## Description

[0002] Respiratory viral infections, including upper and lower respiratory tract viral infections, infects and is the leading cause of death of millions of people each year. Upper respiratory tract viral infections involve the nose, sinuses, pharynx and/or larynx. Lower respiratory tract viral infections involve the respiratory system below the vocal cords, including the trachea, primary bronchi and lungs.
[0003] Nucleoside analogs are a class of compounds that have been shown to exert antiviral activity both in vitro and in vivo, and thus, have been the subject of widespread research for the treatment of viral infections. Nucleoside analogs are usually therapeutically inactive compounds that are converted by host or viral enzymes to their respective active antimetabolites, which, in turn, may inhibit polymerases involved in viral or cell proliferation. The activation occurs by a variety of mechanisms, such as the addition of one or more phosphate groups and, or in combination with, other metabolic processes.

## BRIEF DESCRIPTION OF THE DRAWINGS

[0008] Figure 1 shows example RSV agents.

## DETAILED DESCRIPTION

[0009] Paramyxoviridae family is a family of single stranded RNA viruses. Several genera of the paramyxoviridae family include henipavirus, morbillivirus, respirovirus, rubulavirus, pneumovirus and metapneumovirus. These viruses can be transmitted person to
person via direct or close contact with contaminated respiratory droplets or fomites. Species of henipavirus include hendravirus and nipahvirus. A species of morbillivirus is measles. Species of respirovirus include sendai virus and human parainfluenza viruses 1 and 3 ; and species of rubulavirus include mumps vinus and human parainfluenza viruses 2 and 4. A species of metapneumovirus is human metapneumovirus.
[0010] Human Respiratory Syncytial Virus (RSV), a species of pneumovirus, can cause respiratory infections, and can be associated with bronchiolitis and pneumonia. Symptoms of an RSV infection include coughing, sneezing, runny nose, fever, decrease in appetite, and wheezing. RSV is the most common cause of bronchiolitis and pneumonia in children under one year of age in the world, and can be the cause of tracheobronchitis in older children and adults. In the United States, between 75,000 and 125,000 infants are hospitalized each year with RSV. Among adults older than 65 years of age, an estimated 14,000 deaths and 177,000 hospitalizations have been attributed to RSV.
[0011] Treatment options for people infected with RSV are currently limited. Antibiotics, usually prescribed to treat bacterial infections, and over-the-counter medication are not effective in treating RSV and may help only to relieve some of the symptoms. In severe cases, a nebulized bronchodilator, such as albuterol, may be prescribed to relieve some of the symptoms, such as wheezing. RespiGram ${ }^{\circledR}$ (RSV-IGIV, MedImmune, approved for high risk children younger than 24 months of age), Synagis ${ }^{\circledR}$ (palivizumab, MedImmune, approved for high risk children younger than 24 months of age), and Virzole® (ribavirin by aerosol, ICN pharmaceuticals) have been approved for treatment of RSV.
[0012] Symptoms of the measles include fever, cough, runny nose, red eyes and a generalized rash. Some individuals with measles can develop pneumonia, ear infections and bronchitis. Mumps leads to swelling of the salivary glands. Symptoms of mumps include fever, loss of appetite and fatigue. Individuals are often immunized against measles and mumps via a three-part MMR vaccine (measles, mumps, and rubella). Human parainfluenza virus includes four serotypes types, and can cause upper and lower respiratory tract infections. Human parainfluenza virus 1 (HPIV-1) can be associated with croup; human parainfluenza virus 3 (HPIV-3) can be associated with bronchiolitis and pneumonia. According to the Centers of Disease Control and Prevention (CDC), there are no vaccines against human parainfluenza virus.
[0013] Influenza is a single stranded RNA virus and a member of the Orthomyxoviridae family. There are currently three species of influenza; influenza A, influenza B and influenza C. Influenza A has been further classified based on the viral surface proteins
into hemagglutinin (H or HA) and neuramididase (N). There are approximately 16 H antigens ( H 1 to H 16 ) and 9 N antigens ( N 1 to N 9 ). Influenza A includes several subtype, including H1N1, H1N2, H2N2, H3N1, H3N2, H3N8, H5N1, H5N2, H5N3, H5N8, H5N9, H7N1, H7N2, H7N3, H7N4, H7N7, H9N2, H10N7. As with RSV, influenza viruses can be transmitted from person to person via direct contact with infected secretions and/or contaminated surfaces or objections. Complications from an influenza viral infection include pneumonia, bronchitis, dehydration, and sinus and ear infections. Medications currently approved by the FDA against an influenza infection include amantadine, rimantadine, Relenza ${ }^{8}$ (zanamivir, GlaxoSmithKline) and Tamiflu® (oseltamivir, Genentech).

Definitions
[0014] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as is commonly understood by one of ordinary skill in the art. All patents, applications, published applications and other publications referenced herein are incorporated by reference in their entirety unless stated otherwise. In the event that there are a plurality of definitions for a term herein, those in this section prevail unless stated otherwise.
[0015] As used herein, any " $\mathrm{R}^{\prime \prime}$ group(s) such as, without limitation, $\mathrm{R}^{1 \mathrm{~A}}, \mathrm{R}^{2 \mathrm{~A}}, \mathrm{R}^{3 \mathrm{~A}}$, $R^{4 A}, R^{5 \Lambda}, R^{6 \Lambda}, R^{7 \Lambda}, R^{8 \Lambda}, R^{9 A}, R^{10 \Lambda}, R^{11 A}, R^{12 A}, R^{13 A}, R^{14 A}, R^{15 A}, R^{16 \Lambda}, R^{17 \Lambda}, R^{18 \Lambda}, R^{19 \Lambda}, R^{20 \Lambda}$, $R^{21 A}, R^{22 A}, R^{23 A}, R^{24 A}, R^{25 A}, R^{26 A}, R^{27 A}, R^{28 A}, R^{29 A}, R^{30 A}, R^{31 A}, R^{32 A}, R^{33 A}, R^{34 A}, R^{35 A}, R^{36 A}$, $R^{37 A}, R^{38 A}, R^{18}, R^{2 B}, R^{3 B}, R^{4 B}, R^{5 B}, R^{6 B}, R^{7 B}, R^{8 B}, R^{9 B}, R^{108}, R^{118}, R^{12 B}, R^{13 B}, R^{14 B}, R^{1 C}, R^{2 C}$, $R^{3 C}, R^{4 C}, R^{5 C}, R^{6 C}, R^{7 C}, R^{8 C}, R^{9 C}, R^{10 C}, R^{11 C}, R^{12 C}, R^{13 C}, R^{14 C}, R^{15 C}, R^{16 C}, R^{17 C}, R^{18 C}, R^{19 C}, R^{20 C}$, $R^{21 C}, R^{22 C}$ and $R^{23 C}$ represent substituents that can be attached to the indicated atom. An $R$ group may be substituted or unsubstituted. If two "R" groups are described as being "taken together" the $R$ groups and the atoms they are attached to can form a cycloalkyl, cycloalkenyl, cycloalkynyl, aryl, heteroaryl or heterocycle. For example, without limitation, if $R^{a}$ and $R^{b}$ of an $N^{2} R^{b}$ group are indicated to be "taken together," it means that they are covalently bonded to one another to form a ring:

In addition, if two " $R$ " groups are described as being "taken together" with the atom(s) to which they are attached to form a ring as an alternative, the R groups are not limited to the variables or substituents defined previously.
[0016[ Whenever a group is described as being "optionally substituted" that group may be unsubstituted or substituted with one or more of the indicated substituents. Likewise,
when a group is described as being "unsubstituted or substituted" if substituted, the substituent(s) may be selected from one or more the indicated substituents. If no substituents are indicated, it is meant that the indicated "optionally substituted" or "substituted" group may be substituted with one or more group(s) individually and independently selected from alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkynyl, aryl, heteroaryl, heteroalicyclyl, aralkyl, heteroaralkyl, (heteroalicyclyl)alkyl, hydroxy, protected hydroxyl, alkoxy, aryloxy, acyl, mercapto, alkylthio, arylthio, cyano, halogen, thiocarbonyl, O-carbamyl, N-carbamyl, O-thiocarbamyl, N-thiocarbamyl, C-amido, N-amido, S-sulfonamido, N-sulfonamido, C-carboxy, protected C-carboxy, O-carboxy, isocyanato, thiocyanato, isothiocyanato, nitro, silyl, sulfenyl, sulfinyl, sulfonyl, haloalkyl, haloalkoxy, trihalomethanesulfonyl, trihalomethanesulfonamido, an amino, a mono-substituted amino group and a di-substituted amino group, and protected derivatives thereof.
[0017] As used herein, " $C_{a}$ to $C_{b}$ " in which " $a$ " and " $b$ " are integers refer to the number of carbon atoms in an alkyl, alkenyl or alkynyl group, or the number of carbon atoms in the ring of a cycloalkyl, cycloalkenyl, cycloalkynyl, aryl, heteroaryl or heteroalicyclyl group. That is, the alkyl, alkenyl, alkynyl, ring of the cycloalkyl, ring of the cycloalkenyl, ring of the cycloalkynyl, ring of the aryl, ring of the heteroaryl or ring of the heteroalicyclyl can contain from " $a$ " to " $b$ ", inclusive, carbon atoms. Thus, for example, $a$ " $C_{1}$ to $C_{4}$ alkyl" group refers to all alkyl groups having from 1 to 4 carbons, that is, $\mathrm{CH}_{3}-, \mathrm{CH}_{3} \mathrm{CH}_{2}-, \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2}-,\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}-$, $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$-, $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right)$ - and $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}$-. If no " $a$ " and " $b$ " are designated with regard to an alkyl, alkenyl, alkynyl, cycloalkyl cycloalkenyl, cycloalkynyl, aryl, heteroaryl or heteroalicyclyl group, the broadest range described in these definitions is to be assumed.
[0018] As used herein, "alkyl" refers to a straight or branched hydrocarbon chain that comprises a fully saturated (no double or triple bonds) hydrocarbon group. The alkyl group may have $\mathbf{1}$ to $\mathbf{2 0}$ carbon atoms (whenever it appears herein, a numerical range such as "I to $\mathbf{2 0}$ " refers to each integer in the given range; e.g., " 1 to 20 carbon atoms" means that the alkyl group may consist of 1 carbon atom, 2 carbon atoms, 3 carbon atoms, etc., up to and including 20 carbon atoms, although the present definition also covers the occurrence of the term "alkyl" where no numerical range is designated). The alkyl group may also be a medium size alkyl having 1 to 10 carbon atoms. The alkyl group could also be a lower alkyl having 1 to 6 carbon atoms. The alkyl group of the compounds may be designated as " $\mathrm{C}_{1}-\mathrm{C}_{4}$ alkyl" or similar designations. By way of example only, " $\mathrm{C}_{1}-\mathrm{C}_{4}$ alkyl" indicates that there are one to four carbon atoms in the alkyl chain, i.e., the alkyl chain is selected from methyl, ethyl, propyl, iso-propyl, n-butyl, iso-butyl, sec-butyl, and t-butyl. Typical alkyl groups include, but are in no way limited
to, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, tertiary butyl, pentyl and hexyl. The alkyl group may be substituted or unsubstituted.
[0019] As used herein, "alkenyl" refers to an alkyl group that contains in the straight or branched hydrocarbon chain one or more double bonds. An alkenyl group may be unsubstituted or substituted.
[0020] As used herein, "alkynyl" refers to an alkyl group that contains in the straight or branched hydrocarbon chain one or more triple bonds. An alkynyl group may be unsubstituted or substituted.
[0021] As used herein, "cycloalkyl" refers to a completely saturated (no double or triple bonds) mono- or multi- cyclic hydrocarbon ring system. When composed of two or more rings, the rings may be joined together in a fused fashion. Cycloalkyl groups can contain 3 to 10 atoms in the ring(s) or 3 to 8 atoms in the ring(s). A cycloalkyl group may be unsubstituted or substituted. Typical cycloalkyl groups include, but are in no way limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and cyclooctyl.
[0022] As used herein, "cycloalkenyl" refers to a mono- or multi- cyclic hydrocarbon ring system that contains one or more double bonds in at least one ring; although, if there is more than one, the double bonds cannot form a fully delocalized pi-electron system throughout all the rings (otherwise the group would be "aryl," as defined herein). When composed of two or more rings, the rings may be connected together in a fused fashion. A cycloalkenyl group may be unsubstituted or substituted.
[0023] As used herein, "cycloalkynyl" refers to a mono- or multi- cyclic hydrocarbon ring system that contains one or more triple bonds in at least one ring. If there is more than one triple bond, the triple bonds cannot form a fully delocalized pi-electron system throughout all the rings. When composed of two or more rings, the rings may be joined together in a fused fashion. A cycloalkynyl group may be unsubstituted or substituted.
[0024] As used herein, "aryl" refers to a carbocyclic (all carbon) monocyclic or multicyclic aromatic ring system (including fused ring systems where two carbocyclic rings share a chemical bond) that has a fully delocalized pi-electron system throughout all the rings. The number of carbon atoms in an aryl group can vary. For example, the aryl group can be a $\mathrm{C}_{6}-\mathrm{C}_{14}$ aryl group, a $\mathrm{C}_{6}-\mathrm{C}_{10}$ aryl group, or a $\mathrm{C}_{6}$ aryl group. Examples of aryl groups include, but are not limited to, benzene, naphthalene and azulene. An aryl group may be substituted or unsubstituted.
[0025] As used herein, "heteroaryl" refers to a monocyclic or multicyclic aromatic ring system (a ring system with fully delocalized pi-electron system) that contain(s) one or more
heteroatoms, that is, an element other than carbon, including but not limited to, nitrogen, oxygen and sulfur. The number of atoms in the ring(s) of a heteroaryl group can vary. For example, the heteroaryl group can contain 4 to 14 atoms in the ring(s), 5 to 10 atoms in the ring(s) or 5 to 6 atoms in the ring(s). Furthermore, the term "heteroaryl" includes fused ring systems where two rings, such as at least one aryl ring and at least one heteroaryl ring, or at least two heteroaryl rings, share at least one chemical bond. Examples of heteroaryl rings include, but are not limited to, furan, furazan, thiophene, benzothiophene, phthalazine, pyrrole, oxazole, benzoxazole, 1,2,3-oxadiazole, 1,2,4-oxadiazole, thiazole, 1,2,3-thiadiazole, 1,2,4-thiadiazole, benzothiazole, imidazole, benzimidazole, indole, indazole, pyrazole, benzopyrazole, isoxazole, benzoisoxazole, isothiazole, triazole, benzotriazole, thiadiazole, tetrazole, pyridine, pyridazine, pyrimidine, pyrazine, purine, pteridine, quinoline, isoquinoline, quinazoline, quinoxaline, cinnoline, and triazine. A heteroaryl group may be substituted or unsubstituted.
[0026] As used herein, "heterocyclyl" or "heteroalicyclyl" refers to three-, four-, five-, six-, seven-, eight-, nine-, ten-, up to 18 -membered monocyclic, bicyclic, and tricyclic ring system wherein carbon atoms together with from 1 to 5 heteroatoms constitute said ring system. A heterocycle may optionally contain one or more unsaturated bonds situated in such a way, however, that a fully delocalized pi-electron system does not occur throughout all the rings. The heteroatom(s) is an element other than carbon including, but not limited to, oxygen, sulfur, and nitrogen. A heterocycle may further contain one or more carbonyl or thiocarbonyl functionalities, so as to make the definition include oxo-systems and thio-systems such as lactams, lactones, cyclic imides, cyclic thioimides and cyclic carbamates. When composed of two or more rings, the rings may be joined together in a fused fashion. Additionally, any nitrogens in a heteroalicyclic may be quaternized. Heterocyclyl or heteroalicyclic groups may be unsubstituted or substituted. Examples of such "heterocyclyl" or "heteroalicyclyl" groups include but are not limited to, 1,3-dioxin, 1,3-dioxane, 1,4-dioxane, 1,2-dioxolane, 1,3dioxolane, 1,4-dioxolane, 1,3-oxathiane, 1,4-oxathiin, 1,3-oxathiolane, 1,3-dithiole, 1,3dithiolane, 1,4-oxathiane, tetrahydro-1,4-thiazine, $2 \mathrm{H}-1,2$-oxazine, maleimide, succinimide, barbituric acid, thiobarbituric acid, dioxopiperazine, hydantoin, dihydrouracil, trioxane, hexahydro-1,3,5-triazine, imidazoline, imidazolidine, isoxazoline, isoxazolidine, oxazoline, oxazolidine, oxazolidinone, thiazoline, thiazolidine, morpholine, oxirane, piperidine $N$-Oxide, piperidine, piperazine, pyrrolidine, pyrrolidone, pyrrolidione, 4-piperidone, pyrazoline, pyrazolidine, 2-oxopyrrolidine, tetrahydropyran, 4H-pyran, tetrahydrothiopyran, thiamorpholine, thiamorpholine sulfoxide, thiamorpholine sulfone, and their benzo-fused analogs (e.g., benzimidazolidinone, tetrahydroquinoline, and 3,4-methylenedioxyphenyl). as a substituent, via a lower alkylene group. The lower alkylene and aryl group of an aralkyl may be substituted or unsubstituted. Examples include but are not limited to benzyl, 2phenylalkyl, 3-phenylalkyl, and naphthylalkyl.

[0076] Terms and phrases used in this application, and variations thereof, especially in the appended claims, unless otherwise expressly stated, should be construed as open ended as
opposed to limiting. As examples of the foregoing, the term 'including' should be read to mean 'including, without limitation,' 'including but not limited to,' or the like; the term 'comprising' as used herein is synonymous with 'including,' 'containing,' or 'characterized by,' and is inclusive or open-ended and does not exclude additional, unrecited elements or method steps; the term 'having' should be interpreted as 'having at least;' the term 'includes' should be interpreted as 'includes but is not limited to;' the term 'example' is used to provide exemplary instances of the item in discussion, not an exhaustive or limiting list thereof; and use of terms like 'preferably,' 'preferred,' 'desired,' or 'desirable,' and words of similar meaning should not be understood as implying that certain features are critical, essential, or even important to the structure or function of the invention, but instead as merely intended to highlight alternative or additional features that may or may not be utilized in a particular embodiment. In addition, the term "comprising" is to be interpreted synonymously with the phrases "having at least" or "including at least". When used in the context of a process, the term "comprising" means that the process includes at least the recited steps, but may include additional steps. When used in the context of a compound, composition or device, the term "comprising" means that the compound, composition or device includes at least the recited features or components, but may also include additional features or components. Likewise, a group of items linked with the conjunction 'and' should not be read as requiring that each and every one of those items be present in the grouping, but rather should be read as 'and/or' unless expressly stated otherwise. Similarly, a group of items linked with the conjunction 'or' should not be read as requiring mutual exclusivity among that group, but rather should be read as 'and/or' unless expressly stated otherwise.
[0077] With respect to the use of substantially any plural and/or singular terms herein, those having skill in the art can translate from the plural to the singular and/or from the singular to the plural as is appropriate to the context and/or application. The various singular/plural permutations may be expressly set forth herein for sake of clarity. The indefinite article " $a$ " or "an" does not exclude a plurality. A single processor or other unit may fulfill the functions of several items recited in the claims. The mere fact that certain measures are recited in mutually different dependent claims does not indicate that a combination of these measures cannot be used to advantage. Any reference signs in the claims should not be construed as limiting the scope.
[0078] It is understood that, in any compound described herein having one or more chiral centers, if an absolute stereochemistry is not expressly indicated, then each center may independently be of R-configuration or S-configuration or a mixture thereof. Thus, the

Each chemical element as represented in a compound structure may include any isotope of said element. For example, in a compound structure a hydrogen atom may be explicitly disclosed or understood to be present in the compound. At any position of the compound that a hydrogen atom may be present, the hydrogen atom can be any isotope of hydrogen, including but not limited to hydrogen-1 (protium) and hydrogen-2 (deuterium). (C)
[0172] As shown in Scheme 1, compounds of Formula (I) can be prepared from a nucleoside, for example, a nucleoside of Formula (A). In Scheme $1, \mathrm{R}^{34}, \mathrm{R}^{4 \mathrm{~A}}, \mathrm{R}^{5 n}$, and $\mathrm{B}^{14}$ can be the same as $\mathrm{R}^{3 \mathrm{~A}}, \mathrm{R}^{4 \mathrm{~A}}, \mathrm{R}^{5 A}$, and $\mathrm{B}^{1 A}$ as described herein for Formula ( $)$, and $\mathrm{PG}^{1}$ is a suitable protecting group. A hydroxyalkyl group can be formed at the 4'-position of the pentose ring using suitable conditions known to those skilled in the art. Examples of suitable conditions for forming a hydroxyalkyl include the use of 2-iodoxybenzoic acid (IBX) aqueous formaldehyde and sodium borohydride. Furthermore, one may administer the compound in a targeted drug delivery system, for example, in a liposome coated with a tissue-specific antibody. The liposomes will be targeted to and taken up selectively by the organ.
[0193] The compositions may, if desired, be presented in a pack or dispenser device which may contain one or more unit dosage forms containing the active ingredient. The pack may for example comprise metal or plastic foil, such as a blister pack. The pack or dispenser device may be accompanied by instructions for administration. The pack or dispenser may also be accompanied with a notice associated with the container in form prescribed by a governmental agency regulating the manufacture, use, or sale of pharmaceuticals, which notice is reflective of approval by the agency of the form of the drug for human or veterinary administration. Such notice, for example, may be the labeling approved by the U.S. Food and Drug Administration for prescription drugs, or the approved product insert. [0217] As used herein, the terms "prevent" and "preventing," mean a subject does not develop an infection because the subject has an immunity against the infection, or if a subject becomes infected, the severity of the disease is less compared to the severity of the disease if the subject has not been administered/received the compound. Examples of forms of prevention include prophylactic administration to a subject who has been or may be exposed to an infectious agent, such as a paramyxovirus (e.g., RSV) and/or an orthomyxovirus (e.g., influenza).
[0218] As used herein, the terms "treat," "treating," "treatment," "therapeutic," and "therapy" do not necessarily mean total cure or abolition of the disease or condition. Any alleviation of any undesired signs or symptoms of a disease or condition, to any extent can be considered treatment and/or therapy. Furthermore, treatment may include acts that may worsen the subject's overall feeling of well-being or appearance.
[0219] The terms "therapeutically effective amount" and "effective amount" are used to indicate an amount of an active compound, or pharmaceutical agent, that elicits the biological or medicinal response indicated. For example, a therapeutically effective amount of compound can be the amount needed to prevent, alleviate or ameliorate symptoms of disease or prolong the survival of the subject being treated This response may occur in a tissue, system, animal or human and includes alleviation of the signs or symptoms of the disease being treated. Determination of an effective amount is well within the capability of those skilled in the art, in view of the disclosure provided herein. The therapeutically effective amount of the compounds disclosed herein required as a dose will depend on the route of administration, the type of animal, including human, being treated, and the physical characteristics of the specific animal under consideration. The dose can be tailored to achieve a desired effect, but will depend on such factors as weight, diet, concurrent medication and other factors which those skilled in the medical arts will recognize.
[0220] Various indicators for determining the effectiveness of a method for treating a viral infection, such as a paramyxovirus and/or an orthomyxovirus infection, are known to those skilled in the art. Example of suitable indicators include, but are not limited to, a reduction in viral load, a reduction in viral replication, a reduction in time to seroconversion (virus
undetectable in patient serum), a reduction of morbidity or mortality in clinical outcomes, and/or other indicator of disease response.
[0221] In some embodiments, an effective amount of a compound of Formulae (I), (II) and/or (III), or a pharmaceutically acceptable salt of the foregoing, is an amount that is
orthomyxovirus relative to pre-treatment levels in the range of about 2 to about 5 fold, about 10 to about 20 fold, about 15 to about 40 fold, or about 50 to about 100 fold. In some embodiments, a compound of Formulae (I), (II) and/or (III), or a pharmaceutically acceptable salt of the foregoing, can result in a reduction of paramyxovirus replication in the range of 1 to 1.5 $\log , 1.5 \log$ to $2 \log , 2 \log$ to $2.5 \log , 2.5$ to $3 \log , 3 \log$ to $3.5 \log$ or 3.5 to $4 \log$ more reduction of paramyxovirus replication compared to the reduction of paramyxovinus reduction achieved by ribavirin (Virazole®), or may achieve the same reduction as that of ribavirin (Virazoleß) therapy in a shorter period of time, for example, in one week, two weeks, one month, two months, or three months, as compared to the reduction achieved after six months of ribavirin (Virazole®) therapy. In some embodiments, a compound of Formulae (I), (II) and/or (III), or a pharmaceutically acceptable salt of the foregoing, can result in a reduction of orthomyxovinus replication in the range of 1 to $1.5 \log , 1.5 \log$ to $2 \log , 2 \log$ to $2.5 \log , 2.5$ to 3 $\log , 3 \log$ to $3.5 \log$ or 3.5 to $4 \log$ more reduction of orthomyxovirus replication compared to the reduction of orthomyxovirus reduction achieved by oseltamivir (Tamiflu®), or may achieve the same reduction as that of oseltamivir (Tamiflu®) therapy in a shorter period of time, for example, in one week, two weeks, one month, two months, or three months, as compared to the reduction achieved after six months of oseltamivir (Tamiflu $®$ ) therapy.
[0223] In some embodiments, an effective amount of a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, is an amount that is effective to achieve a sustained viral response, for example, non-detectable or substantially non-detectable paramyxovirus and/or orthomyxovirus RNA (e.g., less than about 500 , less than about 400 , less than about 200 , or less than about 100 genome copies per milliliter serum) is found in the subject's serum for a period of at least about one week, two weeks, one month, at least about two months, at least about three months, at least about four months, at least about five months, or at least about six months following cessation of therapy.
[0224] After a period of time, infectious agents can develop resistance to one or more therapeutic agents. The term "resistance" as used herein refers to a viral strain displaying a delayed, lessened and/or null response to a therapeutic agent(s). For example, after treatment with an antiviral agent, the viral load of a subject infected with a resistant virus may be reduced to a lesser degree compared to the amount in viral load reduction exhibited by a subject infected with a non-resistant strain. In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered to a subject infected with RSV that is resistant to one or more

In some embodiments, development of fesistant RSV strains can be delayed when subjects are treated with a compound of Formula (1), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, compared to the development of RSV strains resistant to other RSV drugs. In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered to a subject infected with an influenza virus that is resistant to one or more different anti-influenza agents (for example, amantadine and rimantadine). In some embodiments, development of resistant influenza strains can be delayed when subjects are treated with a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, compared to the development of influenza strains resistant to other influenza drugs.
[0225] In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can decrease the percentage of subjects that experience complications from a RSV viral infection compared to the percentage of subjects that experience complication being treated with ribavirin. In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can decrease the percentage of subjects that experience complications from an influenza viral infection compared to the percentage of subjects that experience complication being treated with oseltamivir. For example, the percentage of subjects being treated with a compound of Formula (D), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, that experience complications can be $10 \%, 25 \%, 40 \%, 50 \%$, $60 \%, 70 \%, 80 \%$ and $90 \%$ less compared to subjects being treated with ribavirin or oseltamivir.
[0226] In some embodiments, a compound of Formula (l), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, ot a pharmaceutical composition that includes a compound described herein, can be used in combination with one or more additional agent(s). [0227] In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered with one or more additional agent(s) together in a single pharmaceutical composition. In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered with one or more additional agent(s) as two or more separate pharmaceutical compositions. For example, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered in one pharmaceutical composition, and at least one of the additional agents can be administered in a second pharmaceutical composition. If there are at least two additional agents, one or more of the additional agents can be in a first pharmaceutical composition that includes a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, and at least one of the other additional agent(s) can be in a second pharmaceutical composition.
[0228] The order of administration of a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, with one or more additional agent(s) can vary. In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered prior to all additional agents. In some embodiments, a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, can be administered subsequent to the administration of all additional agents.
[0229] A potential advantage of utilizing a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, in combination with one or more additional agent(s) described in paragraph [0226], including pharmaceutically acceptable salts and prodrugs thereof, may be a reduction in the required amount(s) of one or more compounds of paragraph [0226] (including pharmaceutically acceptable salts and prodrugs thereof) that is effective in treating a disease condition disclosed herein (for example, RSV and/or influenza), as compared to the amount required to achieve same therapeutic result when one or more compounds described in paragraph [0226], including pharmaceutically acceptable salts and prodrugs thereof, are administered without a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt the foregoing. For example, the amount of a compound described in paragraph [0226], including a pharmaceutically acceptable salt and prodrug thereof, can be less compared to the amount of the compound described in paragraph [0226], including a pharmaceutically acceptable salt and prodrug thereof, needed to achieve the same viral load reduction when administered as a monotherapy. Another potential advantage of utilizing a compound of Formula (I), a compound of Formula (II) and/or a compound of Formula (III), or a pharmaceutically acceptable salt of the foregoing, in combination with one or more additional agent(s) described in paragraph [0226], including pharmaceutically acceptable salts and

## 17135

prodrugs thereof, is that the use of two or more compounds having different mechanism of actions can create a higher barrier to the development of resistant viral strains compared to the barrier when a compound is administered as monotherapy.

yirus), wherein the compound can be selected from:

respirovirus can be human parainfluenza virus 3. In yet still other embodiments of this paragraph, the virus can be a rubulavirus. . In some embodiments, the rubulavirus can be human parainfluenza virus 2. . In other embodiments, the rubulavirus can be human parainfluenza virus 4. . In still other embodiments, the rubulavirus can be the mumps virus. In some embodiments of this paragraph, the virus can be a metapneumovirus, such as the human metapneumovirus.
[0232] As will be readily apparent to one skilled in the art, the useful in vivo dosage to be administered and the particular mode of administration will vary depending upon the age, weight, the severity of the affliction, and mammalian species treated, the particular compounds employed, and the specific use for which these compounds are employed. The determination of effective dosage levels, that is the dosage levels necessary to achieve the desired result, can be accomplished by one skilled in the art using routine methods, for example, human clinical trials and in vitro studies.
[0233] The dosage may range broadly, depending upon the desired effects and the therapeutic indication. Altematively dosages may be based and calculated upon the surface area of the patient, as understood by those of skill in the art. Although the exact dosage will be determined on a drug-by-drug basis, in most cases, some generalizations regarding the dosage can be made. The daily dosage regimen for an adult human patient may be, for example, an oral dose of between 0.01 mg and 3000 mg of each active ingredient, preferably between 1 mg and 700 mg , e.g. 5 to 200 mg . The dosage may be a single one or a series of two or more given in the course of one or more days, as is needed by the subject. In some embodiments, the compounds will be administered for a period of continuous therapy, for example for a week or more, or for months or years.
[0234] In instances where human dosages for compounds have been established for af least some condition, those same dosages may be used, or dosages that are between about $0.1 \%$ and $500 \%$, more preferably between about $25 \%$ and $250 \%$ of the established human known methods. For example, the toxicology of a particular compound, or of a subset of the compounds, sharing certain chemical moieties, may be established by determining in vitro toxicity towards a cell line, such as a mammalian, and preferably human, cell line. The results of such studies are often predictive of toxicity in animals, such as mammals, or more specifically, humans. Alternatively, the toxicity of particular compounds in an animal model,
such as mice, rats, rabbits, or monkeys, may be determined using known methods. The efficacy of a particular compound may be established using several recognized methods, such as in vitro methods, animal models, or human clinical trials. When selecting a model to determine efficacy, the skilled artisan can be guided by the state of the art to choose an appropriate model, dose, route of administration and/or regime.

## EXAMPLES

[0239] Additional embodiments are disclosed in further detail in the following examples, which are not in any way intended to limit the scope of the claims.

## EXAMPLE 1

Preparatlon of Compound (1a)

[0240] Preparation of (P1-2): To an ice cooled solution of P1-1 ( $10.0 \mathrm{~g}, 40.8$ mmol ) in dry pyridine ( 100 mL ) was added TBSCl in pyridine ( $1 \mathrm{M}, 53 \mathrm{~mL}$ ) dropwise at room temperature (R.T.). The reaction mixture was stirred at R.T. for 16 hours. The reaction mixture was then quenched with water, concentrated to give a residue. The residue was separated by ethyl acetate (EA) and saturated $\mathrm{NaHCO}_{3}$ aq. solution. The organic phase was dried and concentrated. The residue was purified on a silica gel column ( $5 \% \mathrm{MeOH}$ in DCM ) to give a crude 5'-0-TBS protected intermediate as a white solid ( $13.4 \mathrm{~g}, 91 \%$ ). The intermediate was dissolved in anhydrous DCM ( 100 mL ) and sym-collidine ( $17.9 \mathrm{~g}, 149.2 \mathrm{mmol}$ ), $\mathrm{AgNO}_{3}(25 \mathrm{~g}$, 149.2 mmol ) and MMTrCl ( $45 \mathrm{~g}, 149.2 \mathrm{mmol}$ ) were added. The mixture was stirred at R.T. for 16 hours. The mixture was quenched with water, and the organic layer was separated and concentrated. The residue purified on a silica gel column ( $30 \% \mathrm{PE}$ in EA) to give the crude product. The crude product was dissolved in IM TBAF ( 50 mL ) in THF. The mixture was
stirred at R.T. for 2 hours. The solvent was removed, and the residue was purified on a silica gel column ( $50 \%$ PE in EA) to give P1-2 as a white solid ( $21.4 \mathrm{~g}, 66 \%$ for three steps).
[0241] Preparation of (P1-3); To a solution of pyridine ( $521 \mathrm{mg}, 6.59 \mathrm{mmol}$ ) in anhydrous DMSO ( 5 mL ) was added TFA ( $636 \mathrm{mg}, 5.58 \mathrm{mmol}$ ) dropwise at $10^{\circ} \mathrm{C}$ under nitrogen. The reaction mixture was stirred until the solution became clear. The solution was then added into a mixture of P1-2 ( $4.0 \mathrm{~g}, 5.07 \mathrm{mmol}$ ) and DCC ( $3.86 \mathrm{~g}, 18.76 \mathrm{mmol}$ ) in anhydrous DMSO ( 18 mL ) at R.T. under nitrogen. The reaction mixture was stirred at $30^{\circ} \mathrm{C}$ overnight. Water ( 80 mL ) was added into the mixture, diluted with EtOAc ( 100 mL ) and filtered. The filtrate was extracted with DCM $(100 \mathrm{~mL} \times 6)$. The organic layer was washed with saturated aq. $\mathrm{NaHCO}_{3}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The residue was purified on a silica gel column eluted with $1 \% \mathrm{MeOH}$ in DCM to give the intermediate ( $\mathbf{3 . 5} \mathrm{g}$, $87.7 \%$ ) as a yellow solid. The intermediate ( $3.5 \mathrm{~g}, 4.45 \mathrm{mmol}$ ) was dissolved in dioxane ( 25 mL ) and aq. $\mathrm{HCHO}(668 \mathrm{mg}, 22.25 \mathrm{mmol}$ ) was added at R.T. $2 \mathrm{~N} \mathrm{NaOH}(4.5 \mathrm{~mL}, 8.9 \mathrm{mmol})$ was then added. The reaction mixture was stirred at $30^{\circ} \mathrm{C}$ ovemight. $\mathrm{NaBH}_{4}$ ( $593 \mathrm{mg}, 15.6 \mathrm{mmol}$ ) was added in by portions at $5^{\circ} \mathrm{C}$, and the mixture was stirred at R.T. for 15 min . The reaction was quenched with water, and the mixture was extracted with EtOAc ( $100 \mathrm{~mL} \times 3$ ). The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The residue was purified on a silica gel column eluted with $1 \% \mathrm{MeOH}$ in DCM to give P1-3 as a yellow solid ( $2.5 \mathrm{~g}, 67 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 6.82-7.50(\mathrm{~m}, 29 \mathrm{H}), 5.40(\mathrm{~d}, J=23.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.99(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H})$, $4.46\left(\mathrm{dd}, J_{L}=6.0 \mathrm{~Hz}, J_{2}=54.4 \mathrm{~Hz}, 1 \mathrm{H}\right), 3.94\left(\mathrm{dd}, J_{L}=4.4 \mathrm{~Hz}, J_{2}=12.4 \mathrm{~Hz}, 1 \mathrm{H}\right), 3.78(\mathrm{~s}, 6 \mathrm{H})$, 3.42-3.69 (m, 2H), 2.71-3.05 (m, 2H), 2.45 (m, 1H).

The reaction mixture was stirred at R.T. for 16 hours. The reaction mixture was then quenched with water, concentrated to give a residue. The residue was separated in EA and saturated aq. $\mathrm{NaHCO}_{3}$. The organic layer was separated and dried, and then concentrated. The residue was purified on a silica gel column ( $1 \% \mathrm{MeOH}$ in DCM) to give the intermediate as a yellow solid ( $3.2 \mathrm{~g}, 70 \%$ ). ${ }^{1}{ }^{1} \mathrm{H}_{\mathrm{NMR}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 7.53-6.83(\mathrm{~m}, 29 \mathrm{H}), 5.51(\mathrm{~d}, J=21.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.98(\mathrm{~d}, J=7.6$ $\mathrm{Hz}, 1 \mathrm{H}), 4.67\left(\mathrm{dd}, J_{l}=5.6 \mathrm{~Hz}, J_{2}=22.4 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.22\left(\mathrm{dd}, J_{l}=5.6 \mathrm{~Hz}, J_{2}=53.2 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.07$ $(\mathrm{m}, 1 \mathrm{H}), 3.89(\mathrm{~m}, 1 \mathrm{H}), 3.80(\mathrm{~s}, 6 \mathrm{H}), 3.70-3.67(\mathrm{~m}, 1 \mathrm{H}), 3.03-2.98(\mathrm{~m}, 1 \mathrm{H}), 2.26(\mathrm{~m}, 1 \mathrm{H}), 0.93(\mathrm{~s}$, $9 \mathrm{H}), 0.10(\mathrm{~s}, 6 \mathrm{H})$.

The mixture was stirred at R.T. for 16 hours. The reaction mixture was quenched
with water, and the organic layer was separated and concentrated. ## EXAMPLE 60

## Preparation of Compound (63a)

63 -10

[0448] Preparation of (63-2): To a solution of 63-1 ( $50 \mathrm{~g}, 203 \mathrm{mmol}$ ) in anhydrous pyridine ( 200 mL ) was added TBDPS-Cl $(83.7 \mathrm{~g}, 304 \mathrm{mmol})$. The reaction was allowed to proceed overnight at R.T. The solution was concentrated under reduced pressure to give a residue. The residue was partitioned between ethyl acetate and water. The organic layer was separated, washed with brine, dried over magnesium sulfate and concentrated under reduced pressure to give 5'-OTBDPS ether as a white foam ( 94 g ).
[0449] To a solution of the 5'-OTBDPS ether ( $94.0 \mathrm{~g}, 194.2 \mathrm{mmol}$ ) in anhydrous DCM ( 300 mL ) were added silver nitrate ( $66.03 \mathrm{~g}, 388.4 \mathrm{mmol}$ ) and collidine ( $235 \mathrm{~mL}, 1.94$ mol). The mixture was stirred at R.T. After most of silver nitrate was dissolved ( $\sim 15 \mathrm{~min}$ ), the mixture was cooled to $0^{\circ} \mathrm{C}$. Monomethoxytrityl chloride ( $239.3 \mathrm{~g}, 776.8 \mathrm{mmol}$ ) was added as a single portion, and the mixture was stirred ovemight at R.T. The mixture was filtered through Celite, and the filtrate was diluted with MTBE. The solution was washed successively with 1M citric acid, diluted brine and $5 \%$ sodium bicarbonate. The organic solution was dried over sodium sulfate and concentrated under vacuum to give the fully protected intermediate as a yellow foam.
[0450] The fully protected intermediate was dissolved in toluene ( 100 mL ), and the solution was concentrated under reduced pressure. The residue was dissolved in anhydrous THF ( 250 mL ) and treated with TBAF ( $60 \mathrm{~g}, 233 \mathrm{mmol}$ ). The mixture was stirred for 2 hours at R.T., and the solvent was removed under reduced pressure. The residue was taken into ethyl acetate, and the solution was washed with saturated sodium bicarbonate and brine. After drying over magnesium sulfate, the solvent was removed in vacuum. The residue was purified by column chromatography (PE: $\mathrm{EA}=5: 1,1: 1$ ) to give $63-2(91 \mathrm{~g}, 86.4 \%)$ as a white foam.
[0451] Preparation of (63-3): To a solution of 63-2 (13.5 g, 26 mmol ) in DCM (100 mL ) was added pyridine ( $6.17 \mathrm{~mL}, 78 \mathrm{mmol}$ ). The solution was cooled to $0^{\circ} \mathrm{C}$ and Dess-Martin periodinane ( $33.8 \mathrm{~g}, 78 \mathrm{mmol}$ ) was added as a single portion. The reaction mixture was stirred for 4 h at R.T. The reaction was quenched with $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution (4\%) and sodium bicarbonate aqueous solution (4\%) (the solution was adjusted to $\mathrm{pH} 6, \sim 150 \mathrm{~mL}$ ). The mixture was stirred for 15 min . The organic layer was separated, washed with diluted brine and concentrated under reduced pressure. The residue was dissolved in dioxane ( 100 mL ), and the solution was treated with $37 \%$ aqueous formaldehyde ( $21.2 \mathrm{~g}, 10 \mathrm{eq}$ ) and 2 N aqueous sodium hydroxide ( 10 eq ). The reaction mixture was stirred at R.T. overnight. After stirring for 0.5 h at R.T., the excess of aqueous sodium hydroxide was neutralized with saturated with $\mathrm{NH}_{4} \mathrm{Cl}(\sim 150 \mathrm{~mL})$. The mixture was concentrated under reduced pressure. The residue was partitioned between ethyl acetate and $5 \%$ sodium bicarbonate. The organic phase was separated, washed with brine, dried over magnesium sulfate and concentrated. The residue was purified by column chromatography ( MeOH : $\mathrm{DCM}=100: 1-50: 1$ ) to give $63-3(9.2 \mathrm{~g}, 83.6 \%$ ) as a white foam.
[0452] Preparation of ( $63-4$ ); $63-3(23 \mathrm{~g}, 42.0 \mathrm{mmol})$ was co-evaporated with toluene twice. The residue was dissolved in anhydrous DCM ( 250 mL ) and pyridine ( 20 mL ). The solution was cooled to $-35^{\circ} \mathrm{C}$. Triflic anhydride ( $24.9 \mathrm{~g}, 88.1 \mathrm{mmol}$ ) was added dropwise over 10 mins. The reaction was stirring for 40 min at $-35^{\circ} \mathrm{C}$. When TLC (PE: EA=2:1 and DCM: $\mathrm{MeOH}=15: 1$ ) showed that the reaction was complete, the reaction was quenched with water ( 50 mL ) at $0^{\circ} \mathrm{C}$. The mixture was stirred 30 mins , extracted with EA. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered through a silica gel pad. The filtrate was concentrated under reduced pressure. The residue was purified by column chromatography (PE: EA= 100:1-1:1) to give 63-4 ( $30.0 \mathrm{~g}, 88.3 \%$ ) as a brown foam.
[0453] Preparation of ( $63-5$ ); 63-4 ( $30 \mathrm{~g}, 36.9 \mathrm{mmol}$ ) was co-evaporated twice with toluene. The resulting bis-triflate was dissolved in anhydrous DMF ( 150 mL ), cooled to $0^{\circ} \mathrm{C}$ and treated with sodium hydride ( $60 \%$ in mineral oil; $1.5 \mathrm{~g}, 40.6 \mathrm{mmol}, 1.1 \mathrm{eq}$ ). The reaction mixture was stirred at R.T. for 1 h until TLC (DCM: $\mathrm{MeOH}=15: 1$ ) showed the disappearance
of the bis-triflate and formation of the $2,5^{\prime}-$ anhydro intermediate. Lithium chloride $(4.6 \mathrm{~g}, 110.7$ mmol, $\mathbf{3 ~ e q}$ ) was added, and the stirring was continued for 2 h . The mixture was taken into 100 mL of half saturated ammonium chloride and ethyl acetate. The organic phase was separated, washed with diluted brine and concentrated under reduced pressure to give 63-5.
[0454] Preparation of (63-6); $63-5$ was dissolved in THF ( 150 mL ), and the solution was treated with 1 N aqueous sodium hydroxide ( $\sim 41 \mathrm{~mL}, 40.1 \mathrm{mmol}, 1.1 \mathrm{eq}$ ). The mixture was stirred at R.T. for 1 h . The reaction was monitored by LCMS. The reaction was diluted with half saturated sodium bicarbonate ( $\sim 60 \mathrm{~mL}$ ) and extracted with ethyl acetate. The organic phase was dried (magnesium sulfate) and concentrated under reduced pressure. Purification of the residue by column chromatography (DCM: $\mathrm{MeOH}=300: 1-60: 1$ ) gave 63-6 ( $18.3 \mathrm{~g}, 87.6 \%$ ) as a yellow foam.
[0455] Preparation of (63-7); To a solution of $63-6(18.3 \mathrm{~g}, 32.33 \mathrm{mmol})$ in anhydrous DCM ( 150 mL ) was added TBS-Cl ( $17.7 \mathrm{~g}, 64.6 \mathrm{mmol}$ ) and imidazole ( $6.6 \mathrm{~g}, 97$ mmol). The reaction was allowed to proceed overnight at R.T. The reaction was diluted with water and extracted with DCM. The organic layer was separated, washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. Purification of the residue by column chromatography (DCM: $\mathrm{MeOH}=300: 1 \sim 80: 1$ ) gave $63-7(18.4 \mathrm{~g}, 83.7 \%)$ as a white foam.

10456] Preparation of ( 63.8 ): A solution of $63-7$ ( $18.4 \mathrm{~g}, 27.1 \mathrm{mmol}$ ), DMAP ( 6.6 $\mathrm{g}, 54.0 \mathrm{mmol}$ ) and TEA ( $5.4 \mathrm{~g}, 54.0 \mathrm{mmol}$ ) in MeCN ( 450 mL ) was treated with $2,4,6-$ triispropylbenzenesulfonyl chloride (TPSCl, $16.3 \mathrm{~g}, 54.0 \mathrm{mmol}$ ). The mixture was stirred at R.T. for $3 \mathrm{~h} . \mathrm{NH}_{3} \mathrm{H}_{2} \mathrm{O}(70 \mathrm{~mL})$ was added, and the mixture was stirred for 2 h . The solution was evaporated under reduced pressure, and the residue was purified on a silica gel column (DCM: $\mathrm{MeOH}=100: 1$ to $15: 1$ ) to give $63-8(18.0 \mathrm{~g})$ as a light yellow solid.
[0457] Preparation of (63-9); To a solution of $63-8$ ( $18.0 \mathrm{~g}, 26.5 \mathrm{mmol}$ ) in anhydrous DCM ( 150 mL ) was added collidine ( $8.1 \mathrm{~g}, 66.3 \mathrm{mmol}, 2.5 \mathrm{eq}$ ), silver nitrate ( 4.5 g , $26.5 \mathrm{mmol}, 1.0 \mathrm{eq})$ and $\operatorname{DMTrCl}(13.4 \mathrm{~g}, 39.7 \mathrm{mmol}, 1.5 \mathrm{eq})$. The reaction was allowed to proceed overnight at R.T. The mixture was filtered. The filtrate was washed with brine and extracted with DCM. The organic layer was separated, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. The residue was purified by column chromatography ( $\mathrm{PE}: \mathrm{EA}=60: 1 \sim 3: 1$ ) as a yellow foam. The foam was dissolved in THF ( 150 mL ), and TBAF ( $10.4 \mathrm{~g}, 39.7 \mathrm{mmol}, 1.5 \mathrm{eq}$ ) was added. The reaction was allowed to proceed overnight at R.T. The mixture was concentrated, washed with brine and extracted with EA. The organic layer was separated, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated. Purification of the residue by column chromatography (PE: EA $=60: 1 \sim E A$ ) gave $63-9(21.3 \mathrm{~g}, 92.4 \%)$ as a yellow foam.

The mixture was diluted with EtOAc ( 100 mL ) and washed with a mixture of saturated aqueous $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and saturated aqueous $\mathrm{NaHCO} \mathrm{C}_{3}$. The crude product was purified by column chromatography on silica gel ( $\mathrm{PE}: \mathrm{EtOAc}=2: 1$ ) to give $63-10(1.8 \mathrm{~g}, 90 \%)$ as a yellow solid.

The mixture was stired at R.T. for 1 $h$, evaporated and treated with water. The obtained white solid was filtered, dried and washed
with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The white solid was then dissolved in NMP ( 2 mL ) and treated with DIPEA (94 $\mu \mathrm{L} ; 3$ equiv.) and pivaloyloxymethyliodide ( $84 \mu \mathrm{~L} ; 3$ equiv.). The mixture was evaporated in vacuum for 15 min . at $42^{\circ} \mathrm{C}$, than cooled down to R.T. N-Methylimidazole ( $0.009 \mathrm{~mL}, 0.11 \mathrm{mmol}$ ) was added followed by $\mathrm{POCl}_{3}(9 \mu \mathrm{l}$, 0.11 mmol ). The mixture was kept at R.T. for $20-40$ mins. The reaction was controlled by

LCMS and monitored by the appearance of the corresponding nucleoside 5'-monophosphate. After completion of the reaction, tetrabutylammonium salt of pyrophosphate ( 150 mg ) was added, followed by DMF ( 0.5 mL ) to get a homogeneous solution. After 1.5 h at ambient temperature, the reaction was diluted with water ( 10 mL ). The mixture was loaded on the column HiLoad 16/10 with Q Sepharose High Performance, and separation was done in a linear gradient of NaCl from 0 to 1 N in 50 mM TRIS-buffer ( pH 7.5 ). The triphosphate (97a-f) was eluted at $75-80 \% \mathrm{~B}$. The corresponding fractions were concentrated. The residue was dissolved in $5 \%$ ammonium hydroxide, kept for 15 min . at R.T. and concentrated. Desalting was achieved by RP HPLC on Synergy 4 micron Hydro-RP column (Phenominex). A linear gradient of methanol from 0 to $30 \%$ in 50 mM triethylammonium acetate buffer ( pH 7.5 ) was used for elution. The corresponding fractions were combined, concentrated and lyophilized 3 times to remove excess of buffer.

## EXAMPLE 111 <br> RSV Antiviral Assays

[0614] CPE reduction assays are performed as described by Sidwell and Huffman et al., Appl Microbiol. (1971) 22(5):797-801 with slight modifications. HEp-2 cells (ATCC) at a concentration of 6000 cell/weil are infected with RSV Long strain (ATCC) at a multiplicity of infection (m.o.i.) of $\mathbf{0 . 0 1}$, and each of the test compounds are provided to duplicate wells at final concentrations starting from $100 \mu \mathrm{M}$ using $\mathrm{i} / 3$ stepwise dilutions. For each compound, two wells are set aside as uninfected, untreated cell controls (CC), and two wells per test compound receive virus only as a control for virus replication (VC). The assay is stopped after 6 days, before all of the cells in the virus-infected untreated controi wells exhibited signs of virus cytopathology (giant cell formation, syncytia). At the end of the incubation, $20 \mu \mathrm{l}$ of cell counting kit-8 reagent (CCK-8, Dojindo Molecular Technologies, Inc.) are added to each well. After 4 hour incubation, the absorbance is measured in each well according to manufacturer's instruction, and the $50 \%$ effective concentration $\left(\mathrm{EC}_{50}\right)$ is calculated by using regression analysis, based on the mean O.D. at each concentration of compound.
[0615] RT-PCR based assays were performed in HEp-2 cells (ATCC: CCL-23) at a concentration of $20000 \mathrm{cel} /$ well were plated in 96 well plates and incubated ovemight. Each of the test compounds were $1 / 3$ serially diluted and dosed to HEp-2 cells in duplicates. The highest final concentration for each compound was 100 uM . After 24 hour compound pre-incubation, RSV A2 (ATCC: VR-1540) at MOI of 0.1 was added. Two wells per compound were set aside as uninfected, untreated cell controls (CC), and four wells per test compound received virus only as a control for virus replication (VC). The assay was stopped 4 days after virus infection and conditioned media was removed for viral RNA isolation. The quantities of the RSV virus were measured by reai-time PCR using a set of RSV specific primers and probe. The data was analyzed with Prism software with EC50 defined as drug concentration that reduced the viral load $50 \%$ from the viral control (VC).
[0616] Standard RSV polymerase assays were conducted in the presence of $3 \mu \mathrm{~L}$ extract of RSV-infected cells in a reaction buffer containing 50 mM tris-acetate $\mathrm{pH} 8,120 \mathrm{mM} \mathrm{K}$ acetate, $4.5 \mathrm{mM} \mathrm{MgCl} 2,5 \%$ glycerol, 2 mM EDTA, $50 \mathrm{ug} / \mathrm{mL}$ BSA, and 3 mM DTT. Varying concentration of test compounds were used to initiate RNA synthesis for 120 mins at $30^{\circ} \mathrm{C}$, and radioactive 33P GTP ( 15 uCi ) was used as tracer. The reaction was stopped by adding 50 mM EDTA, and RNA samples were purified through G-50 size exclusion spin columns and phenol-

chloroform extraction. The radio-labeled RNA products were resolved by electrophoresis on a $6 \%$ polyacrylamide TBE gel, and visualized and quantitated after being exposed on a phosphorImager screen. Polymerase inhibition experiments ( $\mathrm{IC}_{50}$ ) were conducted the same way in the presence of increasing concentration of test compounds.
[0617] Compounds of Formula (I), Formula (II) and Formula (III) are active in the assay as noted in Tables 6 and 7. In Table 6, ' A ' indicates an $\mathrm{EC}_{50}<2 \mu \mathrm{M}$, ' B ' indicates an $\mathrm{EC}_{50}$ of $\geq 2 \mu \mathrm{M}$ and $<10 \mu \mathrm{M}$ and ' C ' indicates an $\mathrm{EC}_{50} \geq 10 \mu \mathrm{M}$ and $<50 \mu \mathrm{M}$. In Table 7, ' A ' indicates an $\mathrm{EC}_{50}<1 \mu \mathrm{M}, ~ ' B$ ' indicates an $\mathrm{EC}_{50}$ of $\geq 1 \mu \mathrm{M}$ and $<10 \mu \mathrm{M}$ and ' C ' indicates an $\mathrm{EC}_{50} \geq 10 \mu \mathrm{M}$ and $<100 \mu \mathrm{M}$.

## Influenza Antlviral Assay

[0618] Human lung carcinoma A549 cells (ATCC, Manassas, VA) were plated at a density of $5 \times 10^{4}$ cells/mL ( $5 \times 10^{3}$ cells/well) in assay media (Ham's F12 media supplemented with $0.3 \%$ FBS, $1 \%$ penicillin/streptomycin (all Mediatech, Manassas, VA) and $1 \%$ DMSO (Sigma-Aldrich, St Louis, MO)) in black 96 -well plates. After 24 hours, serially diluted test

Cells were infected with 250 IU/well of Influenza strain A/WSN/33 (HIN1) (Virapur, San Diego CA) and incubated for 20 hours at $37^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}$. The cell culture supernatant was aspirated off and $50 \mu \mathrm{~L}$ of 25 $\mu$ M 2'-(4-Methylumbelliferyl)-a-D-N-acetylneuraminic acid (Sigma-Aldrich) dissolved in 33 mM MES, pH 6.5 (Emerald Biosystems, Bainbridge Island, WA) was added to the cells. Cytotoxicity of uninfected parallel cultures was determined by addition of $100 \mu$ Lof CellTiter-Gloßreagent (Promega, Madison, WI), and incubation for 10 mins at R.T. Luminescence was measured on a Victor X 3 multi-label plate reader.

## EXAMPLE 113

Influenza Pol Assay
[0620] Recombinant influenza polymerase trimer is obtained as described (Aggarwal S. et al., PLoS ONE 2010). Standard RNA polymerization assays are conducted in the presence
of 0.15 uM enzyme, $1.5 \mathrm{uM} 50-\mathrm{mer}$ oligonucleotide template, 400 uM AG primer and varying concentration of the test compounds are incubated together for 40 minutes at $30^{\circ} \mathrm{C}$. Radioactive 33P GTP are used as the tracer and the radio-labeled RNA products are resolved by electrophoresis on a $15 \%$ polyacrylamide TBE gel, and is visualized and quantitated after being exposed on a phosphorImager screen. Polymetase inhibition experiments ( $\mathrm{IC}_{50}$ ) are conducted the same way in the presence of increasing concentration of test compounds.

## EXAMPLE 114

## Parainfluenza virus-3 (PIV-3) RT-PCR Assays

[0621] RT-PCR based assays were performed in A549 cells (ATCC: CCL-185). A549 cells at a concentration of 20,000 cells/well were plated in 96 well plates and incubated overnight. Each of the test compounds were $1 / 3$ serially diluted and dosed to A549 cells in duplicates. The highest final concentration for each compound was 100 uM . After 24 hour compound pre-incubation, human parainfluenza virus 3 (hPIV3, ATCC: VR-93) at multiplicity of infection (MOI) of 0.1 was added. Two wells per compound were set aside as uninfected, untreated cell controls (CC), and four wells per test compound received virus only as a control for virus replication (VC). The assay was stopped 7 days after virus infection and conditioned media was removed for viral RNA isolation. The quantities of the hPIV3 virus were measured by real-time PCR using a set of hPIV3 specific primers and probe. The data was analyzed with Prism software with EC50 defined as drug concentration that reduced the viral load 50\% from the viral control (VC). The results are provided in Table 9 and show Compounds of Formula (I), Formula (II) and Formula (III) are active against PIV-3, where 'A' indicates an $\mathrm{EC}_{50}<20$ $\mu \mathrm{M}$, ' B ' indicates an $\mathrm{EC}_{50}$ of $\geq 20 \mu \mathrm{M}$ and $<100 \mu \mathrm{M}$ and ' C ' indicates an $\mathrm{EC}_{50} \geq 100 \mu \mathrm{M}$.

Paralnfluenza virus-3 (PIV-3) Plaque Assay
[0623] MA-104 cells were grown in 24 -well plates to a confluency of $90 \%$ in the presence of minimal essential medium (MEM) supplemented with $10 \%$ fetal bovine serum and antibiotics (C-EMEM). The cells were then washed twice with non-complete minimal essential medium (NC-EMEM). Test articles were dissolved in DMSO to a stock concentration of 10 mM .
[0624] An aliquot of 0.5 mL of the test article at various concentrations was then inoculated in triplicate wells and incubated for 60 minutes at $37^{\circ} \mathrm{C}$ with $5 \% \mathrm{CO}_{2}$ for the diffusion of test article into MA-104 cells. After the incubation period, a stock of human PIV type 3 was thawed and diluted with NC-EMEM to achieve a viral concentration of $10^{4} \mathrm{pfu} / \mathrm{mL}$. An aliquot of 0.1 mL was then inoculated into all the wells except for the negative and test article toxicity control wells. Upon infection, the plates were incubated for 72 hours at $37^{\circ} \mathrm{C}$ at $5 \% \mathrm{CO}_{2}$. After incubation, the plates were examined under microscopy to record cytotoxicity.

The supematants collected for viral quantification using a standard plaque assay using MA-104 cells as the indicator cells.
