- Fully equipped hydronic module
 - Partial heat reclaim
 - Total heat reclaim
 - Direct expansion free-cooling

Air-Cooled Liquid Chillers with Integrated Hydronic Module

30RB 162-802

30RB 162-802

Nominal cooling capacity 162-774 kW

The Aquasnap liquid chiller range features the latest technological innovations:

- ozone-friendly refrigerant R-410A
- scroll compressors
- low-noise fans made of a composite material
- auto-adaptive microprocessor control
- aluminium micro-channel heat exchangers (MCHE)

The Aquasnap can be equipped with an integrated hydronic module, limiting the installation to straightforward operations like connection of the power supply and the chilled water supply and return piping.

Features

Quiet operation

Compressors

- Low-noise scroll compressors with low vibration level
- The compressor assembly is installed on an independent chassis and supported by flexible anti-vibration mountings
- Dynamic suction and discharge piping support, minimising vibration transmission (Carrier patent)
- Acoustic compressor enclosure, reducing radiated noise emissions (option)

■ Condenser section

- Condenser coils in V-shape with an open angle, allowing quieter air flow across the coil
- Low-noise 4th generation Flying Bird fans, made of a composite material (Carrier patent) are now even quieter and do not generate intrusive low-frequency noise
- Rigid fan installation for reduced noise (Carrier patent)

Easy and fast installation

- Integrated hydronic module (option)
 - Centrifugal low or high-pressure water pump (as required), based on the pressure loss of the hydronic installation
 - Single or dual pump (as required) with operating time balancing and automatic changeover to the back-up pump if a fault develops
 - Water filter protecting the water pump against circulating
 - High-capacity membrane expansion tank ensures pressurisation of the water circuit
 - Thermal insulation and frost protection down to -20°C, using an electric resistance heater (see table of options)
 - Pressure gauge to check filter pollution and measure the system water flow rate (option)
 - Water flow control valve (option)

■ Simplified electrical connections

- A single power supply point without neutral (30RB 162-522)
- Main disconnect switch with high trip capacity (see table of options)
- 24 V control circuit without risk from a transformer included

■ Fast commissioning

- Systematic factory operation test before shipment
- Quick-test function for step-by-step verification of the instruments, electrical components and motors

Economical operation

- Increased energy efficiency at part load
 - Eurovent energy efficiency class (in accordance with EN14511-3:2011) B to D
 - The refrigerant circuit includes several compressors connected in parallel. At part load, around 99% of the operating time, only the compressors that are absolutely necessary operate. At these conditions the compressors operating are even more energy efficient, as they use the total condenser and evaporator capacity.
 - The electronic expansion device (EXV) allows operation at a lower condensing pressure (EER optimisation).
 - Dynamic superheat management for better utilisation of the evaporator heat exchange surface
 - All-aluminium micro-channel condenser (MCHE), more efficient than a copper/aluminium coil

Reduced maintenance costs

- Maintenance-free scroll compressors
- Fast diagnosis of possible incidents and their history via the Pro-Dialog Plus control
- R-410A refrigerant is easier to use than other refrigerant blends

Environmental care

- Ozone-friendly R-410A refrigerant
 - Chlorine-free refrigerant of the HFC group with zero ozone depletion potential
 - Very efficient gives an increased energy efficiency ratio (EER)
 - 40% reduction in the refrigerant charge through use of the micro-channel heat exchangers (MCHE)
- Leak-tight refrigerant circuit
 - Brazed refrigerant connections for increased leaktightness
 - Reduction of leaks as no capillary tubes and flare connections are used
 - Verification of pressure transducers and temperature sensors without transferring refrigerant charge

Superior reliability

- State-of-the-art concept
 - Cooperation with specialist laboratories and use of limit simulation tools (finite element calculations) for the design of the critical components, e.g. motor supports, suction/discharge piping
 - Compressor control box installed on the cold side of the compressor (Carrier patent)
 - All-aluminium micro-channel heat exchanger (MCHE) offers 3.5 times higher corrosion resistance than a conventional coil. The all-aluminium construction eliminates the formation of galvanic currents between aluminium and copper that are responsible for the coil corrosion in saline or corrosive atmospheres.
- Auto-adaptive control
 - Control algorithm prevents excessive compressor cycling and permits reduction of the water quantity in the hydronic circuit (Carrier patent).
 - Automatic compressor unloading in case of abnormally high condensing pressure. If an anomaly occurs (e.g. fouled condenser coil, fan failure) Aquasnap continues to operate, but at reduced capacity.
- Exceptional endurance tests
 - Corrosion resistance tests in salt mist in the laboratory
 - Accelerated ageing test on components that are submitted to continuous operation: compressor piping, fan supports
 - Transport simulation test in the laboratory on a vibrating table. The test is based on a military standard and equivalent to 4000 km by truck.

Pro-Dialog Plus operator interface

Pro-Dialog Plus control

Pro-Dialog Plus combines intelligence with operating simpli-city. The control constantly monitors all machine para-meters and precisely manages the operation of compressors, expansion devices, fans and of the evaporator water pump for optimum energy efficiency.

■ Energy management

- Internal time schedule clock: permits chiller on/off control and operation at a second set point
- Set point reset based on the outside air temperature or the return water temperature
- Master/slave control of two chillers operating in parallel with operating time equalisation and automatic change-over in case of a unit fault.
- Start/stop control based on the air temperature

■ Ease-of-use

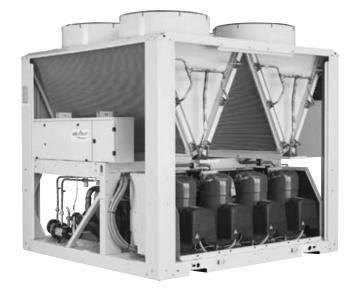

- User interface with synoptic diagram for intuitive display of the principal operating parameters: number of compressors operating, suction/discharge pressure, compressor operating hours, set point, air temperature, entering/leaving water temperature
- Ten menus for direct access to all machine commands, including fault history, allowing fast and complete chiller diagnostics

Remote management (standard)

A simple two-wire communication bus between the RS485 port of the Aquasnap and the Carrier Comfort Network offers multiple remote control, monitoring and diagnostic possibilities. Carrier offers a vast choice of control products, specially designed to control, manage and supervise the operation of an air conditioning system. Please consult your Carrier representative for more information on these products.

- Start/stop: Opening of this contact will shut down the unit
- Dual set point: Closing of this contact activates a second set point (example: unoccupied mode)
- Demand limit: Closing of this contact limits the maximum chiller capacity to a predefined value
- User safety: This contact is connected in series with the water flow switch and can be used for any customer safety loop
- Heat reclaim (option): Closing of this contact allows heat reclaim mode operation
- Water pump 1 and 2 control*: These outputs control the contactors of one or two evaporator water pumps
- Water pump on reversal*: These contacts are used to detect a water pump operation fault and automatically change over to the other pump
- Operation indication: This volt-free contact indicates that the chiller is operating (cooling load) or that it is ready to operate (no cooling load)
- Alert indication: This volt-free contact indicates the presence of a minor fault
- Alarm indication: This volt-free contact indicates the presence of a major fault that has led to the shut-down of one or two refrigerant circuits

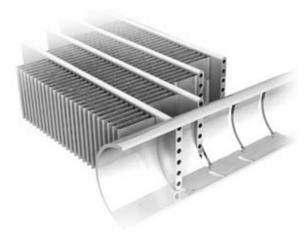

^{*} contacts already supplied with the hydronic module option

Remote management (EMM option)

- Room temperature: Permits set point reset based on the building indoor air temperature (with Carrier thermostat)
- Set point reset: Ensures reset of the cooling set point based on a 4-20 mA or 0-5 V signal
- Demand limit: Permits limitation of the maximum chiller demand based on a 4-20 mA or 0-5 V signal
- Demand limit 1 and 2: Closing of these contacts limits the maximum chiller capacity to three predefined values
- User safety: This contact can be used for any customer safety loop, closing of the contact generates a specific alarm
- Ice storage end: When ice storage has finished, this input permits return to the second set point (unoccupied mode)
- Time schedule override: Closing of this contact cancels the time schedule effects
- Out of service: This signal indicates that the chiller is completely out of service
- Chiller capacity: This analogue output (0-10 V) gives an immediate indication of the chiller capacity
- Compressor operation: This contact signals that one or several compressors are in operation

All aluminium micro-channel heat exchanger (MCHE)

Already utilised in the automobile and aeronautical industries for many years, the MCHE heat exchanger is entirely made of aluminium. This one-piece concept significantly increases its corrosion resistance by eliminating the galvanic currents that are created when two different metals (copper and aluminium) come into contact in traditional heat exchangers. Unlike traditional heat exchangers the MCHE heat exchanger can be used in moderate marine and urban environments.

From an energy efficiency point-of-view the MCHE heat exchanger is approximately 10% more efficient than a traditional coil and allows a 40% reduction in the amount of refrigerant used in the chiller. The low thickness of the MCHE reduces air pressure losses by 50% and makes it less susceptible to fouling (e.g. by sand) than a traditional coil. Cleaning of the MCHE heat exchanger is very fast using a high-pressure washer.

Options

Options	No.	Description	Advantages	For 30RB
Unit for low leaving water temperature	6B	Leaving water temperature of +3°C to -10°C.	All low-temperature applications: ice storage, cold stores, process cooling etc.	162-402
Unit for indoor installation with discharge ducts	12	Fans with available pressure	Ducted condenser air discharge, optimised condensing temperature control, based on the operating conditions and system characteristics	162-802
Low noise level	15	Sound absorbing compressor enclosure	Noise emission reduction	162-802
Very low noise level	15LS	Sound absorbing compressor enclosure and low-speed fans	Noise emission reduction	162-802
Grilles	23	Metallic grilles on all four unit faces (this option includes the supply of enclosure panels)	Improved aesthetics	162-802
Enclosure panels Electronic starter	23A 25	Side panels on each end of the coils Electronic starter on each compressor	Improved aesthetics Reduced start-up current	162-802 162-522
Winter operation down to -20°C	28	Fan speed control via frequency converter	Stable unit operation when the air temperature is between	162-802
Winter operation down to -10°C	28B	Twin-speed lead fan for each circuit	0°C and -20°C Stable unit operation when the air temperature is between	162-802
Winter operation down to -10°C and very low	28C	Sound absorbing compressor enclosure and low-speed fans	0°C and -10°C Noise emission reduction and stable unit operation when	162-802
noise level (options 28B + 15LS) Evaporator and water piping frost	41	+ twin-speed lead fan for each circuit Electric heater on the evaporator and the water inlet/outlet	the air temperature is between 0°C and -10°C Evaporator frost protection for air temperatures between	162-802
protection		piping	0°C and -20°C	
Evaporator, water piping and hydronic module frost protection	42A	Electric heaters on the evaporator, the water inlet/outlet piping and hydronic module	Evaporator and hydronic module frost protection for air temperatures between 0°C and -20°C	162-522
Partial heat reclaim	49	Partial heat reclaim by desuperheating of the compressor discharge gas	Free high-temperature hot-water production simultaneously with chilled water production	
Total heat reclaim	50	See heat reclaim option.	Free hot water production simultaneously with chilled water production	262-522
Master/slave operation	58	Unit equipped with an additional field-installed leaving water temperature sensor, allowing master/slave operation of two chillers connected in parallel	Optimised operation of two chillers connected in parallel with operating time equalisation	162-802
Main disconnect switch without fuse (standard for sizes 162-262)	70	Factory-installed main electric disconnect switch in the control box	Ease-of-installation and compliance with local electrical regulations	302-802
Main disconnect switch with fuse	70D	Factory-installed main electric disconnect switch with fuse in the control box	Same advantage as main disconnect switch and reinforced anti-short circuit protection	302-802
Evaporator with aluminium jacket	88	Evaporator thermal insulation protection by aluminium sheets		162-802
Evaporator and hydronic module with	88A	Evaporator and water piping thermal insulation protection	Improved resistance to climatic aggression	302-522
aluminium jacket	00	by aluminium sheets	O' and Free description of the control of the contr	000 000
Suction valve	92	Shut-off valve on the compressor suction piping (discharge valve as standard)	Simplified maintenance	302-802
Compressor suction and discharge valves		Shut-off valves on the common compressor suction and discharge piping	Simplified maintenance	162-262
High-pressure single-pump hydronic module	116B	Single high-pressure water pump, water filter, expansion tank, pressure gauge, water flow control valve. See hydronic module option.	Easy and fast installation	162-522
High-pressure dual-pump hydronic module	116C	Dual high-pressure water pump, water filter, expansion tank, pressure gauge, water flow control valve. See hydronic module option.	Easy and fast installation, operating safety	162-522
Low-pressure single-pump hydronic module	116F	Single low-pressure water pump, water filter, expansion tank, pressure gauge, water flow control valve. See hydronic module option.	Easy and fast installation	162-522
Low-pressure dual-pump hydronic module	116G	Dual low-pressure water pump, water filter, expansion tank, pressure gauge, water flow control valve. See hydronic module option.	Easy and fast installation, operating safety	162-522
High-pressure single-pump hydronic	116M	Single high-pressure water pump, water filter, expansion	Easy and fast installation	162-522
module High-pressure dual-pump hydronic module	116N	tank, pressure ports. See hydronic module option. Dual high-pressure water pump, water filter, expansion tank,	Easy and fast installation, operating safety	162-522
Low-pressure single-pump hydronic	116P	pressure ports. See hydronic module option. Single low-pressure water pump, water filter, expansion	Easy and fast installation	162-522
module Low-pressure dual-pump hydronic module	116Q	tank, pressure ports. See hydronic module option. Dual low-pressure water pump, water filter, expansion tank,	Easy and fast installation, operating safety	162-522
Di	4404	pressure ports. See hydronic module option.		
Direct-expansion free-cooling system JBus gateway	118A 148B	See free-cooling option. Two-directional communications board, complies with JBus	Economic chilled-water production at low outside temperature Easy connection by communication bus to a building management system	232-522 162-802
Bacnet gateway	148C	Two-directional communications board, complies with	Easy connection by communication bus to a building	162-802
LonTalk gateway	148D	Bacnet protocol Two-directional communications board, complies with	management system Easy connection by communication bus to a building	162-802
Energy Management Module EMM	156	LonTalk protocol See controls manual	management system Easy wired connection to a building management system	162-802
Safety valve with three-way valve fitted	194	Three-way valve upstream of the safety valves (not compatible with BPHE version)	Safety valve inspection and replacement facilitated without refrigerant loss	162-802
Conformance with Australian regulations	200	Heat exchanger approved to Australian code	-	162-802
Unit storage above 48°C	241	Refrigerant charge stored in the condenser. Option not compatible with MCHE coils; Cu/Al coils are required to store the charge.	Unit transport by container only possible with this option	162-802
Anti-corrosion protection Enviro-Shield for microchannel MCHE coils	262	Microchannel MCHE protection by the Carrier factory for applications in standard and moderate corrosive environments.	Better corrosion resistance, recommended for marine or moderately corrosive industrial environments	30RB 162-802
Anti-corrosion protection Super Enviro-Shield for microchannel MCHE	263	Applications in standard and moderate corrosive environments. Microchannel MCHE protection by the Carrier factory for applications in corrosive and aggressive environments	The Super Enviro-Shield option was developed to increase the microchannel MCHE coil application range to extremely	
coils Connection sleeve	266	Piping to be welded with Victaulic connection	corrosive environmental conditions. Ease-of-installation	162-802
Shell-and- tube evaporator	280	Different heat exchanger type	Ensures compatibility with other options than those available	
Power cable connection side extension	283	Side extension on the power control to allow a reduced	with the standard unit (see Electronic Catalogue) Use of thicker power cables	302-802
230 V electrical plug	284	cable bend radius 230 V power source with transformer (180 VA, 0.8 Amps)	Permit connection of a laptop or an electrical device during	30RB
			unit commissioning or servicing	162-802

Units with fans with available pressure for indoor installation (option 12)

This option applies to 30RB units installed inside the building in a plant room. For this type of installation the hot air leaving the air-cooled condensers is discharged by the fans to the outside of the building, using a duct system.

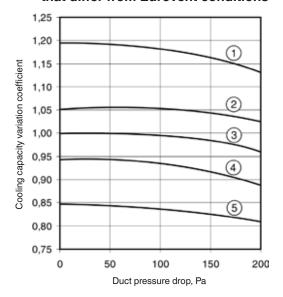

30RB units equipped with fans with available pressure are designed to operate with air discharge ducts with maximum pressure drops of 200 Pa.

To compensate for these pressure drops 30RB units with option 12 are equipped with variable-speed fans with a maximum speed of 19 r/s, instead of 15.8 r/s and fixed-speed fans as for the standard units.

All fans in the same refrigerant circuit are controlled by a single-speed variator and therefore all run at the same speed.

The full-load or part-load speed is controlled by a patented algorithm that permanently optimises the condensing temperature to ensure the best unit energy efficiency (EER) whatever the operating conditions and pressure drops of the system ductwork.

Cooling capacity variations for operating conditions that differ from Eurovent conditions

Operating conditions

Curve No.	Outside temperature, °C	Entering water temperature, °C	•	Load %
1	25	15	10	100
2	25	10	5	100
3 Eurovent	35	12	7	100
4	45	15	10	100
5	45	10	5	100

Each refrigerant circuit (A, B and C) must have a separate ducting system to prevent any air recycling between the condensers of the different refrigerant circuits.

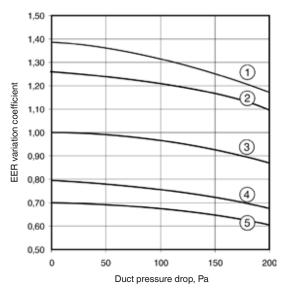

In 30RB units with option 12 each fan is equipped with a factory-installed connection interface, allowing the connection to the ducting system for the specific circuit (A, B and C) for each fan. Please refer to the unit dimensional drawings for the exact dimensions of the connection interface.

The unit cooling capacity and energy efficiency ratio (EER) vary depending on the duct pressure drops:

- between 0 and 100 Pa the unit cooling capacity is only slightly affected
- between 100 and 200 Pa the unit cooling capacity falls considerably depending on the operating conditions (outdoor air temperature and water conditions).

Please refer to the curves below to evaluate the impact of the estimated duct system pressure drop for the installation and the impact of different full load operating conditions on the 30RB unit cooling capacity and EER.

EER variations for operating conditions that differ from Eurovent conditions

Partial heat reclaim using desuperheaters (option 49)

This option permits the production of free hot water using heat reclaim by desuperheating the compressor discharge gases. The option is available for the whole 30RB range.

A plate heat exchanger is installed in series with the air condenser coils on the compressor discharge line of each circuit.

Nominal conditions: Evaporator entering and leaving water temperature = 12°C/7°C, desuperheater entering and leaving water temperature = 50°C/60°C, outside air temperature = 35°C. Gross performances, not in accordance with EN14511-3:2011. These performances do not take into account the correction for the proportional heating capacity and power input generated by the water pump to overcome the internal pressure drop in the heat exchanger.

Operating limits

Desuperheater		Minimum	Maximum
Entering water temperature at start-up	°C	25*	75
Leaving water temperature during operation	°C	30	80
Air condenser		Minimum	Maximum
Outside operating temperature	°C	0**	46

^{*} The entering water temperature at start-up must not be lower than 25°C. For installations

Weights shown are a guideline only
Standard unit (with MCHE coils) and desuperheater option + option 280 (shell-and-tube heat exchanger)

Unit with option 15 (desuperheater)

Unit with option 15 and desuperheater and hydronic module with high-pressure dual pump

with a lower temperature a three-way valve is necessary. ** The minimum outside temperature is 0°C. With the winter operation option it is -20°C.

Total heat reclaim (option 50)

Suitable for heating, domestic hot water preparation, agriculture and food industry, industrial processes and other hot-water requirements.

With the total heat reclaim option it is possible to reduce the energy consumption bill considerably compared to conventional heating equipment such as fossil fuel boilers or electric water tanks.

Operating principle

If hot water production is required, the compressor discharge gases are directed towards the heat reclaim condenser. The refrigerant releases its heat to the hot water that leaves the condenser at a temperature of up to 55°C. In this way 100% of the heat rejected by the liquid chiller can be used to produce hot water. When the demand for heat is satisfied, the hot gas is again directed towards the air condenser where the heat is rejected to the outside air by the fans. Hot water temperature control is ensured by the chiller Pro-Dialog control that independently controls the reclaim operation of each refrigerant circuit.

The water entering temperature at start-up must not fall below 15°C. For installations with a lower temperature an accessory 3-way valve must be installed.

^{*} Nominal conditions: Entering and leaving water temperature: Evaporator 12°C/7°C; heat reclaim condenser: 40°C/45°C.

Performances in accordance with EN14511-3:2011. These performances take into account the correction for the proportional heating capacity and power input generated by the water pump to overcome the internal pressure drop in the heat exchanger.

Svaporator and heat reclaim condenser fouling factor = 0 m²k/kW.

Nominal conditions: Entering and leaving water temperature: Evaporator 12°C/7°C; heat reclaim condenser: 40°C/45°C.

Gross performances, not in accordance with EN14511-3:2011. These performances do not take into account the correction for the proportional heating capacity and power input generated by the water pump to overcome the internal pressure drop in the heat exchanger.

Evaporator and heat reclaim condenser fouling factor = $0 \text{ m}^2\text{K/kW}$. *** Weights are for guidance only.

Hydronic module (option 116)

The hydronic module option saves a lot of installation time. The chiller is factory-equipped with the main components for the hydronic system: Screen filter, water pump, expansion tank, safety valve and water flow control valve (option).

Several water pump types are available to suit any application: Primary single or dual low-pressure pump or single or dual high-pressure pump (30RB 162-522).

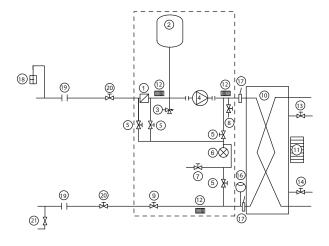

An automatic pump start-up algorithm protects the heat exchanger and the hydronic module piping against frost down to -10°C outside temperature, if the evaporator frost protection option is installed. If necessary increased frost protection down to -20°C is possible by adding the heater option to the hydronic module piping (see options 41 and

The hydronic module option is integrated into the chiller without increasing its dimensions and saves the space normally used for the water pump.

Hydronic module

- 21 Charge valve
- --- Hydronic module (units with hydronic module)

Notes:

With option 42A the unit hydronic module is protected against frost by electric heaters. The unit evaporator must be protected against frost (anti-freeze solution or optional electric

Electrical data, units with hydronic modules

The pumps that are factory-installed in these units comply with the European Ecodesign directive ErP. The additional electrical data required by regulation 640/2009 is given in the installation, operation and maintenance manual.

This regulation concerns the application of directive 2009/125/EC on the eco-design requirements for electric motors.

DX free-cooling system (option 118A)

The DX free-cooling option permits significant energy savings for all applications that require cooling in winter. In the free-cooling mode the compressors are stopped and only the fan and cooling micro-pump are running. The changeover from compressor cooling mode to free-cooling mode is automatically controlled by the Pro-Dialog control, based on the chiller heat load and the temperature difference between chilled water and ambient air.

Important: In order to optimise chiller performances, it is recommended to use the leaving water set point reset function.

Operating principle

When the chilled water-air temperature difference exceeds a threshold value, the Pro-Dialog control carries out a comparison between the instantaneous chiller cooling capacity and the available free-cooling capacity. If the operating conditions allow free-cooling operation, the compressors are stopped, a three-way valve on the suction piping connects the evaporator with the condenser, allowing the migration of the refrigerant vapours to the condenser. The refrigerant condenses in the condenser coils, and the cooling micro-pump transports the liquid to the evaporator. The cooling capacity in free-cooling mode is controlled by the opening of the electronic expansion valve (EXV).

Advantages of the DX free-cooling system

- Operation without glycol
 - Unlike traditional hydronic free-cooling systems that require the use of a glycol solution, the Aquasnap DX free-cooling chiller works with pure water. The evaporator is protected against frost down to -20°C by an electric resistance heater (option).
- Low water pressure losses
 - The Aquasnap DX free-cooling chiller does not include a three-way valve nor free-cooling coils connected in series with the evaporator. The Aquasnap free-cooling chiller has the same water pressure losses as a standard chiller.
- Weight and dimensions gain
 - The DX free-cooling option has little impact on the weight of the liquid chiller.
 - The Aquasnap free-cooling chiller has the same dimensions as a standard chiller.
- Increased energy efficiency
 - In free-cooling mode only the fans and the cooling micro-pump run. At an air-water temperature difference of 10 K for example the average chiller energy efficiency (EER) is 15 (kW/kW).
 - In the mechanical cooling mode chiller thermal and energy performances are not reduced by the use of a water-glycol solution.
 - As the pressure losses of the water circuit are low, the water pumps use less energy.

Eurovent-certified performances in accordance with standard EN14511-3:2011.

Cooling mode conditions: evaporator water entering/leaving temperature 12°C/7°C, outside air temperature 35°C. evaporator fouling factor 0 m² K/W

Gross performances, not in accordance with EN14511-3:2011. These performances do not take into account the correction for the proportional heating capacity and power input generated by the water pump to overcome the internal pressure drop in the heat exchanger.

Cooling mode conditions: evaporator water entering/leaving temperature 12°C/7°C, outside air temperature 35°C.

evaporator fouling factor 0 m² K/W

*** Weight shown is a guideline only. To find out the unit refrigerant charge, please refer to the unit nameplate.

**** Standard unit: base unit without option 15 and hydronic module.

† In accordance with ISO 9614-1 and certified by Eurovent.

‡ For information, calculated from the sound power level Lw(A).

^{*} Type of system earthing

IT system: The short circuit current stability values given above for the TN system are also valid for IT for units 30RB 302 to 522. For units 30RB 162 to 262 and 30RB 602 to 802 modifications are required.

^{*} Standardised Eurovent conditions: evaporator entering/leaving water temperature 12°C/7°C, outside air temperature 35°C.

** Power input, compressors and fans, at the unit operating limits (saturated suction temperature 10°C, saturated condensing temperature 65°C) and nominal voltage of 400 V (data given on the unit

^{***} Maximum unit operating current at maximum unit power input and 360 V.
**** Maximum unit operating current at maximum unit power input and 400 V (values given on the unit nameplate).

[†] Maximum instantaneous start-up current at operating limit values (maximum operating current of the smallest compressor(s) + fan current + locked rotor current of the largest compressor).

^{**} Icw: assigned short-time current

[†] For units with options 12 and 116 use the higher value.

^{††} Icc/Icf: assigned conditional short-circuit current

Electrical data notes for 30RB units:

- 30RB 162-522 units have a single power connection point at the main disconnect switch; 30RB 602-802 units have two connection points at the main disconnect switch. The control box includes the following standard features:
- one main disconnect switch
- Starter and motor protection devices for each compressor and the fan(s)
- Control devices
- Field connections:

All connections to the system and the electrical installations must be in full accordance with all applicable local codes.

- The Carrier 30RB units are designed and built to ensure conformance with these codes. The recommendations of European standard EN 60 204-1 (corresponds to IEC 60204-1) (machine safety - electrical machine components - part 1: general regulations) are specifically taken into account, when designing the electrical equipment.
- Electrical reserves:

Circuit A has disconnect switches and branch sections, designed to supply the evaporator pump power input.

IMPORTANT:

- Generally the recommendations of IEC 60364 are accepted as compliance with the requirements of the installation directives. Conformance with EN 60204 is the best means of ensuring compliance with the Machines Directive § 1.5.1.
- Annex B of EN 60204-1 describes the electrical characteristics used for the operation of the machines.
- The operating environment for the 30RB units is specified below:
 a. Environment* Environment as classified in EN 60721 (corresponds to IEC 60721):
 - outdoor installation*

 - ambient temperature range: -20°C to +48°C \pm 1 K, class 4K3* altitude: \leq 2000 m (for hydronic kit see chapter 5.3 of the installation manual)

 - presence of hard solids, class 4S2 (no significant dust present) presence of corrosive and polluting substances, class 4C2 (negligible)
 - vibration and shock, class 4M2
 - b. Competence of personnel, class BA4* (trained personnel IEC 60364)

- 2. Power supply frequency variation: ± 2 Hz.
- The neutral (N) line must not be connected directly to the unit (if necessary use a transformer).
- Overcurrent protection of the power supply conductors is not provided with the unit.
- The factory-installed disconnect switch(es)/circuit breaker(s) is (are) of a type suitable for power interruption in accordance with EN 60947-3 (corresponds to IEC 60947-3).
- The units are designed for simplified connection on TN(s) networks (IEC 60364). For IT networks derived currents may interfere with network monitoring elements, and it is recommended to create an IT type divider for the system units that require this and/or a TN type divider for Carrier units. Please consult the appropriate local organisations to define the monitoring and protection elements and carry out the electrical installation. Units delivered with speed drive (options 12 and 28) are not compatible with IT network.

If short circuit currents above those given in the electrical data table are likely, modifications are required. Please contact your local Carrier representative.

NOTE: If particular aspects of an actual installation do not conform to the conditions described above, or if there are other conditions which should be considered, always contact your local Carrier representative.

The required protection level for this class is IP43B (according to reference document IEC 60529). All 30RB units are protected to IP44CW and fulfil this protection condition.

Part load performances

With the rapid increase in energy costs and the care about environmental impacts of electricity production, the power consumption of air conditioning equipment has become an important topic. The energy efficiency of a liquid chiller at full load is rarely representative of the actual performance of the units, as on average a chiller works less than 5% of the time at full load.

IPLV (in accordance with AHRI 550/590)

The IPLV (integrated part load value) allows evaluation of the average energy efficiency based on four operating conditions defined by the AHRI (Air Conditioning, Heating and Refrigeration Institute). The IPLV is the average weighted value of the energy efficiency ratios (EER) at different operating conditions, weighted by the operating time.

IPLV (integrated part load value)

Load %	Air temperature °C	Energy efficiency	Operating time %
100	35	EER,	1
75	26.7	EER,	42
50	18.3	EER ₃	45
25	12.8	EER ₄	12
ESEER =	EER, x 1% + EER, x 42	% + EER ₃ x 45% + EEF	R ₄ x 12%

as the outside air temperature, the exposure to the sun and the building occupancy.

The heat load of a building depends on many factors, such

Consequently it is preferable to use the average energy efficiency, calculated at several operating points that are representative for the unit utilisation.

ESEER (in accordance with EUROVENT)

The ESEER (European seasonal energy efficiency ratio) permits evaluation of the average energy efficiency at part load, based on four operating conditions defined by Eurovent. The ESEER is the average value of energy efficiency ratios (EER) at different operating conditions, weighted by the operating time.

ESEER (European seasonal energy efficiency ratio)

Load %	Air temperature °C	Energy efficiency	Operating time %
100	35	EER,	3
75	30	EER,	33
50	25	EER	41
25	20	EER ₄	23
ESEER = E	ER, x 3% + EER, x 33%	6 + EER ₃ x 41% + EER	x 23%

- For application requiring operation at less than 8 or 6.8°C respectively, contact Carrier for
- unit selection using the Carrier electronic catalog.

 For an application, requiring operation up to +15°C leaving water temperature, contact Carrier for the selection of the unit.
- For operation from 0°C to -10°C the units must be equipped with options 28B, 28C "Winter operation". For operation from 0°C to -20°C the units must be equipped with option 28 "Winter operation". For both options the unit must either be equipped with the evaporator frost protection option (for units without hydronic module option) or the evaporator and hydronic module frost protection option (for units with hydronic module option) or the water loop must be protected against frost by the installer, using an anti-freeze solution.

 Maximum outside temperature: For transport and storage of the 30RB units the minimum and maximum allowable temperatures are -20°C and +48°C. It is recommended that these temperatures are used for transport by container.
- ** Unit with fans with available pressure up to 200 Pa.
 † 30RB 162 units use options 28B, 28C for outside temperatures below 10°C.

Operating range - 30RB 162-262 "B" standard units and units with option 280

Operating range - 30RB 302-802

Evaporator $\Delta T = 5 \text{ K}$

The evaporator is protected against frost down to -20°C.

Standard unit operating at full load.

Operating range, units equipped with options 28, 28B, 28C "Winter operation". Option 28 (with variable-speed lead fan for each circuit) allows operation down to -20°C outside temperature.

Options 28B, 28C (with two-speed lead fan for each circuit) allows operation down to -10°C outside temperature. In addition to options 28, 28B, 28C the unit must either be equipped with the evaporator frost protection option (for units without hydronic module option) or the evaporator and hydronic module frost protection option (for units with hydronic module option) or the water loop must be protected by the installer by adding a frost protection

Available static system pressure

Data applicable for:

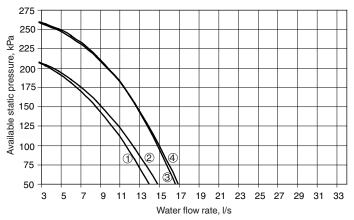

- Fresh water 20°C
- In case of use of the glycol, the maximum water flow is reduced.

Legend

LWT Leaving water temperature, °C
Qc Cooling capacity, kW
EER Energy efficiency ratio, kW/kW Evaporator water flow rate, I/s Evaporator pressure drop, kPa

Application data

Standard units, refrigerant: R-410A Evaporator entering/leaving water temperature difference: 5 K Evaporator fluid: chilled water Fouling factor: $0.18 \times 10^{-4} \, (m^2 \, K)/W$

Performances in accordance with EN14511-3:2011.

Legend
LWT Leaving water temperature, °C
Co Cooling capacity, kW
EER Energy efficiency ratio, kW/kW Evaporator water flow rate, I/s Evaporator pressure drop, kPa

Application data

Standard units, refrigerant: R-410A Evaporator entering/leaving water temperature difference: 5 K Fouling factor: 0.18 x 10⁻⁴ (m² K)/W

Gross performances, not in accordance with EN14511-3:2011. These performances do not take into account the correction for the proportional heating capacity and power input generated by the water pump to overcome the internal pressure drop in the heat exchanger.

Cooling capacities in accordance with EN14511-3:2011

30RB 162-262 "B" units with option 280 (shell-and-tube heat exchanger) and 30RB 302-802 units

Application data

Standard units, refrigerant: R-410A Evaporator entering/leaving water temperature difference: 5 K Evaporator fluid: chilled water Fouling factor: 0.18 x 10⁻⁴ (m² K)/W

Performances in accordance with EN14511-3:2011.

Cooling capacities

30RB 162-262 "B" units with option 280 (shell-and-tube heat exchanger) and 30RB 302-802 units

Application data

Standard units, refrigerant: R-410A Evaporator entering/leaving water temperature difference: 5 K Evaporator fluid: chilled water Fouling factor: 0.18×10^{-4} (m² K)/W

Gross performances, not in accordance with EN14511-3:2011. These performances do not take into account the correction for the proportional heating capacity and power input generated by the water pump to overcome the internal pressure drop in the heat exchanger.

Quality and Environment Management Systems Approval
