 19 | 58 | 58 | 38 |
| 30 | 30 | 20 | 59 | 59 | 39 |
| 31 | 31 | 20 | 60 | 60 | 40 |
| 32 | 32 | 21 | 61 | 61 | 40 |
| 33 | 33 | 22 | 62 | 62 | 41 |
| 34 | 34 | 22 | 63 | 63 | 42 |
| 35 | 35 | 23 | 64 | 64 | 42 |

The point size is determined by means of the parameters Lp and Hp:

$$
\begin{aligned}
& \mathrm{Np}=\mathrm{Lp}+\mathrm{Hp}{ }^{*} 256 \\
& \text { point size }=\mathrm{Np}{ }^{*} 0.5
\end{aligned}
$$

Refer to the following table for details:

| Size specified <br> of Np | Point size <br> (dots) | Rounded up/down <br> size of Np |
| :---: | :---: | :---: |
| 0 | $1)$ | 0 |
| $1 \leq \mathrm{Np} \leq 17$ | 8 | 16 |
| $18 \leq \mathrm{Np} \leq 19^{2)}$ | $9^{2}$ | 18 |
| $\mathrm{~Np}=20$ | 10 | 20 |
| $\mathrm{~Np}=21$ | 10,5 | 21 |
| $22 \leq \mathrm{Np} \leq 23$ | 11 | 22 |
| $24 \leq \mathrm{Np} \leq 25$ | 12 | 24 |
| $26 \leq \mathrm{Np} \leq 125$ | $13-62$ | $26-124$ |
|  |  | (all even digits) |
| $126 \leq \mathrm{Np} \leq 127$ | 63 | 126 |
| $128 \leq \mathrm{Np} \leq 32767$ | 64 | 128 |

1) No change: if the point size assignment of a previous font scaling command is still valid, this point size is used. If the point size assignment is deleted, i.e. no point size is selected, the font is printed in the currently valid font size and the current character pitch (cpi).
2) The size of a font scaled to 9 points has the same appearance as that to a scaled to 8 point.

The table below gives the assignment of selected character pitch Pn to the bitmap fonts used by the printer if scaling is not possible:

| Dots pitch (Pn) | 8,9 |  | 10 |  | 10,5 |  | 21 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bitmap (cpi) | Print | Bitmap (cpi) | Print | Bitmap (срі) | Print | Bitmap (cpi) | Print |
| 1 | 8 prop. |  | prop. |  | prop. |  | prop. | dbl. hight, dbl. width |
| 5-21 | 8 | condensed | 12 | condensed | 12 | condensed | 12 | condensed, dbl. hight |
| 22-24 | 8 |  | 10 | condensed | 10 | condensed | 10 | condensed, dbl. hight |
| 25-30 | 8 |  | 12 |  | 12 |  | 12 | dbl. hight |
| 31-36 | 8 |  | 10 |  | 10 |  | 10 | dbl. hight |
| 37-42 | 8 | bold | 10 | bold | 10 | bold | 10 | dbl. hight, bold |
| 43-48 | 8 | dbl. width | 10 | condensed, dbl. width | 10 | condensed, dbl. width | 10 | condensed, dbl. width, dbl. hight |
| 49-60 | 8 | dbl. width | 12 | dbl. width | 12 | dbl. width | 12 | dbl. hight, dbl. width |
| 61-127 | 8 | dbl. width | 10 | dbl. width | 10 | dbl. width | 10 | dbl. hight, dbl. width |

The following table shows the assignment of the selected font to the font used by the printer when scaling of the specified point size is possible:

| selected | font size bused by printer |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| font | $\mathbf{8 , 9}$ | $\mathbf{1 0 / 1 0 , 5}$ | $\mathbf{1 1 - 2 0}$ | $\mathbf{2 1}$ | 22-64 |
| Courier | Courier | Courier | Courier | Courier | Courier |
| Roman | Roman | Roman | Roman | Roman | Roman |
| Swiss | Swiss | Swiss | Swiss | Swiss | Swiss |
| Prestige | Roman | Prestige | Courier ${ }^{3)}$ | Prestige | Courier ${ }^{3)}$ |
| Orator | Swiss | Orator | Courier $^{3)}$ | Orator | Courier $^{3)}$ |
| Swiss | Swiss | Swiss | Courier ${ }^{3)}$ | Swiss | Courier $^{3)}$ |
| Bold |  | Bold |  | Bold |  |
| Gothic | Swiss | Gothic | Courier ${ }^{3)}$ | Gothic | Courier ${ }^{3)}$ |

3) The font Courier is used as a replacement by the printer when a font is selected in a point size in which it is not scalable. In the sizes $8,9,10$ and 10.5 point, the fonts are printed as bitmap fonts.

## Special cases

- The point size is set to $\mathrm{Np}=42$ (21 point). Proportional and fixed character pitch $\geq 34$ :
- If a font with the exception of Courier, Roman or Swiss is selected, the character for $\mathrm{Np}=42$ (21 point) is twice as high and twice as wide as with a point size of $\mathrm{Np}=21$ (10.5 point).

The following commands use the character pitch set by this command:

ESC I, ESC Q: set left and right margin
$B S$ : backspace
ESC D: setting of horizontal tabs
If a proportional font is selected, the character pitch for these commands is calculated from the following formula:

Character pitch $=360 /$ INT $($ point size * $36 / 10.5+0.5) ~ c p i$

## Downloadable characters

If characters have been downloaded into the printer from the system or by means of the copy function, these characters are printed as follows after defining the character pitch with this command:

Downloadable characters by means of the copy function
Character pitch Size $\leq 21$ point $\quad$ Size $>21$ point
$1 \leq \operatorname{Pn} \leq 71 \quad 10.5$ point $\quad 10.5$ point
$72 \leq \operatorname{Pn} \leq 127$, double height
10.5 point, double width
10.5 point, double height, double width

Downloadable characters downloaded from system

| Character pitch | Size $\leq$ 21 point | Size $>$ 21 point |
| :--- | :--- | :--- |
| $1 \leq \operatorname{Pn} \leq 71$ | loaded bitmap | loaded bitmap, <br> double height |
| $72 \leq \operatorname{Pn} \leq 127$ | loaded bitmap, <br> double width | loaded bitmap, <br> double height, <br> double width |

## Printing in draft quality

If a proportional font is selected by means of this command $(\operatorname{Pn}=1)$, the printer replaces the draft quality with the font selected in the menu in letter quality. If Utility is selected in the menu, the font is replaced by Courier.

If a fixed character pitch is selected by means of this command, printing takes place with the selected character pitch and character sizes stated in the table above for the bitmap character sets.

If no point size is specified in this command (Lp and $\mathrm{Hp}=0$ ), the point size is selected which was previously defined with this command. If the point size is deleted or not set, printing takes place with a size of 10.5 point.
The following commands are suppressed if this command is used for scaling fonts:

ESC W: double-width font
ESC $w$, US: font in double height
ESC SP: set character separation
SI, ESC SI: condensed font
SO, ESC SO: double-width font for one line
If, by means of this command, a fixed character pitch or proportional font is selected, the lamp PROP lights on the control panel in the display field CHARACTER PITCH.

This command is deleted when selecting a character pitch by means of the commands ESC P, ESC M, ESC g, ESC p Pn and ESC!Pn. If the printer is reset, this command is deleted and the step sizes for the initial setting become valid again.

## Character sets and code pages

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Print several characters | 274094 | 1B 28 5E | ESC $(\wedge$ |
| from the fully printable | Ln Hn | Ln Hn | Ln Hn |
| character set | Data | Data | Data |
|  | Ln =0 to 255 |  |  |
|  | Hn =0 to 255 (MSB ignored) |  |  |

With this command, all characters from the range decimal 1 to 255 of a code page are addressed as printable characters. The address 0 is treated as ASCII NUL code.

The parameters Ln and Hn specify the number of characters to be printed:
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$
If the parameters Ln and $\mathrm{Hn}=0$ are set, this command is ignored. This command is effective for all selectable code pages.

| Function | Dec. | Hex. | ASCII |  |
| :--- | :--- | :--- | :--- | :--- | | Assign new code |
| :--- |
| page |

With this command, four different characters sets can be assigned to the command ESC $t \mathrm{Pn}$.
$\mathrm{Hn}=$ integer (number of characters / 256)
$\mathrm{Ln}=$ number of characters $-(\mathrm{Hn} * 256)$

Print characters from the fully printable character set

Assign new code page

For this command, $\mathrm{Hn}=0$ and $\mathrm{Ln}=3$ must be set. With $\mathrm{Ln}+\mathrm{Hn}$ * $256<3$, this command is ignored. With $\mathrm{Ln}+\mathrm{Hn} * 256>3$, all Ln + Hn * 256-3 data following Lp, Hp are ignored.

The parameters $\mathrm{Pn}_{2}$ and $\mathrm{Pn}_{3}$ determine the code pages which are to be assigned to the parameter $\mathrm{Pn}_{1}$. The following values are permissible:
$\mathrm{Pn}_{1}: 00 \mathrm{H}, 01 \mathrm{H}, 02 \mathrm{H}, 03 \mathrm{H}, 30 \mathrm{H}, 31 \mathrm{H}, 32 \mathrm{H}, 33 \mathrm{H}$
$\mathrm{Pn}_{2}: 00 \mathrm{H}, 01 \mathrm{H}, 03 \mathrm{H}, 07 \mathrm{H}, 08 \mathrm{H}, 09 \mathrm{H}$
$\mathrm{Pn}_{3}: 00 \mathrm{H}$
The assignment of the parameters $\mathrm{Pn}_{2}$ and $\mathrm{Pn}_{3}$ to the selectable code pages is listed in the following table:

| $\mathbf{P n}_{2}$ | $\mathbf{P n}_{3}$ | Code page |
| :---: | :---: | :--- |
| 0 | 0 | italic character set |
| 1 | 0 | PC437 (USA) |
| 3 | 0 | PC850 (Multilingual) |
| 7 | 0 | PC860 (Portugal) |
| 8 | 0 | PC863 (Canadian French) |
| 9 | 0 | PC865 (Norwegian) |

If invalid values are assigned to the parameters $\mathrm{Pn}_{1}, \mathrm{Pn}_{2}$ and $\mathrm{Pn}_{3}$, the previous assignment remains valid.

To each valid value of $\mathrm{Pn}_{1}$ can be assigned one of the code pages listed in the above table. The selection of the code pages assigned to parameter $\mathrm{Pn}_{1}$ is performed with the command ESC $t$ Pn, whereby the parameters $\mathrm{Pn}_{1}$ and $\mathrm{Pn}_{2}$ must correspond.

In the initial setting after switching on or resetting the printer, the following assignments are valid:

| Assignment | Pn $_{1}$ | Code page |
| :---: | :--- | :--- |
| 0 | $00 \mathrm{H}, 30 \mathrm{H}$ | italic character set |
| 1 | $01 \mathrm{H}, 31 \mathrm{H}$ | code page selected in the <br> Code Page menu item |
| 2 | $02 \mathrm{H}, 32 \mathrm{H}$ | downloadable character set |
| 3 | $03 \mathrm{H}, 33 \mathrm{H}$ | graphic character set |

The national character set selected in the Language Set menu position is valid for all assignments 0 to 3 . The code page selected by means of ESC $t$ Pn after the assignment therefore possesses the national version selected.

The copy command for the downloadable character set uses the current code page assignment.

The assignment 2 is used as standard for selection of the downloadable character set. If it has been overwritten with another assignment through this command, the downloadable character set can no longer be selected. The printer must be reset so that the standard assignment is valid again.

The selection of the national character set is not changed by changing the code page assignment.

If the current code page is selected by means of the command ESC R Pn , this code page is assigned to the parameter $\mathrm{Pn}_{1}=1$. This code page must therefore be selected with the command ESC $t P n=1$. The code page selected with this command sequence contains no national variations however!

If a national variation is selected with the command ESC R Pn ( $\mathrm{Pn}=$ $0-20,64$ ), the code page 437 (USA) with the previously selected national variation is assigned to the parameter $\mathrm{Pn}_{1}=1$.
The assignment of the code page is reset to the initial setting under the following conditions:

- The printer is reset by hardware, software or the control panel.
- The printer menu is activated.

## Chapter 16: Epson - Control Code Tables

| Function | Dez. | Hex. | ASCII | Print quality |
| :---: | :---: | :---: | :---: | :---: |

## Chapter 17: Epson - Character Sets

This chapter contains the character sets available in Epson emulation. You can choose between three Epson character sets and numerous national character sets.

The code page command allows you to select character sets that replace some less frequently used characters with symbols used in a variety of European languages.

## ASCII Character Set

The »American Standard Code for Information Interchange« is a standarized character set of printable characters (bold) and control codes. The name of the control codes result from their usage in communication and data transmission. Some characters are used to activate printer functions as shown in the corresponding chapters. The entering of control codes may vary from program to program.

| ASCII | Dez | Hex | Ctrl | ASCII | Dez | Hex | ASCII | Dez | Hex | ASCII | Dez | Hex |

## Conversion table

The layout of this conversion table corresponds to the following character set tables. The row and the column headers show the hexadecimal value of the characters. The table contains decimal and octal values. Example: hexadecimal 23 (column 2, row 3) is equal to decimal 35.

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |

## Conversion table

The layout of this conversion table corresponds to the following character set tables. The row and the column headers show the hexadecimal value of the characters. The table contains decimal and octal values. Example: hexadecimal 23 (column 2, row 3) is equal to decimal 35.

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |

## Special character set OCR-B1

The listed code pages show the different character sets that are available in the various printer's typefaces. For example, Codepage 437 (USA) can be printed in Roman, Swiss, Courier etc.

In contrast to that the selection of OCR-characters (Optical Character Recognition) defines the character set as well as the typeface. The OCR-Code contains fixed characters, which can be read and processed by every OCR-scanner.

In Letter Quality (LQ) you can select OCR-B1 character sets, a derivative of the OCR-A-typeface and easy to read.

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Select OCR-B1 | 271075 | 1B 6B 05 | ESC k ENQ |

Although the OCR-typeface is available in various pitches, readibility is only given in 10 cpi .

The actual, error free readibility of typefaces like OCR-A, OCR-B or Barcodes (EAN, UPC, Zip) is influenced by ...

- the printing process (resolution, sharpness of edge).
- the technical quality of the printer.
- the quality of the print medium (toner, ribbon).
- the quality of the printing material (shine, smoothness, coating, age, reflection, surface's consistency).
- the technical quality of the scanner.

## OCR－B1

IBM：1B 6B 05
Epson：1B 6B 05

## Appendix C: Bar codes

The bar code was developed as an automated identification system for simplifying warehouse and stock taking procedures. The quality of the bar code is superior to OCR-A and OCR-B, as the quality of OCR-A and OCR-B may be affected by external influences.

The following factors may influence the readability of bar codes:

- the print process and the sharpness of the stripes.
- the status of the printer and of the print head.
- the quality of the pins and the pin mechanism.
- use of a multicoloured ribbon, its age and colour intensity.
- functionality of the device used.

Furthermore, the following characteristics of the labels influence the readability of bar codes:

- reflection
- smoothness of surface
- transparency
- surface's consistency
- colour
- age of labels

## Note!

For further information about design and safety procedures used with bar codes, see the books "Codiertechnik - Der Schlüssel zum Strichcode", by B. Lenk and H.-G. Hansen, published by Ident, or "The Bar Code Book - Reading, Printing, and Specification of Bar Code Symbols" by Roger C. Palmer, published by Helmers Publishing, Inc.

This chapter only describes how to use the printer function»Bar code printing«.

We do not guarantee that bar codes printed with these commands can be read by all bar code readers. Before you use these commands we recommend that you test whether your bar code reader can read the printed bar codes.

## Bar Code Types

You can print seven different types of bar codes. The bar codes are selected by the command sequences listed below.

The command sequences are:

| EAN Codes | $->$ | EAN 8 | (IAN8, JAN8) |
| :--- | :--- | :--- | :--- |
|  | $->$ | EAN 13 | (IAN13, JAN13) |
| UPC Codes | $->$ | UPC-A |  |
|  | $->$ | UPC-E |  |

Code 39
Code 128
Interleaved 2/5
ZIP Code -> ZIP Code Bar Code
With all bar codes, except the bar code UPC- $E$, it is possible to calculate and print a checksum.

Because of the 24 dot matrix printing technique the smallest bar code size that can be printed is a Low-Density Code and/or an enlargement factor of 1.35 .

EAN, UPC and Code 128 type bar codes can be enlarged in seven steps. Code 39 and Interleaved 2/5 type bar codes the black and/or the white area can be enlarged in seven steps by two parameters. However, it is recommended that both areas be enlarged by the same value.

## Positioning

When designing a bar code ensure that the character position of the bar code is absolute in order to avoid rounding and positioning errors.

## Selection of Type and Size of Bar Code

| Function | Dec. | Hex. | ASCII | Selecting the <br> bar code |
| :--- | :--- | :--- | :--- | :--- |
| Select bar code | 271665 | 1 1B 1041 | ESC DLE A |  |
|  | $p_{1} n_{1} \ldots n_{8}$ | $p_{1} n_{1} \ldots n_{8}$ | $p_{1} n_{1} \ldots n_{8}$ |  |

Use this command to select the type and the size of the bar codes.
Explanation of parameters:

1. $p_{1}$ is the amount of data following $p_{1}$ (MSB is ignored). The command is invalid, when the value 0,1 or 3 is assigned to $p_{1}$. Valid values for $p_{1}$ are $2,4,5,6,7$ and 8 . If $p_{1}$ is equal to or greater than 9 , all data after $\mathrm{n}_{9}$ will be ignored.
2. $n_{1}$ and $n_{2}$ select the type of bar code (high-order half byte is ignored).

| $\mathbf{n}_{\mathbf{1}}$ | $\mathbf{n}_{\mathbf{2}}$ | Bar Code Type |
| :--- | :--- | :--- |
| 0 | 1 | EAN8 |
| 0 | 2 | EAN13 |
| 1 | 0 | UPC-A |
| 1 | 4 | UPC-E |
| 2 | 0 | Code 39 |
| 3 | 0 | Interleaved $2 / 5$ |
| 4 | 0 | Code 128 |

Only the above listed parameters for $\mathrm{n}_{1}, \mathrm{n}_{2}$ are valid. The command will be ignored when other data is transmitted.
3. $n_{3}$ and $n_{4}$ determine the vertical length of the bar code. The length is determined by the following formula: $\left(\mathrm{n}_{3}{ }^{*} 10+\mathrm{n}_{4}\right)$ * $(15 / 180)$ inch. If $n_{3}$ and $n_{4}$ are assigned the value 0 , the current length will be used. If $\left(n_{3}{ }^{*} 10+n_{4}\right) \geq 25$, the length will be set to 24 .

The length of the Start, Centre and the Stop bar for EAN and UPC codes is: $\left(\mathrm{n}_{3}{ }^{*} 10+\mathrm{n}_{4}\right){ }^{*}(15 / 180)+10 / 180$ inch.
4. $n_{5}$ selects the width of one bar code character. The minimum width of one character is $1 / 360$ inch:

If you select the value 0 for $n_{5^{\prime}}$, the current setting will be used. If $n_{5}>=8, n_{5}$ will be set to 7 .

With the bar code types EAN8, EAN13, UPC-A, UPC-E and Code 128 the width of one bar code character is determined by $\mathrm{n}_{5}$.
The maximum values of a bar code character are listed in »Table 1«. Refer to »Table 2« for the width of the individual modules.

With Code 39 or Interleaved 2/5 the width of the black bar code element is determined by $\mathrm{n}_{5}$.

Refer to »Table 3« to determine the character width of Code 39, refer to »Table 4« and »Table 5« to determine the character width of Code Interleaved $2 / 5$. The width of the modules are identical with Code 39 and Interleaved 2/5. Refer to »Table 6« and »Table 7« to determine the width of the individual modules for these two types of bar codes.
5. You select the width of the space elements with $\mathrm{n}_{6}$ :
$\mathrm{n}_{6}$ is ignored with EAN8, EAN13, UPC-A, UPC-E or Code 128. When using Code 39 or Interleaved 2/5, $\mathrm{n}_{6}$ determines the width of the space element. The minimum width of the space element is $1 / 360$ inch. If $n_{6}=0$, previous settings are used. If $n_{6} \geq 8, n_{6}$ is set to 7.
6. The ratio between the wide and the narrow elements is determined by $n_{7}$ :

If $n_{7}=0$, previous settings will be used. If $n_{7} \geq 8, n_{7}$ is set to 7 .
If EAN8, EAN13, UPC-A, UPC-E or Code 128 is selected, $\mathrm{n}_{7}$ will be ignored.

Ratio table

| $\mathbf{n}_{7}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | ---: |
| Ratio | $2: 1$ | $2,5: 1$ | $3: 1$ | $3,5: 1$ | $4: 1$ | $4,5: 1$ | $5: 1$ |

7. $\mathrm{n}_{8}$ selects the print quality of plain writing.

## Table for Selection of Plain Writing

$\mathrm{n}_{8} \quad$ Description
$0 \quad$ No plain (uncoded) writing
1 LQ character as plain writing
The character size of plain writing does not depend on the bar code, it is always set to 12 cpi .

The font of the LQ characters is the same as the font selected for receiving $\mathrm{p}_{1}$ data.

Please note that this command does not start the printer.
The basic settings of this command are:

| $\mathrm{n}_{1}, \mathrm{n}_{2}$ | 1,0 | UPC-A |
| :--- | :--- | :--- |
| $\mathrm{n}_{3^{\prime}} \mathrm{n}_{4}$ | 0,9 | $135 / 180$ inch |
| $\mathrm{n}_{5}$ | 1 | $1 / 72$ inch |
| $\mathrm{n}_{6}$ | 1 | $1 / 72$ inch |
| $\mathrm{n}_{7}$ | 1 | $2,5: 1$ |
| $\mathrm{n}_{8}$ | 2 | LQ |

Tables 1 through to 7 are used to calculate the width of the bar code. If the bar code to be printed extends beyond the right margin of the printing material, the print command will be ignored.

Please refer to tables 1 and 2 for determining the width of the Codes EAN, UPC and Code 128. Tables 3 through to 7 are reserved for Code 39 and Interleaved 2/5.

Table 1 shows the ratio between $\mathrm{n}_{5}$ and the maximum width of a bar code character in combination with the bar code type.

## Table 1

| $\mathbf{n}_{5}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| EAN8 / EAN 13 | 40 | 49 | 70 | 84 | 105 | 119 | 140 |
| UPC-A /-E char. code/ODD |  |  |  |  |  |  |  |
| EAN8 / EAN 13 <br> UPC-A /-E char. code/EVEN | 49 | 70 | 84 | 105 | 119 | 140 |  |
| UPC-A/EAN8 | 15 | 18 | 27 | 31 | 42 | 48 | 57 |
| EAN 13 start/stop code |  |  |  |  |  |  |  |
| UPC-A/EAN8 <br> EAN 13 centre bar | 33 | 38 | 53 | 63 | 78 | 88 | 103 |
| UPC-E <br> start code | 15 | 18 | 27 | 31 | 42 | 48 | 57 |
| UPC-E <br> stop code | 36 | 42 | 60 | 72 | 90 | 102 | 120 |
| Code 128 <br> char. code /start code | 64 | 77 | 110 | 132 | 165 | 187 | 220 |
| Code 128 <br> stop code <br> (unit: 1/360 inch) | 71 | 88 | 127 | 153 | 192 | 218 | 257 |

## Table of Module Widths

The width of the space element is listed below the width of the black elements.

A module is the narrowest element of a bar code. With EAN, UPC and Code 128, the wide elements may be up to four times as wide as one module. The table shows how wide the widths of the bar code elements of a code character are.

## Table 2

| $\mathbf{n}_{\mathbf{5}}$ | Ratio | Single Module | Dual Module | Triple Module | Quadruple Module |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 3 | 9 | 13 | 19 |
|  |  | 9 | 14 | 19 | 24 |
| 2 | 1,5 | 4 | 11 | 18 | 25 |
|  |  | 10 | 17 | 24 | 31 |
| 3 | 2 | 7 | 17 | 27 | 37 |
|  |  | 13 | 23 | 33 | 43 |

| $\mathbf{n}_{5}$ | Ratio | Single Module | Dual Module | Triple Module | Quadruple Module |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 2,5 | 9 | 21 | 33 | 45 |
|  |  | 15 | 27 | 39 | 51 |
| 5 | 3 | 12 | 27 | 42 | 57 |
|  |  | 18 | 33 | 48 | 63 |
| 6 | 3,5 | 14 | 31 | 48 | 65 |
|  |  | 20 | 37 | 54 | 71 |
| 7 | 4 | 17 | 37 | 57 | 77 |
|  |  | 23 | 43 | 63 | 83 |

(unit: 1/360 inch)

## Table 3

Code 39 / Interleaved 2/5 width of black element.
$n_{5}$ defines the width of the black element/bar. Together with $n_{7}$ the total width of the black element can be taken from table 3:

| Type | $\mathbf{n}_{\mathbf{5}}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Ratio | 1 | 1.5 | 2 | 2.5 | 3 | 3.5 | 4 |
| schmales Element | 3 | 4 | 7 | 9 | 12 | 14 | 17 |
| $\mathrm{n}_{7}=1$ | 9 | 11 | 17 | 21 | 27 | 31 | 37 |
| $\mathrm{n}_{7}=2$ | 11 | 14 | 22 | 27 | 32 | 39 | 47 |
| $\mathrm{n}_{7}=3$ | 14 | 18 | 27 | 33 | 42 | 48 | 57 |
| $\mathrm{n}_{7}=4$ | 17 | 21 | 32 | 39 | 49 | 56 | 67 |
| $\mathrm{n}_{7}=5$ | 21 | 25 | 36 | 45 | 57 | 65 | 77 |
| $\mathrm{n}_{7}=6$ | 23 | 28 | 41 | 51 | 64 | 73 | 87 |
| $\mathrm{n}_{7}=7$ | 26 | 32 | 47 | 57 | 72 | 82 | 97 |
| (Unit: 1/360 inch) |  |  |  |  |  |  |  |

## Table 4

Code 39 / Interleaved 2/5 width of black elemt.
$n_{6}$ defines the width of the narrow space element/bar. Together with $n_{7}$ the total width of the wide space element can be taken from table 3:

| Type | $\mathbf{n}_{6}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Ratio | 1 | 1.5 | 2 | 2.5 | 3 | 3.5 | 4 |
| narrow element | 9 | 10 | 13 | 15 | 18 | 20 | 23 |
| $\mathrm{n}_{7}=1$ | 15 | 17 | 23 | 27 | 33 | 37 | 43 |
| $\mathrm{n}_{7}=2$ | 19 | 21 | 28 | 33 | 41 | 46 | 53 |
| $\mathrm{n}_{7}=3$ | 22 | 24 | 33 | 39 | 48 | 54 | 63 |
| $\mathrm{n}_{7}=4$ | 25 | 28 | 38 | 45 | 56 | 63 | 73 |
| $\mathrm{n}_{7}=5$ | 27 | 31 | 43 | 51 | 63 | 71 | 83 |
| $\mathrm{n}_{7}=6$ | 31 | 35 | 48 | 57 | 71 | 80 | 93 |
| $\mathrm{n}_{7}=7$ | 34 | 38 | 53 | 63 | 78 | 88 | 103 |
| (unit 1/360 Zoll) |  |  |  |  |  |  |  |

## Printing a 24-Pin Bar Code

## Print Bar code

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Printing a Bar code | 271666 | 1B 1042 | ESC DLE B |
|  | $\mathrm{P}_{1}\left(\mathrm{P}_{\mathrm{m}}\right)$ | $\mathrm{P}_{1}\left(\mathrm{P}_{\mathrm{m}}\right)$ | $\mathrm{P}_{1}\left(\mathrm{P}_{\mathrm{m}}\right)$ |
|  | DATA | DATA | DATA |

This command does not select type and size of the bar code:

- Unit used is 360 dpi (full).
- printing is always unidirectional.

1. $P_{1}$ is the amount of data according to $P_{1}$.
2. $P_{m}$ selects the type of Code 128 . If Code 128 is not selected, $P_{m}$ has to be omitted.

41 H : Code 128 Set A
42 H : Code 128 Set B
43 H: Code 128 Set C
3. If $P_{m}$ is assigned any value other than the above mentioned value, the command will be ignored.
4. »DATA«
5. Printing starts when the printer has received the entire command.

If $\mathrm{P}_{1}=0$, the bar code cannot be printed.
6. The following values are valid for $\mathrm{P}_{1}$. The check digit code is regarded as one character:
(a) EAN8 8 characters
(b) EAN13 13 characters
(c) UPC-A 12 characters
(d) UPC-E 6 characters
(e) Code 39 maximum of 50 characters
(f) Interleaved 2/5 maximum of 50 characters
(g) Code 128 (Set A, B, C) maximum of 50 characters

If the Code 128 is selected, $\mathrm{P}_{\mathrm{m}}$ is regarded as one character.
The value for $\mathrm{P}_{1}$ cannot be changed for bar code types listed under (a) to (d).

For the bar code types listed under (e) through to (f) you can select any value listed under number 6.

If $P_{1}$ is larger than the above-mentioned numbers, the command will be ignored.
7. The following characters are valid data for printing:
(a) EAN8 $0(30 \mathrm{H})$ to $9(39 \mathrm{H})$
(b) EAN13 $0(30 \mathrm{H})$ to $9(39 \mathrm{H})$
(c) UPC-A $0(30 \mathrm{H})$ to $9(39 \mathrm{H})$
(d) UPC-E $0(30 \mathrm{H})$ to $9(39 \mathrm{H})$
(e) Code $39 \quad \mathrm{SP}(20 \mathrm{H})$ to $\mathrm{Z}(5 \mathrm{AH})$ 43 characters, see Table 5
(f) Interleaved $2 / 5 \quad 0(30 \mathrm{H})$ to $9(39 \mathrm{H})$
(g) Code 128 (Set A) (00H) to (66H)
(h) Code 128 (Set B) (19H) to (7FH)
(i) Code 128 (Set C) (30H) to (3CH) for characters of Code 128, see Table 6

Only the above mentioned data and checksum code is valid.
8. A checksum is generated automatically by sending a checksum code at the end of the bar code data.

9 The checksum code is as follows:
(a) EAN8 @ (40H)
(b) EAN13
@ (40H)
(c) UPC-A
@ (40H)
(d) UPC-E
not possible
(e) Code 39 (40H)
(f) Interleaved 2/5 @ (40H)
(g) Code 128 (SetA) g (67H)
(h) Code 128 (SetB) CAN (18H)
(i) Code 128 (SetC) @ (40H)

## 10. Calculation of Checksum

If a checksum code is sent after the data has been sent, the printer will calculate the checksum and print the checksum instead of the checksum code. However, you can calculate and transmit the checksum yourself.

## Calculating the Checksum for EAN8, UPC-A, Interleaved 2/5

a: add all odd-numbered data positions (starting on the left-hand side)
b: a*3
c: add all even-numbered data positions (starting on the left-hand side)
d: b+c
e: $d \bmod 10$
f: 10-e
f is the check digit

Example: bar code data 1234567@
a: $1+3+5+7=16$
b: $16 * 3=48$
c: $2+4+6=12$
d: $48+12=60$
e: $60 \bmod 10=0(60 / 10=6$ Remainder 0$)$
$\mathrm{f}: 10-0=10, \mathrm{f}:=0$ (If $\mathrm{f}=10$, it is set to $\mathrm{f}=0$ )
Checksum is 0

If the amount of print data for Code Interleaved $2 / 5$ is an odd number, a 0 is added. This 0 is the first bar code character.

## Calculating the checksum for EAN13

a: add all even-numbered data positions
(start on the left-hand side)
b: a*3
c: add all odd-numbered data positions
(starting on the left-hand side)
d: b+c
e: $d \bmod 10$
f: 10-e
f is the checksum.

Example: bar code data 123456789012@

```
a: \(2+4+6+8+0+2=22\)
b: \(22 * 3=66\)
c: \(1+3+5+7+9+1=26\)
d: \(66+26=92\)
e: \(92 \bmod 10=2(92 / 10=9\) Remainder 2\()\)
f: \(10-2=8\)
checksum is 8
```

No calculation takes place for $U P C-E$, it does not print the checksum.

## Calculating the Checksum for Code 39

All values of the bar code data are added. The total is divided by 43 , and the remainder is the checksum.

Table 5

| Character | Value | Character | Value | Character | Value |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{0}$ | 0 | $\mathbf{F}$ | 15 | $\mathbf{U}$ | 30 |
| $\mathbf{1}$ | 1 | $\mathbf{G}$ | 16 | $\mathbf{V}$ | 31 |
| $\mathbf{2}$ | 2 | $\mathbf{H}$ | 17 | $\mathbf{W}$ | 32 |
| $\mathbf{3}$ | 3 | $\mathbf{I}$ | 18 | $\mathbf{X}$ | 33 |
| $\mathbf{4}$ | 4 | $\mathbf{J}$ | 19 | $\mathbf{Y}$ | 34 |
| $\mathbf{5}$ | 5 | $\mathbf{K}$ | 20 | $\mathbf{Z}$ | 35 |
| $\mathbf{6}$ | 6 | $\mathbf{L}$ | 21 | $\mathbf{-}$ | 36 |
| $\mathbf{7}$ | 7 | $\mathbf{M}$ | 22 | $\mathbf{.}$ | 37 |
| $\mathbf{8}$ | 8 | $\mathbf{N}$ | 23 | Space | 38 |
| $\mathbf{9}$ | 9 | $\mathbf{O}$ | 24 | $\mathbf{\$}$ | 39 |
| $\mathbf{A}$ | 10 | $\mathbf{P}$ | 25 | / | 40 |
| $\mathbf{B}$ | 11 | $\mathbf{Q}$ | 26 | $\mathbf{+}$ | 41 |
| $\mathbf{C}$ | 12 | $\mathbf{R}$ | 27 | $\mathbf{\%}$ | 42 |
| $\mathbf{D}$ | 13 | $\mathbf{S}$ | 28 |  |  |
| $\mathbf{E}$ | 14 | $\mathbf{T}$ | 29 |  |  |

Example: bar code data 123LPJ23@
Addition of values: $1+2+3+25+21+19+1+2+3=77$
Division: 77/43 = 1 Remainder 34
Value 34 = character Y
Checksum (character) $=\mathrm{Y}$

## Calculating the Checksum for Code 128

Each of the characters of Code 128 is assigned a reference value. When calculating the checksum, these values are added after they have been multiplied by a weighting. The weighting starts at 1 and is increased by the value 1 for every digit. In addition, the reference value of the start digit is added.

The total modulo 103 is the checksum.
The reference values are listed in Table 6. The different characters are divided into three character sets (Code A, B, C). Character set C consists exclusively of two-digit numbers (00 to 99). Each two-digit number is assigned a bar code unit. This results in a higher information density.

Example: bar code data 1234 XYZg
Start in character set C, change to character set A.
a: Ref. Start character Set $C=105$
b: Ref. character $12=12$
c: Ref. character $34=34$
d: Ref. change to Code A = 101
e: Ref. character $X=56$
f: Ref. character $Y=57$
g: Ref. character $Z=58$
Calculation:
$105+\left(1^{*} 12\right)+\left(2^{*} 34\right)+\left(3^{*} 101\right)+\left(4^{*} 56\right)+\left(5^{*} 57\right)+\left(6^{* 58}\right)=1345$
1345 modulo $103=4(1345 / 103=13$ Remainder 6$)$
Checksum is 6 (Reference value in Set A)
If you calculate this checksum yourself, you have to send the character HEX 26 to the printer in order to obtain the reference value 6 in Set A.

## Table 6

| Ref. <br> Value | Code A <br> ASCII | Hex | Code B <br> ASCII | Hex | Code C <br> Digit |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | Space | $=$ | 20 | Space | $=20$ | 00 |
| 1 | $!$ | $=$ | 21 | $!$ | $=21$ | 01 |

11. After printing the bar code the print head is positioned at the end of the first printed line.
12. If the bar code extends beyond the right margin, the command will be ignored and the bar code will not be printed. $\mathrm{A} » \mathrm{CR} / \mathrm{LF}$ « (Carriage Return/Line Feed) is performed and the bar code is printed in the next line, if the bar code is positioned beyond the right margin before the actual print command.
13. The following bar code types add a start bar, a center bar and a stop bar: EAN8, EAN13, UPC-A, UPC-E.
14. Notes for the Code 128:

The bar code start character of the different character sets is selected by choosing the option Pm of the command Printing a Bar Code (ESC DLE B P1 Pm Data).

A stop character is printed automatically.

The checksum code for character set A, B and C are different. Therefore you must ensure that the code of the character set selected last is used.

Character set Consists of 100 two-digit numbers with the value 00 to 99 . This makes numerical display in double density possible. Subsequently, two bytes are combined to one character when character set $C$ is used. (see Table 6). However, if the amount of print data is an odd number, a zero is added before the first number. Otherwise a zero would be added to the last byte.

Example: bar code data " 555 "
The character string " 0555 " has to be sent to the printer.
A wrong character string " 555 " results in " 5505 ".

## Examples

The following are examples of the printing of bar codes and the command sequences in a hexadecimal format:

Bar code EAN8, 0.5 inch high, smallest width, plain writing LQ

```
1B 10 41 08 00 01 00 06 01 01 01 01 Select bar code
1B 10 42 08 31 32 33 34 35 36 37 40 Print bar code
```

Bar code EAN13, 1 inch high, medium width, plain writing LQ

```
1B 10 41 08 00 02 01 02 04 01 01 01 Select bar code
1B 10 42 OD 31 32 33 34 35 36 37 38 Print bar code
39 30 31 32 40
```

Bar code UPC-A, 2 inch high, largest width, no plain writing

```
1B 10 41 08 01 00 02 04 07 01 01 00 Select bar code
1B 10 42 0C 31 32 33 34 35 36 37 38 Print bar code
39 30 31 40
```

Bar code Code 39, 0.5 inch high, medium width, plain writing LQ

Bar code Interleaved 2/5, 1 inch high, large width, no plain writing

| $1 B$ | 10 | 41 | 08 | 03 | 00 | 01 | 02 | 04 | 04 | 04 | 00 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1B | 10 | 42 | 04 | 31 | 32 | 33 | 40 |  |  |  | Select bar code |  |

Bar code 128 Set A, 0.5 inch high, smallest width, plain writing LQ

```
1B 10 41 08 04 00 00 06 01 01 01 02 Select bar code
1B 10 42 0C 41 30 31 32 33 34 35 36 Print bar code
37 38 39 67
```

## Printing a ZIP Code

Zip Code

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Zip Code | 271667 | 1B 1043 | ESC DLE C |
|  | $\mathrm{p}_{1} \mathrm{n}_{1} \ldots \mathrm{n}_{20}$ | $\mathrm{p}_{1} \mathrm{n}_{1} \ldots \mathrm{n}_{20}$ | $\mathrm{p}_{1}$ DATA |

This command is used for printing a zip code.

1. $\mathrm{p}_{1}$ is the amount of data according to $\mathrm{p}_{1}$ (MSB is invalid) $\mathrm{p}_{1}$ is valid from 01 H to 14 H .
If the value of $p_{1}$ is not within this range, the command will be ignored.

If $p_{1}=1$ is sent together with a checksum, the command will also be ignored.
2. DATA stands for zip code data (MSB is invalid)

Valid data is within the range $0(30 \mathrm{H})$ to $9(39 \mathrm{H})$.
If the DATA is outside this range, the command is invalid.
3. Printing quality is equivalent to 360 dpi .
4. Printing starts when the printer has received the entire command.
5. The checksum can be added by the printer by sending the character "@".
6. If the bar code data extends beyond the right margin, the command will be ignored. In this case, a »CR/LF« (Carriage Return, Line Feed) will be performed.
7. After printing the bar code, the print head is positioned at the end of the first printed line.
8. Height of the upper print process is $21 / 180$ inch, height of the lower print process is $7 / 180$ inch.
9. A high bar is automatically added as start and stop character.
10. Calculating the checksum

All values are added. The deficit to the next digit that can be divided by 10 is the checksum.

Example: bar code data 123456789@
a: $1+2+3+4+5+6+7+8+9=45$
b: next digit which can be divided by 10 is 50
c: $50-45=5$
Checksum is 5

## Example of a 9-digit Zip Code with checksum

```
1B 10 43 0A 31 32 33 34 35 36 37 38 Selection and
3940 Printing of Zip Code
```

## Setting the Print Position

Setting the print position

| Function | Dec. | Hex. | ASCII |
| :--- | :--- | :--- | :--- |
| Setting the Print | 271664 | $1 B 1040$ | ESC DLE @ |
| Position | $\mathrm{P}_{\text {no }} \mathrm{A}_{1} \mathrm{~A}_{2}$ | $\mathrm{P}_{\text {no }} \mathrm{A}_{1} \mathrm{~A}_{2}$ | $\mathrm{P}_{\text {no }} \mathrm{A}_{1} \mathrm{~A}_{2}$ |
|  | $\mathrm{P}_{1} \mathrm{P}_{3} \mathrm{P}_{3} \mathrm{P}_{4}$ | $\mathrm{P}_{1} \mathrm{P}_{3} \mathrm{P}_{3} \mathrm{P}_{4}$ | $\mathrm{P}_{1} \mathrm{P}_{3} \mathrm{P}_{3} \mathrm{P}_{4}$ |

1. The next horizontal position is set.
2. Description of the parameters:
$P_{n o}$ is the amount of data according to $P_{n o}$ (MSB is invalid):
06 H is the default.
The command is invalid, if $\mathrm{P}_{\mathrm{no}}<06 \mathrm{H}$.
$\mathrm{A}_{1}$ determines the type of printing position:
$\mathrm{A}_{1}$ odd = relative printing position from current position.
$\mathrm{A}_{1}$ even $=$ absolute printing position from left margin.
$\mathrm{A}_{2}$ determines the direction of the relative positioning:
$\mathrm{A}_{2}$ odd = backwards
$\mathrm{A}_{2}$ even = forward
$A_{2}$ is invalid, if $A_{1}$ is even-numbered.
$\mathrm{P}_{1} \ldots \mathrm{P}_{4}$ Set printing position:
Low-order half byte is valid (0 ... 9)
High-order half byte is invalid.
The absolute/relative printing position is calculated as follows:

$$
P_{1} * 1000+P_{2} * 100+P_{3} * 10+P_{4} * 1
$$

The unit for positioning is as follows:

| LQ | $1 / 360$ inch |
| :--- | :--- |
| UTL | $1 / 240$ inch |

If the bar code is positioned so that it extends beyond the right margin, printing is suppressed. If the positioning extends the bar code beyond the right margin, a »CR/LF« (Carriage Return/Line Feed) is performed.

## Appendix D: Interface Data

The printer's interface has to be configured according to the specifications of your computer system. This is particularly important when using a serial interface.

One prerequisite for making up an interface cable is basic knowledge about interface signals and wiring. You should also be familiar with the use of soldering irons.

Otherwise the purchase of an interface cable is recommended.

## Parallel Interfacing (Centronics)

In a parallel interface the bits of one byte are transmitted simultaneously via eight separate lines. Additional lines control the flow of data. The bytes are transmitted in succession.

In the printer's menu you can select and configure the items IPrime, Pin 18 and Auto Feed XT.

To connect the printer to the computer you need a Centronics equivalent parallel cable with the following specifications:

Amphenol-plug, 36 pins, 57-30360, AMP 552274-1 or equivalent. Cover AMP 552073-1 or equivalent.

Shielded Beldon cable or equivalent cable with twisted pair conductors. The cable should not exceed 2 m and must be UL and CSA approved.

## Pin Description

| Pin | Signal | Direction | Description |
| :---: | :---: | :---: | :---: |
| 1 | DATA STROBE | To printer | When the signal changes from low to high level, input data is sampled |
| 2-9 | DATA BIT 1-8 | To printer | Input data lines. The High level represents 1 , the Low level represents 0 |
| 10 | $\overline{\text { ACKNOWLEDGE }}$ | From printer | The High level of this signal indicates completion of data input or function operation. |
| 11 | BUSY | From printer | The High level of this signal indicates that the printer cannot receive data. The low level of the signal indicates that the printer is ready for receiving data. |
| 12 | PAPER END | From printer | The High level of this signal indicates that a paper end has been detected. |
| 13 | SELECT | From printer | The High level of this signal indicates that the printer is in the select mode (ON LINE). |
| 14* | AUTOFEED | To printer | In EPSON emulation a Low level of the signal activates the auto line feed. |
| 15 | -- | -- | Not assigned. |
| 16 | 0 V | -- | Signal ground |
| 17 C | HASSIS GROUND | -- | Frame ground |
| 18* | $+5 \mathrm{~V}$ | From printer | + 5-volt supply (max. 50 mA ). |
| 19-30 | 0 V | -- | Twisted pair return for pins 1 to 11. |
| 31 ** | I-PRIME | To printer | Signal Low: Printer controller is initialised. The low level should be held for more than 0.5 ms . |
| 32 | FAULT | From printer | When the paper end is detected this signal changes from High to Low. |
| 33 | 0 V | -- | Signal ground |
| 34 | -- | -- | Not assigned. |
| 35 | -- | -- | Not assigned. |
| 36 | SELECT-IN | To printer | The High level of this signal indicates that the printer can only be selected and deselected using DC1 and DC3 control codes. |

* Pin 14 and 18 can be activated/deactivated by menu item Auto Feed XT or Pin 18.
** The I-Prime signal at Pin 31 is activated by the menu item I-Prime: If you select Invalid the signal will be ignored. With Buffer Print and receiving an I-Prime signal, the printer will be reset after printing the content of the printer buffer. On Buffer Clear the printer will be reset at once and the contents of the printer buffer will be deleted.

Low level: $0,0 \mathrm{~V}$ to $+0,8 \mathrm{~V}$
Signal level
High level: $+2,4 \mathrm{~V}$ to $+5,0 \mathrm{~V}$
Input circuit of DATA STROBE and I - PRIME line.

| Signal | R1 | R2 | C |
| :--- | ---: | ---: | ---: |
| DATA STROBE | $1 \mathrm{k} \Omega$ | $33 \Omega$ | 560 pF |
| I - PRIME | $3,3 \mathrm{k} \Omega$ | $33 \Omega$ | $0,001 \mu \mathrm{~F}$ |
|  | +5 V ? |  |  |

Parallel Data line 1 to 8 (Pin 2 to 9 )

Input Circuit

74LS374 or equivalent

Output Circuit

7407 or equivalent (open collector)

Timing

Testing the Interface

To test the interface connection turn the computer and the printer on (POWER ON). Write the following test programme:

```
10 LPRINT "Everything's okay"
20 LPRINT "1/6 inch line spacing"
30 LPRINT CHR$ (12);: REM Line Feed
```

Type RUN and press the Return key. You will get the following print-out.

Everything's okay
1/6 inch line spacing
If everything is working properly you can start printing.

## RS-232C Serial Interface

In a serial interface the bits of one byte are transmitted consecutively. Additional lines control the flow of data. This type of connection is often used with networks. Using a serial interface large distances can be covered without any disturbances.

When using a serial interface, correct wiring as well as correct setting of the interface parameters (configuration) is of importance. For most applications the default settings are sufficient. Occasionally you might have to change some parameters. Never change values which are not described in your computer or network manual.

The position of jumper plug SP1 should never be changed. If the interface's control program is stored in the microprocessor, SP1 has to connect the two pins close to the interface connection (Position B). If the control program is stored in the EPROM, SP1 has to connect the two pins pointing away from the connection (Position A).

Interface boards may vary in design.

| Pin assignment | Pin | Signal | Direction | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | 1 | Protective Ground, PG |  | Connected to printer's casing. |
|  | 2 | Transmit Data, TD | From printer | Serial signal sent from the printer. |
|  | 3 | Receive Data, RD | To printer | Serial signal received by the printer. |
| * You can set Pin 4, 11 or 20 <br> as flow control line by selecting the menu option Busy Line. | 4* | Ready to Send, RTS | From printer | Indicates that the printer is ready to receive data. |
|  | 5 | Clear to Send, CTS | To printer | Indicates that system is ready to send data to printer. |
| ** You set the evaluation by selecting the menu option DSR Signal (Valid = evaluate, Invalid $=$ ignore $)$. | $6^{* *}$ | Data Set Ready, DSR | To printer | Indicates that the system is ready. |
|  | 7 | Signal Ground, SG | --- | Signal Ground. |
|  | 8-10 |  |  | Not assigned. |
|  | 11* | Flow Control, SSD | From printer | Indicates that the printer is not ready to receive data. |
|  | 12-17 |  |  | Not assigned. |
| *** You may set Pin 18 to $+5 V$ by selecting the тепи option Pin 18. | 18 *** | $+5 \mathrm{~V}$ | From printer | Voltage of +5 Volt (max. 100 mA ). |
|  | 19 |  |  | Not assigned. |
|  | 20 * | Data Terminal Ready, DTR | From printer | Indicates that printer is ready to receive data. |
|  | 21-25 |  |  | Not assigned. |

MARK Polarity: -3 to $-15 \mathrm{~V}: \quad$ LOW $=\mathrm{OFF}=$ Logical " 1 "
SPACE Polarity: +3 to $+15 \mathrm{~V}:$ HIGH $=\mathrm{ON}=$ Logical " 0 "

Input circuit
Equivalent to SN 75154

## Output circuit

Equivalent to SN 75188

Output ।

With this protocol, the printer uses the voltage level on line RTS (4), SSD (11) or DTR (20) to inform the computer whether it is ready to receive data or whether its buffer is full. You can set the Busy line to
one of above mentioned lines by selecting Busy Line. When the printer receive data or whether its buffer is full. You can set the Busy line to
one of above mentioned lines by selecting Busy Line. When the printer is ready to receive data, the Busy-line DTR or RTS is set to high-level (Space). If you select Busy Line to SSD-, line SSD is also set to high-
level (Space) when the printer is ready to receive data. If you select (Space). If you select Busy Line to SSD-, line SSD is also set to high-
level (Space) when the printer is ready to receive data. If you select SSD+, the line is set to low-level (Mark).

With this protocol the printer uses the line Transmit Data TD (2) and the command X-ON (DC1) to inform the computer that it is ready to receive data. The command X-OFF (DC3) is used to inform the computer that the printer buffer is full.

Input

Circuits

Ready/Busy protocol

## X-ON/X-OFF protocol

## Interface Wiring

To indicate that the printer is ready to receive data, select DTR, SSD+, SSD- or RTS in the Busy Line menu.

PC industry standard 25 -pin to 25 -pin

When using this circuit set the menu option Busy Line to DTR and Protocol to READY/BUSY. If you select the X-ON/X-OFF protocol, the setting for Busy Line is irrelevant. The value DSR in the printer тепи must be set to Invalid.

AT industry standard 9 -pin to 25 -pin

When using this circuit set the menu option Busy Line to DTR and Protocol to READY/BUSY. If you select the X-ON/X-OFF protocol, the setting for Busy Line is irrelevant. The value DSR of the printer menu must be set to Invalid.

| Computer |  |  |  | Printer |
| :---: | :---: | :---: | :---: | :---: |
| Protective |  |  |  | Protective |
| Ground |  |  | 1 | Ground |
| RD | 2 | $\leftarrow$ | 2 | TD |
| TD | 3 | $\longrightarrow$ | 3 | RD |
| CTS | 8 | $<$ | 4 | RTS |
| RTS | 7 | $\rightarrow$ | 5 | CTS |
| DSR | 6 | $<\quad \longrightarrow$ | 6 | DSR |
| DCD | 1 | $>$ | 8 | DCD |
| DTR | 4 | $\bigcirc$ | 20 | DTR |
| Signal Ground | 5 |  | 7 | Signal Ground |

It is not possible to give a definitive statement about the connections on computer side. If problems occur using the X-ON/X-OFF protocol, refer to the circuit below. Please note that it is assumed that signal DTR is set to SPACE on the computer.

| Computer |  |  |  | Printer |
| :---: | :---: | :---: | :---: | :---: |
| Protective |  |  | 1 | Protective |
| Ground |  |  | 1 | Ground |
| RD | 2 | $\leftarrow$ | 2 | TD |
| TD | 3 | $\longrightarrow$ | 3 | RD |
| CTS | 8 | $\leftarrow$ | 4 | RTS |
| RTS | 7 |  | 5 | CTS |
| DSR | 6 | $\leftarrow$ | 6 | DSR |
| DCD | 1 | $\leftarrow$ | 8 | DCD |
| DTR | 4 |  | 20 | DTR |
| Signal Ground | 5 |  | 7 | ignal Ground |

AT industry standard 9 -pin to 25 -pin

Ensure that the printer menu option DSR is set to Invalid.

## Interface test

If the menu option Diagnostic
Test is set to Yes and the test plug described below is connected to the serial interface, a test of the serial interface is automatically carried out when the printer is turned on. The result of the test will be printed.

This process is repeated until the printer is switched off. The printer will return to normal operation, when you set the menu option Diagnostic Test to No.

1 Canon DB-25S or equivalent plug

(RS-232C)

If everything is working properly you can start printing.

## RS-422A Serial Interface

The RS-422A interface is often used when data is transmitted over long distances (max. 1.2 km ). The type of data transmission is the same as used by the RS-232C interface, but the pin assignment and the signal levels are different. The transmission parameters of the RS-422A interface (configuration) on the printer side must therefore correspond to the system's parameters in this case as well.

The position of jumper plug SP1 should never be changed. If the interface's control program is stored in the microprocessor, SP1 has to connect the two pins close to the interface connection (Position 1). If the control program is stored in the EPROM, SP1 has to connect the two pins pointing away from the connection (see figure).
The interface cable has to meet the following requirements:
37-pin plug: equivalent to DC-37P
Plug housing: equivalent DC-C1-J16.

Interface boards may vary in design.

| Pin | Signal | Direction | Description |
| :---: | :---: | :---: | :---: |
| 1 | Protective Ground, FG | --- | Connected to the printer's casing |
| $3 *$ 21 | Flow Control, SSD+ <br> Flow Control, SSD- | from printer from printer | With the Ready/Busy protocol this signal indicates that the printer is ready. |
| 4 22 | Send Data, SD+ Send Data, SD- | from printer from printer | Data sent from printer. |
| $\begin{gathered} 6 \\ 24 \end{gathered}$ | Receive Data, RD+ <br> Receive Data, RD- | to printer <br> to printer | Data sent to printer. |
| $7 *$ 25 | Ready to Send, RS+ <br> Ready to Send, RS- | from printer from printer | With the Ready/Busy protocol this signal indicates that the printer is ready. |
|  | Clear to Send, CS+ <br> Clear to Send, CS- | to printer <br> to printer | Data transmission starts when printer confirms the signal as "Space". |
| $11^{* *}$ 29 | Ready to Send, DM + <br> Ready to Send, DM- | to printer <br> from printer | Indicates that data can be sent. The data is received as soon as the printer confirms this signal as "Space". |
| $12 *$ $30 T e r m$ | Terminal Ready, TR+ <br> nal Ready, TR- | from printer <br> from printer | With the Ready/Busy protocol this signal indicates whether the printer is ready to receive data. |
| $\begin{aligned} & 2,5,8,10, \\ & 13 \text { to } 18, \\ & 20,23,26,28 \\ & 31 \text { to } 37 \end{aligned}$ |  |  | Not assigned. |
| 19 | Signal Ground, SG | --- | Signal Ground |

* In the printer menu you can select Pin 3 and 21 (SSD), 7 and 25 (RS) or 12 and 30 (TR) as Busy line.
** Use the menu option DSR Signal to select whether the signal DM is evaluated (option valid) or ignored (option invalid) by the printer.

The signal levels described below are equivalent to the EIA-Standard RS-422A.

MARK Polarity: $-0,2$ to $-6,0 \mathrm{~V}: \quad$ LOW $=$ OFF $=$ Logical " $1 "$
SPACE Polarity: $+0,2$ to $+6,0 \mathrm{~V}: \mathrm{HIGH}=\mathrm{ON}=$ Logical " 0 "

Menu options for
the serial interfaces
(RS-232C,
RS-422A)

| Option | Action |
| :---: | :---: |
| Parity | Is odd or even parity used? odd parity - select Odd. even parity - select Even. no parity - select None. |
| Serial Data 7 or 8 Bits | Is the data format used 7 bit or 8 bit? 7 -bit format - select 7 Bits. 8 -bit format - select 8 Bits. |
| Protocol | Which protocol is used? <br> Ready/Busy Protocol - select Ready/Busy. <br> X-ON/X-OFF Protocol - select X-ON/X-OFF. |
| Diagnostic Test | Do you want to perform an I/F test? Yes - select Yes. <br> Normal printing - select No. |
| Busy Line | Via which line is a Busy signal received? <br> SSD -9 V - select SSD- <br> SSD +9 V - select SSD+. <br> DTR -9 V - select DTR. <br> RTS -9 V - select RTS. |
| Baud Rate | Which baud rate (Bit/s, BPS) is used? 19.2000 Baud - select 19200 BPS. <br> 9.600 Baud - select 9600 BPS. <br> 4.800 Baud - select 4800 BPS. <br> 2.400 Baud - select 2400 BPS. <br> 1.200 Baud - select 1200 BPS. <br> 600 Baud - select 600 BPS. <br> 300 Baud - select 300 BPS. |
| DSR Signal | Does your system send a DSR signal to the printer? <br> Yes - select Valid. <br> No - select Invalid. |
| DTR Signal | When is a DTR signal sent? <br> When turning the printer ON-LINE - select <br> Ready on Select. <br> When turning the printer on - select Ready on Power Up. |
| Busy Time | Which pulse duration is required for a Busy-signal? 200 ms - select 200 ms . <br> 1 second - select $1 \mathbf{s}$. |

When using a serial interface, set the menu options in above table as required by your system's interface.

After selection of the desired options it is recommended to print the menu.

## Transmission Protocols

You can select the two protocols for the serial transmission (interface RS-232C and RS-422A) in the print menu as explained below.

The signal Busy is enabled (Busy), when less than 256 bytes are available in the interface buffer. The signal is disabled (Ready) after 200 ms or 1 second if sufficient buffer capacity has been freed within this period of time. If printing the buffer takes longer than 200 ms or 1 second the signal is disabled (Ready), as soon as sufficient capacity is available.

This protocol uses the ASCII characters DC3 (decimal 19) and DC1 (decimal 17) for the control of data transmission. As soon as there are less than 256 bytes available in the buffer, the code DC3 informs the sender that no more data can be received. The code DC3 is transmitted until no more data is transmitted. If it is possible to print the buffer within 200 ms or 1 second after having sent a DC3 signal, a DC1 signal displays 200 ms or 1 second after sufficient capacity has been freed that the printer is ready to receive data. If it takes longer than 200 ms or 1 second to release the buffer, the code DC1 is sent as soon as sufficient capacity is available.

For both protocols the time period of 200 ms or 1 second can be selected in the menu option Busy Time.

## Connections of the RS-422A Interface

In the RS-422A interface, the incoming and outgoing signals are connected to the ports via differential circuits. Therefore two lines are required for each signal to be transmitted. The inverted signals are identified with " + " and the non-inverted signals are identified with "-".

Four lines are required for this connection, two for the data sent to the printer and two for the status message sent from the printer to the computer.

Ready/Busy

## X-ON/X-OFF

The polarity of the two lines required for each signal is particularly important. A connection with the signal ground between host and printer is not required.

As it is not possible to list all the different RS-422A- interface boards with the different pin assignments and port identifications ("+" and "-" for inverted signals or vice versa), only example circuits with inverted polarity are listed below. The required configuration of the computer is explained in detail. If SSD is used as Ready/Busy line the polarity of the ports "+" and "-" can be selected in the printer menu, where SSD+ is the polarity of the ports TR and RS (see diagram 2). If the ports SSD+ and SSD- are reversed, you have to select the option SSD-. If the printer prints data which is in no way similar to the data sent by the host, the polarity of the ports RD+ and RDmay be reversed.

The wiring of the dual serial interface board HP 24541B with the RS-422A interface of the printer is described as a circuit example. With this interface board the mode RS-232C or RS-422A can be used. For further information about the configuration of this board see the manual of the board.

Ready/Busy-Line (printer): SD
HP 24541B Printer Menu Settings

In this circuit (connection of a HP 24541B interface board with RS-422A-Interface of the printer) the ports SD.A, Pin 9 and SD.B, Pin 10 are connected to the ports RD+, Pin 6 and RD-, Pin 24 of the printer interface. These are the two lines for the transmission of the print data.

The two lines for the Ready/Busy-Signal are created by connecting ports CB (CTS), Pin 5 and RD.B, Pin 18 to the ports TR+, Pin 12 and TR-, Pin 30 of the printer interface. Additionally a connection to CC (DSR), Pin 6, is established on the host side from CB (CTS), Pin 5.

Looking at the two Ready/Busy-lines please note the following: although the port RD.B, Pin 18 on the host side is specific for the RS422A interface, the second line is connected to the ports CB (CTS), Pin 5 and CC (DSR), Pin 6 of the RS-232C interface. This ensures the correct transmission of data with many applications, but it cannot be guaranteed for all applications.

When printer and software status signals X-ON and X-OFF are evaluated by an application while this circuit example is used, the correct data transmission with this type of interface board on the host side is not possible.

Protocol: X-ON/X-OFF
Printer status line: TD

In this circuit example (connecting a HP 24541B interface board with the RS-422A interface of the printer) the ports SD-A, Pin 9, and SD.B, Pin 10 are connected to ports RD+, Pin 6 and RD-, Pin 24 of the printer interface, as shown in example 6. In this circuit example (HP 24541B interface board connected to the RS-422A interface of the printer) the ports SD.A, Pin 9 and SD.B, Pin 10 are connected to the ports RD+, Pin 6 and RD-, Pin 24 of the printer interface. These are the two transmission lines for the print data.

The two lines for the printer status are established by connecting the ports RD.A, Pin 3 and RD.B, Pin 18 with the ports of the printer interface TR+, Pin 12 and TR-, Pin 30.

Please note the Ready/Busy-lines in this circuit: although port RD.B, Pin 18 on host side is specific for the RS-422A interface, the second line is connected to port RD.A, Pin 3 of the RS-232C interface. This ensures correct transmission of data with most applications, but it cannot be guaranteed for all applications.

If an application is confused by the fact that the software printer signals X-ON and X-Off are also sent to port RD.B, Pin 18 with dual function for software and hardware signals, the correct transmission of data with this interface board on host side is not possible.

## Interface Test

You can start a self test of the serial interface by using a test loop plug. The following plug is required for an interface test of the RS422A interface:

If the menu option Diagnostic Test is set to Yes and the test loop plug is connected to the serial interface, a self test is carried out automatically. The result of the test will be printed.

This process is repeated until the printer is turned off. The printer will return to normal printing operation and is ready to receive data, when the menu option Diagnostic Test is set to No.

Canon DC-37P or equivalent plug

(RS-422A)

To set the printer to menu mode while Diagnostic Test is set to Yes, hold the MENU key down while switching the printer on.

## Coresident RS-232C / Current Loop Interface

The arrangement of a short-circuit jumper on the printed circuit board determines whether this interface board is used as RS-232C or Current Loop interface. Both modes allow for three transmission protocols. The protocols are determined by the arrangement of jumpers or can be selected in the printer menu.

The following pages contain information about the correct jumper assignment and the correct menu selections for each mode as well as general technical details and information about transmission protocols.

Interface boards may vary in design.

Technical data

[^0]Term

| Interface type | RS-232C/Current Loop coresident |
| :--- | :--- |
| Data transmission | Serial (Start/Stop Synchronisation) |
| Transmission rate (bit/s) | $110,150,300,600,1200,2400, ~ 4800$, <br> $9600 \mathrm{bit} / \mathrm{s}$ |

| Number of data bits | 7 or 8 Bits* |
| :--- | :--- |
| Parity | Even, odd or no parity |

| Term | Description |
| :--- | :--- |
| Number of stop bits | one or more bits |
| Transmission protocols | three protocols |
| Interface connection | on printer side:25-pin plug, DB-25S <br> or equivalent, <br> 25-pin plug, DP-25P <br> or equivalent |
| Interface signals | see table for interface signals |

The interface signals, pin assignment and circuits of the RS-232C coresident interface are not mentioned again here, as they are like the simple RS-232C interface, described earlier in this chapter..

## Current Loop Interface

| Pin | Signal | Direction | Description |
| :---: | :--- | :---: | :--- |
| 1 | Protective Ground, PG | --- | connected to the <br> printer's casing |
| $2-6$ | --- | --- | not assigned |
| 7 | Signal Ground, SG | --- | Signal Ground |
| 8 | --- | --- | not assigned |
| 9 | Current Loop, D+ <br> Receive loop | to printer | printer receive signal <br> for serial data |
| 10 | Current Loop, D- <br> Receive loop | to printer | return line for D+ signal |
| 11,12 | --- | --- | not assigned |
| 13 | Signal Ground, SG | --- | Signal Ground |
| $14-17$ | --- | not assigned |  |
| 18 | Current Loop, B+ <br> Send loop | from printer | printer send signal for <br> serial data * |
| 19 | Current Loop, B- <br> Send loop | from printer | return line for D+ signal |
| $20-25$ | --- | --- | not assigned |

* The functions of the circuit B+ -> B- differ depending on the protocol used. When selecting a protocol the functions are adjusted automatically:
- Ready/Busy Protocol: indicates that the printer is not ready to receive data. This type of protocol is also used for error detection.
- X-ON/X-OFF Protocol: serial data from printer (the printer only sends the codes DC1 and DC3).
- Centronics Blocked Duplex Protocol: serial data from printer (the printer only sends the codes ACK and NAK).

Interface selection
The selection of different interface modes, the transmission protocol and the number of lines used for the transmission is determined by the arrangement of the five jumpers SP1 to SP5, as shown in the table below, and by the menu settings of the printer.

You select the different modes by setting short-circuit jumper SP2 appropriately. The menu setting of the printer determines whether the Ready/Busy protocol or X-ON or X-OFF protocol is used.

The Centronics Blocked Duplex transmission protocol can only be selected by setting short-circuit jumper SP1 appropriately. The functions of the short-circuit jumpers and the menu settings are listed in the following table.

## Functions of short-circuit jumper and protocol selection in printer menu

| Interface | Protocol | Power <br> Source | Number of <br> Lines | SP1 | SP2 | SP3 | SP4 | SP5 | Menu Settings |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RS-232C | Ready/Busy | - | - | A | A | A | A/B A/B | Ready/Busy |  |
| RS-232C | X-ON/X-OFF | - | - | A | A | A | A/B A/B | X-ON/X-OFF |  |
| RS-232C | CBD* | - | - | B | A | A | A/B A/B | $* *$ |  |
| Current Loop | Ready/Busy | passive | 2 | A | B | B | A | A | Ready/Busy |
| Current Loop | Ready/Busy | passive | 4 | A | B | C | A | A | Ready/Busy |
| Current Loop | Ready/Busy | active | 2 | A | B | B | B | A | Ready/Busy |
| Current Loop | Ready/Busy | active | 3 | A | B | C | B | B | Ready/Busy |

| * CBD $=$ Centronics Blocked Duplex |  |  |  |  |  |  |  |  |  |

Rearrange the jumpers only when the printer is turned off.

The component layout diagram of the printed circuit board for the coresident serial RS-232C/Current Loop interface and the arrangement of the jumpers (SP1-SP5) is shown in the following figures.

Component layout diagram

## Transmission Protocols

The following pages explain the transmission procedures of the three different types of protocol.

Ready/Busy
Protocol

If the printer is unable to receive data, the current loop for signal B + opens when the $50 \mu$ s following the stop bit of the last character is received.

Timing Diagram

Block format: any
Error Message: a parity error is displayed as @ (4OH).
Display of Busy Status: the minimum interval during which the printer is unable to receive data is selected in the Busy Time menu. The interval for the Busy signal can be set to either 200 ms or 1 second.

The printer is not ready to receive data if the capacity of the interface buffer drops below 521 bytes. The printer is ready to receive data again when 512 bytes are free in the printer buffer after 200 ms or 1 s have elapsed. If the memory threshold of 512 bytes is not reached during the busy status of 200 ms or 1 s , the printer only signals its ability to receive data when more than 512 bytes of memory are available.

Timing diagram

Block format: unblocked
Error message: a parity error is displayed as @ (40H).
Display of Busy Status: as soon as the capacity of the interface buffer drops below 512 Byte, the printer sends a DC3 signal to the sender indicating that no data can be received. The signal DC3 is only sent as long as data is sent to the printer (see note).

If after 200 ms or $1 \mathrm{~s}, 512$ bytes or more memory is available, the printer sends the signal DC1 to the sender indicating that it is ready to receive data. The signal DC1 is only sent as soon as 512 Byte or more memory is available. (Select the setting 200 ms or 1 s in the Busy Time menu.)

## Timing diagram

* If data is sent while the printer is unable to receive data, the code DC3 is sent every time data arrives at the printer.

## Centronics Blocked Duplex (CBD) Protocol

Block format: STX + Data + ETX
Data outside a block is ignored.
Error Detection:
A block was transmitted correctly: after having received an ETX signal an ACK signal is transmitted to the sender confirming that the data was received without any errors.

A block was transmitted incorrectly: after having received an ETX signal a NAK signal is transmitted to the sender indicating that an error occured during the transmission. On receipt of the NAK signal the block has to be transmitted again.

Display of Busy Status: None
If no error was detected:

## If an error was detected:

## Data for Bitmap Graphics

The above mentioned timing diagrams are only valid as long as the printer is in text mode. The start character STX and the stop character ETX are only interpreted as control characters of the CBD transmission protocol in text mode. Please note the following if you want to print bitmap graphics:

Maximum length of block: 0 to 1 KByte (8 KByte)
The maximum length of a block of data equals the capacity of the interface's printer buffer. This capacity should not exceed 1 KByte.

If a parity error occurs or if the buffer overflows during the transmission, the block causing the error is ignored, a NAK signal is sent and the block is requested again.

## Connections of the Current Loop Interface

Please note that closed loops are created when using a current loop interface in order to connect the sender (host) to the receiver (printer).

Connections with one or more current loops can also be produced. If only one current loop is used, only the blocked Centronics Blocked Duplex transmission protocol can be used. When using only one circuit, the receiving and sending circuit of the host and printer must be connected in series. It is therefore not possible to receive print data and send status messages simultaneously. Each current loop has to contain a power source which can be made available by either the host or the printer. Several power sources are not allowed within one loop.

Only example circuits are listed below as it is not possible to show the numerous Current Loop interfaces with the different circuits. The required printer configuration is explained in detail.

As an example, the connection of the IBM Asynchronous Communication Adapter to the Current Loop interface of the printer is described. With this adapter the operating mode can be set to RS-232C interface or Current Loop interface. For further information about the configuration of this adapter see IBM Personal Computer Technical Reference Manual, P/N 6936844,.

Power source receive loop: Printer
Power source send loop: Printer

Host Printer | Assignment of |
| :---: |
| Short-Circuit Jumper |

Connection: 2-wire
Power source receive loop: none
Power source send loop: Host

In combination with this circuit you can only use the Centronics Blocked Duplex protocol in order to ensure the correct transmission of data.

Connection: 2-wire
Power source receive loop: Printer Power source send loop: None

Host Printer | Assignment of |
| :---: |
| Short-Circuit Jumper |

In combination with this circuit you can only use the Centronics Blocked Duplex protocol in order to ensure the correct transmission of data.

One must differentiate between 2-wire-connections (see diagram 13 and 14) and circuits in which only the receive loop D+ -> D- of the printer is connected. Strictly speaking these are 4 -wire circuits (see diagram 8 to 11), in which the send loop B+ -> B- of the printer is not integrated in the circuit. It is therefore not possible to control the printer status (Ready to Receive or Receive Buffer Full).

This circuit is often used by measuring systems and unit controls to which a log printer is connected. Received data is printed immediately without having to store it in the buffer. Even if a low transmission rate is used, no data is lost.

To ensure a constant power supply of 15 mA to 20 mA , the wire resistance as well as the number of electronic components in the current loop has to be considered. This means that the appropriate current control resistors of the power source used have to be adjusted to the prevailing electrical conditions on either the printer or the computer.
The above mentioned procedures should only be carried out by trained technicians referring to the technical documentation (circuit diagrams etc.) of the printer interface and the computer interface.

Diagram 14

Power source receive loop: Host Power source send loop: Printer

This connection is equivalent to circuit diagram 10.

| IBM Asynchronous | Printer | Assignment of <br> Short-Circuit Jumper |
| :--- | :---: | :---: |

Connection: 3-wire
Power source receive loop: Printer Power source send loop: Printer

Diagram 17

This connection is equivalent to circuit diagram 12.

This connection is equivalent to circuit diagram 12. A circuit according to diagram 13 is not possible with the IBM Asynchronous Adapter, as the voltage supplied by this adapter's power source is not sufficient for the interfaces. Please refer to the section »Technical Note« earlier on in this chapter.

You can use the Centronics Blocked Duplex protocol only in combination with above circuit.

## Interface Test

Connect the test loop plug described below to the interface in order to perform an interface test.

Select Yes in the Diagnostic Test menu to enable the interface test of the printer.

- Connect the test loop plug to Canon DB-25S or equivalent the connector of the serial interface.
- Connect short-circuit jumper SP2 to side B and SP3 to side B to select the Current Loop operating mode. Plug SP4 into side B and SP5 into side A to activate the interface connection with two transmission lines and a power source on the printer side. This circuit is equivalent to diagram 14.

(Current Loop)
- Turn the printer on. The printer buffer, interface driver and receive loop functions on the serial interface are now tested. On completion of this test all characters are printed in a test pattern.

The result is printed as follows:
The message CORESIDENT SERIAL I/F F/W xx.xx YR40641578 LOOP TEST will be printed, where $x x . x x$ is replaced by the current ROM version.

The printer checks the buffer and prints RAM = GOOD, if no error occurred or RAM $=$ BAD, if an error occurred during the memory test.

The signal logic is also tested. The message CURRENT LOOP I/F = GOOD is printed if no error was detected. If an error occurred, the message CURRENT LOOP I/F = BAD is printed.

Contact your local dealer, if the message CURRENT LOOP I/F = BAD is printed.

From the printer's send loop, hexadecimal characters from 20 H to 7FH are transmitted into the receive loop. These characters are stored in the buffer and printed.

This process is repeated until the printer is turned off. The printer returns to normal operation when you set the Diagnostic Test menu option to No.

To set the printer to menu mode while the Diagnostic Test option is set to Yes, hold the menu key down while switching the printer on.

## Appendix E: Paper formats and print areas

## Continuous Paper

Continuous paper must be punched and folded to sheet length (a). You can use up to four layers of paper (including the original when using duplicating paper).

- The width (b) must be between 76.2 and 254 mm for small printers and between 76.2 and 406.4 mm for large printers.
- You can use paper lengths between 76.2 and 431.8 mm .
- Do not print within 8.9 mm (corresponding to four lines at six lpi) before and after a perforation in order to avoid printing on the perforation.
- For (g) you can select a distance of 6.35 to 22.2 mm to the transportation holes by moving the spiked cylinders. Paper with binding holes must not be printed on the left of these holes.
$\mathrm{a}=76,2$ to $431,8 \mathrm{~mm}$
b = 76,2 to $254 \mathrm{~mm} /$ 76,2 to 406,4 mm
$\mathrm{c}=$ printable width
$\mathrm{d}=16,9 \mathrm{~mm}$
$\mathrm{e}=12,7 \mathrm{~mm}$
$\mathrm{f}=6,35 \mathrm{~mm}$
$\mathrm{g}=6,35$ to $22,2 \mathrm{~mm}$
$h=12,7 \mathrm{~mm}$

## Format

- When using single-layer paper the respective first character can be printed at a distance of 6.35 mm to the transportation holes. To avoid printing on the perforation maintain a distance of 12.7 mm to the perforation.
- When using multiple-layer paper do not print within 12.7 mm of the transportation holes to avoid an impairment of the print quality by glued surfaces.

## Continuous paper without duplicate

The weight must be between 45 and $90 \mathrm{~g} / \mathrm{m}^{2}$, the paper thickness must not exceed 0.36 mm .

## Multiple sets, automatically duplicating

Multiple sets, automatically duplicating, print-sensitive or duplicating paper with a weight between 34 and $41 \mathrm{~g} / \mathrm{m}^{2}$ can be used.

## Multiple sets with carbon

The weight must be between 38 and $45 \mathrm{~g} / \mathrm{m}^{2}$. The paper thickness must not exceed 0.36 mm . A carbon paper must have a maximum thickness of 0.03 mm

## Paper Thickness

Perforation

When using duplicating paper one original and up to 3 duplicates can be produced.

The paper thickness depends on the feeding direction of the paper. The paper thickness must not exceed a total of 0.36 mm , if the paper is fed from the reverse side of the printer. If the paper is fed from the bottom side of the printer the thickness must not exceed 0.44 mm . Labels for OCR-readers are an exception.

- A perforation must withstand the fast transportation speed and must be easily separable.
- The bridges of a perforation must be firmly joined and not be separated at any point. Please note that a separated perforation tears easily.

$a=19,5 \mathrm{~mm}$
$b=6,35 \mathrm{~mm}$
c $=50,8 \mathrm{~mm}$
$\mathrm{d}=3$ to 4 mm

## Horizontal Perforation

Within a range of 1 to 2 mm there must not be any hole at the top or lower edge of the paper.

## Vertical Perforation

If a vertical perforation is within the print area adjust the printer so that you do not print 6.35 mm to the left and right of the perforation (b). Avoid holes at the intersection of vertical and horizontal perforation.

## Further information

$a=88,9$ to $216 \mathrm{~mm} /$ 88,9 to 363 mm
b $=76$ to 420 mm
c = printable length
d = printable width
$\mathrm{e}=\mathrm{min} .6,35 \mathrm{~mm}$
$\mathrm{f}=\mathrm{min} .4,35 \mathrm{~mm}$
$\mathrm{g}=6,35$ to $28,6 \mathrm{~mm}$
$\mathrm{h}=\mathrm{min} .6,35 \mathrm{~mm}$

Format

- The transportation holes must be exactly round and precisely punched. The rim may be toothed.
- The paper must be folded alternately along the horizontal perforation. Do not use paper lying in loops because problems with the paper feed may occur. Also avoid waves and wrinkles (mainly occurring with the first and last sheets of a new paper stack). Do not use these sheets.
- If the continuous paper is separated along the horizontal perforation, the separation rim must be straight, i.e. separation rims and corners must not be wavy or wrinkled.

## Cut sheets

The standard paper format is DIN A4 (210 x 297 mm ). Other paper formats (DIN A5, DIN B5, etc.) can also be used.

- The paper width (a) is between 88.9 and 216 mm (small printer) and between 88.9 and 363 mm (large printer).
- The paper length (b) is 76 to 420 mm .
- The measurements for the non-printable area $(\mathrm{g} / \mathrm{h})$ are between 6.35 and 28.6 mm . For paper with a width of 304.8 mm the size must be between 19.05 and 28.6 mm .

When using a cut sheet feeder (CSF), the cut sheet formats are different:

- The paper width (a) is between 182 and 216 mm (small printer) and between 182 and 364 mm (large printer).
- The paper length (b) is between 182 and 356 mm (small printer) and between 182 and 364 mm (large printer).

You can use paper weights between 45 and $90 \mathrm{~g} / \mathrm{m}^{2}$. When using cut sheets via the cut sheet feeder (CSF), the paper weight must not be less than $60 \mathrm{~g} / \mathrm{m}^{2}$ and must not exceed $90 \mathrm{~g} / \mathrm{m}^{2}$.

## Labels (on single sheets)

- The paper width (a) is between 88.9 and 216 mm (small printer) and between 88.9 and 363 mm (large printer).
- The paper length (b) is between 76 and 420 mm .
- The non-printable left margin is between 6.35 and 28.6 mm . For paper with a width of 304.8 mm the size must be between 19.05 and 28.6 mm .

Weight
$a=88,9$ to $216 \mathrm{~mm} /$
88,9 to 363 mm
b $=76$ to 420 mm
$\mathrm{c}=$ printable length
d = printable width
$\mathrm{e}=\mathrm{min} .6,35 \mathrm{~mm}$
$\mathrm{f}=\mathrm{min} .4,35 \mathrm{~mm}$
$\mathrm{g}=6,35$ to $28,6 \mathrm{~mm}$
$\mathrm{h}=\mathrm{min} .6,35 \mathrm{~mm}$

Format

## Weight

Further information
$\mathrm{a}=\mathrm{min} .6,35 \mathrm{~mm}$
$b=\min .2,54 \mathrm{~mm}$
$c=\min .2 \mathrm{~mm}$
$d=\min .6,35 \mathrm{~mm}$
$\mathrm{e}=12,7 \mathrm{~mm}$
$\mathrm{f}=\mathrm{min} .6,35 \mathrm{~mm}$
$r$ = label corners must be rounded off

The condition of the support paper must ensure that the label is not removed when the paper is turned about $180^{\circ}$ around a cylinder with a diameter of 27 mm . The labels must not detach during the process of printing or paper feeding. The support paper must be as bendable as possible. No labels should be removed from the support paper. A label must not have wrinkles or waves in the feed direction.

## Labels (on continuous paper)

Labels on continuous paper must only be fed from the bottom side of the printer (with additional transportation unit for continuous paper).
The support paper for labels can be processed with a weight of 33 to $41 \mathrm{~g} / \mathrm{m}^{2}$. The overall thickness of 0.28 mm however must not be exceeded.

- The width of the label paper must be between 76.2 and 254 mm (small printer) and between 76.2 and 406.4 mm (large printer).
- You can use paper lengths between 76.2 and 431.8 mm .
- Do not print within 8.9 mm (corresponds to 5 lines at 6 lpi) before and after a perforation to avoid printing on the perforation.

The support paper of the labels can be processed with a weight of 33 to $41 \mathrm{~g} / \mathrm{m}^{2}$. The overall thickness of 0.28 mm must not be exceeded.

- The condition of the support paper must ensure that the label is not removed if the paper is turned about $180^{\circ}$ around a cylinder with a diameter of 27 mm .
- The labels must not detach during the process of printing or paper feeding.
- The support paper must be as bendable as possible.
- No labels should be removed from the paper.
- A label must not have wrinkles or waves in the feed direction.
- The corners of the labels must be rounded off.
- A hole in the label corresponding to the horizontal perforation of the paper must be identical with the perforation. Holes must not appear within a range of 1 to 2 mm from both edges.
- There should not be any holes within 0.5 to 1 mm length from the upper right or left edge.

## Glossary

Most terms are also explained in the context of the different sections. You will find these explanations via the index.

ASCII Character Set (American Standard
Code for Information Interchange)
A standardized code for the character representation in computers which comprises as a 7-bit character set including 128 letters, figures, special characters and control characters.

## Backspace (BS)

The print head is moved one character position to the left.

## Bar Code

A small area with bars of different widths containing coded information. A bar code is grasped with optical readers. Depending on the printer type a bar code is part of the included fonts or can be printed as graphics.

## Baud Rate

The speed of serial interfaces is given in steps per seconds, the unit is one baud. Common interfaces transmit exactly one bit per step. In this case the step speed corresponds to the data transmission rate (having the unit »bits per second«, bps).

## Bidirectional Print

In the first line the print head moves from the left to the right, in the second line the direction is vice versa. This increases the print speed.

## Bit

The smallest information unit in data processing. It can have the value 0 or 1 . Eight bits are combined to one byte. One byte can represent 256 different values.

## Bit Map

A bit map is made up of single dots which can be black or white. Bit maps are transmitted line-by-line ( 9 or 24 dot lines each) to the printer. Its resolution is decisive for the smallest dot size.

## Boldface

Characters are printed twice to emphasize them. The second printed dot is slightly shifted to the right.

## BS

See »Backspace«.

## Buffer

A buffer is a memory area which is reserved (mostly temporarily). Apart from resident buffers there are variable (dynamic) buffers. Their size is automatically adapted to the requirements.

## Byte

A group of 8 bits combines to one byte from which can represent a character or graphic data. A byte can have a value between 0 and 255.

## Carriage Return (CR)

The print head is returned to the beginning of the line. Mostly the carriage return is combined with a line feed to move the print head to the next line.

## Centronics Interface

This interface is mainly used to connect computers and printers. The Centronics interface is a parallel interface. The eight bits of one byte are transmitted simultaneously via eight data lines. Other signal lines control the data transmission (handshake).

## Character

A character is an element from a defined character set. Printable and non-printable characters (control commands) are distinguished.

## Character Set / Code Page

In a character set (= all representable characters) it is determined which characters (letters, figures, special characters) are available.

## Character Spacing

Fonts with set character spacing and proportional fonts are distinguished.

## Colour Ribbon

The colour ribbon is a continuous strip of inked fabric which is re-inked within the cartridge. By the stroke of the needle the ink is transmitted to the paper. See also »dot matrix printer<.

## Compatibility

Compatibility is the »harmony« of different systems with each other. Compatible systems ensure an easy exchange of programs or devices without major modifications.

## Continuous Paper

For the printing of lists, labels or duplicates mostly continuous paper is used which is taken from the stack (folded in Z-shape). Continuous paper is transported via the spikes of the transportation unit which locks into the lateral holes of the paper.

## Control Characters

These non-printable characters of the ASCII character set activate functions such as form feed, line feed or carriage return. The command»Escape« activates command sequences (Escape commands).

## cpi (characters per inch)

The pitch for non-proportional fonts is stated in characters per inch.

## cps (characters per second)

The printing speed is measured in characters per second.

## CR

See »Carriage Return«.

## CSF

See »Cut Sheet Feeder«.

## Cut Sheet

Cut sheets are fed between the platen and different transport rollers.

## Cut Sheet Feeder (CSF)

By means of a cut sheet feeder the printer can process a stack of cut sheets without having to re-feed every single sheet. Cut sheet feeders with two feeding devices are also available.

## Decimal

A term for a digit of the decimal system (based on the number 10).

## DIP Switch (Dual Inline Package)

A DIP switch is an electronic component, often a series of small switches. It serves to preset the printer.

## Dot

The smallest addressable unit in bit maps. One bit is assigned to every dot. The bit can have the value 1 for black (set dot) or 0 for white (non-set dot).

## Dot Matrix Printer

The print characters are made up of dots (dot matrix). The needles strike the colour ribbon onto the paper and produce a dot. Depending on the number of pins $9-18$ - and 24 -pin printers are distinguished. The needles are arranged in one or two columns. Common needle diameters are 0.3 mm for 9-pin printers and 0.2 mm for 24 -pin printers The resolution depends on the needle size, it defines the typeface.

## dpi (dots per inch)

The graphic resolution is given in dots per inch. Usual resolutions for needle printers are between 60 and 288 dpi.

## Driver

See »Printer Driver«.

## Duplicates

With print-sensitive paper or duplicating paper with carbon duplicates (copies) can be made, because the printing is performed by stroke. Three duplicates for 24 -pin printers and four duplicates for 9 -pin printers are common.

## Emulation

Emulation means that the functions of a device are imitated, for example the printer functions of the IBM ProPrinter. In general, your dot matrix printer offers additional commands and printer functions apart from the given options which can be made available by selecting the correct printer driver.

## Epson Emulation

In the selected emulation the printer imitates the chosen printer type and performs the print commands of an Epson LQ printer (24 needles), for example.

## Escape (ESC)

Escape is a non-printable control character of the ASCII character set (decimal 27, hexadecimal 18). Most print commands are initiated by the Escape-character.

## FF

See »Form Feed«.

## Font

A font is defined by the combination of different characteristics such as print quality or character spacing.

## Form Feed (FF)

This printer command terminates one page and outputs it. By pressing the FF-key a form feed can be performed manually.

## Hexadecimal

A term for a digit of the hexadecimal system (with a base of 16). The figures 0 to 9 and additionally the letters A to F (for the numbers 10 to 15) are used.

## IBM Emulation

In the selected emulation the printer imitates the chosen printer type and can perform the print commands of the IBM ProPrinter, for example.

## Impact Printer

A printer which transmits the characters to the paper by mechanical strokes. See also »dot matrix printer«.

## Inch

One inch is equivalent to 2.54 centimetres. Technical data (resolution, for example) is given in inches.

## Interface

An interface is a connection between computer and printer to perform the data exchange. Interfaces can be parallel or serial: parallel interfaces (Centronics) transmit data simultaneously byte-by-byte. Serial interfaces transmit data successively bit-by-bit.

## Italics

A type style with characters that slant upwards to the right.

## KByte

1024 bytes are one kilobyte.

## Landscape

The paper is printed parallel to the longitudinal edge.

## Letter Quality (LQ)

This font is only available for 24-pin printers because it requires a high resolution of the characters due to small needle diameters. By additional dots between the character matrix a uniform typeface is achieved. The print speed is reduced.

## Line

A line is a horizontal sequence of characters. The width of a line is defined by the right and the left margin (beginning of the line). The line spacing (lpi, lines per inch) determines the height of a line.

## Line Feed (LF)

This printer command transports the paper one line ahead. By pressing the LF-key a line feed can be performed manually. Most times a carriage return is also performed to move the print head to the beginning of the line.

## Line Spacing

Common line spacing for the print of characters are 6 and 8 lines per inch (lpi). When printing graphics the selected line spacing must ensure that the lower needles adjoin the upper needles of the next line.

## lpi (lines per inch)

The vertical distance of the print lines is given in lines per inch. Common values are 6 or 8 lpi.

## Main Internal Storage (Random Access Memory, RAM)

In this write-read memory (random access memory) the data received is stored and prepared for line-by-line printout. Depending on the type the printer memory can be enlarged with additional modules and therefore relieve the computer. The contents of the RAM are lost, when the printer is switched off.

## Matrix Printer

The characters are made up of a matrix of single dots. See »dot matrix printer«.

## MByte

1024 bytes are one megabyte.

## Memory

See »Main Internal Storage/RAM«.

## Menu

By means of the menu you may select most of the functions of your printer such as paper format and emulation. The menu is selected via the operating screen.

## Near Letter Quality (NLQ)

This font is available for most 9-pin printers, but it does not reach the print quality of letter quality.

## OCR (Optical Character Recognition)

The OCR-code consists of exactly defined characters which can be read by every OCRdevice.

## Off-line

In this state the printer no longer receives data and is on stand-by. In the off-line mode you can modify the menu setting.

## On-line

In this operating state data can be received, processed, and printed.

## Parallel Interface

Connection element to transmit data between printer and computer. In a parallel interface the eight bits of one byte are transmitted simultaneously via eight data lines. Other signal lines control the data transmission (handshake).

## Parameter

Most commands require additional variables which are mainly figures. These parameters are given either as printable ASCII characters or as decimal or hexadecimal figures.

## Pitch

See »срі«.

## Platen

The platen transports the paper and acts up as a pad for the stroke of the needles. See also »dot matrix printer«.

## Port

A port is an interface of the computer or printer to exchange data.

## Printer Driver

A printer driver is a kind of »translator« to convert the text and graphic commands of a software program into a language understandable for the printer.

## Print Head

The print head comprises the needles which strike the ribbon onto the paper. See also »dot matrix printer«.

## Program

The operating system controls the basic functions of the computer such as input, output, and system administration. Word processors, spreadsheets or graphic programs can be operated by means of application programs.

## Proportional Font

Each character occupies solely the space of its actual width. »l« requires less space than »m«, for instance. By using proportional fonts documents get a font-like, professional look. See also »set character spacing«.

## Protocol, Handshake

A protocol secures the data transmission. Depending on the interface the printer outputs a message by control characters or separate signal lines that the receiving memory is full and is able to ensure a correct data reception and transmission.

## Random Access Memory (RAM)

See »Main Internal Storage«.

## Reset

Systems (computer, printer) are returned to their initial state.

## Resident

A term used in data processing with respect to contents of the RAM.

## Resolution

The resolution of the print depends on the pin diameter of the print head. The resolution is mostly measured in dots per inch (dpi). For graphics the resolution varies from 72 dpi (9-pin printer) up to 300 dpi (24-pin printer).

## ROM (Read-Only Memory)

In this read-only memory which cannot be changed the firmware - the control program of the printer - is stored (emulation and control of the printing mechanism).

## RS-232C Interface

A serial interface according to an American standard. It corresponds to the international ITU standard V. 24 in conjunction with V. 28 and German standard DIN 66020.

## Serial Interface

A connection for data transmission (successively bit-by-bit) between printer and computer. Serial interfaces are suited for longer distances. See also »RS-232C«.

## Set Character Spacing

Similar to typewriter fonts every character occupies the same space regardless of its actual width. See also proportional fonts. The character spacing is given in characters per inch (cpi).

## Shift-Key

By pressing this key a second key function is activated.

## Transportation Unit

It transports continuous paper safely and exactly. The spikes of the transport rollers grip the punched holes of the paper to push it or pull it.
For pushing, the transportation unit feeds the continuous paper from the reverse or bottom side through the printing mechanism.

For pulling, the transportation unit pulls the paper from the top side from the printing mechanism.

## Unidirectional Print

The printer prints only in one direction (from the left to the right). Especially suited for the precise print of graphics.
