HEWLETT  PACKARD

## CERTIFICATION

*The Hewlett-Packard Company certifies that this instrument was thoroughly tested and inspected and found to meet its published specifications when it was shipped from the factory. The Hewlett-Packard Company further certifies that its calibration measurements are traceable to the U.S. National Bureau of Standards to the extent allowed by the Bureau's calibration facility.*

## WARRANTY AND ASSISTANCE

This Hewlett-Packard product is warranted against defects in materials and workmanship. This warranty applies for one year from the date of delivery, or, in the case of certain major components listed in the manual, for the specified period. We will repair or replace products which prove to be defective during the warranty period provided they are returned to Hewlett-Packard. No other warranty is expressed or implied. We are not liable for consequential damages.

Service contracts or customer assistance agreements are available for Hewlett-Packard products that require maintenance and repair on-site.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office.

**SECTION IX D  
TIMER/COUNTER**

**5304A**

**SERIAL PREFIX: 1212A00467**

This section applies directly to HP Model 5304A, Timer/Counters having serial prefix number 1212A00467, and must be inserted into the 5300A Measuring System Manual.

**NEWER INSTRUMENTS**

This Section with enclosed "Manual Changes Pages" applies directly to HP Model 5304A Timer/Counters having prefix numbers above 1212A00467.

**OLDER INSTRUMENTS**

Changes required to back-date this Section for older instruments are in Section IX D, Subsection VII.

## **SECTION IX D**

### **5304A TIMER/COUNTER**

#### **SUBSECTION I**

#### **GENERAL INFORMATION**

##### **9D-1-1. INTRODUCTION**

##### **9D-1-2. Description**

9D-1-3. The Hewlett-Packard Model 5304A/Timer Counter, when plugged onto an HP Model 5300A Measuring System, is capable of: Measuring frequencies up to 10 MHz, Time Interval measurements from 500 nsec to 10,000 seconds, Period Average over a range of 10 Hz to 1 MHz, and Totalizing. The electrical and mechanical specifications are listed in Table 9D-1-1.

##### **9D-1-4. Purpose and Use of Section IX D**

9D-1-5. Section IX D contains the documentation necessary to operate, maintain, and repair the HP Model 5304A Timer Counter plug-on. Also included are parts lists, component locators, and schematics. This information is intended to be inserted into the 5300A Measuring System manual as part of Section IX of that manual.

##### **9D-1-6. INSTRUMENT IDENTIFICATION**

9D-1-7. Hewlett-Packard uses a two-section, nine-digit serial number (0000A00000) mounted on the rear panel to identify the instrument. The first four digits are the serial prefix and the last five digits refer to the specific instrument. If the serial prefix on your instrument differs from that listed on the title page of this section, there are differences between the manual and your instrument. Lower serial prefixes are documented in Section IX D, Subsection VII and higher serial prefixes are covered by a manual change sheet included with the manual.

##### **9D-1-8. Manual Changes and Options**

9D-1-9. The title page lists the serial prefix number to which this information directly applies. If the serial prefix is different from the one listed, a change sheet is included describing the required changes. If this change sheet is missing, the information can be supplied by any Hewlett-Packard Sales and Service office listed in Section VI of the 5300A Measuring System Manual. Options are listed in Section IX D, Subsection VII.

Table 9D-1-1. 5304A Timer/Counter Specifications

### INPUT CHANNELS A AND B

- Range:** DC coupled; 0 to 10 MHz.  
AC coupled; 100 Hz to 10 MHz.
- Sensitivity (min):** 25 mV rms sine wave to 1 MHz. 50 mV rms sine wave to 10 MHz. 150 mV p-p pulse at minimum pulse width, 40 nsec. Sensitivity can be decreased by 10 or 100 times using ATTENUATOR switch.
- Impedance:** 1 M $\Omega$  shunted by less than 30 pF.
- Overload Protection:** 250 V rms on X10 and X100 attenuator settings. On X1 attenuator setting 120 V rms up to 1 kHz, decreasing to 10 V rms at 10 MHz.
- Trigger Level:** PRESET position centers triggering about 0 volts  $\pm$ 25 mV, or continuously variable over the range of -1 V to +1 V times attenuator settings.
- Slope:** Independent selection of triggering on positive or negative slope.
- Channel Inputs:** Common or separate lines.
- Gate Output:** Rear panel BNC. TTL low level while gate is open. May be used to intensity modulate an HP oscilloscope.

### TIME INTERVAL

- Range:** 500 nsec to 10<sup>3</sup> sec.
- Input:** Channels A and B; can be common or separate.
- Overload:** Maximum recommended levels for pulse signals is 2 V p-p. Clipping occurs at 3 V p-p.
- Resolution:** 100 nsec to 10 ms in decade steps.
- Accuracy:** +1 count + time base accuracy + trigger error.\*
- Display:**  $\mu$ s, ms, or s (seconds) with positioned decimal point.
- Time Interval Holdoff:** Front panel concentric knob which inserts variable delay of approximately 100  $\mu$ sec to 100 msec between START (Channel A) and enabling STOP (Channel B); may be disabled. Electrical inputs during delay time are ignored. Delay may be digitally measured in CHECK position. Delay Output: rear panel BNC. TTL low level during delay time. May be used to intensity modulate an HP oscilloscope.

### PERIOD AVERAGE

- Range:** 10 Hz to 1 MHz.
- Input:** Channel A.
- Period Averaged:** 1 to 10<sup>3</sup> automatically selected for maximum resolution.
- Frequency Counted:** 10 MHz.
- Accuracy:** +1 count + time base accuracy + trigger error.\*\*
- Display:**  $\mu$ s, ms with positioned decimal point.

### FREQUENCY

- Range:** 0 to 10 MHz.
- Input:** Channel A.
- Gate Times:** Manually selected 0.1, 1, or 10 seconds. AUTO position selects gate time to fill display for maximum resolution within a 1-second measurement time.
- Accuracy:** +1 count + time base accuracy.
- Display:** Hz, kHz, and MHz with positioned decimal point.

### OPEN/CLOSE (Totalizing)

- Range:** 10 MHz maximum.
- Input:** Channel A.
- Function:** Input signal totalized while gate open. Opening and closing of gate initiated by front panel pushbutton switch.

### GENERAL

- Check:** Inserts internal 10 MHz reference frequency into Channels A and B. Time Interval Holdoff may be digitally measured by switching to CHECK and TIME INTERVAL positions.
- Operating Temperature:** 0° to 50°C.
- Power Requirements:** Including 5300A mainframe, nominally 10 watts. Minimum of 3 hours operation (typically 5 hrs) at 20°C to 30°C operating and charging temperatures.
- Weight:** Net, 1 lb (0.9 kg). Shipping, 3 $\frac{1}{2}$  lbs (1.5 kg).

\*For any waveshape, trigger error is less than

$$\pm \frac{0.005}{\text{Signal Slope (V } \mu\text{s)}} \mu\text{s}$$

\*\*Trigger error is less than  $\pm$ 0.3% of one period.  $\pm$  periods averaged for signal with 40 dB or better signal-to-noise ratio.

## SECTION IX D 5304A TIMER/COUNTER

### SUBSECTION II INSTALLATION

#### 9D-2-1. UNPACKING AND INSPECTION

9D-2-2. If the shipping carton is damaged ask that the carrier's agent be present when the instrument is unpacked. Inspect the instruments for damage such as scratches, dents, broken knobs, etc. If the instrument is damaged or fails to meet performance tests when used with the 5300A Measuring System notify the carrier and the nearest Hewlett-Packard Sales and Service office immediately. Performance check procedures are located in Section IX D-5, and Sales and Service offices are listed in Section VI of the 5300A portion of the manual. Retain the shipping carton and the padding material for the carrier's inspection. The Sales and Service office will arrange for the repair or replacement of the instrument without waiting for the claim against the carrier to be settled.

#### 9D-2-3. STORAGE AND SHIPMENT

9D-2-4. PACKAGING. To protect valuable electronic equipment during storage or shipment always use the best packaging methods available. Your Hewlett-Packard Sales and Service office can provide packaging material such as that used for original factory packaging. Contract packaging companies in many cities can provide dependable customer packaging on short notice. Here is one recommended packaging method:

a. The original container is a corrugated cardboard box with 200 lbs. burst test (HP No. 9211-1620). The instrument is secured and protected, while in the box by a top and bottom molded form of polystyrene foam (HP No. 9220-1545). Also included with the instrument is a plastic dust-protection cover HP Part No. 05300-80004.

#### 9D-2-5. INSTALLATION AND REMOVAL OF PLUG-ON

9D-2-6. The 5304A Timer/Counter must be used with a mating 5300A Measuring System before any measurements can be made. To mate the 5304A Timer/Counter with the 5300A Measuring System, see Figure 2-1 and Paragraph 2-1 of the 5300A portion of the manual.

9D-2-7. ENVIRONMENT. Conditions during storage and shipment should be normally limited as follows:

- a. Maximum altitude: 25,000 feet
- b. Minimum temperature:  $-40^{\circ}\text{F}$  ( $40^{\circ}\text{C}$ ).
- c. Maximum temperature:  $+167^{\circ}\text{F}$  ( $+75^{\circ}\text{C}$ ).

#### 9D-2-8. PORTABLE OPERATION

9D-2-9. The use of the HP Model 5310A Battery Pack enables the 5300A Measuring System and 5304A Timer/Counter to be used in areas removed from ac power sources. The 5310A Battery Pack provides a minimum of 3 hours operation (typically 5 hours) at  $20^{\circ}\text{C}$  to  $30^{\circ}\text{C}$  operating and charging temperature. Tables 1-2 and 1-4 of 5300A portion of the manual list the HP 5310A Battery Pack as an available accessory. Documentation on the 5310A is also included in Section IV through VIII of the 5300A portion of the manual. To prepare the 5300A 5304A for portable operation, refer to Paragraph 2-15 and Figure 2-2, steps a to c of 5300A portion of manual.

**OPERATION**

## SECTION IX D 5304A TIMER/COUNTER

### SUBSECTION III OPERATION

#### 9D-3-1. OPERATING INFORMATION

9D-3-2. The 5300A/5304A Timer/Counter measures frequencies up to 10 MHz, period average to 1 MHz, time interval from 500 nsec to 10,000 seconds; or totalizes input signals.

Figure 9D-3-1. Signal Conditioning Using Attenuator, Level and Slope Controls

9D-3-3. There are four basic signal conditioning controls used in Channel A or Channel B (the effect of these controls is shown in Figure 9D-3-1). These are:

- a. ATTEN switches for Channel A and B.
- b. SLOPE switches for Channel A and B.
- c. LEVEL controls for Channel A and B.
- d. AC-DC switches for Channel A and B.

9D-3-4. ATTEN. X1, X10, X100 switches (both Channels). Large amplitude signals can be attenuated by using the ATTEN switches. Setting the attenuator switches increases the trigger levels and the hysteresis voltages by factors of 1, 10, 100. If input signal levels are unknown, the initial measurements should be made with the attenuator switches set to X100. The attenuator settings are then reduced until a stable, useable measurement is obtained.

9D-3-5. SLOPE Switches (both Channels). The slope switches allow the selection of triggering on the positive (+) or negative (-) slope of the input signals (see Figure 9D-3-1).

9D-3-6. LEVEL Controls (both Channels). The level controls allow adjustment of the triggering point on the input signal waveform. With the LEVEL controls set to PSET or "0", triggering is centered about zero volts. The voltage range over which triggering may be set is -1 volt to +1 volt times the ATTEN switch settings ( $\pm 1$  V to  $\pm 100$  V).

9D-3-7. AC-DC Switches (both Channels). The AC-DC switches select ac or dc coupling. In AC position and PSET, triggering is centered about ac-zero, and dc components on the signal have no effect. In DC position and PSET, triggering is centered about 0 volts dc on the signal.

Figure 9D-3-2. Front-Panel Controls and Connectors

1. COM-SEP-CHK. Three position switch enables selection of input signal from separate or common sources or enables the selection of a Self-Check position.
  - a. COM: Connects INPUT A and INPUT B in parallel.
  - b. SEP: Channel A and Channel B inputs are from separate sources.
  - c. CHK: Self-Check verifies that 5300A 10 MHz crystal oscillator and counting logic and the 5304A gating logic is functioning correctly.
2. INPUT A and B. Input signal frequencies to be measured are connected to INPUT A. INPUT B is used in time interval measurements.
3. ATTEN. Three-position input signal attenuator for both channels.
  - a. X1: Connects input signals directly to input amplifiers.
  - b. X10: Attenuates input signals by factor of 10.
  - c. X100: Attenuates input signals by factor of 100.

Figure 9D-3-2. Front-Panel Controls and Connectors (Continued)

4. **AC-DC.** Two-position switch allows selection of ac-coupling or direct-coupling to input amplifiers.
5. **SLOPE +, -.** Selects the triggering on positive or negative slope of the input signals.
6. **LEVEL.** Adjusts the input trigger levels. Preset to trigger at 0 volts.
7. **FUNCTION.** Twelve-position switch enables 4 modes of operations to be selected. The modes are:
  - a. **T.I. A to B:** Enables time interval measurements to be made from 500 nsec to 10,000 seconds. Resolution is adjustable from .1  $\mu$ s to 10 ms in six decade steps.
  - b. **PER AVG A:** Enables multiple period averages to be made from Channel A with frequencies of 10 Hz to 1 MHz. Periods averaged are automatically selected from 1 to  $10^3$ .
  - c. **FREQ A:** Enables frequency measurements from 0 to 10 MHz when dc coupled and 100 Hz to 10 MHz when ac coupled.
    - 1) **AUTO:** Gate time is automatically selected to fill the display for maximum resolution of the signal being measured, without overflow, up to a maximum of 1 second.
    - 2) **.1S, 1S, 10S:** Counter gate time is manually selected for .1 second, 1 second or 10 seconds.
  - d. **OPEN/CLOSE A (Totalize):** Enables input signals to Channel A to be totalized. Totalizing is initiated by pressing OPEN/CLOSE A switch and terminated by pressing the switch a second time.
8. **DELAY.** Adjustment inserts a time interval delay of 100  $\mu$ sec to 100 msec between Start (Channel A) signal and Stop (Channel B) signal; when disabled, there is a residual delay of about 200 nsec.

Figure 9D-3-3 Rear-Panel Connectors

1. GATE OUT: A TTL-LOW level signal while the 5300A main gate is open.
2. DELAY OUT: A TTL-LOW level signal during the delay time selected by front-panel DELAY control (in T.I. A to B mode only).

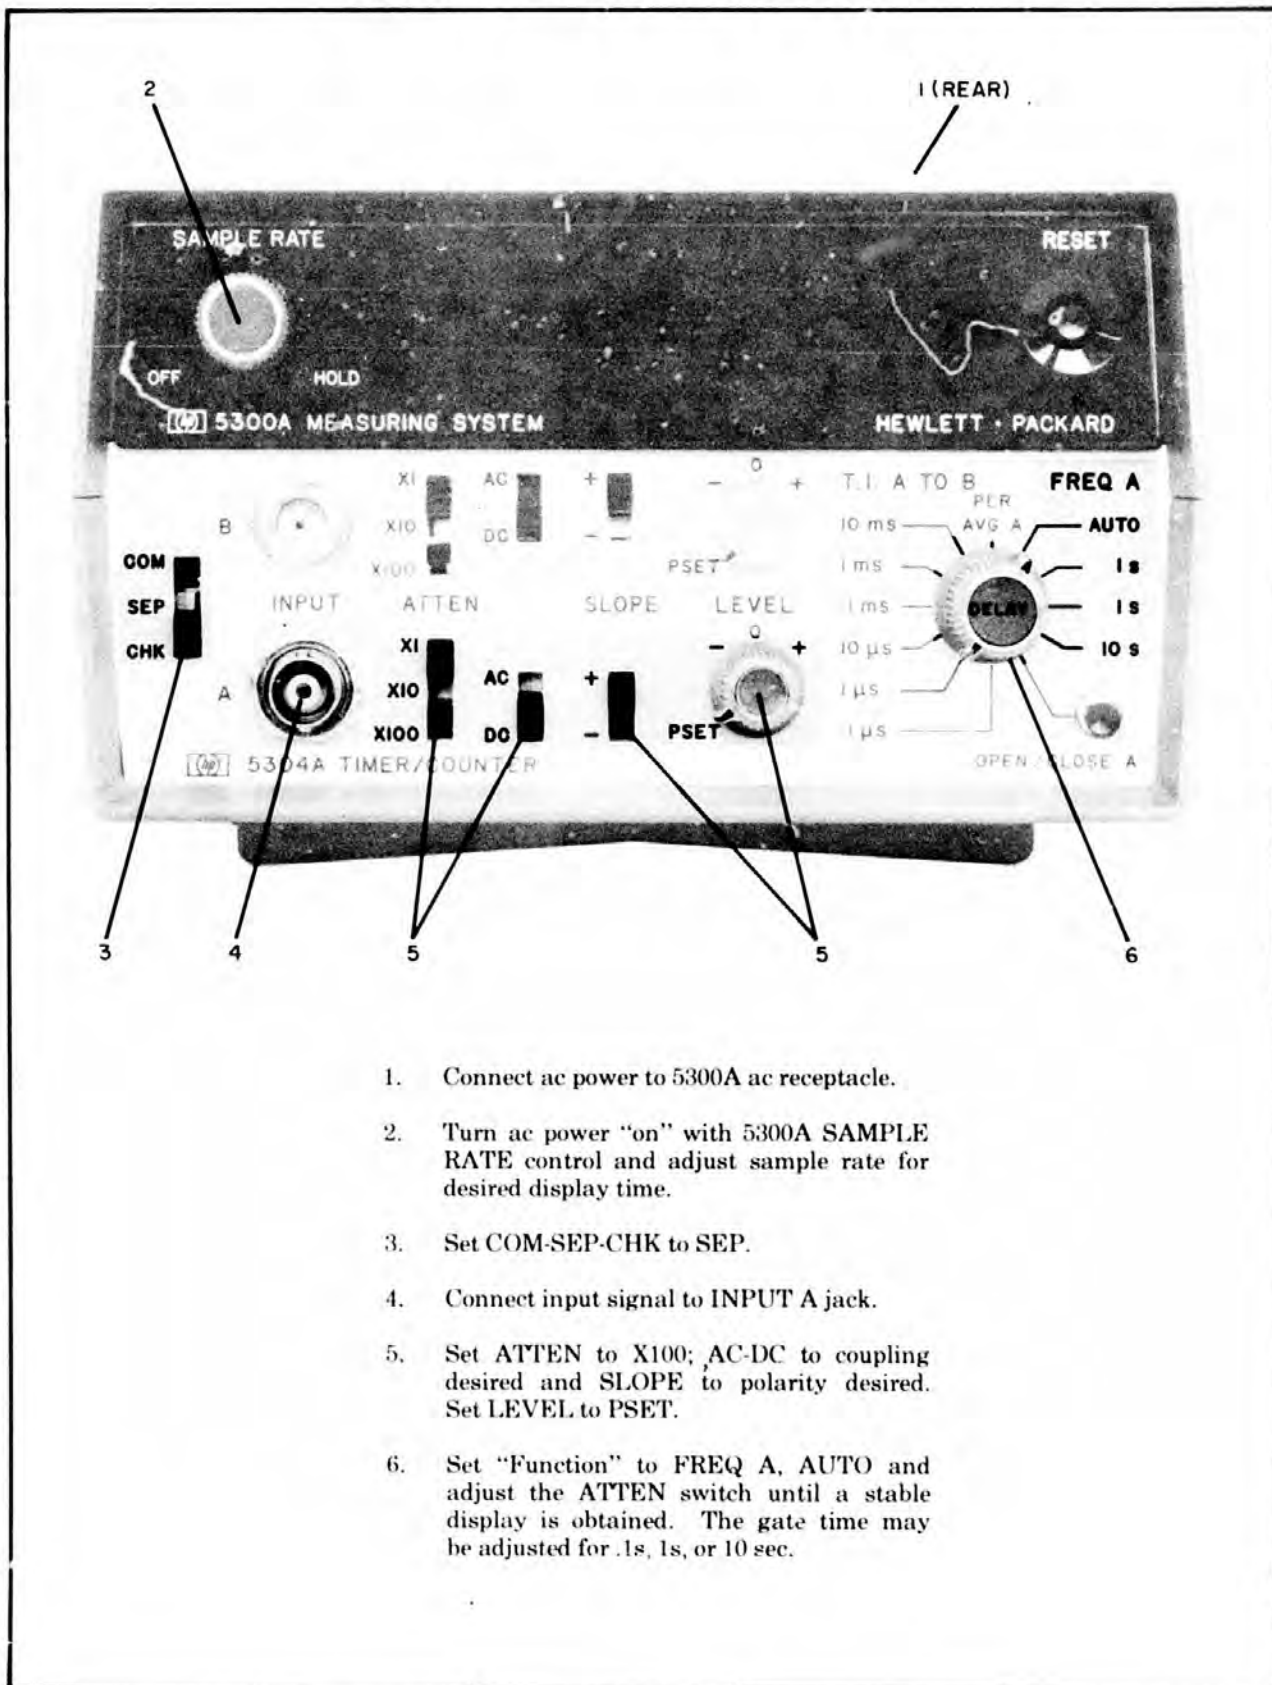

Figure 9D-3-4. Making Self-Check Measurements

1. Connect ac power to 5300A ac receptacle.
2. Turn ac power "on" with 5300A SAMPLE RATE control. Adjust SAMPLE RATE for desired display time.
3. Set 5304A COM-SEP-CHK switch to CHK.
4. Set 5304A "Function" switch to FREQ A, AUTO. Display should be 10.0000 MHz, +1 count.
5. The time interval hold-off may be measured by selecting on of the T.I. A to B positions of the "Function" switch.

Figure 9D-3-5. Making Frequency A Measurements

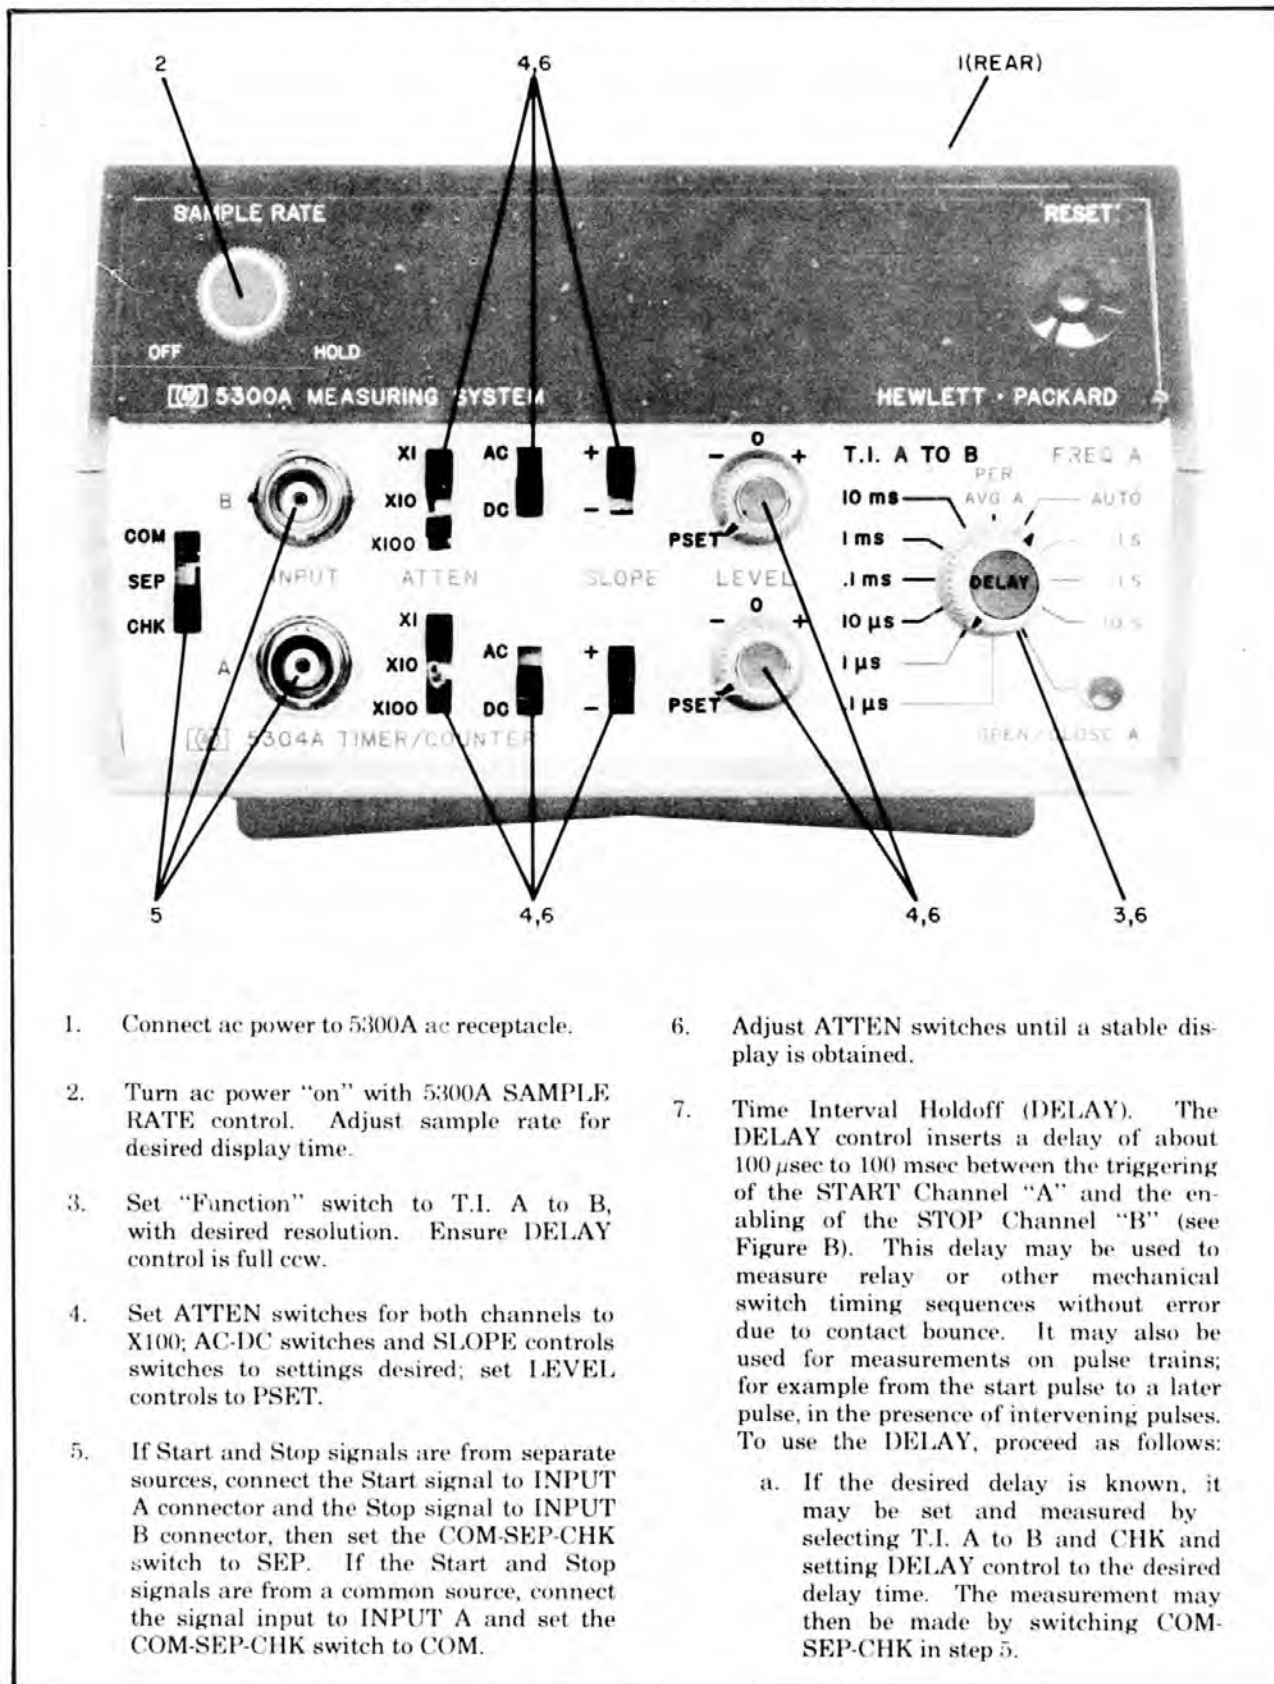

1. Connect ac power to 5300A ac receptacle.
2. Turn ac power "on" with 5300A SAMPLE RATE control and adjust sample rate for desired display time.
3. Set COM-SEP-CHK to SEP.
4. Connect input signal to INPUT A jack.
5. Set ATTEN to X100; AC-DC to coupling desired and SLOPE to polarity desired. Set LEVEL to PSET.
6. Set "Function" to FREQ A, AUTO and adjust the ATTEN switch until a stable display is obtained. The gate time may be adjusted for .1s, 1s, or 10 sec.

Figure 9D-3-6. Making Period Average Measurements

1. Connect ac power to 5300A ac receptacle.
2. Turn ac power "on" with 5300A SAMPLE RATE control. Adjust sample rate for desired display time.
3. Set COM-SEP-CHK to SEP.
4. Connect input signal to INPUT A jack.
5. Set ATTEN to X100, AC-DC to coupling desired and SLOPE to polarity desired. Set LEVEL to PSET.
6. Set "Function" to PER AVG A; adjust ATTEN switch until a stable display is obtained. The number of periods averaged is automatically selected.

Figure 9D-3-7. Making Time Interval Measurements

1. Connect ac power to 5300A ac receptacle.
2. Turn ac power "on" with 5300A SAMPLE RATE control. Adjust sample rate for desired display time.
3. Set "Function" switch to T.I. A to B, with desired resolution. Ensure DELAY control is full ccw.
4. Set ATTEN switches for both channels to X100; AC-DC switches and SLOPE controls switches to settings desired; set LEVEL controls to PSET.
5. If Start and Stop signals are from separate sources, connect the Start signal to INPUT A connector and the Stop signal to INPUT B connector, then set the COM-SEP-CHK switch to SEP. If the Start and Stop signals are from a common source, connect the signal input to INPUT A and set the COM-SEP-CHK switch to COM.
6. Adjust ATTEN switches until a stable display is obtained.
7. Time Interval Holdoff (DELAY). The DELAY control inserts a delay of about 100 μsec to 100 msec between the triggering of the START Channel "A" and the enabling of the STOP Channel "B" (see Figure B). This delay may be used to measure relay or other mechanical switch timing sequences without error due to contact bounce. It may also be used for measurements on pulse trains; for example from the start pulse to a later pulse, in the presence of intervening pulses. To use the DELAY, proceed as follows:
  - a. If the desired delay is known, it may be set and measured by selecting T.I. A to B and CHK and setting DELAY control to the desired delay time. The measurement may then be made by switching COM-SEP-CHK in step 5.

Figure 9D-3-7. Making Time Interval Measurements (Continued)

- b. If the input signals are pulse trains, it is possible to select a pulse out of the train by increasing the DELAY from full ccw; the measured time interval will increase in steps as the delay falls after successive pulses in the train.
- c. For maximum flexibility and ease of interpretation, an oscilloscope may be used to set up the measurement (as shown in Figure A). The DELAY OUTPUT is used to trigger the time base and intensity modulate the display (see Figure A). For a repetitive waveform, the Channel A input may fall during the display cycle, and therefore might not initiate a measurement. The GATE output may be substituted for the DELAY OUTPUT; this allows intensifying the actual measurement rather than the delay. If the inputs are common, the GATE OUTPUT or DELAY OUTPUT can be displayed on the second channel (or a third channel of a four-channel scope), and the other of these two used to intensity modulate.
- d. Set oscilloscope controls as follows:

HP 1801A: Set A and B Channel controls for a display of both input signal. Set DISPLAY to A+B.

HP 1821A: Set TRIGGER to EXT. SLOPE to -. Coupling to ACF. SWEEP MODE to NORM. Time/CM for one cycle of measured Time Interval.

- e. Set DELAY slightly out of full ccw and select the time interval delay. The SWEEP TIME may have to be readjusted.
- f. Adjust INTENSITY to view only the time interval measured.
- g. Oscilloscope time display and 5300A time readout should be the same.

Figure B: Example of Delay Control

Figure A: Delay Control Setup

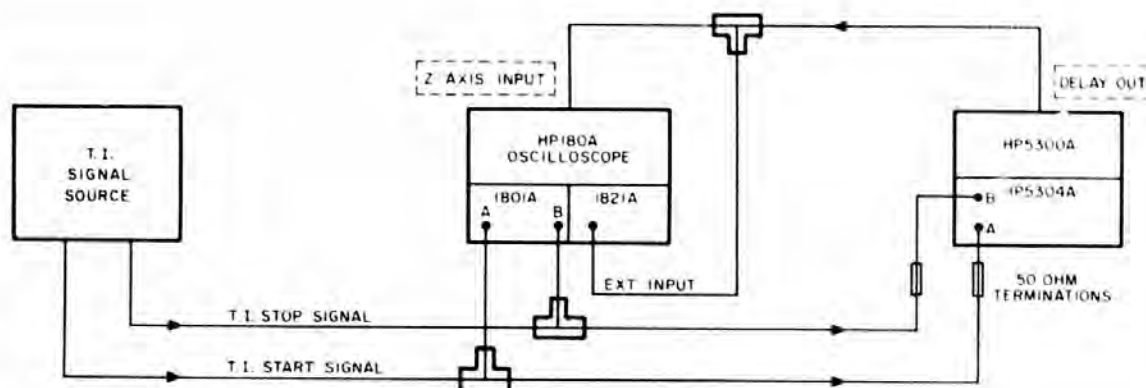

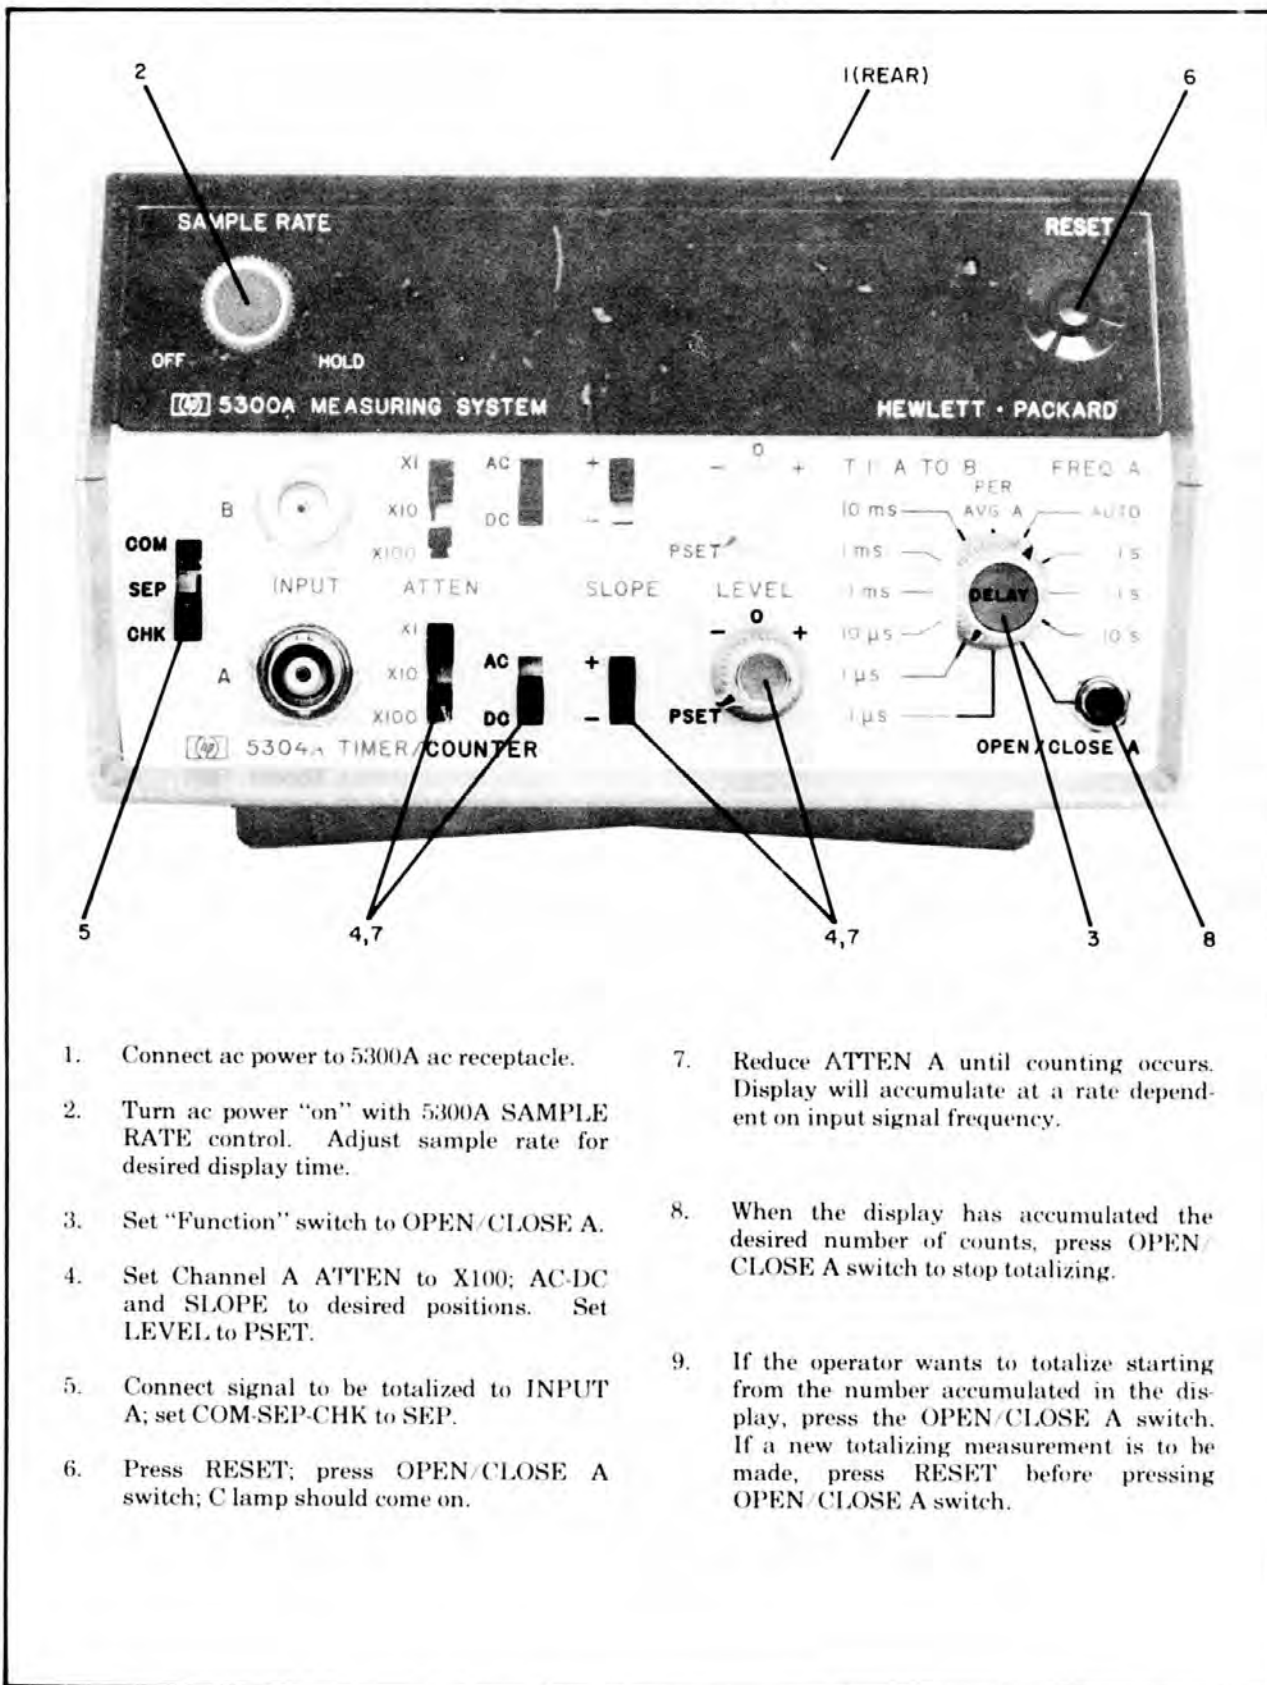

Figure 9D-3-8. Totalizing

1. Connect ac power to 5300A ac receptacle.
2. Turn ac power "on" with 5300A SAMPLE RATE control. Adjust sample rate for desired display time.
3. Set "Function" switch to OPEN/CLOSE A.
4. Set Channel A ATTEN to X100; AC-DC and SLOPE to desired positions. Set LEVEL to PSET.
5. Connect signal to be totalized to INPUT A; set COM-SEP-CHK to SEP.
6. Press RESET; press OPEN/CLOSE A switch; C lamp should come on.
7. Reduce ATTEN A until counting occurs. Display will accumulate at a rate dependent on input signal frequency.
8. When the display has accumulated the desired number of counts, press OPEN/CLOSE A switch to stop totalizing.
9. If the operator wants to totalize starting from the number accumulated in the display, press the OPEN/CLOSE A switch. If a new totalizing measurement is to be made, press RESET before pressing OPEN/CLOSE A switch.

**THEORY**

## SECTION IX D 5304A TIMER/COUNTER

### SUBSECTION IV THEORY OF OPERATION

#### 9D-4-1. INTRODUCTION

9D-4-2. This subsection describes the theory of operation for the 5304A Timer/Counter. Basic operation of gates, certain amplifiers and integrated circuits is found in Section IV of the 5300A portion of the manual.

9D-4-3. To simplify measurement making refer to operating information starting with Paragraph 9D-3-1 for optimum adjustment of various controls.

#### 9D-4-4. INPUT AMPLIFIERS AND MODES OF OPERATION

9D-4-5. CHANNEL A. The Channel A input signal is applied to front-panel INPUT A jack and attenuated by A2 attenuator assembly (X1, X10, X100) and sent to A1 Channel A input amplifier. The A2 Attenuator Board Assembly also contains the AC-DC switches, SLOPE switches, and the LEVEL controls for both channels. The input signal is sent through A2 to the input of matched FET source-follower pair, Q2 and Q4. Diodes CR2, CR4 are limiters for Q2 inputs.

9D-4-6. One side of the FET source-follower pair (Q2) receives the input signal from A2J2 and the other side (Q4) is connected to LEVEL A trigger-level control A2R9. Q2 and Q4 are connected to differential amplifier Q6 and Q8 respectively and provides level shifting and gain of approximately .3 for Channel A signals. Resistor R20 is a dc balance for differential amplifier Q6 and Q8.

9D-4-7. The output from Q6, Q8 drives another differential amplifier, U24B. The U24B output is shaped by Schmitt-Trigger U24A and level-shifted (ECL to TTL) through U21B, Q12 combination. The U21B expander output is used to obtain sufficient signal swing to drive Q12.

9D-4-8. CHANNEL B. The Channel B input signal is applied to front-panel INPUT B jack and attenuated by A2 Attenuator Assembly (X1, X10, X100) and sent to A1 Channel B input amplifier. The A2 Attenuator assembly also contains the Channel B coupling switches, slope switches and the Channel B level control. The Channel B signal is routed through A2 to the input of matched FET source-follower pair Q1 and Q3. Diodes CR1, CR3 are limiters for Q1 inputs.

9D-4-9. One side of the Channel B FET source-follower pair (Q1) receives the input signal from A2J1 and the other side (Q3) is connected to LEVEL B trigger level control A2R10. Q5 and Q7 are connected to differential amplifiers Q5 and Q7 respectively and provide level-shifting and gain of approximately .3 for Channel B signals. Resistor R19 is a dc balance for differential amplifier Q5 and Q7.

9D-4-10. The output from Q5, Q7 drives another differential amplifier U23B. The U23B output is shaped by Schmitt-Trigger U23A and level-shifted (ECL to TTL) through U21A, Q11 combination. The U21A expander output is used to obtain sufficient signal swing to drive Q11.

9D-4-11. VOLTAGE REGULATION. Transistors Q9, Q10 provide regulated, low-ripple dc power to the amplifiers and time interval hold-off circuits.

9D-4-12. SLOPE SELECTION. Slope selection for Channel A is accomplished by using U19C, U20C, and U20D in conjunction with A2S7. Slope selection for Channel B is accomplished by using U19D, U20D, and U20A in conjunction with A2S6.

9D-4-13. CHECK MODE. In the CHECK mode, the operation of the 5300A 10 MHz crystal oscillator and counting logic and the 5304A gating logic is verified. When A2S1 is in CHK mode, ground is applied to U18A(2), U18D(12), and U13C(5). The 10 MHz clock from the 5300A A1J1(16) is routed through the 5304A A1P1(16) and sent to U12D(12). The Channel A switch (U18B) and Channel B switch (U18C), gate the 10 MHz clock signal through. The Channel A switch output is also gated through U12B and U16B and is available as the F1 signal at A1P1(5).

9D-4-14. FREQ A MODE. In the frequency measuring mode, with the "Function" switch S2 in any of its four frequency measuring positions (FREQ AUTO, .1S, 1S, 10S) the Channel A input signal is gated through "Channel A Slope Selection" switch comprised of U19C, U20C, and U20B. The input signal is then routed through another "Channel A" switch made up of U18A and U18B. From U18B(6) the Channel A input signal is gated through U12B and U16B as the F1 signal to the 5300A mainframe which controls the opening and closing of the main gate. The 10 MHz clock signal from

Model 5304A  
Theory of Operation

the 5300A mainframe at A1P1(16) is routed through U12C as the F2 signal to control the time base, which clocks the opening and closing of the main gate.

9D-4-15. The positive-going edge of a negative pulse from U17E is the MAX TIME signal. The MAX TIME signal at A1P1(17) triggers a display cycle in the 5300A mainframe. This negative-going pulse can be generated from one of two sources. One of the sources is the positive-going edge of the MGFF line at A1P1(12) which indicates the closing of the 5300A main gate. This signal is inverted through U17D and differentiated by C14 and R69. CR18 is a clamping diode to shorten the differentiation recovery time. The negative pulse of the differentiated waveform, gates U16A "on" and the narrow positive-going pulse is inverted through U17E as the MAX TIME signal.

9D-4-16. The TIME BASE OUT signal at A1P1(18) comes from the 5300A mainframe and is buffered by Q18 then gated through U14C, U16A, and inverted through U17E as the MAX TIME signal.

9D-4-17. The positive-going edge of the negative pulse at A1P1(17), indicates the display cycle has been triggered.

9D-4-18. PERIOD AVG A MODE. In period average mode the "function" switch S2 enables U1A, U6D, U12C, and U14A. The Channel A signal is routed through "Channel A Slope Selection" and "Channel A Switch" at U18B(6). The signal is then gated through U16C and is available at A1P1(21) as the 1 MHz TIME BASE. The CLOCK signal at A1P1(16) is gated through U12A, U16B as the F1 signal to be counted.

9D-4-19. Flip-flop U4A prevents very narrow pulses from triggering the time base but not the main gate. The first Channel A pulse after the INHIBIT signal goes high at the end of the display cycle "clocks" U4A(5) to a high state and enables U16C. The next positive-going edge of the Channel A signal is gated through U16C as the 1 MHz TIME BASE INPUT signal. The main gate is then closed by one of two events. The first event is: The 9 signal line from 5300A, U3 COUNTER, goes low, and enables the main gate in the 5300A, U5 CONTROL, to close on the next LOG pulse. When the 9 line goes low it indicates that the display is 9% full. The main gate closes at the end of the next decade-multiple of the input signal to prevent overflow. The second event is: The TIME BASE OUT signal (A1P1(18)) from the 5300A, U4 TIME BASE goes

9D-4-2

low indicating the  $10^4$  periods have been counted. The main gate closes because no more counts can be stored in the 5304A exponent counter U8A and U8B. The exponent counter counts the number of decade-transitions of the input signal that have been counted (1, 10, 100, 1000 input transitions or exponent counts of 1, 2, 3, 4).

9D-4-20. The LOG OUTPUT signal (generated by 5300A, U4 TIME BASE) is active in Frequency and Period Average Modes and provides pulses to open and close the main gate. Following a display cycle and reset, the first LOG pulse opens the main gate and a following LOG pulse will close the gate only after a 9 or MAX TIME low signal enables the closing of the main gate flip-flop.

9D-4-21. OPEN/CLOSE A MODE. In open/close mode, with the "function" switch S2 in OPEN/CLOSE position the main gate is opened and closed by successive actuations of pushbutton switch S1. The Channel A input signal is gated through "Slope Selection" switch U19C, U20B, and U20C to "Channel A Switch" U18A and U18B.

9D-4-22. The Channel A input signal is gated through U12B, U16B to be counted. U4B "clocks" on successive actuations of the S1 OPEN/CLOSE switch. When U8B(9) output is low the 5300A main gate is opened (through U19B). When U4B(8) output is low the 5300A main gate is closed (through U14D and U22A). When the "Function" switch S2 is in a position other than OPEN/CLOSE, the U4B Preset and Clear lines (U4B pins 10 and 13 respectively) are set through U10A and B, so that U4B, Q and Q output (U4 pins 9 and 8) are high.

9D-4-23. TIME INTERVAL A-B MODE. In the time interval mode, the "function" switch S2 may be set to any one of six time-interval positions (.1  $\mu$ sec to 10 msec). The 5300A main gate is opened by a Channel A transition and closed by a Channel B transition. Switch A2S1 enables the input signals to be taken from separate sources or from a common source.

9D-4-24. The Channel A signal, after passing through A2 Attenuator Assembly, is processed through Channel A amplifier, Q2 Q4 and differential amplifiers Q6, Q8, and U24B. The U24B output is shaped through U24A Schmitt-Trigger and sent through an ECL-to-TTL level-shifter (U21B, Q21) to the Channel A Slope Selection circuits (U19C, U20C, U20B).

9D-4-25. The output from U20B(4) is gated through Channel A switch, comprised of U18A and B. The Channel A signal "clocks" U15B which is gated through U9C, U19B, and opens the 5300A main gate. During the gate-open time, the TIME BASE OUT

signal from the 5300A A1J1(18) is gated through Q18, U17F, U9B, and U16B to be counted (except in the .1  $\mu$ sec position, where the 10 MHz clock is gated through U12A and U16B). The TIME BASE OUTPUT signal is a 10 MHz clock signal divided down by the time base to allow counting in increments of 1  $\mu$ sec, 10  $\mu$ sec etc.

9D-4-26. The main gate closes when Channel B "clocks" U15A and a display cycle is initiated by the positive-going edge of the MGFF signal at A1P1(12). This signal is inverted through U17D and differentiated by C14 and R69. The negative pulse of the differentiated waveform gates U16A "on" and the narrow positive-going pulse is inverted through U17E as the MAX TIME signal.

9D-4-27. At the end of the display cycle, the RESET signal at A1P1(15) is inverted through U13E and sets U15B(9) low. U15A(5) is set high by the PRESET signal at U15A(4). The INHIBIT signal goes "high" and sets U15B(12) so that U15B changes states on the positive-going transition from U18B(6). This produces two results:

1. U9C(8) goes low which set the OPEN signal at A1P1(10) low through U19B and opens the 5300A main gate.
2. Q16 turns off and allows C12 to charge through R43 and R61.

9D-4-28. Transistor Q15 is an emitter-follower input to Schmitt-Trigger Q13, Q14. The output from Q13 is level-shifted by CR15 and inverted by Q17. Q15, 14, 13, and 17 form a one-shot multivibrator with a very wide timing range. U15A cannot change states until Q17 output goes low; then U15A(3) is clocked to its opposite state by the positive transition of U18C (Channel B switch output). The U15A(5) output is gated and inverted through U14D and U22A. This causes the CLOSE signal line to go low which in turn closes the 5300A main gate.

9D-4-29. The 5300A main gate cannot be re-opened until U15B is cleared by the RESET signal at A1P1(15) and until the INHIBIT signal at A1P1(8) sets U15B(12) high. U15B(8) goes high at RESET and turns on Q16 which discharges C12. When R43(S2) is open (full cew), C12 is not charged up and the one-shot time-interval is very short (about 200 nsec). The time-interval is the interval from the time U15B(8) goes low and Q17 collector goes low.

9D-4-30. A buffered DELAY OUT signal is provided at J3 and may be used for intensifying the oscilloscope Z axis which permits observing the start and stop period in a time interval measurement. A buffered GATE OUT signal is also provided at J4 which permits observing the gate signal duration in a time interval measurement.

9D-4-31. EXPONENT COUNTER; EXPONENT STORAGE. Outputs from the 5300A, U5 EXP line are applied to exponent counter U8A, U8B "Clock input". The RESET signal at A1P1(15) clears U8A and presets U8B for another measurement. Exponent signals "clocked" into U8 indicate length of measurements (10 ms, 100 ms, or 1 sec in FREQ AUTO mode; 1, 10, 100, 1000 periods in PERIOD AVG mode). During the measurement cycle, information is transferred into U7A, B exponent storage by the TRANSFER signal. Therefore, the displayed measurement, the decimal point and the units, change simultaneously.

9D-4-32. Exponent storage U7A, B is disabled (both flip-flops are cleared), except in AUTO measurements, by U6D. Manual reset also clears U7A, U7B, the decimal point and measurement units.

9D-4-33. The remainder of the gates with the exception of U5B provide time base, decimal point, annunciator, and function decoding. The U3A output is high in any of the four frequency-measuring positions. U5B locks out the LOG OUTPUT signal in OPEN CLOSE A and TIME INTERVAL A-B, when the open and closing of the main gate is controlled by OPEN and CLOSE.

9D-4-34. Q19 normally turns off the 9 line except during frequency Auto or Period Average; this allows overflow to occur, if desired, in manual frequency position.

**MAINTENANCE**

## SECTION IX D 5304A TIMER/COUNTER

### SUBSECTION V MAINTENANCE

#### 9D-5-1. INTRODUCTION

9D-5-2. This section contains maintenance and service information for Model 5300A/5304A Timer/Counter. Included are performance check procedures and tests to localize, isolate, and locate defective components.

#### 9D-5-3. RECOMMENDED TEST EQUIPMENT

9D-5-4. Test equipment recommended for performance checks, maintaining, troubleshooting and servicing the 5300A/5304A Timer/Counter is listed in Table 5-1 of 5300A portion of the manual. Test equipment with equivalent characteristics may be substituted for equipment listed.

#### 9D-5-5. INSTRUMENT ACCESS

9D-5-6. For access to plug-on assembly, separate the 5300A from the 5304A as follows:

- a. Turn ac power OFF and disconnect power cord.
- b. Pull the two-side casting latches fully rearward (it is necessary to press the latch handles gently away from the center of the instrument to unlock them).
- c. When latches are fully extended rearward, the 5300A and 5304A castings should be separated by about  $\frac{1}{8}$ -inch.
- d. Lift the 5300A gently away from the 5304A.
- e. Separate 5304A A1 BOARD ASSEMBLY from 5304A casting as follows (refer to Figure 9D-5-1):
  1. Press rear, plastic-nylon retaining clips on each side of 5304A casting and lift the rear of the A1 Board Assembly to release it from the casting.
  2. Press front plastic-nylon retaining clips on each side of 5304A casting and lift the front of the A1 Board Assembly to release it from the casting.
  3. Lift A1 Board Assembly from the casting.
- f. Mate the 5304A, A1 Board Assembly to 5300A and reapply ac power.

g. To reinstall the A1 Board Assembly into the casting reverse procedure of steps d through f.

#### 9D-5-7. PERIODIC MAINTENANCE

9D-5-8. To determine if the 5300A/5304A is operating properly within specifications, perform the In-Cabinet Performance Checks listed in Table 9D-5-1. These checks may also be used for the 5300A performance checks when the 5300A/5304A combination is used.

#### 9D-5-9. MAINTENANCE AND REPAIR

9D-5-10. BOARD REMOVAL. When removing the printed circuit board for replacement, repair, or servicing, always remove ac power and separate the board from the casting using Paragraph 9D-5-6 steps a to e.

9D-5-11. COMPONENT REPLACEMENT. When replacing a circuit board component use a low heat soldering iron. Heat must be used sparingly as damage to the circuit foil may result. Mounting holes may be cleaned out with a toothpick while heat is applied. Connection should be cleaned with a cleaning solution after component removal and replacement.

9D-5-12. INTEGRATED CIRCUIT REPLACEMENT. Two methods are recommended for removing integrated circuits:

a. Solder Gobbler. Solder is removed from board by a soldering iron with a hollow tip connected to a vacuum source. The IC is removed intact so it may be reinstalled if diagnosis is wrong.

b. Clip-Out. This method is used when an IC is proven defective. Clip leads close to case, apply heat and remove leads with long nose pliers. Clean board holes with a toothpick and cleaning solution.

#### 9D-5-13. INSTRUMENT TROUBLESHOOTING

9D-5-14. Trouble isolation can best be accomplished by first obtaining all possible information from the controls, connectors, and indicators on the 5300A and 5304A, then logically using this information to locate the defective component. If the

Figure 9D-5-1. Separation Procedure

performance checks indicate a malfunction or if instrument operation is suspect, perform the Self-Check procedures in Table 9D-5-1. For further tests, separate the 5304A from the casting and reconnect to 5300A using Paragraph 9D-5-6 steps a to e as a guide. Operating procedures in Subsection 9D-3 can be used to help understand operation. To test the 5304A, obtain the test equipment listed in Table 5-1 of the 5300A portion of the manual.

9D-5-15. Figure 9D-5-2 to Figure 9D-5-6 are troubleshooting flow diagrams for each of the five modes of operation. Signal flow is outlined for each mode and waveform test points and voltage test points are indicated. The waveforms or voltage level for each mode is included with the figures. To obtain the waveforms and/or levels for each mode, follow the directions for instrument connections which are listed with the troubleshooting flow diagrams of each respective mode.

#### 9D-5-16. DC BALANCE ADJUSTMENT

9D-5-17. If Channel A or Channel B fail to operate with their respective LEVEL controls in PSET position when measuring sine wave signals, or when periodic maintenance/calibration is performed, the dc balance may be adjusted as follows:

a. Connect an HP 651B Oscillator, set to 10 MHz, 50 mV rms/50 $\Omega$ , through a 50 OHM BNC Feed-thru Termination, to Channel A input.

b. Set the 5304A controls as follows:

ATTEN to X1 (both channels).  
AC-DC to AC (both channels).  
+, - to + (both channels).  
LEVEL to PSET (both channels).  
SEP-CHK to SEP  
"Function" to FREQ A, AUTO

c. Connect an HP 180A oscilloscope through a 10 M $\Omega$  probe to U18(6).

d. Adjust the oscilloscope controls to monitor a useable signal.

e. Adjust A1R20 for a symmetrical waveform with minimum or no change in duty-cycle when SLOPE switch is changed from + to - and minimum or no change when AC-DC switch is set to AC or DC.

f. Connect the oscilloscope probe to U18(8) and the 651B input signal to Channel B.

g. Adjust A1R19 for a similar display observed in step e.

Model 5304A  
Maintenance

TIME INTERVAL A TO B Mode, .1  $\mu$ sec position.

Equipment connections: Connect equipment as shown in Figure 9D-5-4A.

Control Settings: 5300/5304A.

ATTEN (both channels) to X1.  
AC-DC (both channels) to DC.  
SLOPE (both channels) to +.  
LEVEL. Set Channel A LEVEL slightly positive (+) until the "C" lamp comes on. Set Channel B LEVEL cw until a stable 5300 display is obtained.  
Function to .1  $\mu$ sec.  
COM/SEP/CHK to SEP.

Oscilloscope:

VOLTS/CM to 2 (both channels).  
DISPLAY to A + B.  
INPUT (both channels) to DC.  
TIME/CM to 1  $\mu$ sec.  
SWEEP MODE to NORM.  
TRIGGER to INT.  
SLOPE to +.  
Coupling to ACF or AC.

No. 1 HP 222A:

REP RATE to 1K-10K with adjustment centered.  
PULSE DELAY has no effect.  
PULSE WIDTH to .05-.5. Vernier adjusted for oscilloscope display of .1  $\mu$ sec.  
PULSE POLARITY to +.  
PULSE AMPLITUDE for a +2 V pulse on oscilloscope.

No. 2 HP 222A:

REP RATE to MAN/EXT +.  
PULSE WIDTH to .05-.5. Vernier adjusted for oscilloscope display of .1  $\mu$ sec.  
PULSE POLARITY to +.  
PULSE AMPLITUDE for a +2 V pulse on oscilloscope.  
PULSE DELAY for approximate display, on oscilloscope and 5300A, of 10  $\mu$ sec (5300 display should be approximately 00010.0  $\mu$ S C).

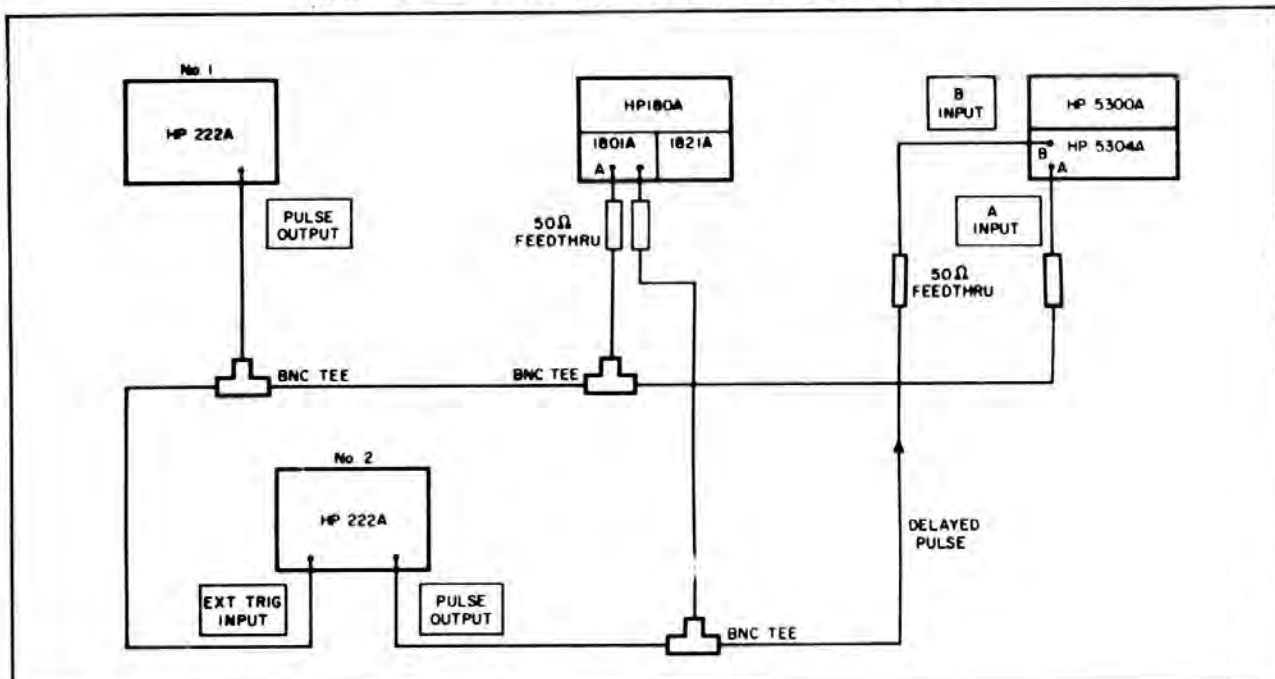

From the set-up outlined in Figure 9D-5-4A, disconnect the Channel A input to the HP 180A Oscilloscope. Connect a 10:1 divider probe and check for the waveforms listed.

Test points using an HP 10525A Logic Probe

H = High (lamp on)  
L = Low (lamp off)

- TP1 H (dim). Flash rate decreases when DELAY control is turned cw or when SAMPLE RATE is turned cw.
- TP2 H (dim). Flash rate decreases when DELAY control is turned cw or when SAMPLE RATE is turned cw.
- TP3 H (dim). Flash rate decreases when DELAY control is turned cw or when SAMPLE RATE turned cw

Model 5304A  
Maintenance

OPEN/CLOSE MODE

5304A Controls:

Channel A, SEP, X1, DC, +, PSET  
OPEN/CLOSE A. Press RESET, then  
OPEN/CLOSE; display should be ac-  
cumulating at a 10 Hz rate.

INPUT:

651B set to 10 Hz, 100 mV rms/50Ω.

Oscilloscope:

HP 180A, HP 1801A Vert Amp, HP 1821A T.B.  
through a 10:1 probe.

Settings:

AC coupled (except as noted).  
NORM sweep mode.  
+ slope (except as noted)  
AC (except as noted)  
Channel A

5300A Sample Rate ccw out of OFF (except  
as noted).

5304A: OPEN/CLOSE Mode

- TP1 H. Goes Low when OPEN/CLOSE switch is  
pressed. Remains Low if this switch is  
held depressed.
- TP2 L. Goes High when RESET is pressed. Re-  
mains High if this switch is held depressed.
- TP3 L
- TP4 L. Goes High when OPEN/CLOSE is pressed  
to stop accumulation or when RESET is  
pressed during accumulation.
- TP5 H. Goes Low when OPEN/CLOSE is pressed  
to stop accumulation or when RESET is  
pressed during accumulation.

Table 9D-5-1. In-Cabinet Performance Checks

1. CHK mode and Time Interval Holdoff.

- a. Set 5300A OSC switch to INT.
- b. Mate 5300A to 5304A and ensure the casting latches at rear of 5300A are latched.
- c. Connect ac power to 5300A ac receptacle.
- d. Turn ac power "on" with 5300A SAMPLE RATE slightly cw out of OFF.
- e. Set COM-SEP-CHK to CHK; "Function" switch to FREQ A, AUTO. Display should be 10.0000 MHz +1 count.
- f. Set "Function" switch to T. I. A to B, .1  $\mu$ sec. Press 5300A RESET switch; the 5300A display should be about .2  $\mu$ sec (200 nsec residual holdoff). It may also be .0  $\mu$ sec.
- g. Set the DELAY slightly cw out of the detent position. Display should be approximately 100  $\mu$ sec.
- h. Adjust the DELAY control cw until maximum setting is reached. Display should be about \* 00000.0  $\mu$ s (\* = OVERFLOW) (100,000.0  $\mu$ sec).
- i. Repeat steps g and h for the following ranges; display should be as listed.

| T. I. A to B | Approximate 5300A Display with DELAY control: |                  |
|--------------|---|------------------|
|              | ccw out of Detent                             | max. cw          |
| 1 $\mu$ sec  | 000100 $\mu$ sec                              | 100000 $\mu$ sec |
| 10 $\mu$ sec | 0000.10 MS                                    | 0100.00 MS       |
| 1 ms         | 00000.0 MS                                    | 00100.0 MS       |
| 1 ms         | 000000 MS                                     | 000100 MS        |
| 10 ms        | 0000.00 S                                     | 0000.10 S        |

2. FREQ A Mode.

RANGE: dc coupled: 0 to 10 MHz.  
ac coupled: 100 Hz to 10 MHz.

Sensitivity as in Table 9D-1-1.

Obtain following test Equipment:

HP 651B Test Oscillator  
HP 11048B 50-Ohm Feed-Thru Termination

Table 5-1 in the 5300A portion of the manual and Table 9D-5-1 lists equipment used; equipment with equivalent characteristics may be used.

- a. Connect 651B 50-Ohm OUTPUT through the 50-Ohm feed-thru to 5304A "A INPUT" connector. Set 5304A "Function" switch to FREQ A, AUTO; set COM-SEP-CHK to SEP, ATTEN to X1, AC-DC to AC, SLOPE to +, LEVEL to PSET or adjusted until a stable count is displayed.
- b. Set 651B to frequencies and output levels listed below: Display should be as listed.

3. FREQ A Mode, Pulse Measurements.

RANGE: dc coupled: 0 to 10 MHz

Sensitivity as in Table 9D-1-1.

Pulse Width: 40 nsec minimum

Obtain the following test equipment:

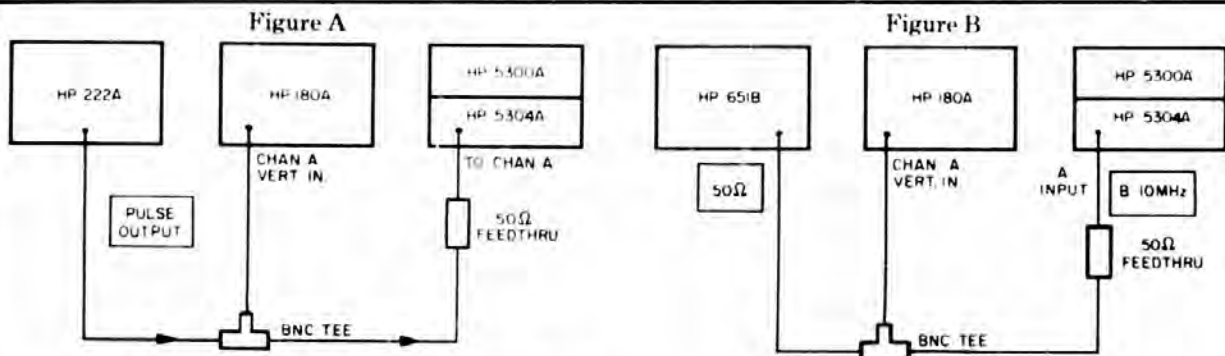

HP Model 222A Pulse Generator  
HP Model 11048B 50-ohm Feed-thru Termination  
HP Model 180A Oscilloscope  
BNC Tee Connector

- a. Connect equipment as in Figure A.

| 651B OUTPUT<br>mV rms | 651B FREQ Hz<br>Approximate | "Function"<br>(sec) | Approximate Display<br>$\pm 1$ Count $\pm$ Accuracy<br>of source |
|-----------------------|-----------------------------|---------------------|--|
| 25                    | 10 Hz                       | 10                  | 00010.0 Hz   |
| 25                    | 10 kHz                      | 10                  | 10000.0 Hz   |
| 25                    | 100 kHz                     | 1                   | 100000 Hz  |
| 25                    | 1 MHz                       | .1                  | 1000.00 kHz  |
| 50                    | 10 MHz                      | AUTO                | 10.0000 MHz  |

Table 9D-5-1. In-Cabinet Performance Checks (Continued)

- b. Set 222A for "+" PULSE POLARITY; 40 nsec pulse width; 150 mV p-p as monitored on oscilloscope.
- c. Monitor 222A pulse output with oscilloscope and set REP RATE for 10 Hz.
- d. Set 5304A Channel A controls as follows:
  - ATTEN switch to X1
  - AC-DC to DC
  - SLOPE to +.
  - LEVEL to PSET or adjust until a stable count is displayed.
- e. 5300A display should be approximately 10 Hz.
- f. Repeat step c with 222A repetition rates of 10 kHz, 100 kHz, 1 MHz and 10 MHz. The 5300A display should be the same as the 222A repetition rate setting.
- g. Set 222A PULSE POLARITY to "-". Set 5304A Channel A SLOPE to -. Repeat steps b through f.

4. SLOPE to +.
5. LEVEL to PSET or adjusted until a stable display is obtained.
- c. Monitor the oscilloscope and set 651B controls for 10 Hz, 100 mV rms output.
- d. Display should be approximately \* 00.0000 MS, C (\* = OVERFLOW) (100 msec).
- e. Monitor the oscilloscope and set 651B for the following frequencies; display should be as listed.

| 651B    | 5300A/5304A       |
|---------|-------------------|
| 10 kHz  | 100.000 $\mu$ s C |
| 100 kHz | 10.0000 $\mu$ s C |
| 1 MHz   | 01.0000 $\mu$ s C |

NOTE

Periods averaged are automatically selected to provide maximum resolution.

4. PER AVG A Mode.

RANGE: 10 Hz (.1 sec) to 1 MHz (1  $\mu$ sec).

Obtain the following test equipment:

- HP Model 651B Test Oscillator.
- HP Model 11048B 50 OHM Feed-thru Termination.

- a. Connect equipment as shown in Figure B.
- b. Set 5304A Channel A controls as follows:
  1. "Function" switch to PER AVG A.
  2. ATTEN to X1.
  3. AC-DC to AC.

5. T. I. A to B (Time Interval) Mode.

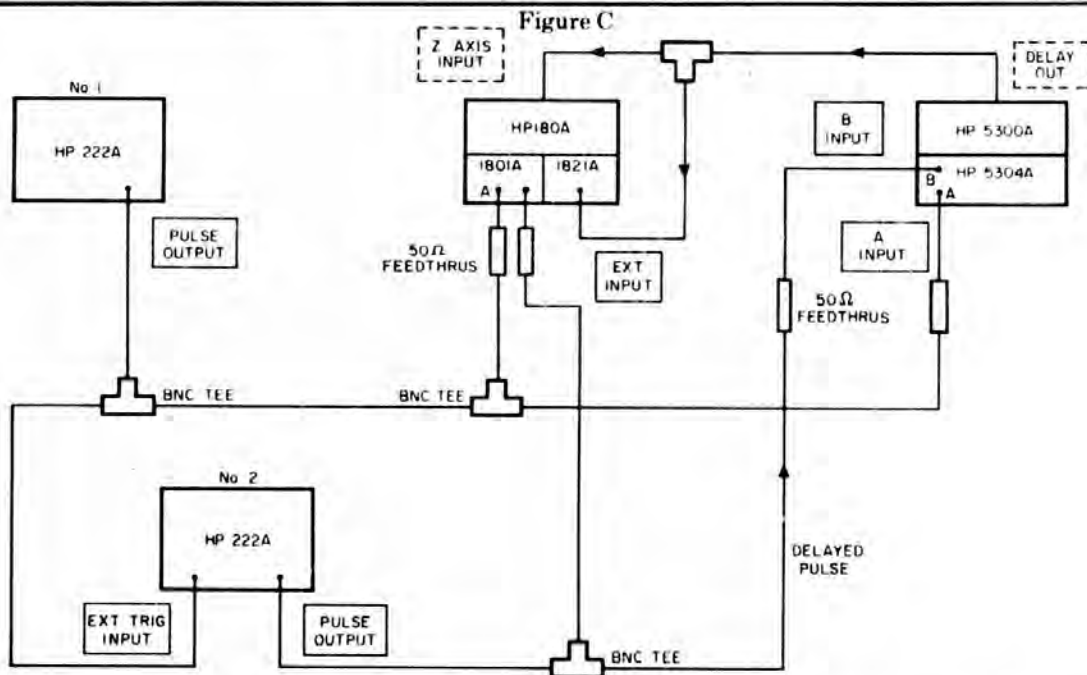

RANGE: 500 nsec to 10,000 seconds.

Obtain the following test equipment:

- HP Model 222A Pulse Generator (2 required).
- HP Model 11048B 50-Ohm Feed-thru Termination (2 required).
- HP Model 180A Oscilloscope.
- BNC Tee Connectors, (3 required).

- a. Connect equipment as shown in Figure C.

Table 9D-5-1. In-Cabinet Performance Checks (Continued)

- b. While monitoring generator No. 1 output with oscilloscope, set No. 1 generator controls as follows:
  1. REP RATE to 1k-10k with adjustment centered.
  2. PULSE WIDTH for .2  $\mu$ sec pulse at 2 V amplitude.
  3. PULSE POLARITY to +.
- c. While monitoring generator No.2 output with oscilloscope, set No. 2 generator controls as follows:
  1. REP RATE to MAN/EXT +.
  2. PULSE POLARITY to +.
  3. PULSE WIDTH for .2  $\mu$ sec pulse at 2 V amplitude.
  4. PULSE DELAY for .5  $\mu$ sec.
- d. Set Oscilloscope DISPLAY control to A + B to monitor No.2 pulse position.
- e. Set 5304A control as follows:
  1. ATTEN (both channels) to X1.
  2. AC-DC (both channels) to DC.
  3. SLOPE (both channels) to +.
  4. LEVEL (both channels) to PSET.
  5. COM-SEP-CHK to SEP.
- f. 5304A should display 00000.5  $\mu$ sec; verify time interval with oscilloscope.
- g. While monitoring oscilloscope, adjust No. 2 generator PULSE DELAY for time intervals from .5  $\mu$ sec to 150  $\mu$ sec. 5300A Display should be the same as oscilloscope display.
- h. Set No. 1 generator REP RATE to 100-1k and adjustment centered.
- i. While monitoring oscilloscope, adjust No. 2 generator PULSE DELAY for time intervals from 150  $\mu$ sec to 2000  $\mu$ sec. 5300A display should be the same as oscilloscope display.
- j. Set No. 1 generator REP RATE to 10-100 and adjustment full ccw.
- k. While monitoring oscilloscope, adjust No. 2 generator PULSE DELAY for time intervals from 2000  $\mu$ sec to 6000  $\mu$ sec. 5300A display and oscilloscope display should indicate the same time intervals.

NOTE

Measurement resolution may be adjusted from .1  $\mu$ sec to 1 msec with the T.I. A to B switch.

Table 9D-5-1. In-Cabinet Performance Checks (Continued)

**6. Totalizing (OPEN/CLOSE A) Measurements.**

Obtain the following test equipment:

HP Model 651B Test Oscillator.

HP Model 11048B 50-Ohm Feed-thru Termination.

- a. Connect 651B 50-Ohm output, set to 10 Hz at 100 mV rms, to 5304A Channel A INPUT connector.
- b. Set Channel A ATTEN switch to X100, AC-DC to AC; SLOPE to + and LEVEL to PSET.
- c. Set "Function" switch to OPEN/CLOSE A.
- d. Instrument gate is controlled by operator when OPEN/CLOSE A pushbutton is pressed.
- e. Press OPEN/CLOSE A switch; 5300A C lamp will turn on; adjust Channel A ATTEN to X1; 5300A display should accumulate.
- f. To stop 5300A from accumulating, press OPEN/CLOSE A. To continue accumulation from the number displayed press OPEN/CLOSE A, otherwise press RESET to clear display.

# **PARTS LIST**

**SECTION IX D**  
**5304A TIMER/COUNTER**

**SUBSECTION VI**  
**REPLACEABLE PARTS**

**9D-6-1. INTRODUCTION**

9D-6-2. This subsection contains information for ordering replacement parts. Table 9D-6-1 lists parts used in the HP 5304A.

**9D-6-3. ORDERING INFORMATION**

9D-6-4. To obtain replacement parts address order or inquiry to your local Hewlett-Packard Sales and

Service Office (see lists in Section VI, 5300A Manual for addresses). Identify parts by their Hewlett-Packard part number. To obtain a part that is not listed, include:

- a. Instrument model number.
- b. Instrument serial number.
- c. Description of the part.
- d. Function and location of the part.

| REFERENCE DESIGNATORS |                          |    |                    |    |                 |    |  |

See introduction to this section for ordering information

**BACK DATING  
MANUAL  
CHANGES**

**SECTION IX D**  
**5304A TIMER/COUNTER**

**SUBSECTION VII**  
**MANUAL CHANGES AND OPTIONS**

**9D-7-1. MANUAL CHANGES**

9D-7-2. Section IX D applies directly to Models 5304A Timer/Counter having serial prefix number 1212A00467.

**9D-7-3. NEWER INSTRUMENTS**

9D-7-4. As changes are made, newer instruments may have serial prefix numbers not listed in Section IX D. The manuals for these instruments will be supplied with "manual changes" pages containing the required information; replace the affected pages with the "replacement manual changes" pages. Contact the nearest Hewlett-Packard Sales and Service Office for information if this sheet is missing.

**9D-7-5. OLDER INSTRUMENTS**

9D-7-6. Changes for 5304A instruments with serial numbers 1116A00466 and below are listed as replacement pages in Table 9D-7-1, 7-2, 7-3, and Figure 9D-7-1.

**To back date the manual, do the following:**

Replace the 5304A Title Page with the replacement page containing Tables 9D-7-1 and 7-2. Replace page 9D-6-3 and 9D-6-4 with replacement page containing Table 9D-7-3 and 7-4. Replace page 9D-8-5 with replacement page containing Figure 9D-7-1.

**9D-7-7. OPTIONS**

9D-7-8. No options at time of printing.

Table 9D-7-1, 5304A Section IX D Timer/Counter Title Page

**SECTION IX D  
TIMER/COUNTER  
5304A**

**SERIAL PREFIX: 1116A**

This section applies directly to HP Model 5304A, Timer/Counters having serial prefix number 1116A, and must be inserted into the 5300A Measuring System Manual.

**NEWER INSTRUMENTS**

This Section with enclosed "Manual Changes Sheet(s)" applies directly to HP Model 5304A Timer/Counters having prefix numbers above 1116A.

**OLDER INSTRUMENTS**

Changes required to back-date this Section for older instruments are in Section IX D, Subsection VII.

# **SCHEMATIC DIAGRAMS**

**SECTION IX D**  
**5304A TIMER/COUNTER**

**SUBSECTION VIII**  
**CIRCUIT DIAGRAMS**

**9D-8-1. GENERAL**

9D-8-2. Subsection VIII contains:

- a. Schematic diagram notes are contained in Section VIII of the 5300A portion of the manual.
- b. Instrument interconnection pin list of signals listing where they originate and where they go.
- c. Component locators, circuit and block diagrams of assemblies.

Model 5304A  
Circuit Diagrams

Table 9D-8-1. Instrument Interconnection List

| PIN NO. | SIGNAL NAME                  | DESCRIPTION   |
|---------|------------------------------|---|
| 1       | +5 V                         | Input DC from 5300A   |
| 2       | -5 V                         |   |
| 3       | -17 V                        |   |
| 4       | GROUND                       |   |
| 5 *     | F1                           | This is the signal to be accumulated in the counter after gating by the control circuit.  |
| 6 *     | $\overline{9}$               | Goes low when the counter reaches 9% full scale.  |
| 7 *     | F2                           | The input signal to the time base gated by the control circuit.   |
| 8       | $\overline{\text{INHIBIT}}$  | High during the measurement cycle, low during the display cycle.  |
| 9 *     | $\overline{\text{OPEN}}$     | Low signal forces the main gate flip-flop to the open position.   |
| 10 *    | $\overline{\text{CLOSE}}$    | Low signal forces the main gate flip-flop to the close position.  |
| 11      | $\overline{\text{LOG}}$      | Logarithmic output pulse train from time base triggers main gate flip-flop on rising edge.  |
| 12      | $\overline{\text{MGFF}}$     | Main gate flip-flop signal is low when gate is open.  |
| 13      | $\overline{\text{EXPONENT}}$ | Inverted log pulses while main gate is open indicates number of auto ranging steps.   |
| 14      | NO CONNECTION                |   |
| 15      | RESET                        | High signal resets all registers.   |
| 16      | CLOCK                        | 10 MHz reference signal from crystal oscillator.  |
| 17 *    | $\overline{\text{MAX TIME}}$ | Low signal enables closing of the gate on next log pulse. Rising edge initiates display cycle.  |
| 18      | TIME BASE OUTPUT             | Output from the time base decade position selected by the time base select code on pins 22, 23, and 24.   |
| 19      | $\overline{\text{PRINT}}$    | Low signal provides print command to rear panel connector.  |
| 20      | $\overline{\text{TRANSFER}}$ | Low signal transfers data to display. High signal stores data.  |
| 21 *    | 1 MHz TIME BASE INPUT        | Input direct from plug-on bypasses control circuit.   |
| 22 *    | TIME BASE SELECT A           | Time base select code A, B, and C selects the time base division factor of the signal at the time base output at pin 18.  |
| 23 *    | TIME BASE SELECT B           |   |
| 24 *    | TIME BASE SELECT C           |   |
| 25      | +22 V                        | Full wave rectified voltage from the power transformer secondary. Provides power to charge the battery pack. If no battery pack is used, pin 25 is connected via the plug-on to pin 50. |
| 50      |                              |   |
| 26      | +17 V                        | Pins 27 through 31 provide the drive to the annunciator lights on the front panel. A low signal lights the corresponding indicator.   |
| 27 *    | $\overline{\text{Hz}}$       |   |
| 28 *    | $\overline{\text{M}}$        |   |
| 29 *    | $\overline{\text{S}}$        |   |
| 30 *    | $\overline{\text{K}}$        |   |
| 31 *    | $\overline{\text{Z}}$        |   |
| 32      | MANUAL RESET                 | Low signal from front panel pushbutton switch on rear panel input clears the system to zero.  |
| 33 *    | $\overline{\text{DP1}}$      | Low signal activates decimal point 1.   |
| 34 *    | $\overline{\text{DP2}}$      | Low signal activates decimal point 2.   |

# **MANUAL CHANGES**

MANUAL CHANGES

CHANGE DATE: December 15, 1981  
 This change supersedes all earlier dated changes.

- \*\*\* Make all corrections listed under ERRATA before making other changes.
- \*\*\* Check following table for your instrument's serial prefix or series number and make listed change(s) to manual.

MANUAL DESCRIPTION  
 \* \* \* \* \*  
 \* INSTRUMENT: 5304A \*  
 \* Timer-Counter Module \*  
 \* Operating and Service Manual \*  
 \* \* \* \* \*

 \* \* \* \* \*  
 \* DATE PRINTED: AUG 1973 \*  
 \* HP PART NO: 05304-90006 \*  
 \* MICROFICHE NO: 05304-90009 \*  
 \* \* \* \* \*

# INDICATES NEW OR REVISED ITEM > INDICATES ACTION TO BE TAKEN

NPC = NO PREFIX CHANGE

| SERIAL PREFIX OR SERIES NUMBER | MANUAL CHANGE(S) | SERIAL PREFIX OR SERIES NUMBER | MANUAL CHANGE(S) |
|--------------------------------|------------------|--------------------------------|------------------|
| 1704A . . . . .                | 1                |                                |                  |
| 1716A . . . . .                | 1,2              |                                |                  |
| 1804A . . . . .                | 1,2,3            |                                |                  |
| 1940A . . . . .                | 1,2,3,4          |                                |                  |
| 2024A . . . . .                | 1,2,3,4,5        |                                |                  |
| 2148A . . . . .                | 1 thru 6         |                                |                  |
| #(NPC) . . . . .               | 1 thru 7         |                                |                  |

Information for any optional circuit boards described in this manual agrees with the series numbers on the circuit board(s) for the option, which may not be the same as the Serial Prefix Number on the rear of the instrument.

(C5304AS)7061-7096/7485/9455/7080E/6=12160/7=13167

**ERRATA**

Page 9D-2-1, 9D-3-2, 9D-3-6, and 9D-3-10:

>Add the following:

**WARNING**

TO AVOID POSSIBILITY OF BODILY INJURY AND/OR EQUIPMENT DAMAGE, DO NOT CONNECT "HOT" SIDE OF POWER LINE TO INSTRUMENT CHASSIS GROUND. HEWLETT-PACKARD RECOMMENDS USING AN ISOLATION TRANSFORMER WHEN MEASURING AC LINE FREQUENCIES. ADDITIONALLY, DO NOT EXCEED THE INPUT VOLTAGE LIMITATIONS SPECIFIED IN TABLE 9D-1-1.

Page 9D-3-8, Figure 9D-3-7, Paragraph 6:

>Change to read as follows:

Adjust ATTEN switches and LEVEL controls until a stable display is obtained.

Page 9D-5-18, Table 9D-5-1, In-Cabinet Performance Checks:

>Change step e.4. to "COM-SEP-CHK to SEP."

>Change step e.5. to "LEVEL (both channels) to position giving most stable display."

Page 9D-8-5, Figure 9D-8-1, A1 (05304-60001) Schematic Diagram:

>Add "NOTE 3" just above line showing connection between A1U12D(13) and junction of A1U12A(2) and A1U12C(9).

>Add the following under NOTES:

3. IN "REV D" CKT BOARDS, A1U12D(13) IS CONNECTED TO A1U12C(8); NOT TO THE JUNCTION OF A1U12A(2) AND A1U12C(9).

Page 9D-6-4, Table 9D-6-1, Replaceable Parts:

>Add A2S1; 3101-1598; SWITCH-SLIDE DP3T 0.5A 125V AC/DC; 28480; 3101-1598.

#Page 9D-6-4, Table 9D-6-1, Miscellaneous Replaceable Parts:

>Change CASE part number from 05300-20010 to 05300-20006 in HP and Mfr Part Number columns.

CHANGE 1 (1704A)

Page 9D-6-2, Table 9D-6-1, A1 (05304-60001) Replaceable Parts:

- >Add "SERIES 1704" to Description for A1 circuit board.
- >Change A1Q1 and A1Q2 from 05304-80001 to 1855-0213; DUAL JFET N-CHANNEL 2N5912; 28480; 1855-0213.
- >Change A1R19 and A1R20 from 2100-1768 (20-ohm) to 2100-2010; RESISTOR-VAR COMP 10-ohm 20%; 32997; 3329H-1-10R.

Page 9D-8-5, A1 (05304-60001) Schematic Diagram:

- >Add "SERIES 1704" at top of A1 (05304-60001) schematic.
- >Add "NOTE 4" between A1Q1/A1Q3 and A1Q2/A1Q4.
- >Add the following under NOTES:
  - "4. A1Q1/A1Q3 AND A1Q2/A1Q4 ARE DUAL JFET N-CHAN UNITS WITH CENTER LEAD TO CASE CJT OFF."
- >Change Q1-4 in TABLE OF ACTIVE COMPONENTS to Q1/Q3, Q2/Q4; and HP PART NUMBER to 1855-0213.
- >Change the values of A1R19 and A1R20 from 20 to 10-ohm.

CHANGE 2 (1716A)

Page 9D-6-2, Table 9D-6-1, A1 (05304-60001) Replaceable Parts:

- >Change A1 from series 1704 to 1716.
- >Change A1U15 from 1820-0077 (3N7474N) to 1820-1112; IC TTL LS DUAL-D FLIP-FLOP; 01295; SN74LS74N.

Page 9D-8-5, Figure 9D-8-1, A1 (05304-60001) Schematic Diagram:

- >Change series number, at top of diagram, from 1704 to 1716.
- >Change A1U15 in TABLE OF ACTIVE COMPONENTS to 1820-1112.
- >Change A1 schematic by disconnecting A1U15B(13) from the junction of U13E(10) and U8(1,10).
- >Add a connection between A1U15B pins 12 and 13.

CHANGE 3 (1804A)

Page 9D-6-2, Table 9D-6-1, A1 (05304-60001) Replaceable Parts:

- >Change A1 series number from 1716 to 1804.
- >Change A1R19 and A1R20 from 2100-2010 (10-ohm) to 2100-1985; RESISTOR-TRMR 20-ohm 20% C TOP-ADJ 1-TURN; 32997; 33294-1-20R.

Page 9D-8-5, Figure 9D-8-1, A1 (05304-60001) Schematic Diagram:

- >Change A1 series number from 1716 to 1804.
- >Change the values of A1R19 and A1R20 from 10 to 20-ohm.

CHANGE 4 (Serial Prefix 1940A)

Page 9D-6-3, Table 9D-6-1, A2 (05304-60003) Replaceable Parts:

- >Add (SERIES 1940) to A2 Description.
- >Change A2S1, S2 and S3 from 3101-1598 to 3101-2383 in HP and Mfr Part Number columns.
- >Change A2S4 thru S7 from 3101-1596 to 3101-2334 in HP and Mfr Part Number columns.

Page 9D-8-5, Figure 9D-8-1, A2 Schematic Diagram:

- >Add (SERIES 1940) at top of A2 schematic diagram.

CHANGE 5 (Serial Prefix No. 2024A)

Page 9D-6-3 A2 (05304-60003), Replaceable Parts:

>Change A2 (05304-60003) Series Number to 2024A.

Page 9D-6-4 A2 (05304-60003), Replaceable Parts:

>Change A2S1, S2 and S3 from 3101-2383 to 3101-1313; SWITCH-SLIDE DPDT 0.5A  
125V 28480; 3101-1313.

CHANGE 6

Pages 9D-6-3 and 9D-6-4, Table 9D-6-1. A2 (05304-60003) Replaceable Parts:

>Change A2 SERIES number to 2148.

>Change A2S1, S2 and S3 to 3101-2383; SWITCH-SLIDE DP3T MINTR .5A 125VAC PC

Page 9D-8-5, Figure 9D-8-1. A2 Attenuator Board Assembly Schematic Diagram:

>Change A2 SERIES number to 2148, at top of schematic.

#CHANGE 7

Page 9D-6-3, Table 9D-6-1. A1 (05304-60001) Replaceable Parts:

>Change A1U21 to 05300-80013; IC GATE ECL OR-NOR, DUAL 2-INP

Page 9D-8-5, Figure 9D-8-1. A1 Time Interval Board Assembly Schematic Diagram:

>Change A1U21 part number to 05300-80013 in TABLE OF ACTIVE COMPONENTS.

# MANUAL CHANGES

## MANUAL IDENTIFICATION

Model Number: 5304A  
Date Printed: August 1973  
Part Number: 05304-90006

This supplement contains important information for correcting manual errors and for adapting the manual to instruments containing improvements made after the printing of the manual.

To use this supplement:

Make all ERRATA corrections.

Make all appropriate serial number related changes indicated in the tables below.

| Serial Prefix or Number | Make Manual Changes | Serial Prefix or Number | Make Manual Changes |
|-------------------------|---------------------|-------------------------|---------------------|
| 1323U-01151             | 1                   |                         |                     |
| 1632U                   | 1-2                 |                         |                     |
| 1714U                   | 1-3                 |                         |                     |
|                         |                     |                         |                     |
|                         |                     |                         |                     |
|                         |                     |                         |                     |

\* NEW ITEM

## ERRATA

Pages 9D-2-1, 9D-3-2, 9D-3-6 and 9D-3-10:  
Add the following:

### WARNING

TO AVOID POSSIBILITY OF BODILY INJURY AND/OR EQUIPMENT DAMAGE, DO NOT CONNECT "HOT" SIDE OF POWER LINE TO INSTRUMENT CHASSIS GROUND. HEWLETT-PACKARD RECOMMENDS USING AN ISOLATION TRANSFORMER WHEN MEASURING AC LINE FREQUENCIES. ADDITIONALLY, DO NOT EXCEED THE INPUT VOLTAGE LIMITATIONS AS SPECIFIED IN TABLE 9D-1-1.

Page 9D-3-8, Figure 9D-3-7, Paragraph 6:

Change to read as follows:

"Adjust ATTN switches and LEVEL controls until a stable display is obtained".

### NOTE

Manual change supplements are revised as often as necessary to keep manuals as current and accurate as possible. Hewlett-Packard recommends that you periodically request the latest edition of the supplement. Free copies are available from all HP offices. When requesting copies quote the manual identification information from your supplement or the model number and print date from the title page of the manual.

15-9-77

Page 1 of 3

HEWLETT  PACKARD

## ERRATA (Cont'd):

Page 9D-5-18, Table 9D-5-1, In Cabinet Performance Checks:

Change Step e.4. to "COM'SEP-CHK to SEP".

Change Step e.5. to "LEVEL (both channels) to position giving most stable display".

Page 9D-6-2/3, Table 9D-6-1:

\* Change A1R19/20 to 2100-1985.

Add MP1 Part Number 1460-1312 Spring Clip.

Add MP1 Part Number 0905-0479 Gasket.

CHANGE 1

Page 9D-6-2, Table 9D-6-1:

Add A1 Part Number 05304-20001 Board Blank RevD.

Page 9D-8-5, Figure 9D-8-1, A1 (05304-60001) Schematic Diagram:

Add "NOTE 3" just above line showing connection between A1U12D (13) and junction of A1U12A (2) and A1U12C (9).

Add the following under NOTES:

3. IN "REV D" CKT BOARDS, A1U12D (13) IS CONNECTED TO A1U12 (8); NOT TO JUNCTION OF A1U12A (2) AND A1U12C (9).

Page 9D-6-4, Table 9D-6-1:

Under Miscellaneous Parts:

Change 05300-20010 to 05300-20025.

CHANGE 2

Page 9D-6-2, Table 9D-6-1:

Change A1Q13/A14 to Part Number 1854-0094 XSTR NPN SI.

Page 9D-7-7, Figure 9D-7-1:

In Table of active components:

Change A1Q13/14 to 1854-0094.

Page 9D-8-5, Figure 9D-8-1:

In Table of active components:

Change A1Q13/14 to 1854-0094.

CHANGE 3

Page 9D-6-2, Table 9D-6-1, A1 (05304-60001) Replaceable Parts:

Change A1Q1 and A1Q2 from 05304-80001 to 1855-0213; DUAL JFET N-CHANNEL 2N592.

CHANGE 3 (Cont'd):

Page 9D-6-3, Table 9D-6-1:

Change A1U15 to 1820-1112 INT CCT SN74LS74.

Page 9D-8-5, A1 (05304-60001) Schematic Diagram:

Add "NOTE 4" between A1Q1/A1Q3 and A1Q2/A1Q4.

Add the following under NOTES:

4. "A1Q1/A1Q3 and A1Q2/A1Q4 ARE DUAL JFET N-CHAN UNITS WITH CENTER LEAD TO CASE CUT OFF".

Change Q1-4 in TABLE OF ACTIVE COMPONENTS to Q1/q3, Q2/Q4 and HP PART NUMBER to 1855-0213.

Page 9D-8-5:

In table of active components:

Change U15 to 1820-1112.

Alter Schematic to show change of wiring:

- a) Connect Pins 12 and 13 of U15 together.
- b) Remove track from U13 Pin 10 to U15 Pin 13.
