AUTOMATIC VALVE

NOVI, MICHIGAN USA

Automatic Valve is here to serve your pneumatic actuation needs.

For over 55 years, our focus has been exclusively fluid power, our foundation: engineering and quality. Our systems are registered to ANSI N45.2 and ISO 9001. Our engineers are experienced, knowledgeable, and customer focused.

With a library of thousands of working applications, we can quickly provide you with the solution to your specialized pneumatic applications.

Our network of full service distribution is there to help you with on-site support, rapid deliveries and total package solutions.

Whether you are looking for a single air valve, a manifold with complicated pneumatic circuitry, or something individually dedicated to your specifications, we can help with a world class pneumatic solution.

Call us at 248.474.6700

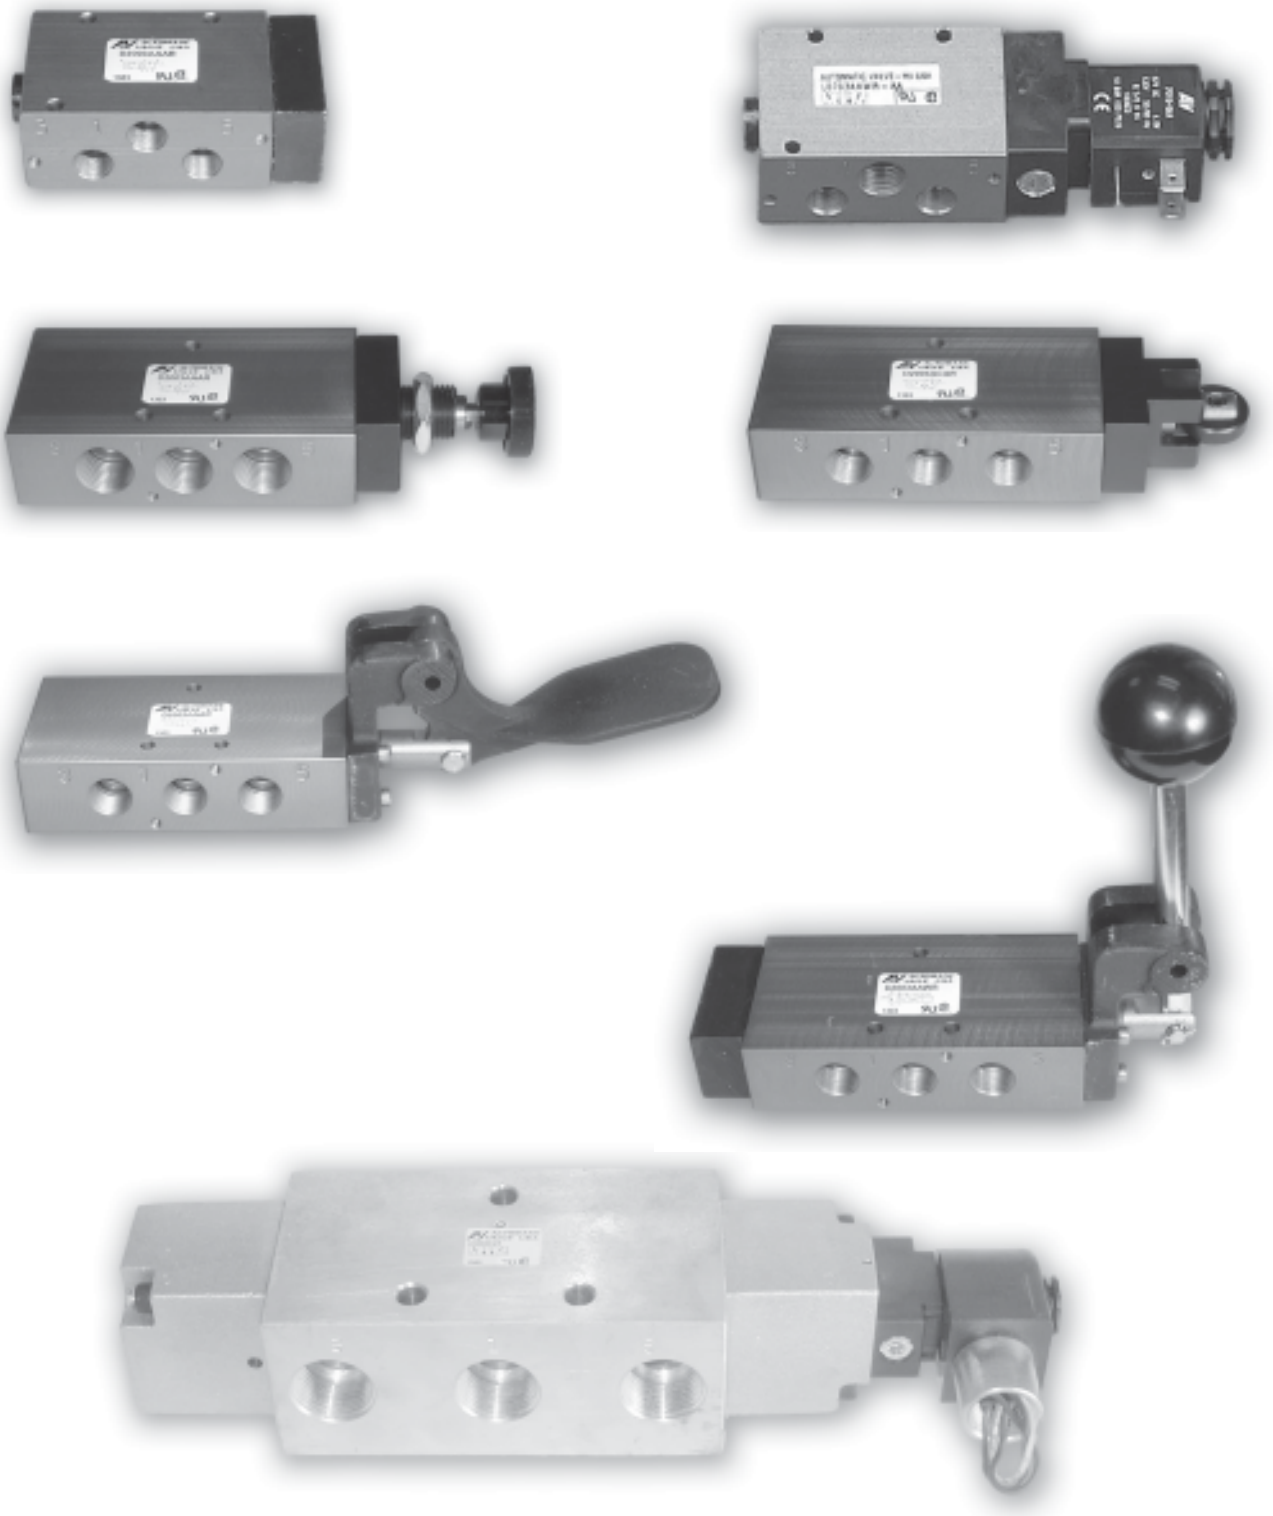
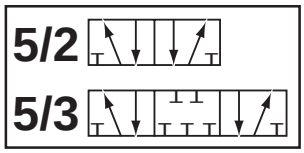
* SPOOL VALVES CAN BE PLUGGED FOR 2 WAY OR 3 WAY FUNCTION.

ISO 9001

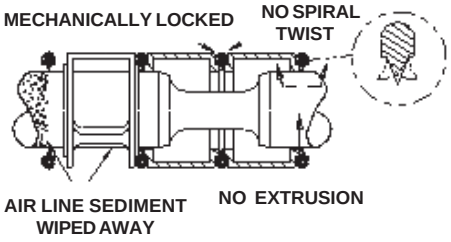
AUTOMATIC VALVE



COMPACT SPOOL VALVES

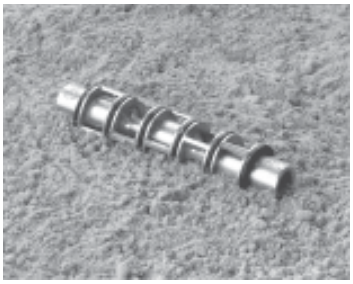


DESIGN FEATURES



VALVES

- Balanced spool construction allows ports to be plugged for 2 or 3 way function, or restricted for inexpensive cylinder exhaust speed control. For selector or dual pressure applications, consult the Factory.
- Inline or manifold mount: flexible, efficient.
- Wide variety of options and operators available.
- Specific application needs? Consult the Factory. We will build it for you.



TAPERED TEE-SEAL ..... Eats Dirt

- Bi-directional tapered Tee-Seal flexes to clean spool. Eliminates Monday morning sticking problems.
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

SOLENOID ... Guaranteed Against Burnout

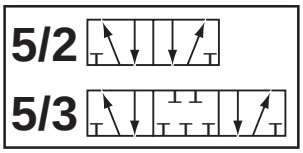
- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push non-locking override (Extended turn and turn lock available).

PRODUCTS CERTIFIED TO

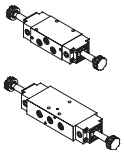
- CSA - (C22.2)
- UL - (STD 429)
- ATEX - (2018x)
- PTB - (EExmIIT5) (EExiaIICT6)
- CE - (73/23/EEC), (89/336/EEC)

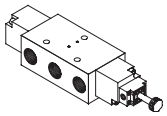
INDEX

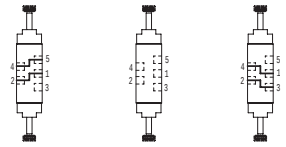
SPECIFICATIONS



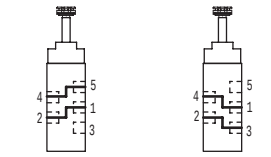
VALVE OPERATION



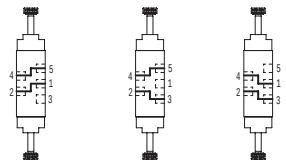




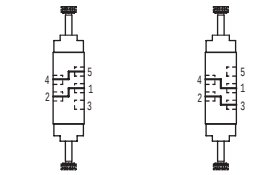
5/3 BLOCK - 4 way 3 position blocked center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with all ports blocked.



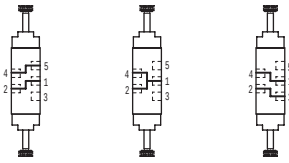
5/2 SINGLE - 4 way 2 position single operator valves shift, apply pressure from port 1 to 4, and exhaust pressure from port 2 to 3 when a maintained signal is applied to operator 1-4. Valves reset, apply pressure from port 1 to 2, exhaust pressure from port 4 to 5 when the signal is removed.



5/3 EXHAUST - 4 way 3 position exhaust center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 2 open to 3, port 4 open to 5, and port 1 blocked.



5/2 DOUBLE - 4 way 2 position double operator valves shift, apply pressure from port 1 to 4,and exhaust pressure from 2 to 3 when a momentary signal is applied to operator 1-4. Valves shift, apply presure from port 1 to 2, and exhaust pressure from 4 to 5 when a momentary signal is applied to operator 1-2.



5/3 PRESURE - 4 way 3 position pressure center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 1 open to ports 2 and 4, and ports 3 and 5 are blocked.

OPERATING TEMPERATURES	SOLENOID PILOT OPERATED	TREATED BUNA-N SEALS (TREATED NBR, Standard)	FLUOROELASTOMER SEALS (FPM (FKM), Option A)
	Standard	-18°C to +52°C (0°F to +125°F)	-18°C to +52°C (0°F to +125°F)
	High Temp Coil (Option CT)	-18°C to +82°C (0°F to +180°F)	-18°C to +82°C (0°F to +180°F)

OPERATING PRESSURES	SOLENOID PILOT OPERATED	INLET PORT	EXTERNAL PILOT PORT
	Standard 2 Position	240 - 1030 kPa (35 - 150 PSIG)	Not Required
	Standard 3 Position	345 - 1030 kPa (50 - 150 PSIG)	Not Required
	External Pilot (Option B)	Vacuum - 240 kPa (Vacuum - 35 PSIG)	240 - 1030 kPa (35 - 150 PSIG)

FILTRATION AND LUBRICATION

MEDIA - AIR OR INERT GAS

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 viscosity, and have an aniline range of 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

Filter to 50 microns or better.
For temperatures below 40°F, air must be dry to prevent formation of ice.

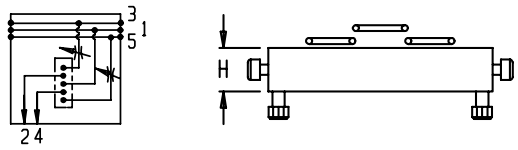
ACCESSORIES

SANDWICH FLOW CONTROL



SERIES	MODEL NUMBER	DIMENSION H	WGT Kg (LB)
L07	B7106-005	12,7 .50	0,06 (.14)
L20	B8022-005	12,7 .50	0,09 (.19)

Units of Measure: Top - mm, Bottom - inches

FEATURES

- Restricts air flow from port 2 to port 3 and from port 4 to port 5.
- Mounts between valve and manifold.
- Vibration proof metering control.

A

OPTIONS

(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

A - FLUOROELASTOMER SEALS

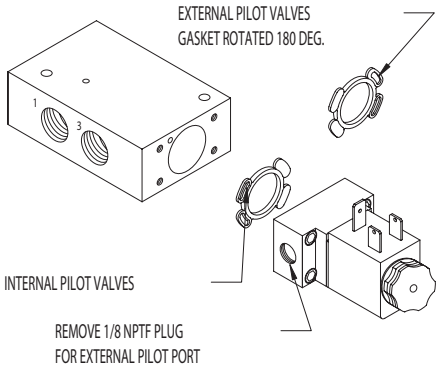
For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.

B - EXTERNAL PILOT

For solenoid applications when the pressure to port 1 is less than 35 PSIG (2 BAR). See example below for field conversion.

FIELD CONVERSION

- Remove solenoid and cap from valve body.
- Rotate gasket 180 degrees so that the internal pilot hole in the valve body is covered by the gasket.
- Reassemble the gasket, cap and solenoid to the valve body. Make sure gasket completely covers internal pilot hole before tightening screws.
- Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.



C - CONDUIT COIL

Refer to Electrical Section for details.

CT - CONDUIT COIL HIGH TEMPERATURE

Refer to Electrical Section for details.

D - DUSTPROOF

For applications in extremely dusty and contaminated environments. Standard vent ports are plugged. Operators breathe through the exhaust ports via flats on the end of the spools.

G - COIL WITH 18" FLYING LEADS

Refer to Electrical Section for details.

L - LOW WATT COIL

Refer to Electrical Section for details.

S - STAINLESS STEEL

Stainless steel body, all other external parts corrosive resistant; for corrosive environment applications.

SS - 316 STAINLESS STEEL

Stainless steel body, all other external parts corrosive resistant; for corrosive environment applications.

W - G THREADS

Y - EXPLOSION-PROOF COIL (CSA,FM)

Refer to Electrical Section for details.

Z - EXPLOSION-PROOF COIL (ATEX, PTB)

Refer to Electrical Section for details.

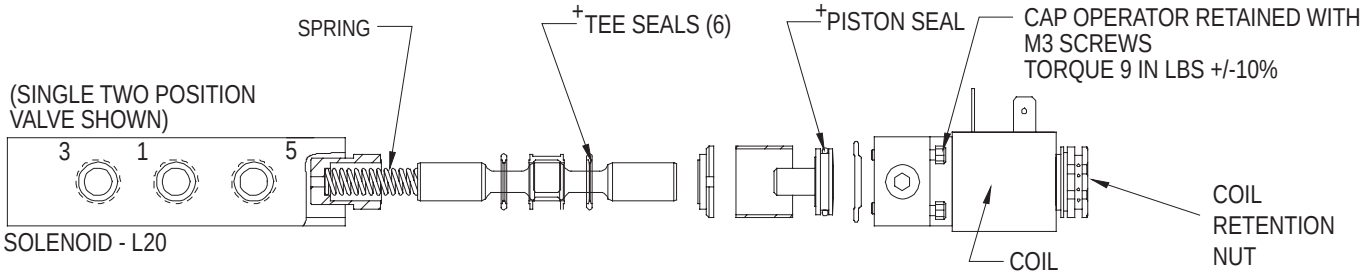
SERVICE KIT INFORMATION



SERVICE KIT INSTALLATION

1. Remove Coil retention nut.
2. Remove Coil.
3. Remove screws from cap of operator.
4. Remove cap.
5. Remove existing serviceable components.
6. Replace with kit components. **+All seals must be lubricated with Magnalube-G or equivalent.**
7. Align pilot hole in body with pilot hole in cap.
8. Torque screws as shown above.

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

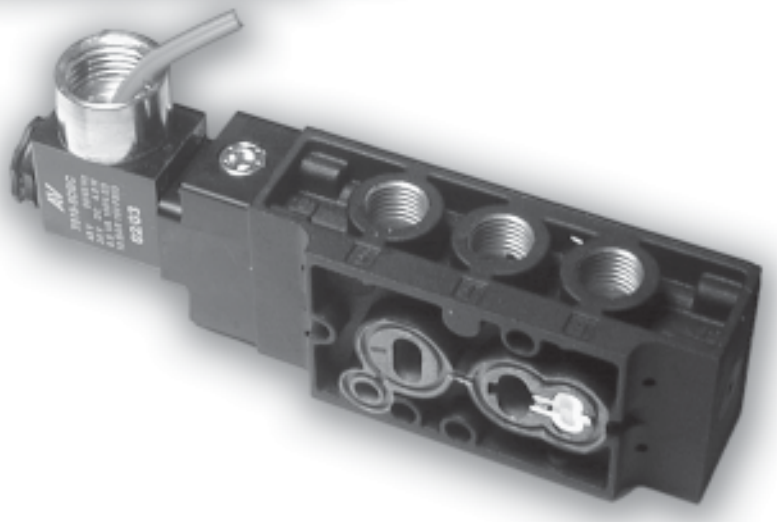
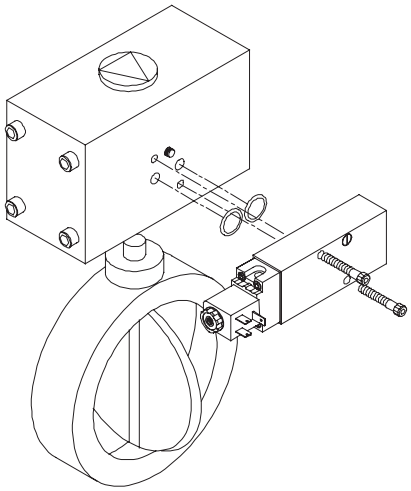
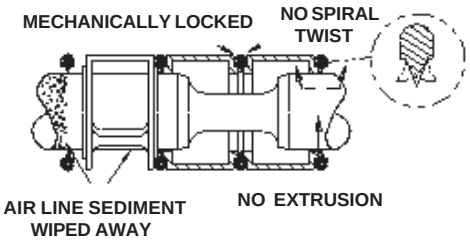
AUTOMATIC VALVE

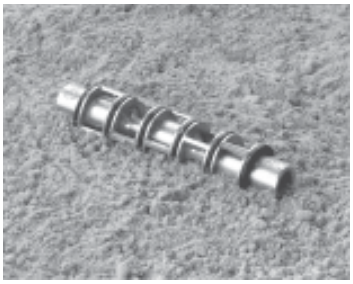




ACTUATOR MOUNT NAMUR SOLENOIDS

DESIGN FEATURES





VALVES

- Proven design with 10+ years OEM experience.
- Options available to meet your requirements: Nema 7, stainless steel, fluoroelastomer seals.
- Easily converted from 4 way to 3 way operation.

TAPERED TEE-SEAL ..... Eats Dirt

- Bi-directional tapered Tee-Seal flexes to clean spool. Eliminates Monday morning sticking problems.
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

SOLENOID ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push non-locking override. (Extended turn and turn lock available)

PRODUCTS CERTIFIED TO INCLUDE

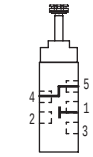
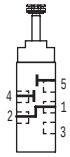
VALVE OPERATION



DE-ENERGIZED



ENERGIZED

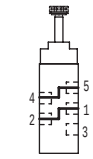
3/2 NC - 3 way 2 position normally closed valves shift and apply pressure when a maintained signal is applied to the operator then reset and block pressure when the signal is removed.

ENERGIZED

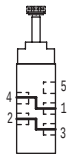
DE-ENERGIZED

ENERGIZED

5/3 BLOCK - 4 way 3 position blocked center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with all ports blocked.



DE-ENERGIZED



ENERGIZED

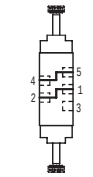
5/2 SINGLE - 4 way 2 position single operator valves shift, apply pressure from port 1 to 4, and exhaust pressure from port 2 to 3 when a maintained signal is applied to operator 1-4. Valves reset, apply pressure from port 1 to 2, exhaust pressure from port 4 to 5 when the signal is removed.

ENERGIZED

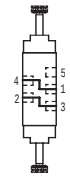
DE-ENERGIZED

ENERGIZED

5/3 EXHAUST - 4 way 3 position exhaust center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 2 open to 3, port 4 open to 5, and port 1 blocked.



DE-ENERGIZED



ENERGIZED

5/2 DOUBLE - 4 way 2 position double operator valves shift, apply pressure from port 1 to 4,and exhaust pressure from 2 to 3 when a momentary signal is applied to operator 1-4. Valves shift, apply presure from port 1 to 2, and exhaust pressure from 4 to 5 when a momentary signal is applied to operator 1-2.

ENERGIZED

DE-ENERGIZED

ENERGIZED

5/3 PRESURE - 4 way 3 position pressure center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 1 open to ports 2 and 4, and ports 3 and 5 are blocked.

FILTRATION AND LUBRICATION

MEDIA - AIR OR INERT GAS

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 viscosity, and have an aniline range of 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

Filter to 50 microns or better.
For temperatures below 40°F, air must be dry to prevent formation of ice.

OPTIONS

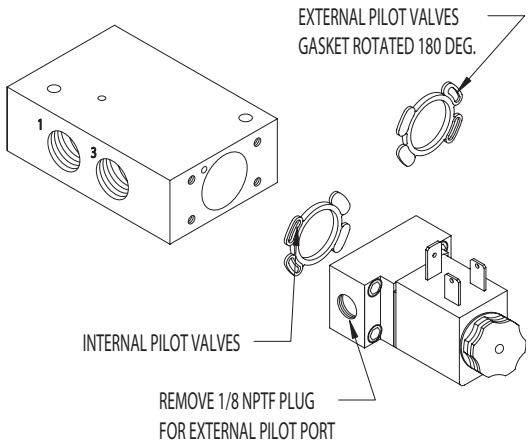
(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

A - FLUOROELASTOMER SEALS
For applications where fluid media or ambient conditions are not compatible with nitrile seals.
Note: Fluorocarbon seals do not increase the effective temperature range of the valve.
For high temperature applications, consult the factory.

B - EXTERNAL PILOT
For solenoid applications when the pressure to port one is less than 35 PSIG (2 BAR). See example below for field conversion.

FIELD CONVERSION

- Remove solenoid and cap from valve body.
- Rotate gasket 180 degrees so that the internal pilot hole in the valve body is covered by the gasket.
- Reassemble the gasket, cap and solenoid to the valve body. Make sure gasket completely covers internal pilot hole before tightening screws.
- Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.



C - CONDUIT COIL
Refer to Electrical Section for details.
CT - CONDUIT COIL HIGH TEMPERATURE
Refer to Electrical Section for details.
D - DUSTPROOF
For applications in extremely dusty and contaminated environments. Standard vent ports are plugged. Operators breathe through the exhaust ports via flats on the end of the spools.
G - COIL WITH 18" LEADS
Refer to Electrical Section for details.
P - TRANSITION PLATE
For mounts to surfaces smaller than 2 1/2" x 1 3/8". Refer to next page for Installation Instructions.
Q - CLOSED LOOP
S - STAINLESS STEEL
Stainless steel body, all other external parts corrosive resistant; for corrosive environment applications.
SS - 316 STAINLESS STEEL
Stainless steel body, all other external parts corrosive resistant; for corrosive environment applications.
W - G THREADS
Y - EXPLOSION-PROOF COIL (CSA, FM)
Refer to Electrical Section for details.
Z - EXPLOSION-PROOF COIL (ATEX, PTB)
Refer to Electrical Section for details.

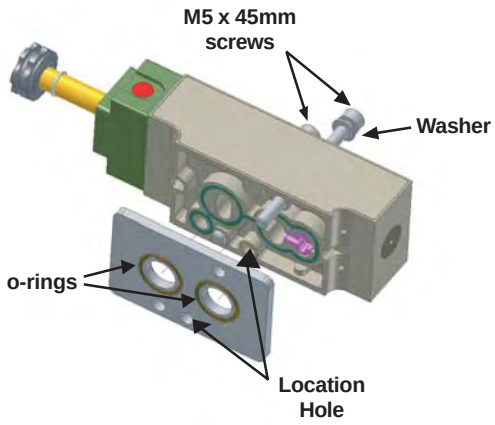
5/2
5/3

TRANSITION PLATE

Part Number A8021-339

Installation Instructions

This plate is designed for use in situations where the NAMUR solenoid valve needs to be raised above the mounting surface or where the sealing face of the solenoid valve extends beyond the mounting surface.
(The minimum required mounting area measures 2 1/2" x 1 3/8")



MOUNTING SURFACE

Installation

1. Place the plate between the solenoid valve and the mounting surface.

2. Use the supplied M5 x 45mm screws to secure the solenoid valve/plate assembly to the mounting surface. DO NOT use the solenoid valve screws (they are too short to engage correctly).

3. Note: The o-ring face of the plate must seal on the mounting surface. The gasket on the solenoid valve will seal on flat surface of the plate.

4. Orientation of the plate is universal (but keep the o-rings against the mounting surface). Location holes must be aligned.

5. Washers on the supplied screws should be retained between the screw head and the top of the solenoid.

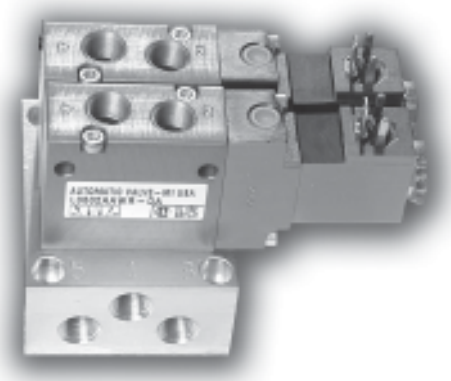
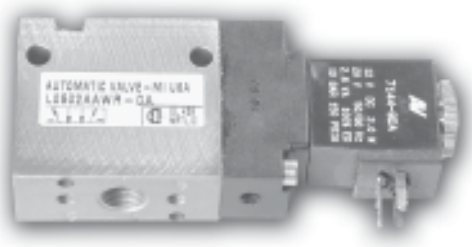
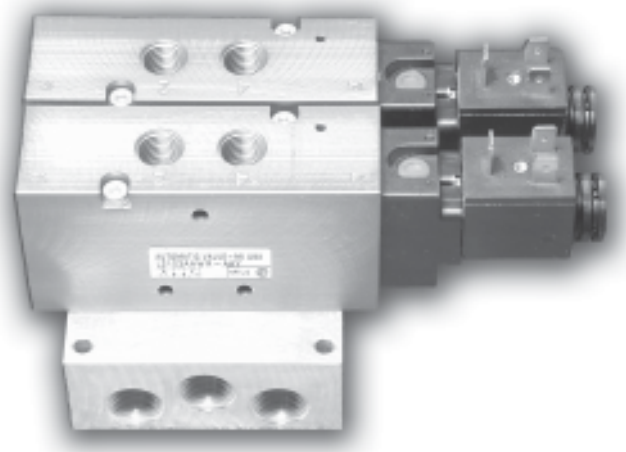
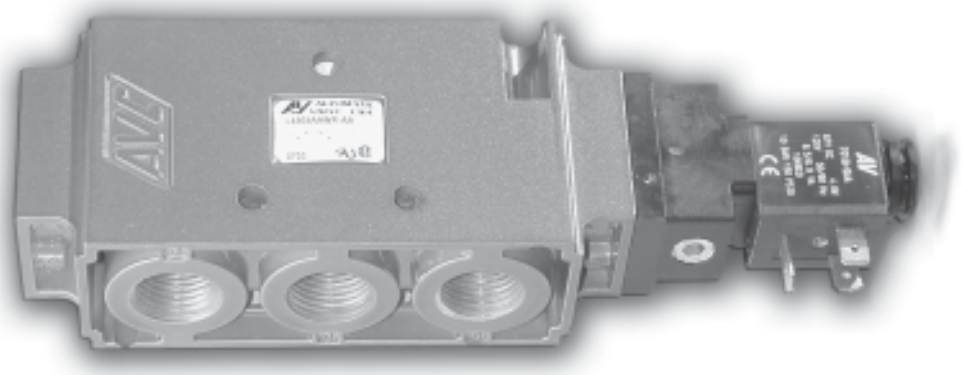
AUTOMATIC VALVE



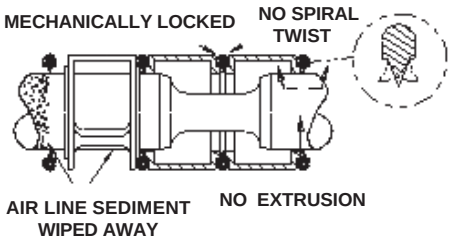






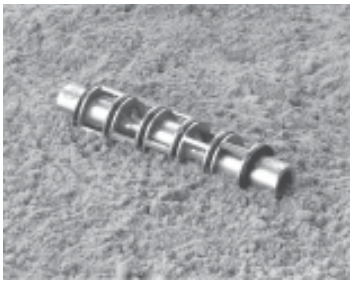
TOP MOUNT SPOOL VALVES

DESIGN FEATURES



VALVES

- Balanced spool construction allows ports to be plugged for 2 or 3 way function, or restricted for inexpensive cylinder exhaust speed control. For selector or dual pressure applications, consult Factory.
- Manifold or line mount - flexible, efficient.
- Solid manifold construction for rugged, reliable performance.
- Specific application needs? Consult the Factory. We will build it for you.



TAPERED TEE-SEAL - L21, L45 ..... Eats Dirt

- Bi-directional tapered Tee-Seal flexes to clean spool. Eliminates Monday morning sticking problems.
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

SOLENOID ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Push non-locking override. (Extended turn and turn lock available).

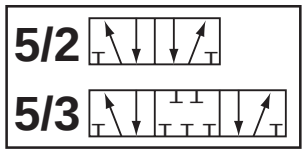
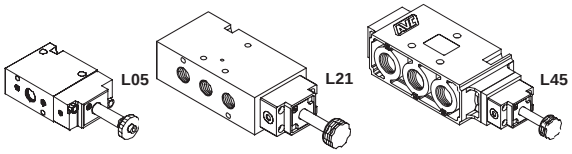
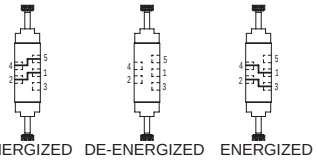
SPECIFICATIONS

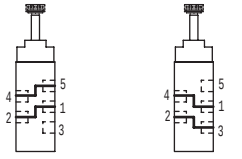


VALVE OPERATION

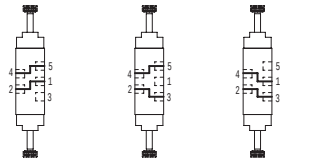




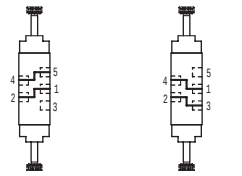
5/3 BLOCK - 4 way 3 position blocked center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with all ports blocked.



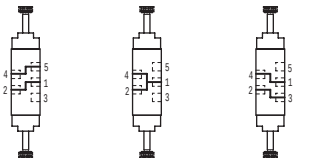
5/2 SINGLE - 4 way 2 position single operator valves shift, apply pressure from port 1 to 4, and exhaust pressure from port 2 to 3 when a maintained signal is applied to operator 1-4. Valves reset, apply pressure from port 1 to 2, exhaust pressure from port 4 to 5 when the signal is removed.



5/3 EXHAUST - 4 way 3 position exhaust center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 2 open to 3, port 4 open to 5, and port 1 blocked.



5/2 DOUBLE - 4 way 2 position double operator valves shift, apply pressure from port 1 to 4,and exhaust pressure from 2 to 3 when a momentary signal is applied to operator 1-4. Valves shift, apply presure from port 1 to 2, and exhaust pressure from 4 to 5 when a momentary signal is applied to operator 1-2.



5/3 PRESSURE - 4 way 3 position pressure center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 1 open to ports 2 and 4, and ports 3 and 5 are blocked.

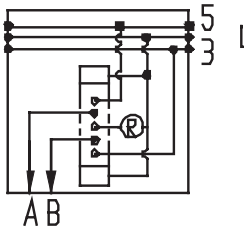
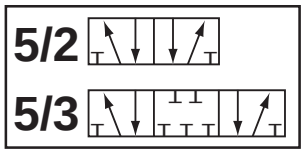
L21	B8023-067	DOUBLE	33,0 1.30	136,6 5.38	,4 (.8)

Units of Measure: Top - mm, Bottom - inches

FEATURES

- Regulates single inlet pressure from inlet port 1 to cylinder ports 2 & 4.
- Mounts between valve and base.
- Pressure range: L05: 345 - 1030 kPa (50 - 150 PSIG)
  L21: 240 - 1030 kPa (35 - 150 PSIG)
  Work port pressure is adjustable from:
  0 - 1030 kPa (0 - 150 PSIG)
- 1/8 NPTF gage port: Available with single valves only.
- Valve and regulator sold together.
- See Accessories Section for in port regulator, PO check and flow control alternatives.





OPTIONS

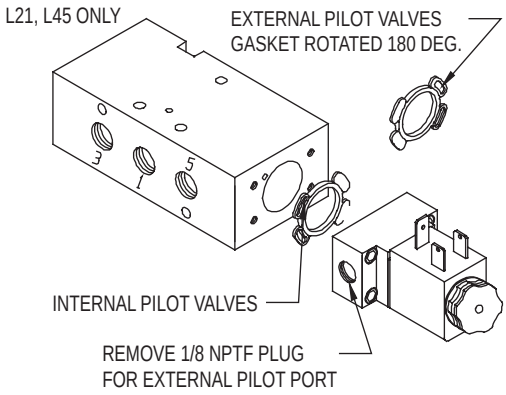
(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

A - FLUOROELASTOMER SEALS (L21 & L45)
For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of a solenoid valve. For high temperature applications, consult the factory.

B - EXTERNAL PILOT
For solenoid applications when the pressure to port is less than 35 PSIG (2 BAR). See example below for field conversion of L21 & L45. The L05 must be ordered as an externally piloted valve, if required.

FIELD CONVERSION FOR L21 & L45

1. Remove solenoid and cap from valve body.
2. Rotate gasket 180 degrees so that the internal pilot hole in the valve body is covered by the gasket.
3. Reassemble the gasket, cap and solenoid to the valve body. Make sure gasket completely covers internal pilot hole before tightening screws.
4. Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.



C - CONDUIT COIL
Refer to Electrical Section for details.

CT - CONDUIT COIL HIGH TEMPERATURE
Refer to Electrical Section for details.

D - DUSTPROOF
For applications in extremely dusty and contaminated environments. Standard vent ports are plugged. Operators breathe through the exhaust ports via flats on the end of the spools.

G - COIL WITH 18" LEADS
Refer to Electrical Section for details.

W - G THREADS

Y - EXPLOSION PROOF COIL (CSA, FM)
Refer to Electrical Section for details.

Z - EXPLOSION PROOF COIL (ATEX, PTB)
Refer to Electrical Section for details.

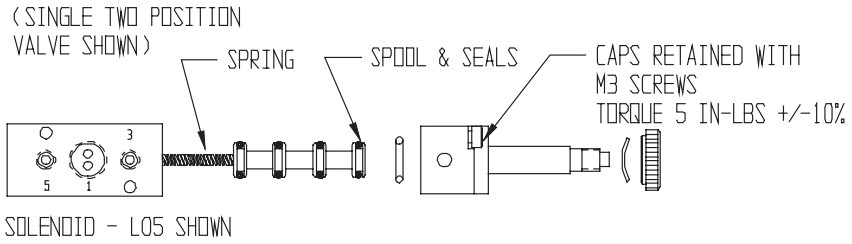
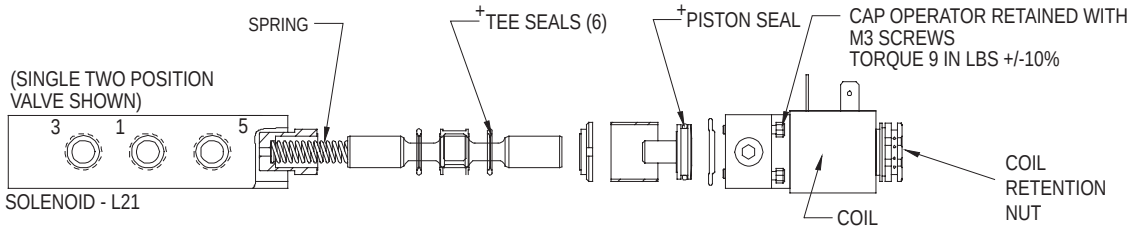
SERVICE KIT INFORMATION





SERVICE KIT INSTALLATION

1. Remove Coil retention nut.
2. Remove Coil.
3. Remove screws from cap of operator.
4. Remove cap.
5. Remove existing serviceable components.
6. Replace with kit components. **+All seals must be lubricated with Magnalube-G or equivalent.**
7. Align pilot hole in body with pilot hole in cap.
8. Torque screws as shown above.

+ ANY VALVE REBUILT MUST BE LUBRICATED TO FACTORY SPECIFICATIONS.
Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82ºC (180ºF) and 99ºC (210ºF). Refer to Maintenance section of catalog for recommended lubricants.

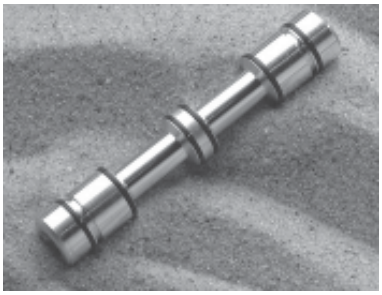
5/3

DESIGN FEATURES

VALVES

- Modular design allows for solutions tailored exactly to your needs, easy upgrades.
- Circuit boards replace wire tangles.
- Terminal strip, PLC and multiple serial bus electronic interfaces available.
- Pneumatic accessories include interposed regulator with gage port; dual pressure isolated station feeds; pilot operated checks, flow controls and soft start.
- Piped solenoid exhaust is standard.
- Diecast aluminum body, aluminum spool, zamak alloy end caps.
- 1.6 - 2.0 Cv.

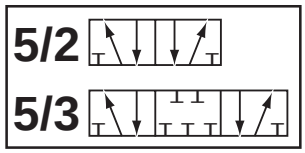


TAPERED FLEX SEAL....COMPACT DESIGN

- Tough, new, inverted NBR Tee-Seal retains the advantages of our standard seals. Eliminates Monday morning sticking problems.
- Abrasion resistant formulation.
- Ability to run with or without lubrication (if lubrication is not started).

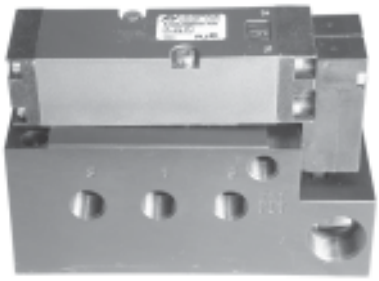
INDEX

DESIGN FEATURES (continue)



SOLENOID....GUARANTEED AGAINST BURNOUT

- 1.2 watt Nema 4/IP65 solenoid.
- Polarity insensitive.
- LED status indicator - green.
- Internal surge supression.
- Seal material: NBR.
- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 120 PSIG (240 to 830 KPA).
- Coil is hermetically sealed as an integral watertight molded unit.
- Push non-locking override is standard.



BASE MOUNTED VALVES
5 PORTED 4 WAY 2 AND 3 POSITION Cv 1.6

- Internal wiring eliminated.
- Easy connect terminal strip.
- 1.2 watt solenoid or air pilot.
- Designed to meet Nema 4/IP65 specifications.

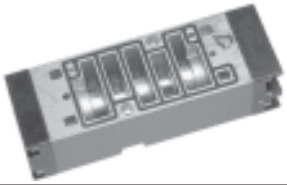
MANIFOLD MOUNTED VALVES
5 PORTED 4 WAY 2 AND 3 POSITION Cv 1.6

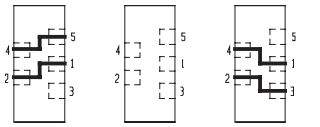
- Multipurpose electrical interface cap allows round, conduit or sub-d connection.
- Captured fasteners for easy assembly.
- Easy, flexible connection to serial bus/electronics.
- Push-to-connect cartridge fittings available.
- Station positions may be moved without changes to valves or boards.
- Designed to meet Nema 4/IP65 specifications.

5/2
5/3

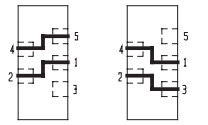
SPECIFICATIONS

VALVE OPERATION

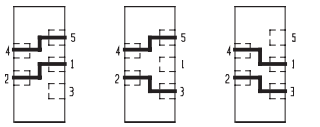




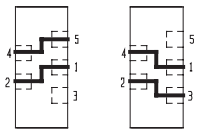
5/3 BLOCK - 4 way 3 position blocked center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with all ports blocked.



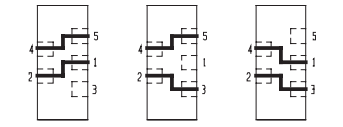
5/2 SINGLE - 4 way 2 position single operator valves shift, apply pressure from port 1 to 4, and exhaust pressure from port 2 to 3 when a maintained signal is applied to operator 1-4. Valves reset, apply pressure from port 1 to 2, exhaust pressure from port 4 to 5 when the signal is removed.



5/3 EXHAUST - 4 way 3 position exhaust center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 2 open to 3, port 4 open to 5, and port 1 blocked.



5/2 DOUBLE - 4 way 2 position double operator valves shift, apply pressure from port 1 to 4,and exhaust pressure from 2 to 3 when a momentary signal is applied to operator 1-4. Valves shift, apply presure from port 1 to 2, and exhaust pressure from 4 to 5 when a momentary signal is applied to operator 1-2.



5/3 PRESURE - 4 way 3 position pressure center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 1 open to ports 2 and 4, and ports 3 and 5 are blocked.

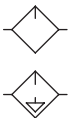
OPERATING TEMPERATURES

SOLENOID PILOT OPERATED	TREATED BUNA-N SEALS (TREATED NBR, Standard)
Standard	-18°C to +52°C (0°F to +125°F)

OPERATING PRESSURES

SOLENOID PILOT OPERATED	INLET PORT	EXTERNAL PILOT PORT
Standard 2 Position	240 - 830 kPa (35 - 120 PSIG)	Not Required
Standard 3 Position	345 - 830 kPa (50 - 120 PSIG)	Not Required
External Pilot (Option B)	Vacuum - 240 kPa (Vacuum - 35 PSIG)	240 - 830 kPa (35 - 120 PSIG)

FILTRATION AND LUBRICATION



MEDIA - AIR OR INERT GAS

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 viscosity, and have an aniline range of 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

Filter to 50 microns or better.
For temperatures below 40°F, air must be dry to prevent formation of ice.

OPTIONS

(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

B - EXTERNAL PILOT
For solenoid applications when the pressure to port one is less than 35 PSIG (240 kPa). See example below for field conversion.

FIELD CONVERSION

- REMOVE 1/8 PIPE PLUG FROM TOP OF CAP.
- ADD 1/16 NPTF PIPE PLUG IN SAME LOCATION OF 1/8 PLUG.
- REINSTALL 1/8 PIPE PLUG.
- REMOVE 1/8 PIPE PLUG FROM FRONT OF CAP FOR EXTERNAL PIPE PLUG CONNECTION.

D

PIN MAPPING

POSITION ON MANIFOLD

- All addressing starts from the electrical cap on the manifold.
- The right solenoid position on the first manifold adjacent to the electrical end cap is Station 1.
- This address extends from Station 1 through Station 16, regardless of whether the station is used.
- Field bus channels used correspond to used pins only. The first active pin is mapped to Channel 1, the next is to Channel 2, etc.
- Please consult Factory for manifold requirements above 8 stations/16 solenoids.

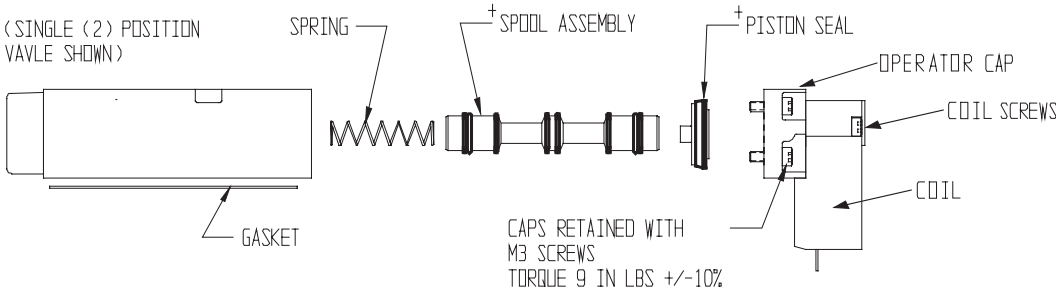
SERVICE KIT INFORMATION



SERVICE KIT INSTALLATION

I. Remove screws from the coils.

1. Remove screws from cap of operator.
2. Remove cap.
3. Remove existing serviceable components.
4. Replace with kit components. **+All seals must be lubricated with Magnalube-G or equivalent.**
5. Align pilot hole in body with pilot hole in cap.
6. Torque screws as shown above.

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

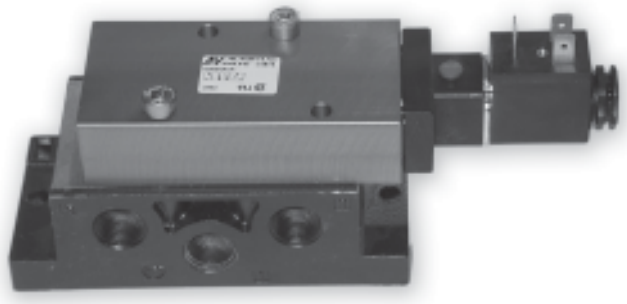
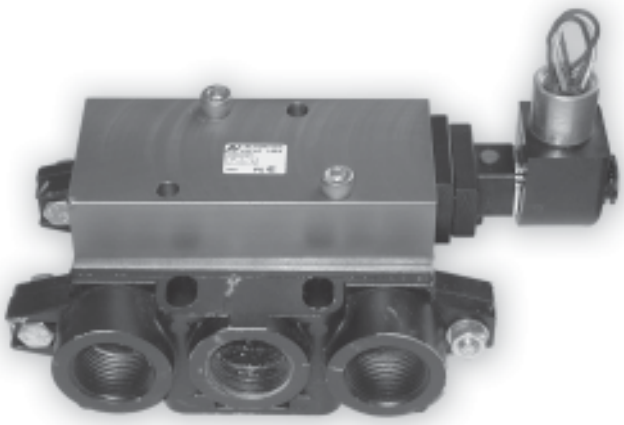
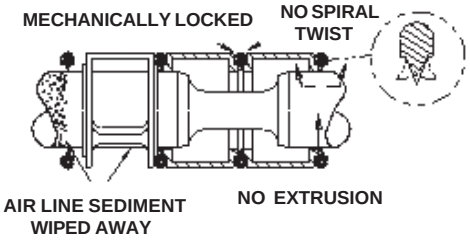
AUTOMATIC VALVE

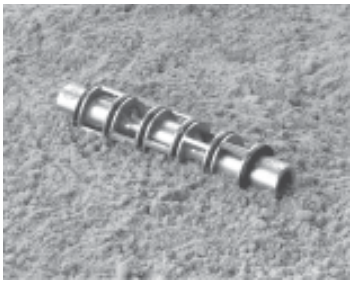




ISO SPOOL VALVES

DESIGN FEATURES





VALVES

- Conform to ISO 5599\1 specifications for size 1, 2 and 3.
- Complete range of operators available.

TAPERED TEE-SEAL ..... Eats Dirt

- Bi-directional tapered Tee-Seal flexes to clean spool. Eliminates Monday morning sticking problems**.**
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

SOLENOID ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push non-locking override. (Extended turn and turn lock available)

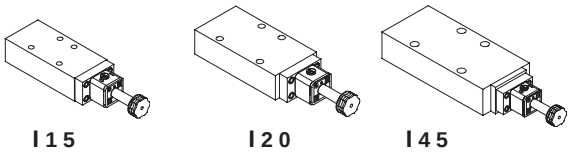
PRODUCTS CERTIFIED TO INCLUDE

- CSA - (C22.2)
- UL - (STD 429)
- ATEX - (2018x)
- PTB - (EExmIIT5) (EExiaIICT6)
- CE - (73/23/EEC), (89/336/EEC)

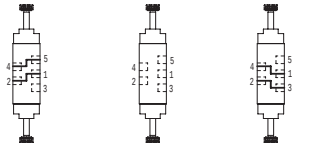
INDEX

SPECIFICATIONS

5/2 
5/3 
VALVE OPERATION

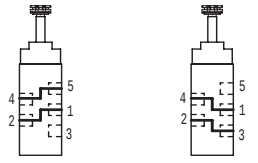


I15 I20 I45



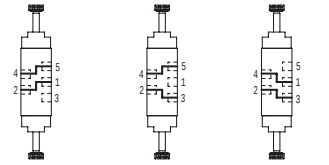
ENERGIZED DE-ENERGIZED ENERGIZED

5/3 BLOCK - 4 way 3 position blocked center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with all ports blocked.



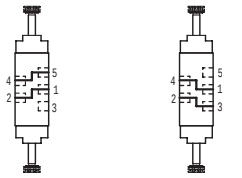
DE-ENERGIZED ENERGIZED

5/2 SINGLE - 4 way 2 position single operator valves shift, apply pressure from port 1 to 4, and exhaust pressure from port 2 to 3 when a maintained signal is applied to operator 1-4. Valves reset, apply pressure from port 1 to 2, exhaust pressure from port 4 to 5 when the signal is removed.



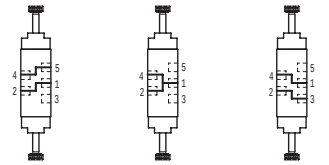
ENERGIZED DE-ENERGIZED ENERGIZED

5/3 EXHAUST - 4 way 3 position exhaust center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 2 open to 3, port 4 open to 5, and port 1 blocked.



DE-ENERGIZED ENERGIZED

5/2 DOUBLE - 4 way 2 position double operator valves shift, apply pressure from port 1 to 4,and exhaust pressure from 2 to 3 when a momentary signal is applied to operator 1-4. Valves shift, apply presure from port 1 to 2, and exhaust pressure from 4 to 5 when a momentary signal is applied to operator 1-2.



ENERGIZED DE-ENERGIZED ENERGIZED

5/3 PRESURE - 4 way 3 position pressure center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 1 open to ports 2 and 4, and ports 3 and 5 are blocked.

OPTIONS

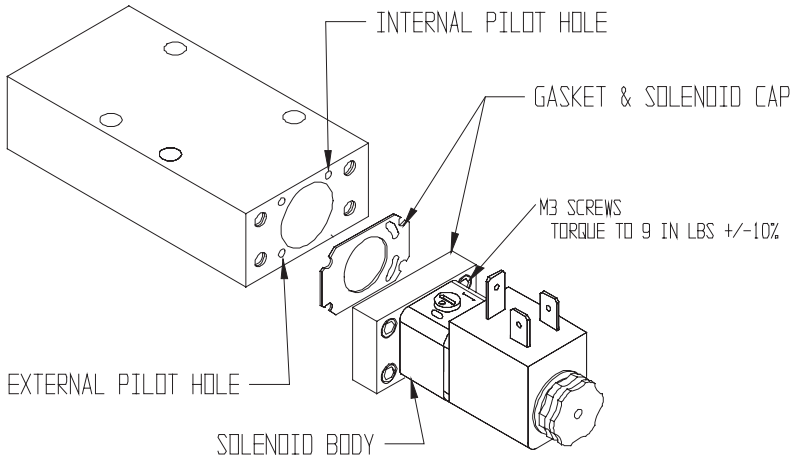
(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

A - FLUOROELASTOMER SEALS
For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.

B - EXTERNAL PILOT
For solenoid applications when the pressure to port one is less than 35 PSIG (2 BAR). See example below for field conversion.

FIELD CONVERSION

- Remove nut, then solenoid coil from stem.
- Remove screws from solenoid body.
- Rotate solenoid cap and gasket 180°.
- Verify that slots in gasket are in line with external pilot hole in body.
- Install Solenoid and Coil.
- External pilot connection through base now engaged.



C - CONDUIT COIL
Refer to Electrical Section for details.
CT - CONDUIT COIL HIGH TEMPERATURE
Refer to Electrical Section for details.
D - DUSTPROOF
For applications in extremely dusty and contaminated environments. Standard vent ports are plugged. Operators breathe through the exhaust ports via flats on the end of the spools.
G - COIL WITH 18" LEADS
Refer to Electrical Section for details.
W - G THREADS
Sub-base and Manifold only.
Y - COIL EXPLOSION PROOF (CSA, FM)
Refer to Electrical Section for details.
Z - COIL EXPLOSION PROOF (ATEX, PTB)
Refer to Electrical Section for details.
1 - PUSH TURN LOCKING OVERRIDE
2 - EXTENDED TURN LOCKING OVERRIDE

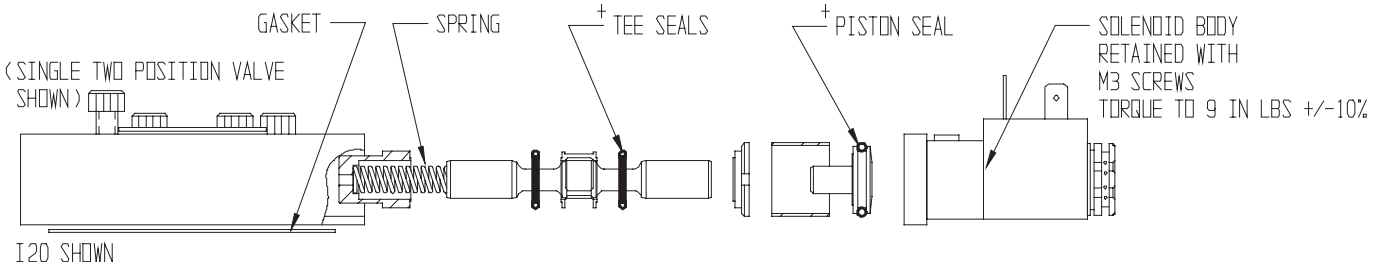
SERVICE KIT INFORMATION



SERVICE KIT INSTALLATION

1. Remove screws from cap of operator.
2. Remove cap.
3. Remove existing serviceable components.
4. Replace with kit components. **+All seals must be lubricated with Magnalube-G or equivalent.**
5. Align pilot hole in body with pilot hole in cap.
6. Torque screws as shown above.

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

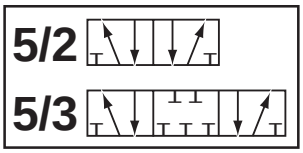
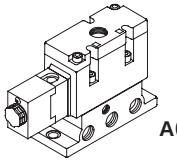
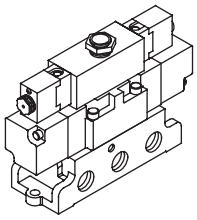
SPECIFICATIONS



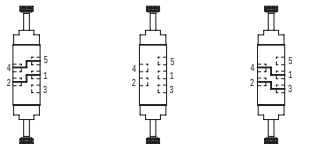
VALVE OPERATION



A04

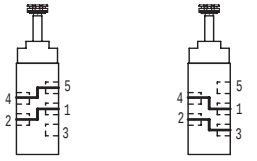


A06



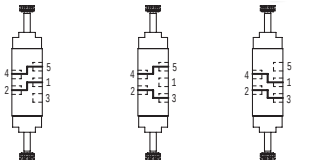
ENERGIZED DE-ENERGIZED ENERGIZED

5/3 BLOCK - 4 way 3 position blocked center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with all ports blocked.



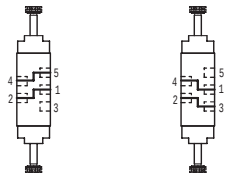
DE-ENERGIZED ENERGIZED

5/2 SINGLE - 4 way 2 position single operator valves shift, apply pressure from port 1 to 4, and exhaust pressure from port 2 to 3 when a maintained signal is applied to operator 1-4. Valves reset, apply pressure from port 1 to 2, exhaust pressure from port 4 to 5 when the signal is removed.



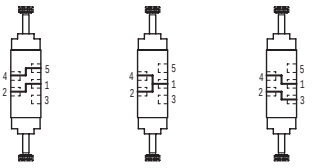
ENERGIZED DE-ENERGIZED ENERGIZED

5/3 EXHAUST - 4 way 3 position exhaust center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 2 open to 3, port 4 open to 5, and port 1 blocked.



DE-ENERGIZED ENERGIZED

5/2 DOUBLE - 4 way 2 position double operator valves shift, apply pressure from port 1 to 4,and exhaust pressure from 2 to 3 when a momentary signal is applied to operator 1-4. Valves shift, apply presure from port 1 to 2, and exhaust pressure from 4 to 5 when a momentary signal is applied to operator 1-2.



ENERGIZED DE-ENERGIZED ENERGIZED

5/3 PRESURE - 4 way 3 position pressure center valves operate like 5/2 double valves except shift when a maintained signal is applied to either 1-2 or 1-4. Valves reset to center position when signal is removed with port 1 open to ports 2 and 4, and ports 3 and 5 are blocked.

OPERATING TEMPERATURES	SOLENOID PILOT OPERATED	TREATED BUNA-N SEALS (TREATED NBR, Standard)	FLUOROELASTOMER SEALS (FPM (FKM), Option A)
	Standard	-18°C to +52°C (0°F to +125°F)	-18°C to +52°C (0°F to +125°F)
	High Temp Coil (Option T)	-18°C to +82°C (0°F to +180°F)	-18°C to +82°C (0°F to +180°F)

OPERATING PRESSURES	SOLENOID PILOT OPERATED	INLET PORT	EXTERNAL PILOT PORT
	Standard 2 Position	240 - 1030 kPa (35 - 150 PSIG)	Not Required
	Standard 3 Position	345 - 1030 kPa (50 - 150 PSIG)	Not Required
	External Pilot (Option B)	Vacuum - 240 kPa (Vacuum - 35 PSIG)	240 - 1030 kPa (35 - 150 PSIG)

FILTRATION AND LUBRICATION

MEDIA - AIR OR INERT GAS

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 viscosity, and have an aniline range of 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

Filter to 50 microns or better.
For temperatures below 40°F, air must be dry to prevent formation of ice.

OPTIONS

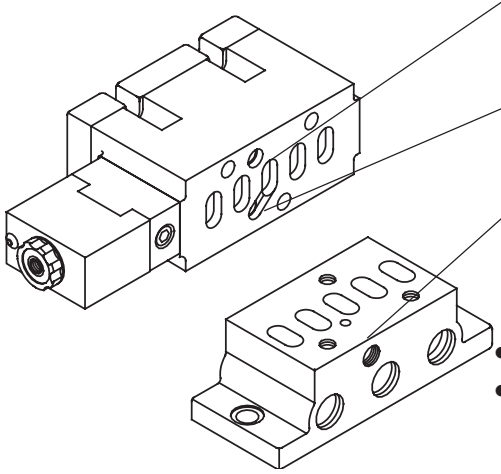
(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

A - FLUOROELASTOMER SEALS

For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory. Available for A04, A06 only.

B - EXTERNAL PILOT

For solenoid applications when the pressure to port is less than 35 PSIG (2 BAR). See example below for field conversion.



1/16 NPTF External Pilot Supply Port.
Plugged for standard internal pilot supply.
Open for external pilot supply - Option B.

1/16 NPTF Internal Pilot Supply Port.
Plugged for external pilot supply - Option B.
Open for standard internal pilot supply.

External Pilot Supply
1/8 NPTF - Series A04 and A06
1/4 NPTF - Series A10 and A20

FIELD CONVERSION

- Remove the valve from the sub-base and turn upside down.
- Remove the 1/16 NPTF pipe plug from the external pilot supply port in the valve and install it in the internal supply port.
- Connect air supply to the external pilot supply port in the base.

D - DUSTPROOF

For applications in extremely dusty and contaminated environments. Standard vent ports are plugged. Operators breathe through the exhaust ports via flats on the end of the spools.

0-7 - WIRING

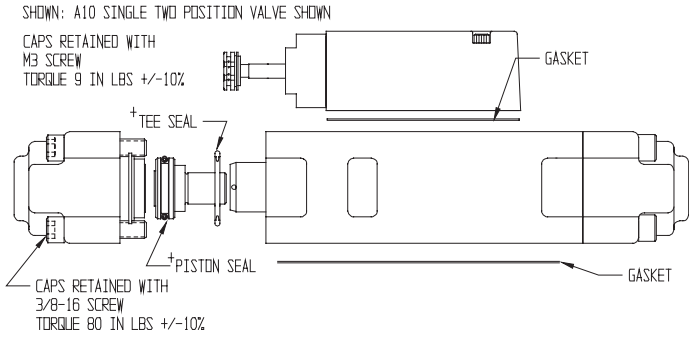
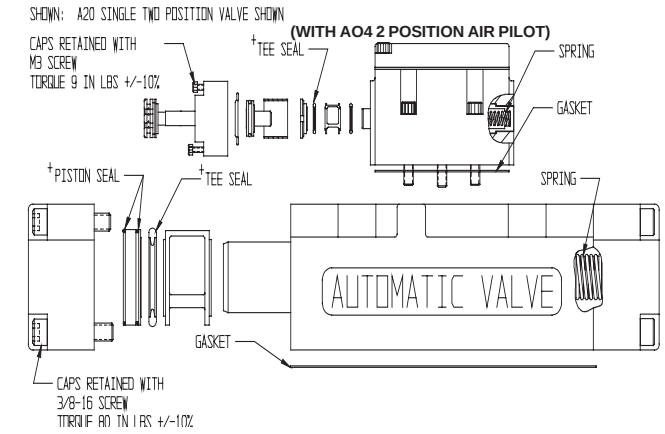
SERVICE KIT INFORMATION





SERVICE KIT INSTALLATION

1. Remove screws from cap of operator.
2. Remove cap.
3. Remove existing serviceable components.
4. Replace with kit components. **+All seals must be lubricated with Magnalube-G or equivalent.**
5. Align pilot hole in body with pilot hole in cap.
6. Torque screws as shown above.

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

FILTRATION AND LUBRICATION

MEDIA AIR OR INERT GAS

Lubrication of Automatic Valves is not required but recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline range of 82°C (180°F) to 99°C (210°F). Refer to Maintenances section of catalog for recommended lubricants.

Filter to 50 microns or better.
For temperatures below 40°F, air must be dry to prevent formation of ice.

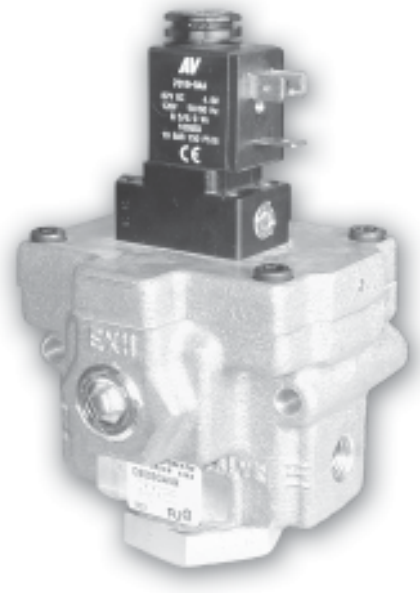
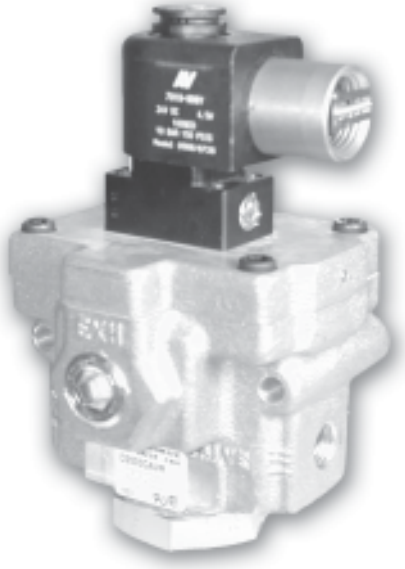
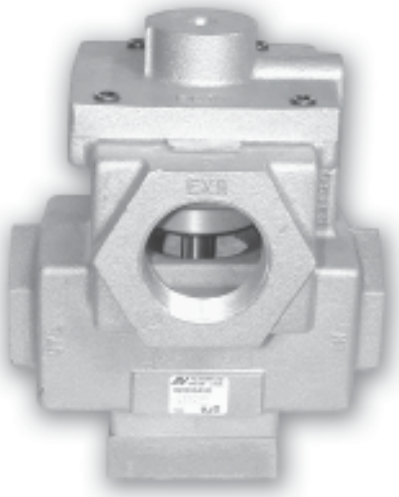
AUTOMATIC VALVE







PILOT INLINE POPPET VALVES

DESIGN FEATURES

VALVES

- Reliable - used world-wide in power plant applications.
- High flow design with short stroke for fast response.
- Front or rear mounting.
- Flow from 6 to 36 Cv.

TAPERED CUSH-N-SEAL

- Molded from superior, tough, Carboxylated Nitrile. Provides five times the abrasion resistance and service life of standard Buna-N (NBR) seals.
- Cushion design increases life.
- Self-cleansing, cushioned poppet allows quieter operation.

SOLENOID ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (241 to 1034 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Push non-locking override. (Extended turn and turn lock available)

PRODUCTS CERTIFIED TO INCLUDE

- CSA - (C22.2)
- UL - (STD 429)
- ATEX - (2018x)
- PTB - (EExmIIT5) (EExiaIICT6)
- CE - (73/23/EEC), (89/336/EEC)

INDEX

SPECIFICATIONS

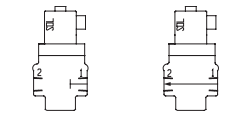
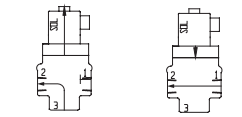
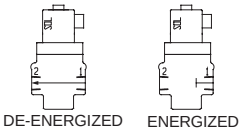
VALVE OPERATION



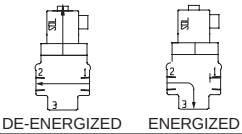
2/2 NC - 2 way 2 position normally closed valves shift and apply pressure when a maintained signal is applied to the operator then reset and block pressure when the signal is removed.



3/2 NC - 3 way 2 position normally closed valves shift and apply pressure when a maintained signal is applied to the operator then reset and exhaust pressure when the signal is removed.



2/2 NO - 2 way 2 position normally open valves shift and block pressure when a maintained signal is applied to the operator then reset and apply pressure when the signal is removed.



3/2 NO - 3 way 2 position normally open valves shift and exhaust pressure when a maintained signal is applied to the operator then reset and apply pressure when the signal is removed.

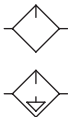
OPERATING TEMPERATURES

	BUNA-N SEALS (NBR, Standard)	FLUOROELASTOMER SEALS (FPM (FKM), Option A)
Solenoid Pilot Operated Standard	-18°C to +52°C (0°F to +125°F)	-18°C to +66°C (0°F to +150°F)
Solenoid Pilot Operated High Temp Coil (Option)T	-18°C to +82°C (0°F to +180°F)	-18°C to +82°C (0°F to +180°F)
Air Pilot Operated Standard	-18°C to +82°C (0°F to +180°F)	-18°C to +121°C (0°F to +250°F)

OPERATING PRESSURES

SOLENOID PILOT OPERATED	INLET PORT	EXTERNAL PILOT PORT
Standard	240 - 1030 kPa (35 - 150 PSIG)	Not Required
External Pilot (Option B)	0 - 1030 kPa (0 - 150 PSIG)	240 - 1030 kPa (35 - 150 PSIG) and ≥ inlet
Vacuum Spring (Option J)	Vacuum	240 - 1030 kPa (35 - 150 PSIG) and ≥ inlet
Air Pilot Operated		
Standard	0 - 1720 kPa (0 - 250 PSIG)	Min 240 kPa (35 PSIG) and ≥ inlet
Vacuum Spring (Option J)	Vacuum	240 - 1030 kPa (35 - 150 PSIG)

FILTRATION AND LUBRICATION



Media - Air or Inert Gas

Lubrication of Automatic Valves is not required but recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline range of 82°C (180°F) to 99°C (210°F). Refer to Maintenances section of catalog for recommended lubricants.

Filter to 50 microns or better.
For temperatures below 40°F, air must be dry to prevent formation of ice.

Units of Measure: Top - mm, Bottom - inches, M = Tap Size

OPTIONS

(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

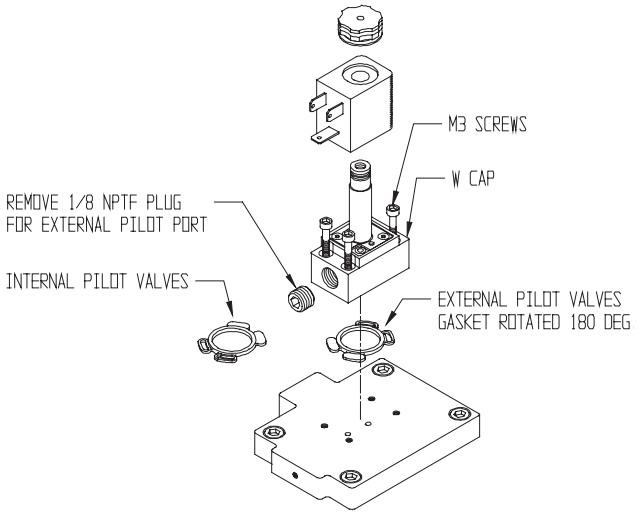
A - FLUOROELASTOMER SEALS
For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.

B - EXTERNAL PILOT
For solenoid applications when the pressure to port 1 is less than 35 PSIG (2 BAR). See example below for field conversion.

FIELD CONVERSION

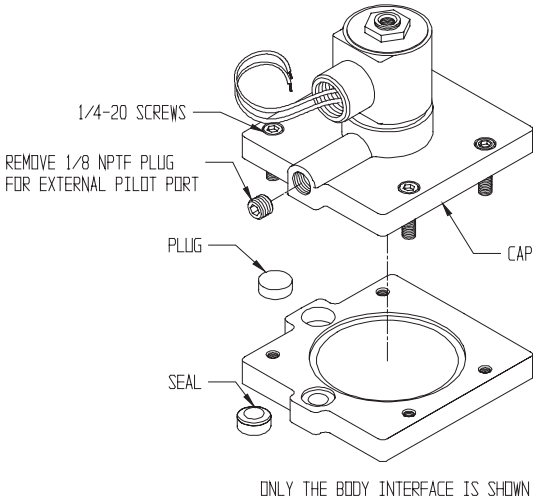
For W Solenoids

- Remove W cap.
- Remove gasket from botton of W cap.
- Rotate gasket 180° and re-position on bottom of cap so that internal pilot hole is covered.
- Reassemble W cap to body and torque screws to 9 in/lbs (+/- 10%).
- Remove pipe plug from cap and make 1/8 external pilot connection.



For B & D Solenoids

- Remove cap from valve body.
- Remove seal from internal pilot supply and replace with plug stored in body.
- Reassemble cap to body and torque screws to 55 in/lbs (+/- 10%).
- Remove pipe plug from cap and make 1/8 external pilot connection.



C - CONDUIT COIL (P06, P14)
Refer to Electrical Section for details.

CT - CONDUIT COIL HIGH TEMPERATURE
Refer to Electrical Section for details.

G - COIL WITH 18" LEADS
Refer to Electrical Section for details.

J - VACUUM SPRING
Provides additional reset force when pressure at port 1 is less than 0 PSIG (0 kPa). For solenoid pilot valves, also specify option "B".

T - HIGH TEMPERATURE COIL (P36 ONLY)
For temperatures to 95°C (200°F) maximum.

Y - EXPLOSION-PROOF COIL (CSA, FM)
Refer to Electrical Section for details.

Z - EXPLOSION-PROOF COIL (ATEX, PTB)
Refer to Electrical Section for details.

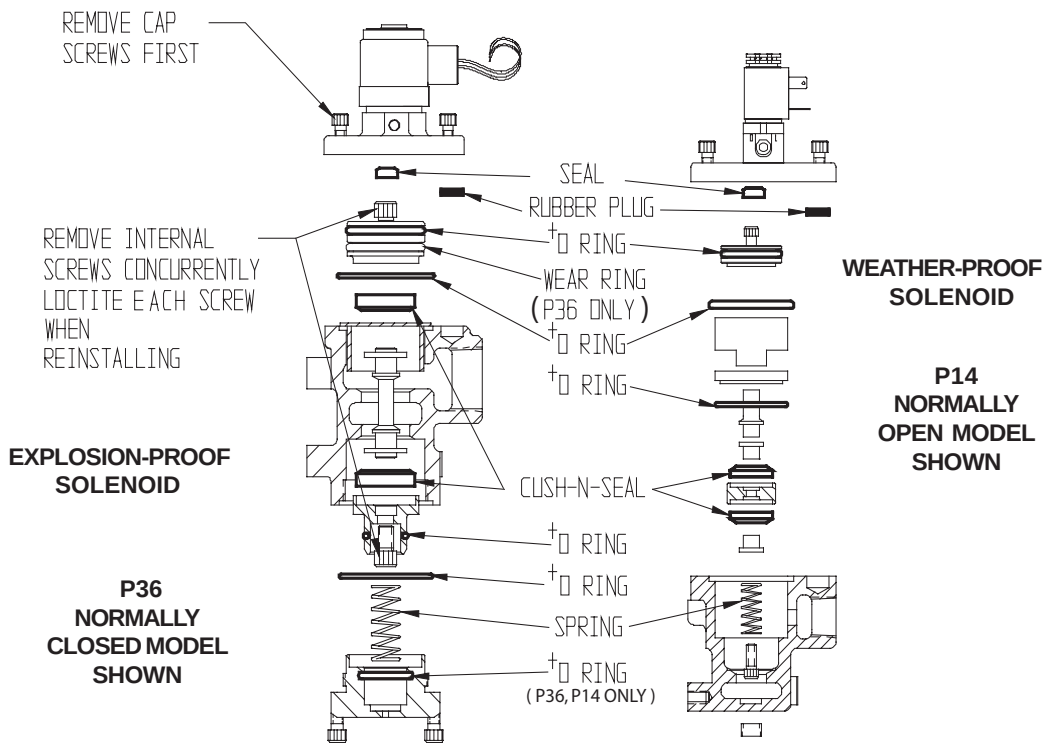
SERVICE KIT INFORMATION



SERVICE KIT INSTALLATION

1. Remove screws from cap of operator.
2. Remove cap.
3. Remove existing serviceable components.
4. Replace with kit components. **+All seals must be lubricated with Magnalube-G or equivalent.**
5. Align pilot hole in body with pilot hole in cap.
6. Torque screws as shown above.

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to Maintenance section of catalog for recommended lubricants.

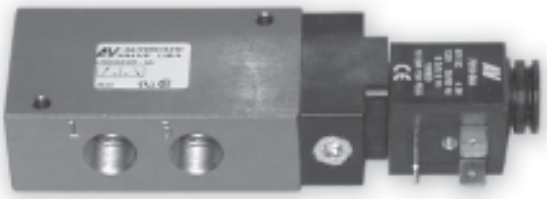
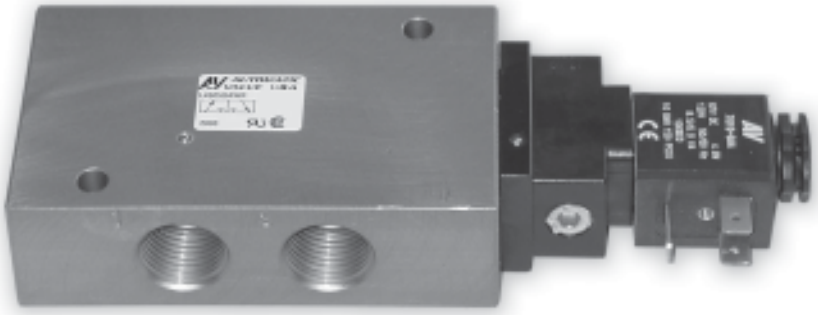
ISO 9001

AUTOMATIC VALVE

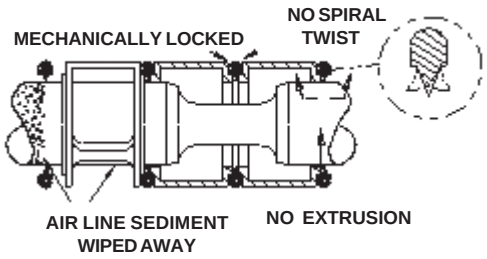


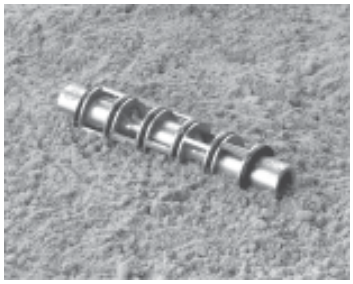


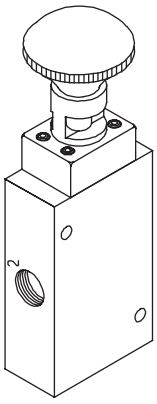
3 WAY COMPACT SPOOL VALVES

3/2

DESIGN FEATURES
L20/L45 3 WAY 2 POSITION VALVE







VALVES

- Lockout tested and approved to SAE specifications.
- Compact size, high flow.

TAPERED TEE-SEAL ..... Eats Dirt

- Bi-directional tapered Tee-Seal flexes to clean spool.
- Eliminates Monday morning sticking problems**.**
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

SOLENOID ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push non-locking override. (Extended turn and turn lock available).

PRODUCTS CERTIFIED TO INCLUDE

- CSA - (C22.2)
- UL - (STD 429)
- ATEX - (2018x)
- PTB - (EExmIIT5) (EExiaIICT6)
- CE - (73/23/EEC), (89/336IEEC)

LOCKOUT

- Short stroke for quick response.
- Bright red handle for visibility.
- Padlockable in the closed position.
- When handle is pulled outward, inlet port 1 is connected to outlet port 2 and exhaust port 3 is blocked.
- When handle is pushed inward, inlet port 1 is blocked and outlet port 2 is connected to exhaust port 3.

INDEX

3/2

SPECIFICATIONS

VALVE OPERATION			
 DE-ENERGIZED ENERGIZED	**3/2 NC** - 3 way 2 position normally closed valves shift and apply pressure when a maintained signal is applied to the operator then reset and block pressure when the signal is removed.	 DE-ENERGIZED ENERGIZED	**3/2 NO** - 3 way 2 position normally open valves shift and exhaust pressure when a maintained signal is applied to the operator then reset and apply pressure when the signal is removed.

OPERATING TEMPERATURES	SOLENOID PILOT OPERATED	TREATED BUNA-N SEALS (TREATED NBR, Standard)	FLUOROELASTOMER SEALS (FPM (FKM), Option A)
	Standard	-18ºC to +52ºC (0ºF to +125ºF)	-18ºC to +52ºC (0ºF to +125ºF)
	High Temp Coil (Option CT)	-18ºC to +82ºC (0ºF to +180ºF)	-18ºC to +82ºC (0ºF to +180ºF)

OPERATING PRESSURES	SOLENOID PILOT OPERATED	INLET PORT	EXTERNAL PILOT PORT
	Standard 2 Position	240 - 1030 kPa (35 - 150 PSIG)	Not Required
	External Pilot (Option B)	Vacuum - 240 kPa (Vacuum - 35 PSIG)	240 - 1030 kPa (35 - 150 PSIG)

FILTRATION AND LUBRICATION	MEDIA - AIR OR INERT GAS
	Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 viscosity, and have an aniline range of 82ºC (180ºF) and 99ºC (210ºF). Refer to Maintenance section of catalog for recommended lubricants. Filter to 50 microns or better. For temperatures below 40ºF, air must be dry to prevent formation of ice.

DIMENSIONAL INFORMATION

OPTIONS

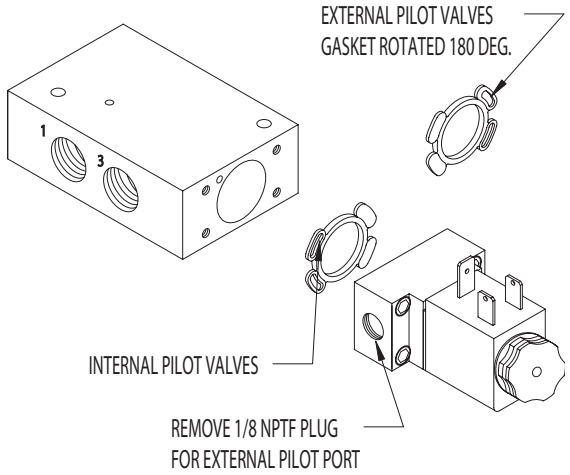
(LISTED AT THE END OF THE MODEL NUMBER IN ALPHA-NUMERIC ORDER)

A - FLUOROELASTOMER SEALS
For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.

B - EXTERNAL PILOT
For solenoid applications when the pressure to port 1 is less than 35 PSIG (2 BAR). See example below for field conversion.

FIELD CONVERSION

- Remove solenoid and cap from valve body.
- Rotate gasket 180 degrees so that the internal pilot hole in the valve body is covered by the gasket.
- Reassemble the gasket, cap and solenoid to the valve body. Make sure gasket completely covers internal pilot hole before tightening screws.
- Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.



C - CONDUIT COIL
Refer to Electrical Section for details.

CT - CONDUIT COIL HIGH TEMPERATURE
Refer to Electrical Section for details.

D - DUSTPROOF
For applications in extremely dusty and contaminated environments. Standard vent ports are plugged. Operators breathe through the exhaust ports via flats on the end of the spools.

G - COIL WITH 18" LEADS
Refer to Electrical Section for details.

S - STAINLESS STEEL
Stainless steel body, all other external parts corrosive resistant; for corrosive environment applications.

SS - 316 STAINLESS STEEL
Stainless steel body, all other external parts corrosive resistant; for corrosive environment applications.

W - G THREADS

Y - EXPLOSION-PROOF COIL (CSA, FM)
Refer to Electrical Section for details.

Z - EXPLOSION-PROOF COIL (ATEX, PTB)
Refer to Electrical Section for details.

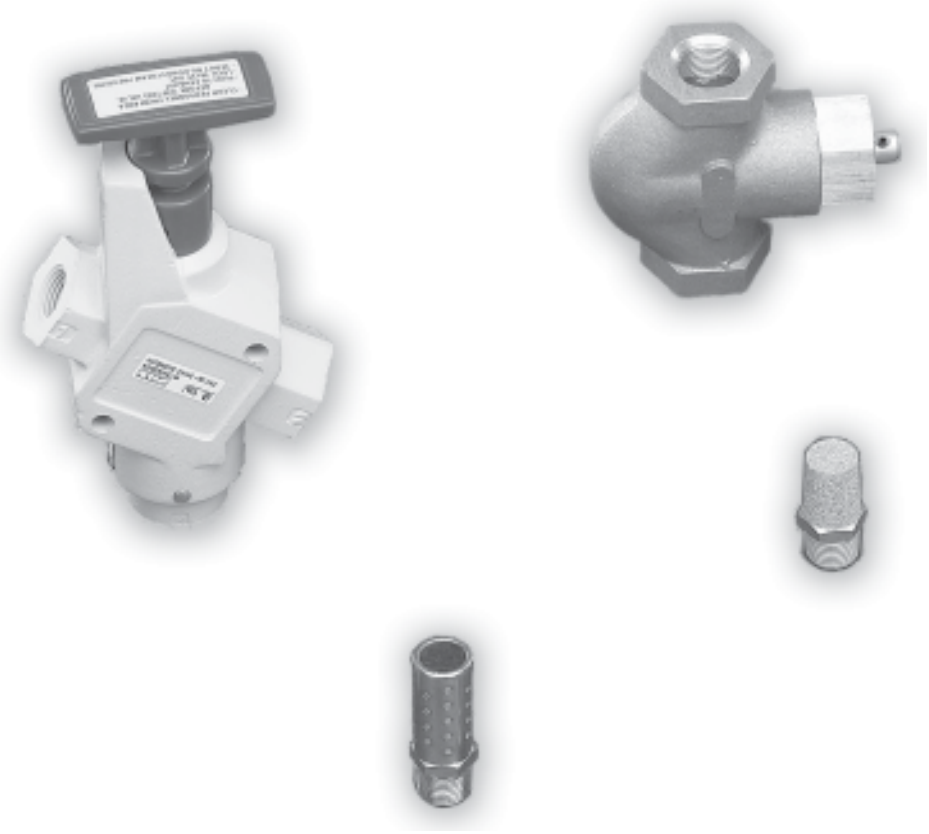
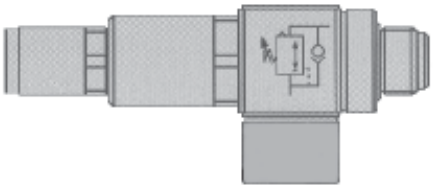
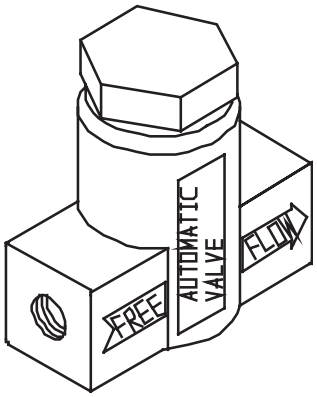
ISO 9001

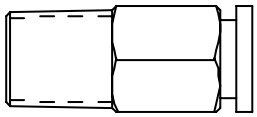
AUTOMATIC VALVE



ACCESSORIES







INDEX

IN-LINE MOUNTED FLOW CONTROL VALVES

DESIGN FEATURES

- Allows free flow of air in one direction and adjustable flow in the opposite direction.
- Piped between valve and cylinder.
- High flow, accurate adjustment. Tamper proof locking screw standard.
- Self-cleansing poppet eliminates sediment accumulation.

IN-LINE MOUNTED CHECK VALVES

DESIGN FEATURES

- Allows low cracking pressure and full area free flow of air in one direction and instantaneous shut-off in the reverse direction.
- Self-cleansing poppet eliminates sediment accumulation.

QUICK EXHAUST, CHECK AND SHUTTLE VALVES

DESIGN FEATURES

- One model does all three functions.
- Rugged internal construction outlasts and out performs competition.
- Quick Exhaust Valve: When **IN** is pressurized, flow is from **IN** to **OUT** with **EXH** blocked. When **OUT** is pressurized, flow is from **OUT** to **EXH** with **IN** blocked.
- Check Valve: Free flow from **IN** to **OUT** with **EXH** plugged. No flow from **OUT** to **IN** with **EXH** plugged.
- Shuttle Valve: When **IN** is pressurized, flow is from **IN** to **OUT** with **EXH** blocked. When **EXH** is pressurized, flow is from **EXH** to **OUT** with **IN** blocked.

LOCKOUT VALVES

DESIGN FEATURES

- 3 way 2 position valve.
- Short stroke for quick response.
- Padlockable in the closed position.
- Bright red handle for visibility.
- When handle is pulled outward, inlet port 1 is connected to outlet port 2 and exhaust port 3 is blocked.
- When handle is pushed inward, inlet port 1 is blocked and outlet port 2 is connected to exhaust port 3.
- These products are defined as energy isolation devices, NOT AN EMERGENCY STOP DEVICE.

MUFFLERS

DESIGN FEATURES

- Reduces exhaust noise level in air systems.
- Maintains full volume air flow with minimum back pressure.
- Threads into exhaust port.

- Reduces exhaust noise level in air systems.
- Sintered bronze bonded to a copper plated male pipe fitting.
- Corrosion resistant.
- Cleanable 40 micron filter element.

- Reduces exhaust noise level in air systems.
- Allows adjustment of exhaust air flow to accurately control cylinder speeds.
- Corrosion resistant.
- Cleanable 40 micron filter element.

FITTINGS

DESIGN FEATURES

- Push-in plastic or soft metal tubing for instant connection; hold down insert for instant tubing release.
- Allows leak-free, full flow operation with no internal restriction.
- Brass contruction.
- Teflon sealant pre-applied to threads.
- Internal hex aids installation.

- Push-in plastic or soft metal tubing for instant connection; hold down insert for instant tubing release.
- Allows leak-free, full flow operation with no internal restriction.
- Teflon sealant pre-applied to threads.

- Threads into cylinder port for accurate speed control with lockable settings and push-in tube connection.
- Allows full flow into cylinder and controlled flow out.
- Brass and plastic contruction.
- Teflon sealant pre-applied to threads.

- Threads into solenoid exhaust ports for external plumbing of solenoid exhaust.
- Brass and plastic construction.

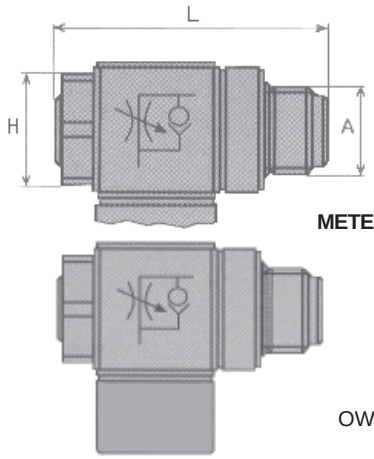
PNEUMATIC ACCESSORIES

- Media: Compressed air or inert gas, lubricated or non-lubricated.
- Seals: NBR
- Springs and Bodies: Stainless steel.
- Internals: Brass and zinc plated brass.
- Plastic Parts: PA.
- Pressure Range: 100 kPa - 1035 kPa [(15 psi - 150 psi), (1 BAR - 10 BAR)]. Note: soft start = 310 kPa - 1035 kPa [(45 psi - 150 psi), (3 BAR - 10 BAR)].
- Temperature Range: -7°C to 65°C (20°F - 150°F).



SIZE	1/8	1/4	3/8	1/2
SCFM	6.53	12.02	34.52	50.25

RIGHT ANGLE FLOW (RAF) CONTROL FEATURES

- Eliminates at least one fitting.
- Efficient control of air at source.
- Locks in place once cylinder speed is set.

MODEL NUMBER AND DIMENSIONS			
MODEL NUMBER	A PORT SIZE	H mm (Inches)	L mm (Inches)

DESIGN

PRECAUTIONS

Automatic Valve products are general purpose industrial pneumatic and vacuum devices. They are not themselves inherently harmful. However, the control systems in which they operate must have necessary safeguards to prevent injury or damage should failure of system components occur.

Use Automatic Valve products only with the operating specifications stated for the product in each catalog section.

Read and be familiar with the precautions listed under the 'Design", "Installation", "Maintenance" and "Troubleshooting" portions of this section of the catalog. Provide adequate warnings and information on system components and in system operating manuals.

Power Presses: Do not use Automatic Valve for power presses. Automatic Valve does not manufacture the special purpose dual safety clutch and brake valves required by OSHA Regulation 1910.217, dated November 1, 1975, and ANSI Standard B11.1, Revision 1982, and EN 13736: 1999.

Two Position Valves: Two position 2 and 3-way valves will have a flow path from the valve's inlet port to one of the valve's outlet ports in either one or both of the two positions. 4-way valves will always have a flow path from the inlet to one of the outlet ports regardless of its position. If retaining pressurized air in the system presents a hazard during system operation or servicing, a separate method must be used to exhaust the trapped air.

Three Position Valves: Solenoid operated and air piloted three position 3-way and 4-way valves will move to the center position if one of the operators is not actuated. Manually operated three position valves may or may not return to the center position, depending on the centering operator. When one of the operators is actuated, a flow path will exist as it does in two position valves. When the valve is in the center position, the flow path described below exists.

Closed Center: All ports, including inlet and exhaust posts, are blocked when the valve is in the center position. If trapping air in either or both of the valve outlet cylinder ports presents a hazard during system operation or servicing, a separate method must be used to exhaust the trapped air or the valve should not be used.

Caution: *Valves with closed centers should be used with discretion because there is no makeup air. Any leaks in the valve, cylinder, or system lines and fittings can cause drifting (movement) of the cylinder.*

Open Center: When the valve is in the center position, the inlet port is closed and the cylinder ports are open to exhaust ports. If this condition is hazardous in either operation or during servicing, the valve should not be used.

Solenoid Manual Overrides: Some Automatic Valve air piloted and solenoid operated valves incorporate manual overrides which, when actuated, shift the valve as if the solenoid or air pilot were actuated. If accidental or intentional operation of the manual override could cause a dangerous problem, the valve should be ordered without a manual override.

DESIGN

VALVE SIZING CALCULATIONS

Find the appropriate valve size for an application by calculating the required C_v (flow coefficient) as shown below and then choose a valve with a Cv equal to or greater than the calculated valve. The equation is:

$$Cv = \frac{Q}{22.67} \times \sqrt{\frac{2 \times G \times T}{(P_1^2 - P_2^2)}}$$

Where:
- **Q** = Standard cubic feet of free air (scfm)
- **G** = Gas constant
  - = 1.00 for air
- **T** = Absolute temperature
  - = Number of F^0 + 460
- P_1 = Valve inlet pressure
  - = psia (pounds per square inch absolute)
  - = psig (pounds per square inch gage) + 14.7
- P_2 = Valve outlet pressure
  - = psia (pounds per square inch absolute)
  - = psig (pounds per square inch gage) + 14.7

Step 1: Determine the cylinder operating speed, **S** in ft/min. The equation is:

$$S = \frac{(60 \times L)}{12 \times t} \quad \text{or} \quad \frac{(5 \times L)}{t}$$

Where:
- **L** = Length of cylinder stroke in inches
- **t** = Time to extend or retract in seconds

Step 2: Determine the volume of free air, **Q**. The equation is:

$$Q = \frac{(\pi \times D^2)}{576} \times S \times \frac{P_1}{14.7}$$

Where:
- π = 3.14
- **D** = Cylinder diameter in inches
- **S** = Cylinder operating speed
- P_1 = Valve inlet pressure, psia

Step 3: Apply Step 1 and 2 results to the Cv formula.

Example: A 2" bore x 2" stroke cylinder is to extend in .500 seconds at 80 psig inlet pressure with a 10 psi drop through the valve (70 psig outlet pressure). Assume an operating temperature of 70°F.

Step 1:

$$S = \frac{(5 \times L)}{t}$$

$$= \frac{(5 \times 2)}{.500}$$

$$= 20 \text{ ft/min}$$

Step 2:

$$Q = \frac{(\pi \times D^2)}{576} \times S \times \frac{P_1}{14.7}$$

$$= \frac{(3.14 \times 2^2)}{576} \times 20 \times \frac{(80 + 14.7)}{14.7}$$

$$= 2.8 \text{ scfm}$$

Step 3:

$$Cv = \frac{Q}{22.67} \times \sqrt{\frac{2 \times G \times T}{(P_1^2 - P_2^2)}}$$

$$= \frac{2.8}{22.67} \times \sqrt{\frac{2 \times 1 \times (70 + 460)}{(80 + 14.7)^2 - (70 + 14.7)^2}}$$

$$= \mathbf{.094}$$

DESIGN

VALVE SIZING CHART

The chart below may be used instead of mathematical calculations for close approximations or required valve Cv. The Valve Sizing Chart assumes the following:

- Valve inlet pressure is 80 psig.
- Pressure drop through the valve is 10% inlet pressure or 8 psi.
- There are no line restrictions between the valve and cylinder.
- Distance between the valve and cylinder is 6 feet or less.

Step 1: Calculate the required cylinder speed in inches per second: $S = \frac{L}{t}$

Where: **S** = Cylinder speed in inches/second
L = Length of cylinder stroke in inches
t = Time to extend or retract in seconds

Step 2: Choose the applicable cylinder bore size column.

Step 3: Move vertically down the column to select a speed (inches per second) equal to or greater than the calculated speed and read the required Cv in the left hand column.

	CYLINDER BORE SIZE (inches)															
Cv		.75	1.00	1.13	1.50	2.00	2.50	3.00	3.25	4.00	5.00	6.00	7.00	8.00	10.00	12.00
	.1	26.8	15.1	11.9	6.7	3.8	2.4	1.7	1.4	.94	.60	.42	.31	.24	.15	.10
	.2	53.7	30.2	23.9	13.4	7.5	4.8	3.4	2.9	1.9	1.2	.84	.62	.47	.30	.21
	.5	134	75.5	59.6	33.6	18.9	12.1	8.4	7.1	4.7	3.0	2.1	1.5	1.2	.75	.52
	1.0	268	151	119	67.1	37.7	24.2	16.8	14.3	9.4	6.0	4.2	3.1	2.4	1.5	1.0
	2.0	537	302	239	134	75.5	48.3	33.6	28.6	18.9	12.1	8.4	6.2	4.7	3.0	2.1
	4.0	-	604	477	268	151	96.6	67.1	57.2	37.7	24.2	16.8	12.3	9.4	6.0	4.2
	8.0	-	-	-	536	302	193	134	114	75.5	48.3	33.6	24.7	18.9	12.1	8.4
	16.0	-	-	-	-	604	387	268	229	151	96.6	67.1	49.3	37.7	24.2	16.8
	32.0	-	-	-	-	-	773	537	457	302	193	134	98.6	75.5	48.3	33.6

VALVE CONVERSION CHART

FOR
Single operator spring return valves with balanced spools

PORTS:
1 = SUPPLY = P
2 = OUTLET =A
3 = EXHAUST = EA
4 = OUTLET = B
5 = EXHAUST = EB

OPERATION	PLUG	SUPPLY*	OUTLET	EXHAUST
2 WAY NORMALLY CLOSED	2,3,5	1	4	-
2 WAY NORMALLY OPEN	4,3,5	1	2	-
3 WAY NORMALLY CLOSED	2,3	1	4	5
3 WAY NORMALLY OPEN	4,5	1	2	3
3 WAY DIVERTER	3,5	1	2,4	-
3 WAY SELECTOR	3,5	2,4	1	-
4 WAY		1	2,4	3,5

*Minimum operating pressure is 35 psi. Use external pilot when using a port other than 1 for supply or when using a fluid media besides air.

DESIGN

FLOW CHARACTERISTICS

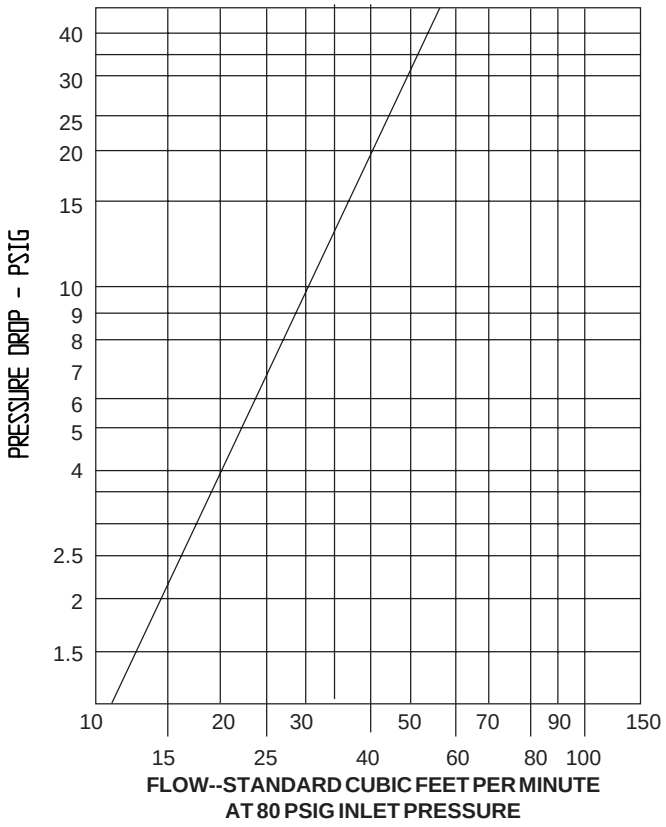
The chart at the right shows the flow (scfm) characteristics for a valve with a Cv of 1.0. Because there is a linear relationship between Cv and flow, a valve with a Cv of 3.0 will have three times the flow at the same pressure drop as does a valve with a Cv of 1.0. This linear relationship many be used to find the required Cv for any flow rate and pressure drop.

Example: Required - Flow of 200 scfm at 80 psig inlet with a 4 psi pressure drop.

Step 1: From the chart at right, a valve with a Cv of 1.0 and a pressure drop of 4 psi, has a flow of 20 scfm.

Step 2: Divide the required flow, 200 scfm, by 20 scfm to determine the required Cv:

$$\frac{200 \text{ scfm}}{20 \text{ scfm}} = \mathbf{10\ Cv}$$



The "SCFM to Cv Approximation" chart at the right is another method for determining Cv. This chart assumes conditions of 70°F with a 10% pressure drop. "Q" is the standard cubic feet of free air (scfm).

Example: Required - Flow of 200 scfm at 80 psig inlet with a 10% pressure drop and 70°F.

Step 1: From the chart at right, the formula for 80 inlet psig is:

Cv = .0376 x Q

Where: Q = 200 scfm

Step 2: **Cv = .0376 x 200 = 7.52**

An approximation of the Cv with a required flow of 200 scfm at 80 psig inlet with a 10% pressure drop could be obtained from the graph above by determining the numerical value of the 10% pressure drop (80 psig x .10) = 8 psig. This 8 psig pressure drop has a flow of about 26.5 scfm. 200 scfm divided by 26.5 = **7.47 Cv**.

SCFM TO C_v APPROXIMATION @ 70° WITH A 10% PRESSURE DROP	
INLET PRESSURE	**Cv**
30 psig	.089 x Q
40 psig	.070 x Q
50 psig	.0575 x Q
60 psig	.0489 x Q
70 psig	.0425 x Q
80 psig	.0376 x Q
90 psig	.0338 x Q
100 psig	.0306 x Q
110 psig	.0280 x Q
120 psig	.0258 x Q

INSTALLATION

PRECAUTIONS

Automatic Valve products should only be installed by trained and qualified personnel who have knowledge of how specific pneumatic products are to be piped and electrically connected.

Install Automatic Valve products only in systems which contain adequate safeguards to prevent injury or damage in the event of product failure.

Insure that the system has provisions for turning air and electrical power off and for exhausting all air trapped within the system.

OPERATING MEDIA

Automatic Valve products are designed primarily for use with air or other inert gases. For use with other media, contact your Automatic Valve distributor.

When solenoid piloted valves are used for vacuum service, an external pilot supply must be used.

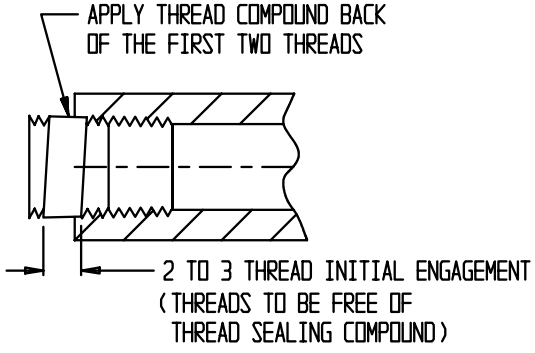
AIR LINES

Before installing any pneumatic product, air lines must be blown clean to remove all contamination. Clean air line filters after purging is completed.

Caution: *Compressed air streams are dangerous. Divert the stream away from personnel and equipment. Personnel in the area must wear suitable eye and ear protection.*

PIPE AND FITTING PREPARATION

Pipe sealant or tape should be applied behind the first two or three threads to prevent the sealant from entering and contaminating the system.



MOUNTING

Spool valves must be mounted with the spool in a horizontal position. Other valves, cylinders, and accessories maybe mounted in any position.

Where practical, mount valves so that they are accessible for service and so that solenoid manual overrides can be used.

INSTALLATION

VALVE INLET LINES

Valve inlet lines should have an inside diameter equal to or greater than the valves' inlet port size as shown in the following chart:

INLET TAP SIZE	SUPPLY ID (MIN.)
1/8 NPT	.25"
1/4 NPT	.38"
3/8 NPT	.50"
1/2 NPT	.63"

INLET TAP SIZE	SUPPLY ID (MIN.)
3/4 NPT	.75"
1 NPT	1.00"
1 1/4 NPT	1.25"
1 1/2 NPT	1.50"

Restricted inlet lines will reduce the system operating speed and can cause valve malfunction. Eliminate or minimize sharp bends and install regulators as close as possible to the valve inlet port.

VALVE OUTLET LINES

For optimum system performance, locate valves as close as possible to the device they are operating. Minimize all sharp bends and other restrictions.

VALVE EXHAUST PORTS

Spool valve exhaust ports may be restricted to provide speed control for cylinders or other devices.

Poppet valve exhaust ports must not be restricted. Such restriction can cause valve malfunction.

All open valve exhaust ports should have mufflers installed to reduce noise levels and to prevent the entry of atmospheric contaminations.

FILTRATION

Filters with 50 micron elements are adequate for all Automatic Valve products. However, where devices not made by Automatic Valve are used in the system, the manufacturer should be consulted regarding their filtration requirements.

Install filters within 20 feet of the valve or per the manufacturer's instructions.

OPERATING PRESSURES AND TEMPERATURES

Minimum and maximum operating pressures and temperatures for Automatic Valve products are specified in each catalog section. While products may function at lower or higher limits, such operation is unsafe and must be avoided.

Contact your Automatic Valve distributor if your application requires products that exceed the operating limits shown in this catalog.

PILOT PRESSURE

For proper operation, pilot pressure must be within the minimum and maximum operating pressures shown in each catalog section.

If solenoid piloted valves are to operate at lower or higher operating pressures than the specified pilot pressure limits, an external pilot supply within the proper pressure range must be used. Valves may either be ordered with an external pilot supply, option "B", or may be field converted as shown in each catalog section.

INSTALLATION

LUBRICATION

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Where devices not made by Automatic Valve are used in the system, the manufacturer should be consulted regarding their lubrication requirements.

Lubricators should be installed downstream of regulators, per the manufacturer's instructions.

Oils used in air line lubricators should be compatible with seals used in the system. Generally, Automatic Valve products use Buna "N" seals. Fluoroelastomer seals are available as option "A". Oils should be parafinic, petroleum based with oxidation inhibitors, an ISO 32 or lighter viscosity, and an aniline point between 82°C (180°F) and 99°C (210°F).

In general, lubricators should not be synthetic or reconstituted, and should not have alcohol content or detergent additives.

MAINTENANCE

PRECAUTIONS

Automatic Valve products should be serviced only by qualified and knowledgeable personnel who understand the function and operation of the product.

Before servicing any pneumatic system, verify that the air and electrical power are **off** and that all air within the system has been exhausted.

Take all necessary precautions to prevent degradation of products caused by stepping on them, dropping them or hitting them with a hammer or other object.

Return products damaged as a result of improper handling to Automatic Valve for inspection.

PREVENTATIVE MAINTENANCE

Install all pneumatic systems as described in the “Installation” portion of this catalog. Improper installation can cause sluggish system performance and, if contaminates are not purged, premature wear of components.

Drain, clean, and service air line filters on a periodic basis or as recommended by the manufacturer.

Adjust air line lubricators per the manufacturer’s recommendations (generally, one drop per minute) and fill the reservoir at scheduled intervals. When filling the reservoir, use lubricating oils as prescribed under “Installation”.

To avoid possible solenoid malfunction, keep all electrical switches and relay contacts in good condition.

Inspect mechanical actuators, such as cams and rollers, for signs of wear and replace when necessary.

Automatic Valve products are designed to operate in normal air system environments with a minimum of maintenance. In extreme conditions, as evidenced by sluggish performance or sticking problems, a periodic program for cleaning internal product components should be established.

To clean products, use a water soluble detergent. To avoid component damage, do not use abrasive compounds or scrape metal parts.

SERVICING

When servicing Automatic Valve products, use only those components furnished in Automatic Valve service kits. Items contained in these kits are designated in the service portion of each catalog section or on the drawing.

After a product has been disassembled, discard all items designated as service kit items.

Clean remaining metallic components, except for solenoid coils and housings, with a non-abrasive, water soluble detergent.

When reassembling the product, refer to the appropriate service section or the drawing and lightly lubricate items, designated to be lubricated, to the drawing instructions.

Test the product according to the drawing instructions.

TROUBLESHOOTING

PRECAUTIONS

Read and follow the precautions listed in the “Maintenance” section of this catalog. Stay clear of all moving parts that must be actuated when troubleshooting.

GENERAL COMMENTS

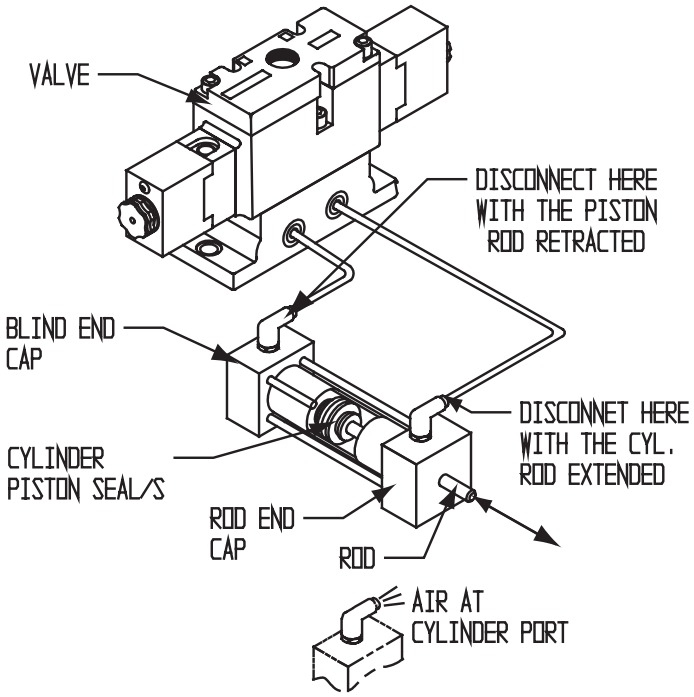
Of all the components in an electrical/mechanical/pneumatic system, it is most often the control valve that will be faulted for system malfunction. In many cases, the valve is only the symptom of the problem. Leaking cylinder seals, poor electrical connectors, clogged air line filters, and broken or jammed mechanical components are just a few of the problems that can initially be diagnosed as a valve problem.

Before disassembling any system component, use the following troubleshooting guide to try to pinpoint the exact cause of the problem.

PROBLEM	POSSIBLE CAUSE	SOLUTION
Valve leaks to exhaust Not actuated	Defective cylinder or valve seals Maintenance	Paragrpah 1 Paragraph 17
Valve leaks to exhaust Acutated	Defective cylinder or valve seals Inadequate air supply Inadequate pilot supply Contamination Maintenance	Paragrpah 1 Paragraph 2 Paragraph 3 Paragraphs 4 & 5 Paragraph 17
Solenoid pilot leakage	Dirt on seats or seal wear Maintenance	Paragraph 6 Paragraph 17
Operator vent leaks	Worn piston seal Damaged cap seal Maintenance	Paragraph 7 Paragraph 7 Paragraph 17
Sluggish operation	Contamination Inadequate air supply Inadequate pilot supply Improper or clogged muffler Inadequate or improper lubrication Mechanical binding Maintenance	Paragraphs 4 & 5 Paragraph 2 Paragraph 3 Paragraph 8 Paragraph 9 Paragraph 15 Paragraph 17
Poppet valve chatter	Inadequate air or pilot supply Contamination Improper or clogged muffler Inadequate or improper lubrication Maintenance	Paragraphs 2 & 3 Paragraphs 4 & 5 Paragraph 8 Paragraph 9 Paragraph 17
Solenoid buzzes or solenoid burnout	Incorrect voltage Faulty or dirty solenoid Maintenance	Paragraph 10 Paragraph 11 Paragraph 17
Solenoid valve fails to shift electrically but shifts with manual override	Incorrect voltage Override left activated Defective coil or wiring Maintenance	Paragraph 10 Paragraph 12 Paragraph 13 Paragraph 17
Solenoid valve fails to shift electrically or with manual override	Inadequate air supply Inadequate pilot supply Contamination Inadequate or improper lubrication Mechanical binding Maintenance	Paragraph 2 Paragraph 3 Paragraphs 4 & 5 Paragraph 9 Paragraph 15 Paragraph 17
Valve shifts but fails to return	Broken spring Mechanical binding Maintenance	Paragraph 14 Paragraph 15 Paragraph 17
Cam operated valve fails to operate	Cam or roller adjustment Maintenance	Paragraph 16 Paragraph 17

TROUBLESHOOTING

GENERAL COMMENTS - PARAGRAPH 1 - VALVE EXHAUST PORT LEAKAGE



Verify if the leakage is caused by the cylinder or valve as follows: (Use extreme caution, as the valve and cylinder will both be actuated during this procedure.)

1. With the piston rod retracted, disconnect the line at the cylinder blind end cap. If air comes out of the cylinder port fitting, as shown above, the cylinder piston seals are defective amd must be replaced. If there is no leakage, reconnect the line.

2. With the cylinder rod extended, disconnect the line at the cylinder rod end cap. If there is leakage at the cylinder port fitting, the cylinder piston seals must be replaced.

3. If there is no leakage at the fitting, the leakage is caused by defective valve seals or gaskets. Reconnect the line and install new seals and gaskets that are included in the valve body service kit.

GENERAL COMMENTS - PARAGRAPH 2 - INADEQUATE AIR SUPPLY

An inadequate air supply can cause the pilot supply pressure to drop during valve actuation. This can result in valve chatter or oscillation, particularly in poppet valves, or may keep the valve in a partially shifted condition where it continually blows to exhaust. If the pressure gage falls by more than 10% during valve actuation, there is probably a deficiency in the air supply system.

1. Airline filters should be cleaned and pressure regulators checked for proper operation. The line sizing recommendations in the “Installation” section of this catalog should be reviewed and modifications made if restrictions or undersize inlet lines are found.

2. Verify that the air compressor has sufficient capacity to meet all systems requirements.

TROUBLESHOOTING

GENERAL COMMENTS - PARAGRAPH 3 - PILOT SUPPLY

Remote air pilot signals or pilot supplies to externally piloted solenoid valves that are restricted or are below the minimum operating pressures given in this catalog can cause valve oscillation or partial actuation resulting in exhaust port leakage.

1. Verify that the operating signal is at the proper pressure and that there are no restrictions caused by clogged filter elements or improperly sized pilot lines.

2. Comments in Paragraph 2 also apply to pilot supplies.

GENERAL COMMENTS - PARAGRAPH 4 - LIQUID CONTAMINATION

Accumulation of oil and water at low points in the system, including valves, can cause erratic or sluggish performance and exhaust leaks.

1. If heavy concentrations of water or oil are found when a device is disassembled, it should be thoroughly cleaned, re-lubricated and reassembled.

2. Filters and lubricators should be cleaned and checked for proper operation. If necessary, air lines should be rerouted to eliminate low points.

3. If there are concentrations of moisture at below freezing temperatures, ice can form and cause erratic operations, or completely bind system components. In such situations, steps must be taken to dry the air to a dew point of at least 10°F below the minimum system operating temperature. Also, filters should be equipped with automatic drains.

GENERAL COMMENTS - PARAGRAPH 5 - SOLID CONTAMINANTS

Solid contaminants, such as broken pieces of pipe threads, pipe sealant or tape, or rust scale, can cause valve seal damage, scratches on spools and sealing surfaces, or system binding and possible exhaust leaks. Such problems are most often encountered in new installations that have not been properly purged or where there are heavy concentrations of atmospheric contaminants.

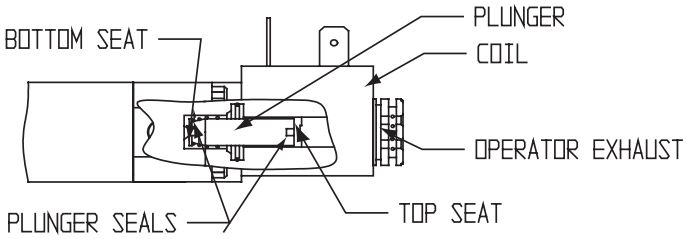
1. In may cases, cycling the valve several times will flush the particles away. If not, the item must be disassembled, the parts thoroughly examined for signs of damage and replaced as necessary.

2. Before reinstalling the product, the air line should be purged, as stated in the “Installation” section of this catalog. Air line filters should be cleaned and checked for proper operation. Properly sized mufflers should be installed in valve exhaust ports.

3. If there is heavy atmosphere contamination, valves with foundry option “D” should be installed.

TROUBLESHOOTING

GENERAL COMMENTS - PARAGRAPH 6 - SOLENOID PILOT LEAKAGE

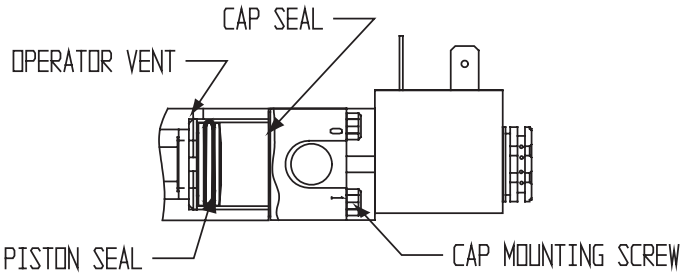


Continuous leakage from the operator exhaust port when the solenoid is de-energized can be caused by a foreign particle trapped between the bottom seat and the plunger, by a damaged bottom seat, or by a worn or damaged bottom plunger seal.

Leakage at the exhaust port and/or solenoid buzzing when the solenoid is energized can result from a foreign particle lodged in the top seat area. Leakage in this area can also be caused by worn or damaged top seats or top plunger seals.

1. The solenoid should be disassembled, cleaned, and the parts examined for wear or damage.
2. If damaged plunger seals are found, the plunger should be replaced.
3. A damaged bottom seat requires replacement of the operator.
4. A damaged top seat requires replacement of the solenoid.
5. Before reinstalling the product, follow the recommendations in Paragraph 5 regarding contaminants.

GENERAL COMMENTS - PARAGRAPH 7 - OPERATOR VENT LEAKS



Vent leakage when the solenoid is energized can be caused by either a faulty operator piston or cap seal, by an improperly placed cap seal, or by improperly tightened cap mounting screws.

Vent leakage when the solenoid is de-energized is often caused by an improperly placed cap seal or by improperly tightened cap mounting screws.

1. In either case, tighten the cap mounting screws before disassembling the operator to determine if this will stop the problem.
2. If tightening the screws does not work, disassemble the operator, clean it, replace worn or damaged seals, and reassemble taking care to properly position the cap seal.

TROUBLESHOOTING

GENERAL COMMENTS - PARAGRAPH 8 - MUFFLERS

Mufflers that are undersized for the application or that have become clogged can cause slow system response or, in the case of poppet valves, system malfunction or valve oscillation.

1. Remove the muffler and cycle the valve several times to see if it operates satisfactorily without the muffler.

2. If it does, the muffler should be cleaned or, if it is not dirty, replaced with a larger muffler with adequate exhaust flow capacity.

GENERAL COMMENTS - PARAGRAPH 9 - IMPROPER LUBRICATION

Air line lubricators that are not set at the proper flow rate or that contain lubricants not compatible with seals can cause sluggish system performance or malfunction.

1. If oil mist can be seen in the exhaust air, if films of oil are in evidence on surfaces around exhaust ports, or if pools of oil are found in valves or other devices, the lubricator is set at too high a flow rate. As a general rule, a flow rate of one drop per minute is adequate to provide a thin film of oil on moving surfaces.

2. If the flow rate is too low or the reservoir is empty, system elements that require lubrication can slow down or even bind. Lubricator reservoirs should be filled on a scheduled basis and the proper lubricator flow rate maintained.

3. Compatibility of the luburicating oil with system seals should also be verified, as stated in the “Installation” section. Incompatible lubricants can cause seals to swell which can result in sluggish performance or even binding of moving parts.

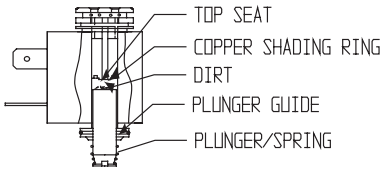
GENERAL COMMENTS - PARAGRAPH 10 - INCORRECT SOLENOID VOLTAGE

Automatic valve solenoids are designed to operate at between 90% to 110% of the rated voltage shown on the solenoid coil. A supply voltage that does not fall within the range shown can cause solenoid buzzing, failure of the valve to shift, or coil burnout.

1. To verify proper voltage, shut off and exaust the air supply to the valve.

2. Attach a voltmeter to the solenoid’s electrical supply, energize the solenoid, and note the voltage reading. If the reading is too low, the electrical supply is inadequate and must be corrected.

GENERAL COMMENTS - PARAGRAPH 11 - INCORRECT SOLENOID VOLTAGE



Improper voltage, broken or damaged shading rings, or dirt on the plunger or around the top seat can cause solenoid buzzing or even coil burnout.

TROUBLESHOOTING

GENERAL COMMENTS - PARAGRAPH 11 - INCORRECT SOLENOID VOLTAGE CONT.

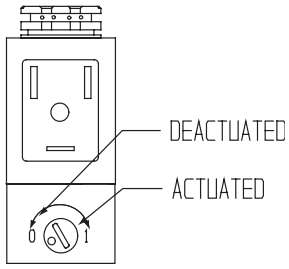
1. Correct voltage should first be verified per Paragraph 10. The electrical supply should be shut off and the pilot section disassembled for inspection.

2. If the copper shading ring around the top seat is cracked or damaged, the solenoid assembly should be replaced.

3. If dirt is found in the plunger guide and on the plunger/spring, they should be thoroughly cleaned and inspected for damage. If no damage is found the solenoid assembly can be reassembled. If damage is present, the solenoid assembly should be replaced.

GENERAL COMMENTS - PARAGRAPH 12 - MANUAL OVERRIDE LEFT ACTIVATED

DIRECT ACTING
SOLENOID
(K02 SERIES)



TYPE W AND X
SOLENOIDS

If a turn locking manual override is left in the activated position, the valve will operate when the override is again cycled, from on to off and back to on, but will fail to operate electrically. This happens because the override is holding the plunger in its activated position.

1. Verify that locking type overrides are in their normal deactived position and that non-locking overrides have not become stuck.

GENERAL COMMENTS - PARAGRAPH 13 - DEFECTIVE COIL OR WIRING

Coils used by Automatic Valve seldom burn out when operated within listed voltage limits.

1. Verify that the operating voltage is correct per Paragraph 10.

2. Verify that there is no dirt in the plunger per Paragraph 11.

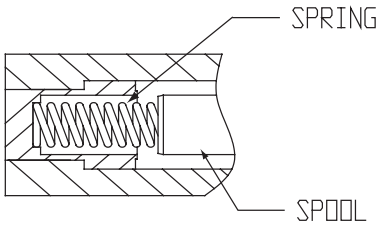
3. Verify that washdown applications have not caused thermal shock.

4. Verify the integrity of the coil by shutting electrical power off and using an ohmmeter to check continuity. If the coil is open, it is burned out and must be replaced. If there is coil continuity, the electrical system should be checked for loose or broken connections and for worn or defective switches and contacts.

5. If cam operated switches are part of the electrical system, check for worn or loose cams.

TROUBLESHOOTING

GENERAL COMMENTS - PARAGRAPH 14 - BROKEN SPRING



Broken springs on spring return valves can cause a valve to remain in the actuated position or to only partially return and perhaps leak to exhaust.

1. Broken springs must be replaced and are included in service kits.

GENERAL COMMENTS - PARAGRAPH 15 - MECHANICAL BINDING

Mechanical binding of cylinders or other mechanical components can cause symptoms that can be improperly diagnosed as sluggish valve operation or even failure of a valve to shift. If a valve appears stuck, note the flow from the valve exhaust ports as the valve is actuated and deactuated. If there is a puff of air from each exhaust port, yet the device fails to move, the probable cause is mechanical binding.

1. Turn air and electrical power off.
2. Follow all safety precautions recommended by the manufacturer of the equipment.
3. Make mechanical inspections and adjustments as required.

GENERAL COMMENTS - PARAGRAPH 16 - CAM OR ROLLER ADJUSTMENT

When cam activated valves fail to activate, check cams and rollers for proper alignment or wear.

1. Make any required adjustments.
2. Replace worn cams and rollers.

GENERAL COMMENTS - PARAGRAPH 17 - MAINTENANCE

1. When disassembling, carefully place parts in same order of removal.
2. Refer to “Installation” section for lubrication, installation, and maintenance.
3. Reassemble parts in reverse order of disassembly.

GLOSSARY

Ambient Temperature: The temperature of the immediate environment.

ATEX: European Community directive concerning equipment and protective systems intended for use in potentially explosive atmospheres.

CE: Conformite Europienne - Certification of a product to indicate that the product satisfies all the regulations governing safety laid down by the European Community. Products displaying this mark can be freely distributed within the markets of the European Community. Consult the Factory for information on products certified by CE.

Celsius, Degree: A unit of temperature measurement abbreviated °C. Celsius temperatures are calculated from Fahrenheit temperatures by the following formula:

$$C = \frac{5(F - 32)}{9}$$

CSA: Canadian Standards Association - Provides certification services for manufacturers who, under license from CSA, wish to use the appropriate CSA marks on certain products of their manufacturer to indicate conformity with CSA standards. Consult the Factory for information on products conforming to CSA standards.

Cv: Measure of calculating flow of a valve (or other pneumatic device) that takes into effect the temperature, pressure, pressure drop, and flow.

Detent: A devise for retaining movable parts in one or more fixed positions; usually a spring-loaded device fitting into a depression. Positions of parts are changed by exerting sufficient force to overcome the detent spring, or by releasing the detent.

DIN 43650/DIN 43650C: International standard for 3-pin connectors.

Fahrenheit, Degree: A unit of temperature measurement abbreviated °F. Fahrenheit temperatures are calculated from Celsius temperatures by the following formula:

$$F = \frac{9}{5} C + 32$$

Fluid: A liquid or a gas.

FM: Factory Mutual Insurance Company partnership recognized as a Nationally Recognized Testing Laboratory(NRTL) under 29 CFR 1910.7.

kPa: Kilopascals - International measure of pressure. 145 psig = 1000 kPa.

Media: The fluids used in a fluid power system. In a pneumatic system they are gases such as air, nitrogen or various inert gases.

Media Temperature: The temperature of the fluid within a valve or other device.

NEMA 4: National standard for enclosure protection. Provides protection against dirt, dust, water hosedown and rain.

NEMA 7: National standard for enclosure protection. Provides protection in Hazardous Locations. (presence of flammable vapours)

Pressure Range: The range of inlet pressures with which a device can operate satisfactorily.

psi: Pressure - pounds per square inch - A measure of force per unit area.

psia: Absolute Pressure - pounds per square inch absolute - The sum of atmospheric pressure and gauge pressure.

psig: Gauge Pressure - pounds per square inch gauge - Pressure above or below atmospheric pressure.

PTB: Physikalisch Technische Bundesanstalt - The National Institute of Natural and Engineering Sciences and the highest technical authority for metrology and physical safety engineering of the Federal Republic of Germany.

scfm: Flow Rate - standard cubic feet per minute - The volume or weight of fluid passing through a conductor per unit of time.

Signal: A fluid or electric command to the valve actuator causing the valve to change position.

Standard Air: Air at a temperature of 68°F, a pressure of 14.69 pounds per square inch absolute (psia), and a relative humidity of 36 per cent (0.0750 pounds per cubic foot). In gas industries the temperature of standard air is usually specified as 60°F.

Vacuum: Pressure less than atmospheric pressure.

AUTOMATIC VALVE

World Class Pneumatic Solutions

WARRANTY

Automatic Valve warrants its products to be free from defect in material or workmanship over a period of 18 months from the date of shipment from its factory. Automatic Valve will, at its option, either repair or replace the allegedly non-conforming product at no charge, FOB our factory, upon return of the product with transportation prepaid.

Automatic Valve will replace standard commerical Nema 4 solenoid coils which fail due to burnout when operated within their rated capacity or voltage.

Automatic Valve is not responsible for damage to its products through improper installation, maintenance, use, repairs, or operating beyond rated capacity of voltage, intentional or otherwise. Automatic Valve is not liable for claims for labor, loss of profit or good will, repairs, delay damages, direct or indirect penalties, or expenses incidental to replacement. The buyer, by acceptance of delivery, assumes all liability for the product's use or misuse in the as-shipped condition.

Automatic Valve, recognizing its goal of continuous improvement, reserves the right to discontinue or change specifications, products, or prices without incurring obligation.

PRECAUTIONS

Applications: Automatic Valves are general pupose, industrial pneumatic and vacuum service valves. They are not themselves inherently harmful. However, the control systems in which they operate must have necessary safeguards to prevent damage or injury should failure of the system components occur.

OSHA 1910.217, dated November 1, 1975, ANSI B11.1, Revision 1982, and EN 13736: 1999 specifically recommend special purpose dual (double) safety clutch and brake valves for power presses. Automatic Valve does not manufacture special purpose dual safety valves for presses. Do not use Automatic Valves for power presses.

Two position Automatic Valves, whether they are 2-way, 3-way, or 4-way, will always have a flow path from the valve's inlet port or ports to one of the outlets, regardless of which of the two positions is used. If air trapped in or exhausted from the ports presents a hazard in operation or in servicing the system, a separate method must be provided to exhaust this air or the valve should not be used.

Three position 3-way and 4-way Automatic Valves, whether solenoid operated, air piloted, or manually operated, can move to the center position if the operators are not actuated. If air trapped in or exhausted from the ports presents a hazard in operation or in servicing the system, a separate method must be provided to exhaust this air or the valve should not be used.

Some solenoid and air piloted Automatic Valves incorporate manual overrides. Manual overrides, when activated, shift the valve as if the solenoid or air pilot were actuated. If accidental or intentional operation of the manual override could cause a dangerous problem, valves without a manual override should be used.

Use Automatic Valves only within specification limits listed in our catalog.

Installation: Consult the Engineering and Maintenance section of the Automatic Valve catalog for installation instructions. Do not install Automatic Valves without first turning off air and electricity. Automatic Valves must be installed by qualified and knowledgeable personnel who understand how specfic valves are to be piped and electrically connected. Do not install valves unless the valve's flow path, as described by ANSI and ISO symbols in our catalog, conforms to the application's design specifications.

Maintenance: Disconnect air and electricity and bleed all pressurized cylinder lines before removing two and three position Automatic Valves. Consult the Engineering and Maintenance section of the Automatic Valve catalog for maintenance instructions. Automatic Valves must be serviced by qualified and knowledgeable personnel who understand the function and operation of specific valves. Care must be followed to prevent damage to valves caused by stepping on them, dropping them, or hitting them with any object. Damaged valves should be retrurned to Automatic Valve for inspection and rebuilding.
