VOLUME II¹
THE DOWNSTREAM PROBABILITY DENSITY FUNCTION FOR NORTH
AMERICA AND EURASIA

Table I. North America and Table II. Eurasia were computed from the data in Table I. Constant Wind, Volume II, by introducing the actual wind profiles for these two regions for various heights and seasons. The appropriate wind profiles were then integrated between the initial latitude and each successive latitude band in order to obtain the value of \hat{U} (see page 15, Volume I) appropriate to each band. The corresponding relative frequencies were determined by linear interpolation.

For example, if, for a specified region, height, and season, the value of \hat{U} corresponding to the latitude band 40°N to 35°N is WEST 43 kts for an initial latitude of 50°N , then the appropriate relative frequencies are obtained from the page in Table I, Volume II, headed T - 50 - 40 to 35, where T = 1, 3, 6, or 12 days, by interpolating 3/10ths of the way between the values in the WEST 40-kt and WEST 50-kt columns.

The parameters in Tables I and II are:

Region: Table I. North America.

Table II. Eurasia.

Season: January, April, July, and October.

Height: 40,000, 50,000, 60,000, 70,000, and
80,000 feet.

ϕ_0 - initial latitude (degrees).

λ - longitude (degrees).

ϕ - 5-degree latitude bands.

Solutions are given for time periods of 1, 3, 6, and 12 days.

At the top of each page appears the table number and region; either Table I. North America or Table II. Eurasia. Immediately below the table designation is a group of numbers which gives the time, initial latitude, and height. For example, the number group 3 - 35 - 40,000 is decoded as follows:

- 3 - time in days.
- 35 - initial latitude in degrees.
- 40,000 - the 40,000-foot level

At the extreme left are the names of the four mid-season months: January, April, July, and October. To the right of these is a column headed LAT BAND which designates the 10 latitude bands. These bands are repeated for each month. The word LONGITUDE beneath the number group pertains to the row immediately below which gives the distance in degrees longitude from the origin.

The numbers in the body of the tables are relative frequency (that is, percent of total balloons launched to the nearest 1/10th of 1 percent of balloon location). The following illustrates the use of these tables:

EXAMPLE. If balloons launched at 45°N in North America in October were to float at a constant level of 80,000 feet, what would be the relative frequency of balloons between 55°N and 50°N at a distance of 80° longitude from the origin after 12 days?

SOLUTION. (a) Turn to the page in Table I. North America headed by the designator group 12 - 45 - 80,000.
 (b) Consult the bottom block of data next to the word October. At the intersection between the row labelled 55 - 50 and the column headed 80, read off 2.8 percent.

The pages of Tables I and II are arranged in the following order with respect to the various parameters:

- Time: 1, 3, 6, and 12 days.
- Initial latitude: 30°N through 70°N at 5° latitude intervals.
- Height: 40,000 through 80,000 feet at 10,000-foot intervals.

For those cases where the mean zonal wind for a given season changes sign at some latitude, we have prepared two separate tables, one for eastward displacements and one for westward displacements. This situation occurs in Volume III, Table I. North America, as follows:

FOREWORD

This Geophysics Research Paper is published in three separate volumes.

In Volume I the theory of large-scale atmospheric diffusion is developed. The application of this theory to air trajectories is presented in Volumes II and III.

Volume II contains probability tables for various constant values of mean zonal wind.

Volume III consists of probability tables for North America and Eurasia.
