1.0 OVERVIEW	1
2.0 THE ROUTINES	1
3.0 CORE MAP	3
4.0 FLOWCHARTS AND LISTINGS	4

The Job Control Processor is the combination (via Add Binary) of three separate assemblies, the sources for which are JLnn, CMnn, XSAnn, and XSBnn. (nn is the current version number for each source.)

1.0 OVERVIEW

JL contains most of the code in Job Control which references things within the Monitor. It contains a LODSYM statement, which obtains the Monitor symbol table from the last assembly of the Monitor. Note: JL must be reassembled whenever the Monitor is modified. It is, however, the only Job Control module which refers to Monitor locations outside page 0. Included in JL are the end-of-job cleanup routines, which restore various Monitor flags and pointers to their "normal" values; the code which loads field 1 sections of Job Control; and the binary loader, which is actually not read into core until Job Control processing is complete.

2.0 THE ROUTINES

CM contains the command interpreter and command display routine. It is entered at CMINIT with the internal code of the system unit in the AC. This is stored as the initial default device and preferred load unit. Control transfers to CMPMOV, which moves a number of constants and initial values of variables into page 0, then returns to CMI000, the start of the command interpreter. After initializing pointers and state values, a read is issued to the Teletype¹, and the index is read from the system unit.

At CMI100, the value of MAJOR is used to set the appropriate help frame, and control flows into the main display loop at CMI110. The pointers LSTCHR and NEWCHR are maintained pointing to the last character typed in the buffer and the next available buffer location, respectively. When the location pointed to by LSTCHR becomes zero, a character has been rubbed out. If it was a delimiter, (LSTDEL points to the last delimiter), the command string is rescanned to determine the current state of the command. When the location pointed to by NEWCHR becomes non-zero, a new character has been typed. The code at CMI200 performs nominal validity checking, and if the character is a delimiter, calls the appropriate delimiter handler, as indicated by the control table at DELS.

¹Teletype is a registered trademark of the Teletype Corporation.

If a line terminator (carriage return, line feed or ALT MODE) is struck, CMI9000 is called. This routine attempts to complete scanning of the input string. If an error is found, the user will not be able to correct it because the Teletype read has been closed. Control therefore returns to CMI0000, where the buffer is cleared, and a new command accepted. Then, if no errors are found and the terminator was carriage return, final setup on page 37 is performed, and the loader called to read in the desired function.

The index service routines, XSnn, are invoked in the following circumstances:

- 1) At end-of-job, when a function has been completed successfully and taken a normal exit, EJS, the end-of-job file saving routines, are invoked by the Job Cleanup routine, EOJ, in module JL.
- 2) During interpretation of a command, whenever a file is named, it is either looked up or a working area is allocated to contain it, by calling XS.
- 3) Whenever the special command DX is used, the index display routines in XS are called.

EJS is non-reusable, and is overlaid by the DX buffers whenever DX is called. When EJS is called, it scans the file descriptor blocks in page 37, and allocates index entries for any permanent output files on mass storage devices named there. For each file to be saved, EJS checks the validity of the specified name, and requests a new name from the user if it is invalid.

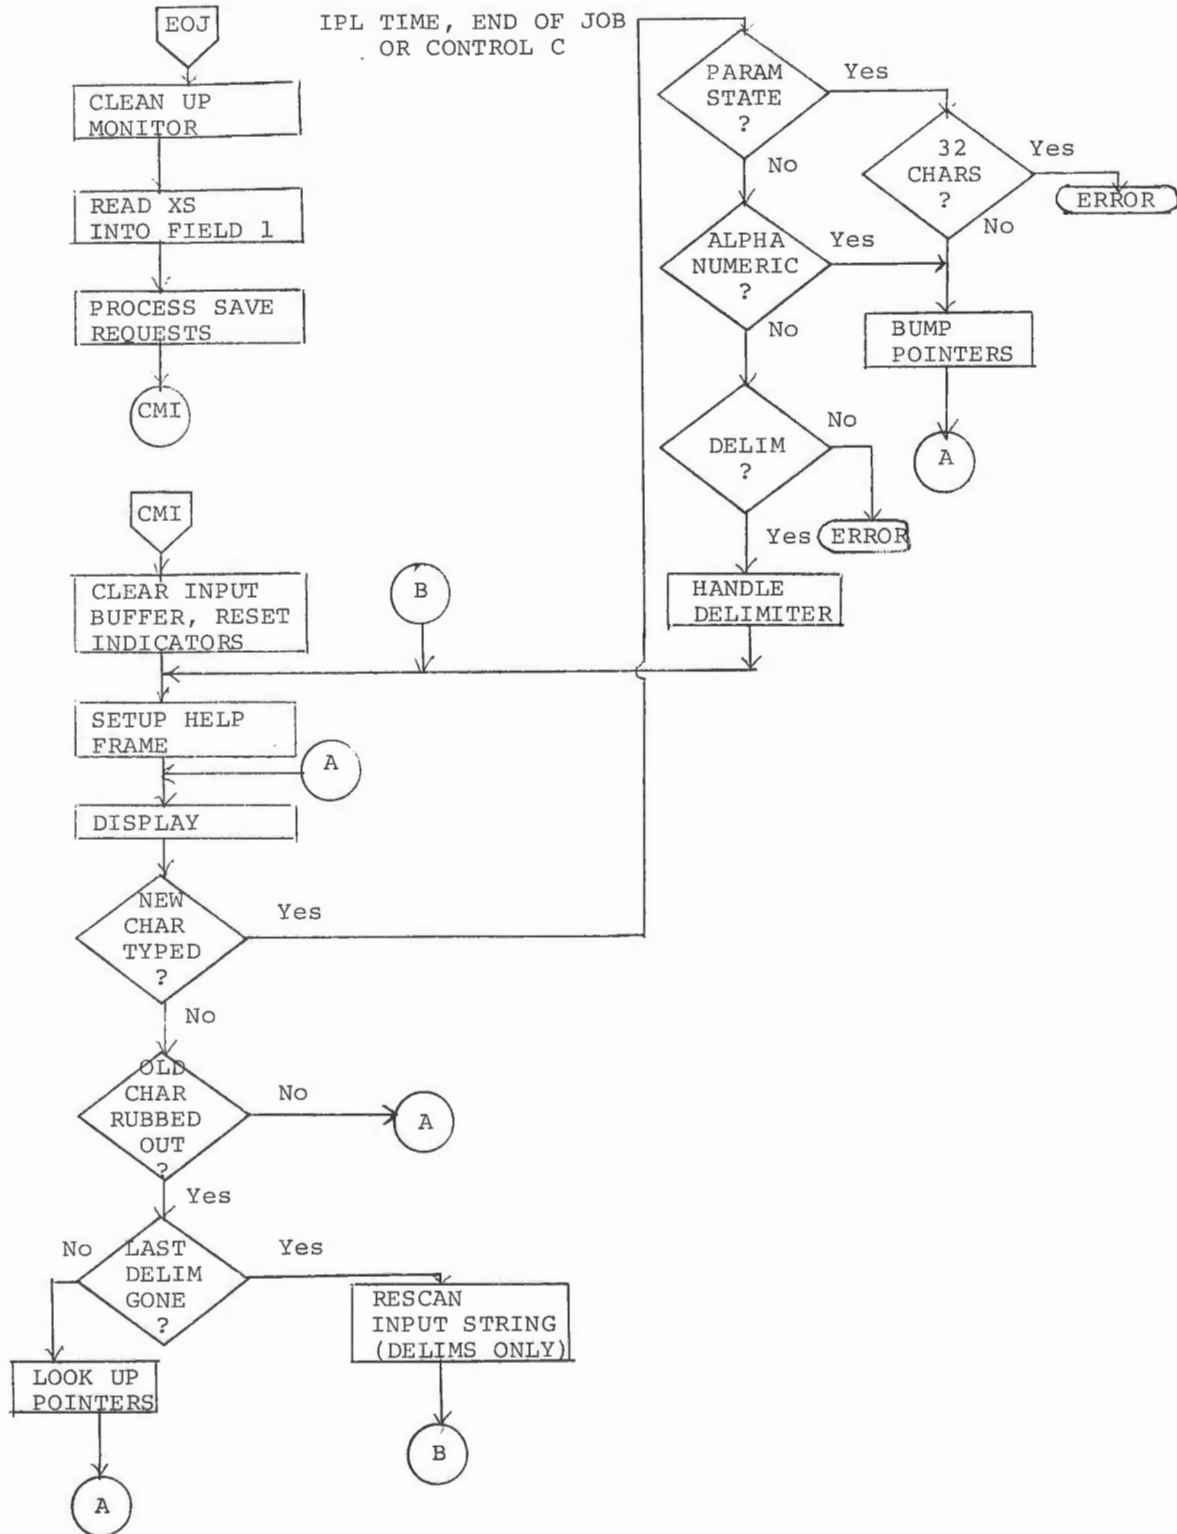

DX is serially reusable. The index to be displayed must be at location 4000 in field 1. While it is displayed, the user may DELETE, ALIAS, or RENAME any file (by typing the initial character of each function); print the index (by typing P); move forward or backward in the index by typing F or B to move by pages; or type line feed or ALTMODE to move by lines, or L to locate a file entry.

Typing carriage return at this time will return the user to the Job Control display and make permanent any changes entered. If the user makes changes in the index, but decides he does not want the changes, he may type CTRL/C to return to Job Control without making the changes permanent.

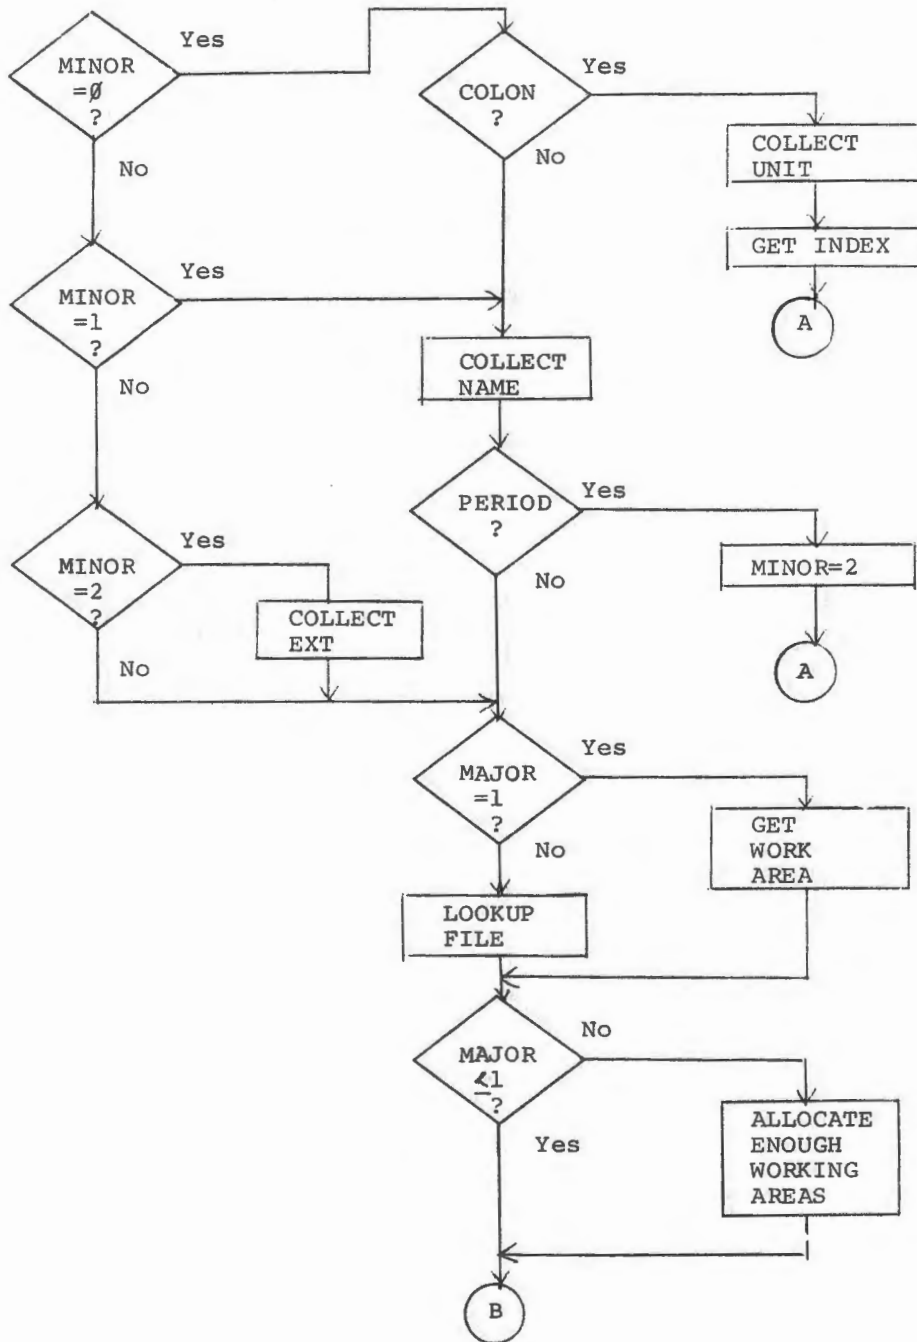

3.0 CORE MAP

Field 0:	0000-0043	Reserved for Monitor
	0044-0137	Command Interpreter page 0 (loaded by CMINIT)
	0140-2577	Monitor
	2600-3377	Unused
	3400-3777	JL: EOJ, control D, Loader loader
	4000-6777	Command Interpreter
	7600-7777	Page 37: information passed to program
Field 1:	0000-0177	XS page 0
	0200-1577	General purpose index service routines
	1600-34xx	Display index with option handlers
	34xx-3777	DX buffer (EOJ file saving until DX called)
	4000-4177	EOJ page 37 analysis, overlaid by index
	4000-7777	Current default unit index
	7000-7777	Loader, when called

LDP SYSTEM JOB CONTROL
COMMAND INTERPRETER

CM02

/COPYRIGHT 1970; DIGITAL EQUIPMENT CORP.
MAYNARD, MASS. 01754

VERSION 0: DECEMBER 1, 1970
JUD LEONARD

THE HEART OF JOB CONTROL (THROB)

ENTER HERE WHEN END-OF-JOB PROCESSING
IS COMPLETE, OR AT END OF DX.

THERE ARE SEVERAL "CURRENT STATE" INDICATORS,
WHOSE MEANINGS ARE AS FOLLOWS:

MAJOR 0=FUNCTION FILE IS BEING ENTERED
1=OUTPUT FILES ARE BEING ENTERED
2=INPUT FILES ARE BEING ENTERED
3=PARAMETER STRING

FILCNT HAS MEANING ONLY IN MAJOR STATES 1 AND 2,
WHERE IT COUNTS THE NUMBER OF FILES THAT
HAVE BEEN SPECIFIED

MINOR 0=UNIT OR FILENAME IS BEING ENTERED
1=FILENAME IS BEING ENTERED
2=EXTENSION IS BEING ENTERED
3=UNIT IS SEQUENTIAL; NO FILENAME
OR EXTENSION IS ALLOWED.

CMPPARM CONTAINS THE UNIT NUMBER OF THE LAST MASS
STORAGE DEVICE SPECIFIED IN THE COMMAND;
IE, THE DEFAULT UNIT.

NEWCHR CONTAINS A POINTER TO THE BUFFER
LOCATION WHERE A NEW CHARACTER
IS EXPECTED WHEN TYPED.

LSTCHR IS ONE LESS THAN NEWCHR, POINTS TO THE
LOCATION THAT WILL BECOME ZERO
IF A RUBOUT IS TYPED.

LSTDEL POINTS TO THE LAST (RIGHTMOST) DELIMITER
TYPED. IF THE DELIMITER IS RUBBED OUT,
A BACKSCAN WILL BE NECESSARY
TO RESET THE STATE INDICATORS.

CREP=14 /LISTAPE UNIT
PMODE
*4000
