## PREFACE

The Naval Underwater Systems Center's mission is to be the Navy's principal research, development, and test and evaluation center for submarine warfare and submarine weapon systems. The project described in this report is part of an ancillary Center program called Technology Transfer. It represents a small part of the Center's overall program in terms of effort and budget, but is significant in terms of returning the benefits of Federal research and development to the public and private sectors.

The project was jointly sponsored by the Naval Underwater Systems Center, the National Science Foundation, and the New York City Police Department. It was conducted under NUSC Projects A90614 and B90614, NSF Grant ISP 7419143 (GT 43500), and NYCPD Contracts 0159000008, 0151P00419, and 0151005000; Principal Investigator, Mr. William J. McGrath (Code 001); Program Manager, Mr. Michael C. Ahrens (Code 0702).

The Technical Reviewer for this report was Mr. Robert J. Donovan (Code 07), Program and Financial Manager.

Any opinions, findings, conclusions, or recommendations expressed in this publication are those of the authors and do not necessarily reflect the views of the National Science Foundation.

**Reviewed and Approved; 16 November 1981**

  
R. J. Donovan

**Head, Program and Financial Management Staff**

The authors of this report are located at the New London  
Laboratory of the Naval Underwater Systems Center,

ABSTRACT

This report describes the New York City Police Department (NYCPD) Automated Fuel Monitoring System, from the original study, through system design, to implementation. The system provides complete control of fuel usage for an agency with 4,000 motor vehicles and 25,000 vehicle operators. As far as is known, it is the largest system of its kind installed to date. The system can be scaled up or down to meet the needs of other governmental units. Estimated annual cost savings to NYCPD are \$2,000,000.

This report is the second of two volumes. Volume I is an overview of the project. Copies of either volume can be obtained on request from:

Office of Special Programs Development (Code 0702)  
U.S. Naval Underwater Systems Center  
New London Laboratory  
New London, CT 06320  
Telephone: (203) 447-4108, -4590

Interested state and local government officials are encouraged to inspect the NYCPD system.

## FOREWORD

The Naval Underwater Systems Center (NUSC) has expertise in a broad range of technologies, including acoustics, electronics, ocean engineering, computer services, technical management, and systems development. Since 1970 it has been the Center's policy to share its technology with other Federal agencies and state and local governments. This sharing of resources, called Technology Transfer, became an article of Navy policy in 1972. Technology transfer now is a nationwide program for bringing the benefits of Federal technological research and development to the public and private sectors. It is an organized and systematic effort to help overcome problems that will yield to technological solutions.

The Congress of the United States has recognized the value of the technology transfer effort and has indicated its approval by passage, in late 1980, of the Stevenson-Wydler Technology Innovation Act, now Public Law 96-480. Section 11 of the Law directs the Federal Government to "strive where appropriate to transfer federally owned or originated technology to State and local governments and to the private sector."

NUSC's participation in technology transfer began in 1970 and has grown steadily, within the constraints that apply to the Navy's program: it cannot interfere with the Center's mission nor compete with private enterprise. The Center is now involved in technology transfer activities at the local, state, regional, and national levels. NUSC's Office of Special Programs Development is responsible for managing the program, which matches the network of resources with the users of technology to deliver technical assistance where it is most needed.

NUSC is a member of the Federal Laboratory Consortium for Technology Transfer, which includes about 200 Federal research and development laboratories and technical centers. The Consortium, in turn, is a participant in a program initiated in 1967 within the National Science Foundation's Division of Intergovernmental and Public Service Science and Technology. Since its inception, the Foundation's program has pioneered in the formation of a network of technology transfer users--state, local, and regional governments--and has helped the members of the network to recognize their technology needs, to define their problems, to seek assistance from resources available through the network, and to share the benefits of the problems they have thus solved.

The Automated Fuel Monitoring System designed and implemented for the New York City Police Department is a major project of NUSC's Technology Transfer program. This documentation of the project (TR 6567-II) is presented as a response to the spirit and intent of the nationwide technology transfer effort. The project is transferable to state, regional, and local governments. It can be, and has been, scaled up or down to meet the requirements of a broad spectrum of users. We believe it answers many questions that may be posed by potential users in terms of productivity, cost/benefit analysis, use of natural resources, and vehicle fleet use and maintenance, and that it can advance state and local governments well along the way toward solving troublesome problems. In addition, the private sector market has been stimulated to respond to system needs identified during the course of the project.

### ACKNOWLEDGMENTS

Many individuals and organizations contributed generously of their time and expertise to the successful completion of this project. Management and staff of the Naval Underwater Systems Center and the New York City Police Department participated in all phases of the project, from problem definition through system design and implementation, by providing data, technical assistance and advice, graphics, and other essentials. While it was part of their responsibility, we hereby acknowledge with thanks their efforts "above and beyond the call of duty." Gratitude is deserved also by the following for their special contributions:

The cosponsorship of the project by the National Science Foundation's Division of Intergovernmental and Public Service Science and Technology was made possible by the support of Mr. Bruce J. Reiss, Program Manager for Local Governments. He provided the initial funding to the New York City Police Department, which led to the start of this project. The NSF Local Governments Program also sponsors the Urban Technology System, which provides funding for technology agents in a number of medium-sized cities (50,000 to 500,000 population) around the country. An Urban Technology System Brief led to the identification of fuel monitoring as a primary need by NYCPD.

The Federal Laboratory Consortium member laboratories, through their technology transfer representatives, provided technical advice when requested, and gave encouragement throughout the project. Mr. Nicholas Montanarelli, when he was program manager for Federal Laboratories at the National Science Foundation, provided funding for documentation of this project.

Deputy Inspector Kenneth R. Strange, Support Services Bureau, and Mr. Eugene C. Masci, director of the Motor Transport Division, New York City Police Department, steered the operation through the many administrative procedures and retained their equanimity and enthusiasm throughout. The dedication and perseverance of Sergeant Frank E. Stryjewski, the first User Representative, and Sergeant Thomas A. Kiernan and Police Officer Kenneth A. Hamel of the Fuel Control Center were the building blocks that finally put the system together.

NEW YORK CITY POLICE DEPARTMENT  
AUTOMATED FUEL MONITORING SYSTEM  
VOLUME II--DOCUMENTATION REPORT

Section I

INTRODUCTION

A. BACKGROUND

On May 1, 1977, the Naval Underwater Systems Center (NUSC) entered into an agreement with the Police Department of the City of New York (NYCPD) to provide a technology linking agent to NYCPD. The purpose of the project was to determine if the results of Federal research and development could be applied to solve some of the technological problems of NYCPD. This activity was begun with a 1974 grant award from the National Science Foundation's Intergovernmental Science Division to the NYCPD Applied Technology Unit, Support Services Bureau. Since the late 1960's the National Science Foundation has provided funding for a broad spectrum of applied science and technology assistance projects with local, regional, and state governments. Its Intergovernmental Science Division is structured to include program elements for both users and providers of applied science and technology.

Mr. William J. McGrath, a management systems analyst from NUSC's New London Laboratory, was assigned on May 1, 1977, to the NYCPD Motor Transport Division, under the mobility provisions of the Intergovernmental Personnel Act of 1970. Mr. McGrath previously had designed and implemented an Asset Management System (AMS) for the NYCPD Quartermaster. AMS provided for control of all Department assets, including fleet vehicles, but vehicle maintenance was not built into the system. Mr. McGrath's assignment to the Motor Transport Division was made specifically to investigate the advantages of adding vehicle maintenance to the already existing Asset Management System. Also under consideration was a computerized parts inventory system.

B. PROBLEM IDENTIFICATION

During the first week of the project, Mr. McGrath was primarily concerned with assisting NYCPD Motor Transport Division in identifying their technical problems. In intergovernmental science parlance, this process is called needs assessment; it consists of listing all problems, and then placing priorities on each. Mr. McGrath reviewed available literature on successful automotive-related technology transfer programs and presented a number of brief technical write-ups to NYCPD officials. One was Urban Technology System Brief 42 concerning a Fuel System Monitor for Oklahoma City.

Within 2 weeks of the beginning of the project, the head of NYCPD Motor Transport Division identified fuel dispensing and monitoring as the first priority technical problem. He asked Mr. McGrath to study their existing system and make recommendations for improving it.

1. User Representative

There are two essential requirements of any systems analysis task, both of which were strictly adhered to by Mr. McGrath. The first is that a full-time user representative be assigned to work with the analyst beginning on Day One of a project. It is particularly important in intergovernmental projects, since the provider of the service usually is unfamiliar with the governmental unit to which he/she has been assigned. Mr. McGrath strongly recommended the assignment of a user representative and, accordingly, a sergeant assigned to the Motor Transport Division was designated as such on May 1. His participation contributed importantly to the short time-frame of the problem identification phase of the project.

The second requirement of systems analysis is to adequately define the problem before attempting to arrive at a solution or alternative solutions. The work described in section II of this report meets that requirement.

C. CONTACTS

The following individuals may be contacted for additional information or clarification of the material contained in this report:

## Section II

## STUDY

## A. PROBLEM DEFINITION

On May 11, 1977, the fuel system study was initiated at the direction of the Commanding Officer, Deputy Commissioner of Administration Office, NYCPD. The study was to be performed under the supervision of the Commanding Officer, Motor Transport Division.

1. Framework

The following information is essential to provide a conceptual understanding of the complexity of the NYCPD fueling operation:

- a. The Department is divided into 73 Precincts within the 5 Boroughs of New York City (Bronx, Brooklyn, Manhattan, Queens, Staten Island). Sixty-eight precincts have pumping stations.
- b. Any Department vehicle can secure fuel at any of the 68 stations.
- c. Some stations have two gas pumps, some only one.
- d. The capacity of the in-ground tanks varies from 550 to 3600 gallons.
- e. The Department has approximately 25,000 qualified motor vehicle operators.
- f. The Department operates about 4,000 motor vehicles, including motorcycles and scooters.
- g. Private vehicle fueling is provided for personnel on special detail.
- h. The number of transfers of personnel between Precincts is significant.

2. Existing Fuel System (May 1, 1977)

A flowchart of the manual fuel control system used by NYCPD was prepared with the cooperation of Motor Transport Division and the Department Quartermaster (see appendix A). Exhaustive interviews were held with all personnel involved in managing the fuel system. Mr. McGrath queried gas attendants, vehicle operators, and precinct desk officers about the dispensing and receiving processes, and Quartermaster office personnel about the billing process. It was essential to the study that he determine all the physical steps and paper flow involved in the operation. He also checked Department directives and compared the directives with actual procedures.

The primary findings were:

- a. All transactions (dispensing and receiving) were manually recorded in the Gasoline and Oil Receipt Book (referred to as MT 9, figure II-1) by the attendant, and were signed by the Department operator.

Figure II-1. Exhibit From Gasoline and Oil Receipt Book

b. The manual system required the services of a full-time gas attendant for at least two of the three daily duty shifts.\*

c. Each Precinct was responsible for reordering its own fuel from vendor.

Appendix A illustrates the complexity and potential for error inherent in the manual billing transactions.

### 3. Data Collection

A decision was made to gather data for the month of January 1977.

#### a. Fuel Dispensing Questionnaire

A fuel dispensing questionnaire (figure II-2) was developed and forwarded on May 18 to the NYCPD Chief of Operations for endorsement. It was approved and forwarded to the fueling precincts on May 23.

#### b. Fuel Matrix

A fuel matrix was developed (figure II-3) and completed on May 31. Data gathered from the NYCPD Personnel Office concerning manpower distribution and labor costs, and from the questionnaires and MT 9 books received from the Precincts, were posted to the matrix, which was completed on June 28. All receipts and deliveries for the month of January 1977, approximately 32,000 transactions, were physically checked and posted.

#### c. Inspection of Automated Systems in Other Localities

Early in August 1977, Mr. McGrath of NUSC and the Quartermaster and the user representative of NYCPD inspected currently operating automated fueling systems in Cincinnati, Ohio, and Oklahoma City, Oklahoma. The physical inspection was useful for concept and comparison purposes. Interested state and local government officials are encouraged to inspect the NYCPD system.

### 4. Proposed Automated Fuel System

A flowchart of a proposed automated on-line fuel system was prepared (see appendix B). The data gathered during the study were used to make cost comparisons between the existing (manual) and proposed (automated) systems.

---

\*If the gas attendant was at lunch or off duty, gas pumps were padlocked. In that case, officers needing fuel had to secure MT 9 books and keys from the Desk Sergeant, unlock pumps, pump their own gas, make entries in the MT 9, lock pumps, and return keys and books to the Desk Sergeant--often a somewhat lengthy procedure.

QUESTIONNAIRE PERTAINING TO FUEL DISPENSING

COMMAND \_\_\_\_\_ LOCATION \_\_\_\_\_

1. Number of personnel assigned to dispensing gasoline? \_\_\_\_\_
2. The rank/title of the above personnel?  
 P.O. \_\_\_\_\_ MVO \_\_\_\_\_ Laborer \_\_\_\_\_ Cleaner \_\_\_\_\_ Other \_\_\_\_\_
3. Are the gasoline dispensing duties full time or collateral?  
 Full \_\_\_\_\_ Collateral \_\_\_\_\_  
 If collateral what percentage of time spent in this duty? \_\_\_\_\_%
4. Number of pumps at your station? \_\_\_\_\_
5. Total tank capacity? \_\_\_\_\_
6. Number of privately owned vehicles permitted to get fuel at your station? \_\_\_\_\_
7. Specify the amount of gasoline delivered by the vendor to your tanks on each of the listed dates as per Precinct Log Entries.

5. Study Report to NYCPD Management

A formal presentation and report were prepared and presented to Department management on September 13, 1977. Pertinent portions of the report are reproduced on the following pages. They are:

- Analysis of Response from Precinct Pumping Stations for January 1977\*
- General Recording Problems Noted During Analysis
- Major System Problems
- Manpower and Labor Cost (Existing System)
- Projected Annual Error
- System Options
- Annual Operating Systems Comparison
- On-Line System Cost (1977 dollars)
- What's Next? (illustrates only that the study has been completed and further action necessitates a decision by Department management).

Portions of the NYCPD Patrol and Administrative Guides containing the duties and responsibilities of gasoline dispensers, delivery of gasoline to a station house, daily gasoline summary, private vehicle authorization, vehicle identification plates, and gas and oil for private vehicles were included in the report (see appendix C) to illustrate differences between the guidelines and the practices actually followed as determined during the study.

Mr. McGrath recommended a fully automated fuel dispensing system.

---

\*The number of precincts with pumping stations increased slightly from the time of the study to total system installation.

**NYCPD FUEL DISPENSING STUDY FOR JANUARY 1977  
ANALYSIS OF RESPONSE FROM PRECINCT PUMPING STATIONS**

**64 COMMANDS WITH PUMPING STATIONS**

- 2 COMMANDS RESPONSE INCOMPLETE BY CUTOFF DATE
- 2 COMMANDS PUMPS OUT OF SERVICE DURING SURVEY PERIOD
- 1 COMMAND COULD NOT LOCATE MT9's FOR SURVEY PERIOD
- 1 COMMAND DOES NOT MAINTAIN MT9's

**58 COMMANDS SURVEYED FOR MONTH OF JANUARY 1977  
REPRESENTED:**

- 121 MT9 FUEL RECEIPT BOOKS
- 32,000 RECEIPT TRANSACTIONS FOR JANUARY
- 574 DELIVERIES FROM VENDOR
- 100,000 GAL IN-GROUND CAPACITY (APPROX)

**GENERAL RECORDING PROBLEMS  
NOTED DURING ANALYSIS**

**INSTANCES OF RECORDING ERRORS WERE NOTED  
IN THE FOLLOWING AREAS:**

- RECEIPTS WITHOUT GALLONS DISPENSED POSTED
- VEHICLES NOT IDENTIFIED PROPERLY
- GAS DISPENSED EXCEEDED VEHICLE TANK CAPACITY
- PROTECTIVE COUNTER READINGS NOT RECORDED OR RECORDED AFTER THE FACT
- INCOMPLETE ENTRIES
- POSTINGS ILLEGIBLE
- PAGES MISSING
- DATES SKIPPED YET GAS DELIVERED DURING PERIOD
- RECEIPT BOOKS POORLY MAINTAINED

**MAJOR SYSTEM PROBLEMS**

- **SYSTEM LACKS CAPABILITY TO CORRELATE DELIVERIES AND DISPENSING ON BOTH A CONTINUING AND DEMAND BASIS FOR CONTROL AND/OR AUDIT PURPOSES**

**WHAT'S NEXT?**

B. PILOT PROJECT

One week following the study report presentation, NYCPD management decided to proceed with the design and installation of the recommended automated fuel dispensing system. Mr. McGrath and the NYCPD User Representative were given the responsibility for preparation of the system specifications and Request for Proposal. In Mr. McGrath's opinion, the optimum design would use a minicomputer housed at Motor Transport Division to activate the pumps and perform validity checks, with the bulk of the data being passed to a central computer at Police Headquarters, in the Management Information Systems Division (MISD). However, MISD rejected that plan from the outset, because they did not have enough manpower to support an additional activity of this size and scope.

About this time the New York City Mayor's Office of Operations became interested in the project, with a view toward eventually installing an automated fuel system citywide. The Office of Operations offered to furnish host computer capability for the total system but suggested a pilot installation for proof of concept. They also offered to loan NYCPD an IBM System 7 computer for the pilot, which they were not using at that time. NYCPD accepted the suggestion and the computer, and decided to carry out the pilot project in the three precincts on Staten Island, all of which have pumping stations. The reason for using Staten Island as a test site is worth mentioning: it has finite boundaries and is remote from the other four boroughs; therefore, there is very little crossover of police officers from other districts into Staten Island. This eliminated the problem of officers from other districts having difficulty getting fuel for department vehicles because they did not have the necessary magnetic-stripe cards to activate the system.

NYCPD management had given careful consideration to the decision to proceed with the installation of an automated fueling system. They, therefore, determined to go ahead with the suggested pilot system, but only for approximately 4 months. Specifications for the total system were to be prepared, and bids let, during that period. The pilot, in essence, was to provide the necessary time for NYCPD to interface with the Mayor's Office of Operations, and to explore the use of the host computer.

The bid on the pilot system was won by American Energy Management Systems, and the three Staten Island precincts were automated on October 30, 1978. The pilot was successful and well accepted by the users. It ran for a much longer period than was originally intended, and eventually was discontinued when the supply of actuator cards ran out and difficulties arose in having repairs made to the System 7 computer.

Section III  
SYSTEM DESIGN

A. INTRODUCTION

The original design for the Departmentwide automated fuel dispensing system was prepared presuming the use of an IBM 370 host computer residing in the Mayor's Office of Operations. For that reason, a great deal of time in writing the Request for Proposal was given over to defining the reporting requirements for the system. It was intended that a minicomputer in the NYCPD Motor Transport Division Control Center would perform validity checks and activate the pumps, and also would provide the capability to validate and invalidate operator and vehicle cards instantaneously. The data would be passed daily to the IBM 370, and the 370 would provide the reporting capability necessary for complete fleet maintenance and budgetary cost control. Reports would be issued within 24 hours.

Following is the text of a memorandum to all New York City Departments from the Director of Operations, Office of the Mayor, dated March 6, 1978:

"The Police Department in cooperation with the Naval Underwater Systems Center have been investigating different gas monitoring systems. They have chosen an on-line credit card system in Staten Island.

"I believe that this system could have citywide application and has the potential for reducing gas expense by ten percent.

"I would like to invite you to a presentation by the Police Department on March 15th, at 10:00 AM at 250 Broadway, 18th Floor.

"There will be a discussion period after the presentation, and we will ask you for your comments pertaining to implementation in your Department."

The presentation was made, as scheduled, by the Motor Transport Division team. Subsequently, the Mayor's Office of Operations decided to proceed with the design of an all-encompassing citywide fuel system. Much of that design was to be similar to the NYCPD system, but was to be expanded to a massive interdepartmental effort including a diversity of equipment and management practices. The time lag for the design and implementation of a citywide system would be long and costly. NYCPD had the design and was ready to go ahead with implementation, with assistance from the NUSC management systems analyst funded by the National Science Foundation. In order to avoid further delay in implementation of a much-needed system, NYCPD decided to proceed, though still using the City's IBM 370 computer. Later, after the contract for the Departmentwide system had been awarded, it was determined that the 370 was not available because of programming priorities, and the system had to be reprogrammed to stand alone. It is hoped that New York City eventually will adopt the original system designed for NYCPD, which included fleet maintenance reporting. In that event, however, reprogramming the NYCPD system will be expensive.

For the information of agencies that may consider replicating this system design, a list of equipment suppliers, a configuration diagram of the original system design, a list of the host computer files, and a sample listing of the host computer file report capability are included in this report as appendixes D and E.

## B. SYSTEM SPECIFICATIONS AND CHANGE ORDERS

On December 7, 1978, a specification package for the total system was submitted to NYCPD management for review and approval. On February 4, 1979, a meeting was held with New York City Public Works Department to discuss the bid procedures, which they were to handle. On June 11, 1979, Public Works submitted a finalized proposal to Motor Transport Division for comments. It was reviewed and returned to Public Works on June 12, 1979, and was advertised in the City Record on June 18, 1979.

The first bid opening was July 10, 1979. Only one vendor submitted a bid. A number of other prospective vendors felt they did not have sufficient time for submittal, and the bid price was considerably over the capital funds set aside for the project. These factors caused Public Works to readvertise the proposal.

Three bids were received at the second opening on August 30, 1979. Problems existed with each bid in terms of exceptions and performance bonds, so Public Works advertised a third time. After the third bid opening, on December 10, 1979, the contract was awarded to E. J. Ward, Inc., of San Antonio, Texas.

The Specifications and Change Orders are included in appendix F of this report. The Specifications are for the system using a minicomputer in the NYCPD Motor Transport Division Control Center and the IBM 370 host computer in the Mayor's Office of Operations. The Change Orders reflect, among other things, the loss of the host capability. They (necessarily) were promulgated after the contract was awarded, and were agreed to by the vendor.

## C. SYSTEM CONFIGURATION

A diagram of the New York City Police Department On-Line Fuel Monitoring System Configuration is shown in figure III-1. The Transaction Type Codes in figure III-1 are further defined in the Octane Transaction File Layout, figure III-2. The system incorporates the following equipment:

1. IBM Series/1 Modular Units mounted in an IBM 4997 Model 2A Rack Enclosure, with:
  - a. IBM 4955 Model E Processor
  - b. IBM 4959 Model A Input/Output Expansion Unit
  - c. IBM 4962 Model 2 Disk Storage Unit
  - d. IBM 4964 Model 1 Diskette Unit
  - e. UDS RM-16DC Multiple Modem Enclosure, Rack Mounted RM-16CAB Cabinet.

 Reverse Blank

The Series 1 collects and stores all the data generated by the system and provides output for the other system components on command. Data are stored on hard disk and are written off to diskettes weekly. One diskette holds approximately 1 week's data.

2. Sixty-eight Remote Terminals, 1 in each of the 68 pumping stations/precincts. The Remote Terminals activate the pumps and feed data to the Series 1, where the data are stored on disk.

3. Two Model 43 Teleprinters 4320KSR (Keyboard Send-Receive) with EIA-RS232 Interface Pin Feed Catalog No. 4320 AAK. One KSR, designated "KSR Log," logs transactions that come in from the Remote Terminals. It has the capability to log all transactions, to log no transactions, or to log transactions selectively, e.g., by location only. The other KSR, designated "KSR Control," is used (a) to update the operator, vehicle, and tank pump files, and (b) to receive all exception/error conditions, i.e., reorder instructions, bad transactions (sounds an audible alarm), intrusion of the Remote Terminals (also sounds an audible alarm). Updates (file changes) go directly to disk, not on the KSR Log.

4. One IBM 4973 Model 1 Printer. Prints system reports on command of the operator of the KSR Control.

5. Two Black and White ADM-3A Terminals with 1920 characters (24 lines with 80 characters per line) designated "CRT." One CRT is in the office of the director of NYCPD Motor Transport Division, the other in the Fuel Monitoring System Office (Control Center). They are used for status inquiry into the system.

6. One Intecolor Model 8001 Color Data Terminal, designated "C-CRT." The color CRT is in the Control Center, and is used to monitor the system. The following data are displayed on the monitor simultaneously for all 68 pumping stations:

Site Location

Number of Tanks at Each Location (1 or 2)

Number of Pumps for Each Tank (1 or 2)

Capacity of Each Tank

Balance in Each Tank

Tank/Pump Status:

O = On-Line

S = Taken Off-Line by System (Tank Out of Gas)

M = Manually Taken Off-Line at Control Center.

The site locations are listed in series, corresponding to the 10 dedicated telephone lines that service them. Status and activity are color coded: Green = OK (station operating normally); Yellow = Alert (tank approaching reorder point); Red = Off (station off-line); Blue = Tank Size (capacity); Flashing Lights = Attention.

7. Ten Dedicated Telephone Lines. The dedicated phone lines are necessary to the operation of an on-line system. On-line operation was chosen, over a dial-up system, because the Remote Terminals could not store enough data (20,000 operators/4,000 vehicles) for dial-up. NYCPD required that the system provide fueling for any operator/vehicle at any pumping station; therefore, it is necessary, for instance, to be able to invalidate lost cards as soon as possible.

8. Actuator Cards. These are four magnetic-stripe encoded cards available to the system. The cards are of credit-card quality, size (2 x 3½ inches), and appearance, and are color-coded to distinguish them from each other.

a. Standard Cards. Two magnetic-stripe encoded cards are required to record all system transactions--dispensing, delivery, in-ground inventory, and oil-add. In addition, for the dispensing function, proper sequential use of the cards is necessary to activate the fuel pump. (The operator card must be inserted first in every case.) The two standard cards are designated Operator Card (figure III-3) and Vehicle Card (figure III-4).

b. Master Card. In addition to the two standard cards (Operator and Vehicle), there is a Master Card (figure III-5), which is used to:

- (1) Record fuel delivery transactions
- (2) Record in-ground inventory transactions
- (3) Substitute for missing Vehicle Card
- (4) Allow dispensing of fuel to small equipment that has no Department identification (lawn mowers, snow blowers, etc.)
- (5) Fuel scooters and motorcycles.

One Master Card is located at each of the 68 dispensing locations. It is assigned to the Precinct station house as opposed to being assigned to an individual or a vehicle. Use of the Master Card is limited to the above functions, and must always be used in conjunction with an Operator Card. In performing any of these functions at the Octane Control Unit (terminal), the thumbwheel dials are used to record the type of transaction and the other data required to complete the transaction. (See Computerized Fueling Instructions, figure IV-5.)

c. Private Vehicle Fueling Card. In addition to the Master Card located at each of the 68 fueling locations, there is also a Private Vehicle Fueling Card (figure III-6) located at and assigned to the station house.

The Private Vehicle Fueling Card is used by Department members who have been authorized to use private vehicles in special cases. Since there are no private vehicles resident in the Fuel Control System Vehicle file, there is no need for an operator to identify the vehicle or the mileage of the vehicle. Therefore, when using the Private Vehicle Fueling Card, the operator is required to dial in the last four digits of his/her social

**Operator Card**  
(White Bkgd/W/Blue Type)

Issued to all department motor vehicle operators.

Must be used for each and every transaction in conjunction with the appropriate vehicle, master, or private vehicle fueling card.

**Vehicle Card**  
(Blue Bkgd/W/White Type)

Maintained in all department vehicles except 2 wheel scooters and motorcycles.

Used for all vehicle dispensing functions.

Gallon limit is the vehicle tank capacity.

Figure III-3

Figure III-4

**Master Card  
(Green)**

One card issued to each fueling location; maintained in Station House.

1. Substitute for missing vehicle card
2. Fuel equipment with no department identification
3. Perform in-ground inventory
4. Record fuel deliveries

Gallon limitation and thumbwheel settings vary depending upon use.

Figure III-5

**Private Vehicle Fueling Card  
(Red)**

Dispensing fuel to private vehicles only.

Thumbwheel switches require 00 plus 4 low order digits of employees social security number.

10 gallon limitation.

Figure III-6

security number with the variable thumbwheels. These digits are checked against the operator's personal card to ensure that authority for private vehicle fueling has been granted to the individual. Each private vehicle fueling transaction is limited to 10 gallons.

d. Card Use. On each card, the magnetic stripe is encoded with the actuator card number that is imprinted on the face of the card (operator card is a 5-digit sequential number; vehicle card is a 4-digit sequential number). A security code assigned by the vendor, unique to the NYCPD Fuel System, is also encoded on the cards to preclude similar credit cards from being accepted in the system.

The first consideration regarding the actuator cards was: did NYCPD want a one-card system or a two-card system? A one-card system would identify the vehicle being fueled, but it would not identify the operator of the vehicle. NYCPD management elected a two-card system. The next consideration was the type of card to be used. The choice was between a Hollerith-coded punched card or the magnetic-stripe card. Extensive testing was performed on both; they were

- (1) Soaked in water and placed in a freezer for an extended period of time
- (2) Bent and mutilated
- (3) Smearred with grease, oil, and grime.

The results of the testing indicated that, for use in the NYCPD system, the magnetic-stripe card was far superior. In addition, considerable weight was given to the security factor. The magnetic-stripe card is difficult to duplicate, which is one of the reasons for its exclusive use by the American Banking Association.

The next consideration was the data to be encoded in the magnetic stripe. Since the decision was made that it would be a two-card system, and because of the high volume of active cards required (25,000 operator and 4,000 vehicle), it was decided to encode the cards such that they could be reissued. To have specific identification data (such as a social security number) magnetically encoded in the operator card would preclude the use of that card again should the original assignee retire, etc. Therefore, in the interest of providing the capability to reissue cards, it was decided that the magnetic-stripe coding would contain a sequential number that would be assigned randomly but that would be associated with an individual member in the computer file. This same logic applied also to the vehicle actuator cards.

The final consideration for the two standard cards was the card design. This was addressed in the system specifications to the extent that NYCPD would provide the successful vendor with the card design and wording within 10 days after contract award.

9. Vehicle Card Holders. Heavy-duty plastic pouches (2½ x 3 inches) were supplied by the Vendor to hold the vehicle cards in each Department vehicle. They were backed with an adhesive tape for attachment to the

TR 6567-II

dashboard, but the tape was not strong enough to support constant removal of the cards, so the pouches were bolted to the dashboard.

D. REPORTS

The following reports are provided by the system (examples appear in appendix G):

Index Reports

Operator Index Listing

Vehicle Index Listing

Section IV  
SYSTEM IMPLEMENTATION

## A. SCHEDULE

The Implementation Schedule for the NYCPD Fuel Monitoring System is shown below. Since it is intended only as a guide for use in replicating the project, the time allocation segment has been eliminated. The overall responsibility for system implementation was vested with the NYCPD Motor Transport Division Fuel Control Center

<u>TASK</u>	<u>RESPONSIBLE</u>
1. Build Vehicle File	NYCPD Motor Transport Division
2. Build Operator File	NYCPD Motor Transport Division
3. Deliver Computer to San Antonio	E. J. Ward Inc.
4. Assemble and Test Central Processing Unit	E. J. Ward Inc.
5. Ship Phase I Terminals to N.Y.	E. J. Ward Inc.
6. Ship Pump Modification Kits to N.Y.	E. J. Ward Inc.
7. Ship File Builds to San Antonio	NYCPD Motor Transport Division
8. Install Phase I Terminals-- Queens	E. J. Ward Inc.
9. Test Phase I Software-- San Antonio	E. J. Ward Inc.
10. Develop Training Package	NYCPD Police Academy & NYCPD Motor Transport Division
11. Ship Phase II Terminals to N.Y.	E. J. Ward Inc.
12. Install and Test Telephone Lines	NYCPD Communications Division and New York Telephone Co.
13. Ship Phase II Pump Modification Kits to N.Y.	E. J. Ward Inc.
14. Revise Pertinent Orders	NYCPD Office of Management Analysis and Motor Transport Division
15. Ship Remaining Terminals to N.Y.	E. J. Ward Inc.

<u>TASK</u> (Cont'd)	<u>RESPONSIBLE</u> (Cont'd)
16. Ship Remaining Pump Modification Kits to N.Y.	E. J. Ward Inc.
17. Ship Actuator Cards to N.Y.	E. J. Ward Inc.
18. Install Bronx Terminals	E. J. Ward Inc.
19. Ship Spare Parts to N.Y.	E. J. Ward Inc.
20. Finalize Card Issue Procedures	NYCPD Motor Transport Division
21. Install Manhattan Terminals	E. J. Ward Inc.
22. Develop Operation Day Procedures	NYCPD Motor Transport Division
23. Train Users	NYCPD Motor Transport Division
24. Finalize Computer Manning	NYCPD Support Services Bureau
25. Finalize Maintenance Manning	NYCPD Support Services Bureau
26. Issue Pertinent Department Orders	NYCPD Office of Management Analysis
27. Issue Actuator Cards	NYCPD Motor Transport Division
28. Final Software Testing -- San Antonio	E. J. Ward Inc.
29. Install Staten Island Terminals	E. J. Ward Inc.
30. Ship Computer to N.Y.	E. J. Ward Inc.
31. Ship Associated Hardware to N.Y.	E. J. Ward Inc.
32. Initialize Computer and Associated Hardware	E. J. Ward Inc.
33. Install Brooklyn Terminals	E. J. Ward Inc.
34. Implement Staten Island	NYCPD and E. J. Ward Inc.
35. Implement Queens	NYCPD and E. J. Ward Inc.
36. Implement Bronx	NYCPD and E. J. Ward Inc.
37. Implement Manhattan	NYCPD and E. J. Ward Inc.
38. Implement Brooklyn	NYCPD and E. J. Ward Inc.
39. Train Operations Personnel	E. J. Ward Inc.

TASK (Cont'd)RESPONSIBLE (Cont'd)

- |                                 |  |
|---------------------------------|--|
| 40. Train Maintenance Personnel | E. J. Ward Inc.                              |
| 41. Document System             | W. J. McGrath, Margaret M. McNamara,<br>NUSC |

## B. BUILDING THE FILES

The NYCPD Fuel Monitoring System has three Master Files resident in the IBM Series 1 Computer:

1. Operator File
2. Vehicle File
3. Tank/Pump File.

The data elements of these files had to be manually coded in the exact format required by the associated programs. File Build (Data Input) Sheets were supplied by the vendor for the Operator File (figure IV-1) and Vehicle File (figure IV-2), along with associated instructions and allowable coding (figures IV-3 and IV-4). NYCPD Control Center personnel coded the data, which were put into machine-readable language and entered in the Series 1 Computer by the vendor. The Tank/Pump File data were taken from the specifications.

1. The Operator File

The Control Center did not know which NYCPD personnel were authorized to operate Department vehicles, nor which had Command approval to use fuel in private vehicles. Accordingly, a memorandum was sent to each of the approximately 400 Commands requesting that they furnish that information to the Control Center by a specified cutoff date. At the same time, they obtained an alphabetical listing of all personnel from the Department's Management Information Systems Division. Upon receipt of those data elements, the file build process was initiated.

## NOTE

The cutoff meant that adds, changes, or deletes to the Operator or Vehicle files would not be tracked after the established date. The Operator and Vehicle files were updated immediately prior to going operational. All Department Personnel Orders listing personnel changes and records on vehicle changes were collected daily and held until after the files were established and proofread.

When the coded input sheets were completed, they were forwarded to the vendor for entry into the Series 1 Computer.

As a matter of interest, there were some 18,300 operators coded in the initial Operator File Build. As anticipated, there was a surge in adding personnel after the first Borough's cards were issued.

Figure IV-2. Vehicle File Build Data Sheet

- Position 1 - Card Type  
A constant "C"
- Position 2 - Card Type  
A constant "6"
- Positions 3-7 - Assigned Actuator Card Number  
This number will identify the operator actuator card assigned to the individual.
- Position 8 - A constant comma.
- Position 9 - A constant "E"
- Positions 10-18 - The operator's Social Security Number.
- Position 19 - A constant comma.
- Position 20 - A constant "N"
- Positions 21-29 - Surname of Operator
- Position 30 - A constant comma.
- Position 31 - A constant "I"
- Position 32 - The Operator's first initial.
- Position 33 - A constant comma.
- Position 34 - A constant "B"
- Positions 35-37 - Blank
- Position 38 - A constant comma.
- Position 39 - A constant "C"
- Positions 40-42 - Command  
A three digit numeric field that identifies the assigned command of the Operator.
- Position 43 - A constant comma.
- Position 44 - A constant "S"
- Position 45 - Status Code  
A numeric digit defining the Operator status as follows:
  - 0 = Regular Fuel Authority
  - 1 = Private Fuel Authority

Figure IV-3. Instructions for Operator Data Sheet

- Position 1 - Card Type  
A constant "C"
- Position 2 - A constant zero ("0")
- Positions 3-6 - Actuator Card Number  
This number will identify the actuator card number and will be four (4) numeric digits-0001 to 8000.
- Position 7 - A constant comma.
- Position 8 - A constant "V".
- Position 9 - A constant one ("1").
- Position 10 - A constant zero ("0").
- Positions 11-14 - NYCPD Vehicle Number  
This is a five (5) digit number assigned by NYCPD to identify the vehicle. Numbers are 00001 to 99999.
- Position 15 - A constant comma.
- Position 16 - A constant "K".
- Positions 17-18 - Odometer check code.  
Identifies the manner in which the computer handles checking the vehicles odometer as follows:
- Code 00 - No checking and zero out the odometer field in the transaction. (Normally used for vehicles without odometers).
  - Code 01 - Capture thumbwheel settings with no odometer checking.
  - Code 03 - Issue no fuel unless new odometer reading is entered. (Offers tight control over user ODOMETER entries and produces constant ODOMETER ERROR until entered correctly.)
  - Code 07 - Produce ODOMETER ERROR if new ODOMETER is not within miles limit of old ODOMETER reading on first try. Issue fuel on second entry regardless of ODOMETER reading and flag transaction according to the condition; (high or low).  
Flag 0 = No Error  
Flag 1 = Odometer entry low  
Flag 2 = Odometer entry high.
- Position 19 - Constant comma.
- Position 20 - Constant "M".

Figure IV-4. Instructions for Vehicle Data Sheets

Positions 21-23 - Miles Limit

The maximum number of miles from old odometer reading without the computer issuing an odometer error. (Normally the maximum miles the vehicle can travel before refueling)

Position 24 - A constant comma.

Position 25 - A constant "T".

Position 26 - Fuels allowed (Primary and Secondary)

The coded primary fuel type allowed for this vehicle as shown in Fuel Types table below.

Position 27 - A constant comma.

Position 28 - A constant "T".

Position 29 - Secondary Fuel Type

The alternate fuel type authorized for this vehicle as shown in the table below.

Fuel Type Table

0=No fuel type	6=Propane Fuel
1=Regular Gasoline	7=Reserved
2=Unleaded Gasoline	8=Reserved for Oil
3=Premium Gasoline	9=All above Fuels
4=Reserved	
5=Diesel Fuel	

Position 30 - A constant comma.

Position 31 - A constant "H".

Positions 32-34 - Vehicle Command

This is a three (3) digit numerical field that identifies the coded NYCPD Command to which this vehicle is assigned.

Position 35 - A constant comma.

Position 36 - A constant "C".

Positions 37-39 - Vehicle Classification

This is an alphameric field that identifies the make, model, and year of the vehicle. (See NYCPD Vehicle Classification Code Table page \_\_\_\_\_).

Positions 40-42 - Vehicle Tank Capacity

A three (3) digit numeric field that identifies the maximum number of gallons that this vehicles tank will hold.

Figure IV-4. (Cont d) Instructions for Vehicle File Build Data Sheets

## 2. The Vehicle File

The NYCPD Motor Transport Division is responsible for all vehicle acquisitions, assignments, and history records. The Control Center secured the records from Motor Transport and posted the data to the Vehicle File Build Data Sheets (figure IV-2) in accordance with instructions (figure IV-4). The cutoff for the Vehicle File was the date the Data Sheets were forwarded to the vendor for entry into the Series 1 Computer. Adds, changes, and deletes received after the cutoff were held until the Series 1 was delivered to New York, and then were entered into the Computer by Control Center personnel.

## 3. The Tank/Pump File

There was a very limited number of records for the Tank/Pump File. Therefore, a list was submitted to the vendor, and the vendor prepared the file build.

When the Series 1 Computer and associated hardware were shipped from San Antonio to New York and made operational, the first step was to run a complete listing of the three files (Operator, Vehicle, and Tank/Pump). These files were then proofread: the Operator File against the alphabetical listing and posted input sheets, the Vehicle File against the source documents posted and input sheets. The error rate was considerably higher than anticipated but, considering the volume of records and the fact that several individuals did the posting and several others keyed the posted data into the computer, the final result was a very high confidence-level in the accuracy of the data.

Accuracy of the data files was of prime importance. The benefits accrued from exhaustive data checks far outweigh the one-time effort in initiating a new system of this complexity.

## C. INSTALLATION OF TERMINALS AND TELEPHONE LINES

Detailed instructions for the vendor for installation of the remote terminals are contained in the System Specifications, appendix F. Specifications for the telephone lines are in the Service Guide, appendix J, page I-2, item 3, and page I-5.

From an overall project administration standpoint, the following comments are worth considerable emphasis:

The remote terminals must be installed first, then the telephone equipment, though the phone lines should be ordered well in advance of the anticipated dates required. It is recommended that a project leader establish contact with a phone company representative, and that both have considerable input to arranging orderly installation of terminals and lines. Otherwise, there is a risk that a company serviceman will arrive at a site prior to installation of the terminal, which can be likened to building a house and having the roofer arrive first. Moreover, various foremen are in charge of areas defined by the telephone company, and these areas will not necessarily conform to the structure of NYCPD.

D. PERSONNEL

The Fuel Control Center operates 7 days a week, 24 hours a day. It is staffed by a combination of uniformed and civilian personnel, but more important than the mix is the fact that they are an extremely competent team selected in advance of equipment installation. In fact, several members have been assigned to the project from conception through file build to implementation. The pilot installation provided them with the opportunity to become knowledgeable in the operation of an automated fueling system while it was still a small operation (three pumping stations on Staten Island). They learned to deal with the problems and inadequacies of the pilot, and were able to contribute to the development of the total system specifications. The extensive training resulting from their early involvement was essential. In addition, members of the team are familiar with the Department structure and user needs.

It would be hard to overemphasize the need for competent personnel, in a fuel control center, in sufficient numbers for data gathering and checking, responding to inquiries, maintenance, and supervision. Among other things, it makes the transition smoother.

NOTE

It may not be necessary for Control Center personnel to have previous experience in data processing. It is desirable however (and worked well in this case) that they be interested in the project and the system, and the professional challenge it presents. It also is useful for the user project leader to have some input into the selection of other personnel in the Control Center.

E. REVISION OF DEPARTMENT PROCEDURES

NYCPD fuel dispensing procedures were revised by Interim Order No. 9 entitled "Computerized Fuel Dispensing System," dated March 27, 1981. A copy is in appendix C.

F. TESTING AND BACKUP PROCEDURES

The following procedures were developed:

TEST PROCEDURES

1. Open terminal--Turn to Automatic
  - a. Did screen turn green?
  - b. Did intrusion alarm register?
  - c. Did transaction register?

2. Test Dispensing Transaction
  - a. Valid Dept. Vehicle--Pump 1
  - b. Valid Dept. Vehicle--Pump 2
  - c. Valid Dept. Vehicle--Pump 3 (fuel error light)
  - c. Valid Dept. Vehicle--Pump 4 (fuel error light)
  - e. Valid Vehicle Card--Wrong Fuel Type
  - f. Valid Oil Transaction
3. Test Private Vehicle Card Transaction (RED MASTER)--00(SSN)
  - a. Using Valid SSN
  - b. Using Invalid SSN
  - c. Try to exceed 10 gallons
4. Test Equipment with no Dept. I.D. Transaction (GREEN MASTER)-009999
  - a. Valid 9999 Transaction
  - b. Try to exceed 5 gallons
5. Test In-Ground Inventory Transaction (GREEN MASTER)-70XXXX
  - a. Valid Dip Transaction
  - b. Exceed Tank Capacity
6. Test Fuel Delivery Transaction (GREEN MASTER-90XXXX)
  - a. Valid Delivery
  - b. Exceed Tank Capacity
7. Test Missing Vehicle Card Transaction (GREEN MASTER)
  - a. Valid Dept. Vehicle Number
  - b. Invalid Dept. Vehicle Number
  - c. Valid Vehicle--Wrong Fuel Type
8. Test Two-Wheel Scooter Transaction (GREEN MASTER)-009xxx
  - a. Valid Transaction
  - b. Exceed 2 gallons
  - c. Valid Transaction--Wrong Fuel Type

9. Test Department Motorcycle Transaction (GREEN MASTER)-0089xx
  - a. Valid Transaction
  - b. Attempt to exceed 5 gallons
  - c. Wrong Fuel Type
10. General
  - a. Address Correct
  - b. Blue Oil Label On Terminal
  - c. Pumps Labeled 1 and 2
  - d. Fill Caps Identified 1 and 2

#### MANUAL OVERRIDE PROCEDURE

The Computerized Fuel Dispensing System being implemented in the Department uses two actuator cards, similar to credit cards, to obtain gasoline. In the event of a system failure that prevents the dispensing of fuel automatically, it may be necessary to put the affected location(s) in "MANUAL OVERRIDE." Pumps will then be locked and fueling transactions will be recorded in gasoline receipt books (MT 9), which will be maintained at each location.

When a failure condition occurs, a supervisor from that location will notify the Fuel Control Center by telephone (476-7524). The Fuel Control Center will determine the extent of the problem. If it is necessary to put that location on manual override, the Fuel Control Center will either dispatch personnel or notify the Patrol Borough concerned to make the computer terminal key available to the fueling site.

After the problem has been corrected, Fuel Control personnel will collect the information recorded on the MT 9 for entry into the computer, and will return the computer terminal to automatic fueling.

#### G. TRAINING

There are three distinct groups of individuals who must be trained in operation of a fuel control system:

1. Users in the field
2. Operating personnel in the control center
3. Equipment repair personnel.

## 1. Users in the Field

This group is all-inclusive. Everyone must be trained in use of the cards and operation of the terminal and fuel pumps--from Deputy Commissioners and Chiefs to Police Officers and "Rookies." And this group includes, of course, groups 2 and 3 mentioned above. NYCPD used a multifaceted training approach that included film, flip charts, instruction cards, etc.

1.a. Training Film. A training film was prepared by the NYCPD Police Academy Video Production Section to instruct all police officers on proper fueling procedures. A test terminal in the Control Center, which is cable-connected to the main computer, proved to be very useful in this instance and in others, which will be discussed later.

The video production people came to the Fuel Control Center at the Motor Transport Division to develop the videotape production. They went through the procedures with Control Center personnel using the test terminal, and then discussed methods of getting the information to Department personnel. The issues were:

- What is the message?
- How do we construct the message?
- How do we deliver the message?

The Control Center had to decide which elements were most important. They wanted four transactions shown:

- (1) Fueling a department vehicle
- (2) Fueling a department vehicle when the vehicle card is missing
- (3) Fueling a private vehicle
- (4) Receiving a fuel delivery.

However, the problem associated with that much material was time. The video production people knew from experience that the attention span of the audience was 5 to 7 minutes. The decision then was made to proceed with a film of about 5 minutes.

The completed film (of 5-minutes duration) communicated the following message:

- (1) It showed the old way of fueling a vehicle--get the MT 9 book and fuel pump keys, or if they are misplaced, find them; go out to the station; unlock the pump; pump fuel; make book entries; lock the pump; return the book and keys.
- (2) Then it showed the new fueling system--a standard dispensing transaction using two cards, pump-selection, entry of odometer reading; if an error light appears, correct the error and start over from Step 1; if there is still a problem, call 476-7524 (Control Center phone number) for assistance, and trained personnel will talk you through the procedure.

Each precinct has three tours of duty a day (midnight to 8 a.m., 8 a.m. to 4 p.m., 4 p.m. to midnight), 7 days a week. There is a training session before each tour during which the platoon receives information and instructions on changes of procedure and major events in the precinct (rash of muggings, parades, homicide investigations, etc.). There is a video-cassette player at every site, and the Control Center arranged for the fuel dispensing film to be shown at the training sessions before each tour for 6 weeks, beginning in October 1980 (the training cycle for new procedures is 6 weeks). In that period of time it was certain that every officer would see the film at least once, taking into account vacations, sick leave, and temporary assignments.

1.b. Introduction to the System for Department Management. A document was prepared entitled, "An Introduction to the Department-Wide Automated Fuel Monitoring System, March 1980" (see appendix H). While the total system was being installed, Sergeant Kiernan and Officer Hamel made presentations to groups of Chiefs, Borough Commanders, and Captains to introduce them to the system. They used a 24 x 36 inch flip chart and provided an 8½ x 11 inch handout of the chart to each attendee.

The document explains the study, problems noted, benefits to the users, system configuration, and data output. The introductory sessions eliminated surprise at the management level when technicians came to the precincts to install telephone lines and terminals.

1.c. Vehicle Operator Instructions and Training. Figure IV-5, Computerized Fueling Instructions, was prepared as a training guide for vehicle operators. The gold-colored sections refer to fueling of department vehicles:

- (1) Far left: vehicles with both vehicle and operator card available.
- (2) Far right (three columns): vehicles with cards missing (cards are not issued for two-wheel scooters and motorcycles because of difficulty of maintaining them in those vehicles).

Note that the only difference in these instructions is the odometer entry, which allows the computer to identify any nonstandard transaction. (For definition purposes here, a "standard" transaction is the fueling of a vehicle that has an assigned card.)

The white columns refer to authorized private vehicle fueling, equipment with no identification number (e.g., snow blowers), in-ground fuel tank inventory, and fuel delivery. Here again, the major difference is in the odometer entry.

Directions for adding oil to vehicles and a list of problems and solutions also appear on the instruction sheet.

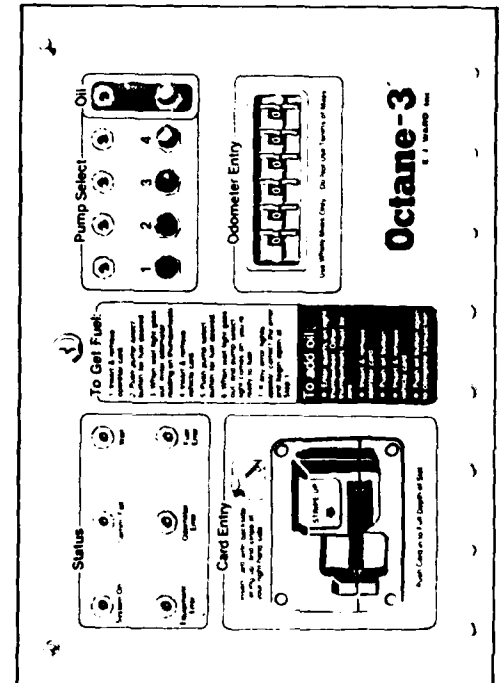

It is very important to emphasize that the final instruction design and wording were arrived at with total participation by all members of the project staff: the NUSC project leader, assistant, and graphic artist and the Fuel Control Center leaders and staff, as well as other user representatives. Mechanics from the Motor Transport Division and other Department

# COMPUTERIZED FUELING INSTRUCTIONS

Figure IV-5

employees completely unfamiliar with the system were solicited for their opinions, and additional changes were made before the final design was settled on.

Instructions were printed in four sizes:

30 x 36 inch (posters)--10 copies

20 x 24 inch--250 copies

8½ x 11 inch--1,000 copies

4 x 8½ inch--50,000 copies

A series of training sessions was held for all Department personnel before the total system was put into operation. The sessions were conducted by Sergeant Kiernan and Officer Hamel and held at Headquarters, in each Borough Headquarters (several sessions in each to reach all officers), and at the Police Academy. The 30 x 36 inch instruction posters were used for illustration, and each attendee received one of the 8½ x 11 inch size sheets. In addition to the instructional content, personnel were given a short history of the project, the reasons for the decision to automate, and a statement of the benefits of the system to them in terms of time and effort saved.

- A copy of the 20 x 24 inch sheet was placed for reference in a prominent location in each of the 68 pumping locations.

- A copy of the 8½ x 11 inch instruction sheet was taped to the front of each terminal on the day each precinct became operational.

- Copies of both the 8½ x 11 inch and 4 x 8½ inch instructions were handed out as the operator cards were issued (precinct by precinct as the terminals became operational).

- The 4 x 8½ inch instruction was hole-punched to fit into the officers' "memo books" of that size. The memo books contain summonses and important information such as Miranda rights, warnings, and Spanish phrases.

1.d. Test Terminal in Control Center. A test terminal, hard-wired to the Central Processing Unit, is installed as part of the permanent equipment in the Control Center. Control Center personnel tested all actuator cards on the test terminal before they were issued. The test terminal also provides the ability to test the telephone lines and the component boards in the Control Center.

Operator cards were issued at the Control Center in the same sequence as the phased automating at the remote sites. Command training officers were requested to pick up the vehicle and operator cards for their respective Commands at the Control Center. At that time they were given a demonstration on the use of the cards, using the test terminal. While this involved only a small number of vehicle operators, the training officers were nevertheless able to instruct the rest of the police officers in their Commands.

1.e. Operation Day Assistants. On the day each fueling station became operational, an officer familiar with the operation of the system was sent to the precinct to assist precinct personnel with first-time use. The assistants announced the startup at the morning turnout (roll call--about 7 a.m.), and then assisted the officers in first-time fueling of their vehicles. Police officers were used for this function because it was felt that they would relate better to their peers. The high level of acceptance of the system reinforces the belief that this procedure substantially affected the efficient implementation of the system and should be an element of any user training plan.

## 2. Operational Personnel in the Control Center

It was the vendor's responsibility to provide training to the Control Center operating personnel. It is desirable that they understand the logic, know the functions of all the equipment and how to operate it, and how to develop reports and history files. Since the operating personnel had been assigned to the project well in advance of implementation of the total system, the vendor's task in this case was much easier. In addition, because they had been working on the project for some time, their understanding of the system allowed them to generate better questions during the vendor's training sessions. The Control Center operating personnel are now familiar with all components of the system.

Appendix I, Operations Manual, contains all computer commands used for this system.

## 3. Equipment Repair Personnel

Since NYCPD maintains its own system, it was necessary to train three groups of individuals in repair of the remote terminals:

1. Control Center personnel
2. Building maintenance personnel who had responsibility for repair of the pumps
3. Backup personnel from Motor Transport Division.

A vendor representative conducted the training session, which consisted of a classroom lecture and a demonstration using the test terminal in the Control Center. All three groups were trained to recognize problems and to institute the following procedures:

1. Testing to determine if the terminals were communicating with the Central Processing Unit (polling),
2. Replacing the:
  - a. Interface and Power Supply Board
  - b. Modem
  - c. Random Access Memory (RAM) Board

- d. Read on Memory (ROM)
- e. Central Processor Unit
- f. Modem Board.

Appendix J, NYCPD Automated Fuel System Service Guide, was prepared by the vendor, and sufficient copies were provided to be available to personnel as needed.

#### H. ISSUING CARDS

After the files were established using the previously mentioned cutoff date, they were proofed and then updated using the adds, changes, and deletes taken from Department personnel and vehicle records. It was a time-consuming task, but was well worth the effort in terms of user credibility for the system.

Typed labels were prepared and placed on the Operator Cards to identify the card with the authorized operator. Cards were issued Command by Command in sequence with the phased implementation. A computer printout was run for each Command and one individual from the Command picked up and signed for the cards. They were then distributed with paychecks and signed for by the authorized operators. Personnel orders were tracked continuously to determine movement between Commands.

Vehicle cards were issued to Command training officers, who placed them in the assigned vehicles.

#### I. PHASED IMPLEMENTATION

The size of the system clearly indicated going operational in stages. Therefore it was phased in Borough-by-Borough according to a predetermined schedule. There was slippage in the schedule because the task of getting ready to implement was greater than had been anticipated. As has been stated, the cross-checking of all elements was a lengthy procedure, but it did ensure a high level of confidence in the reliability of the system. A critique was held after each stage to determine if implementation could be done better for the next stage.

The implementation procedures included:

1. Checking cards against current personnel printouts by Command
2. Issuing cards about 10 days before implementation (The decision was made not to issue too far in advance, since items tend to be lost more easily if they are not in use.)
3. Installing vehicle card holders--done by maintenance shops
4. Reintroducing the training film at a daily training session 7-10 days prior to going operational at the precinct level
5. Coordinating with the fuel vendor so that tanks were filled to capacity

6. Testing the remote terminals 24-48 hours before going operational
7. Coordinating with the Borough Commanders so they would know what to expect and what was needed from them
8. Sending a directive via teletype to each command 8-12 hours before going on line, ordering the system into operation
9. Re-educating the team of Operation Day Assistants and providing them with terminal keys, instructions, manual override procedures, and transportation to their assigned precinct (It proved to be most advantageous to have knowledgeable individuals in place to demonstrate a "live" transaction for the first time.)
10. Assuring that there was an adequate team in the Control Center to answer the phones.

While some of these procedures might be eliminated, there is evidence that they contributed immeasurably to the success of the implementation phase and to acceptance of the system by the NYCPD users.

## Section V

## CONCLUSIONS

## A. COSTS

The cost figures set out in Section I of this report are estimates in 1977 dollars, based on the best available information at the time of the study (mid-1977). It should also be noted that the projected savings were calculated on the basis of labor only, since those figures are easily auditable. All costs have escalated since that time--capital costs for system installation, labor, telephone line rental, and fuel. However, based on the 1977 estimates, NYCPD Management made the decision that an automated fuel system would be cost effective. It is even more so now, as reflected in the following figures compiled by NYCPD as of July 1981 with slightly over one-half of the fueling sites fully automated:

Startup and Capital Costs:	\$1,082,386
(includes labor, training, telephone line installation and rental)	
Annual Operating Costs:	\$638,858
(includes labor, system maintenance, telephone line rental)	
Estimated Savings Upon Completion:	<u>\$2,624,000</u>
(represents labor--uniformed and civilian personnel)	
Net Annual Benefits:	\$1,985,142
<u>Payback Time of Startup and Capital Costs:</u>	<u>Under 1 Year</u>

## B. BENEFITS

The foregoing projected cost savings are a benefit in terms of labor dollars saved, and are auditable. The uniformed and civilian personnel represented by the figures have been reassigned to other essential duties. Other benefits are less quantifiable, but merit discussion here:

1. Central control of fuel ordering and dispensing ensures fewer sites out-of-fuel and for shorter periods.
2. Because of 1, there is less out-of-precinct travel, since personnel do not have to go from site to site looking for gas.
3. NYCPD has control of the total fuel operation, both for management and accounting purposes.

TR 6567-II

In its present form, the system produces 50 management reports (appendix G). However, the optimum configuration would be a system as originally designed (appendix E), the reporting capabilities of which would provide for complete fleet maintenance and management. It is hoped that a total system is in the future for NYCPD.

**DELIVERY OF GASOLINE TO A STATION HOUSE**

DATE ISSUED	DATE EFFECTIVE	REVISION NUMBER	PAGE
10-1-72	10-1-72		1 of 1

- PURPOSE** To verify amount of gasoline received at department facilities.
- PROCEDURE** When gasoline is to be delivered to a department facility:
- GAS DISPENSER**
- 1. Measure the contents of the tank before delivery.
  - 2. Measure contents of tank after delivery.
  - 3. Verify amount received on vendor's invoice.
  - 4. Deliver invoice to the station house supervisor.
- S.H. SUPERVISOR**
- 5. Sign invoice.
  - 6. Return one copy to vendor.
  - 7. Retain one copy and deliver to clerical patrolman for forwarding to Quartermaster Section on next day after delivery.
  - 8. Enter in Command Log:
    - a. Amount of gasoline received
    - b. Invoice Number
    - c. Vendor's name
    - d. Name of gasoline dispenser verifying receipt.
- NOTE**
- 1. If gasoline is not available in a department facility, the station house supervisor will notify Communications Division. A second notification is made after gas has been received.
  - 2. The Gas Dispenser will order gasoline from the designated vendor, direct, when the tank is half full. If the vendor is closed, notification will be made after 0700 hours and the order recorded in the Telephone Record.

**PATROL GUIDE**

125-12

**DAILY GASOLINE SUMMARY**

DATE ISSUED	DATE EFFECTIVE	REVISION NUMBER	PAGE
10-1-72	10-1-72		1 of 1

- PURPOSE** To account for gasoline received, dispensed and on hand each day.
- PROCEDURE** At 2345 hours daily:
- GAS DISPENSER**
1. Measure amount of gasoline in storage tank.
  2. Determine amount of gasoline dispensed in the past 24 hours.
    - a. Refer to RECEIPT FOR GASOLINE, OIL, GREASE AND ANTI-FREEZE (PD 561-013).
  3. Report figures to station house supervisor.
- S.H. SUPERVISOR**
4. Enter in Command Log with heading "Gasoline Summary."
    - a. Gasoline in tank 0001 ..... Gal.  
(1) Determine from last "Gasoline Summary."
    - b. Gasoline received past 24 hours ..... Gal.  
(1) Determine from Command Log entries.
    - c. Total gasoline for 24 hours ..... Gal.
    - d. Total gasoline dispensed past 24 hours ..... Gal.
    - e. Gasoline now in tank ..... Gal.
    - f. Verified by (Gasoline Dispenser - Name).
  5. Assign a Sergeant to investigate discrepancies.
  6. Report results of investigation to commanding officer for necessary action.
- NOTE** The station house supervisor, 2nd. and 3rd. platoons, is required to enter in the Command Log at the start of his tour, "Patrolman Jones, Gas Dispenser, reports . . . gallons of gas on hand."

PROCEDURE No

325-14

<b>PRIVATE VEHICLES AUTHORIZATION</b>			
DATE ISSUED	DATE EFFECTIVE	REVISION NUMBER	PAGE
4-5-76	4-5-76		1 of 1

**PURPOSE**

To authorize members of the service to use their private vehicles in the performance of official police duty.

**PROCEDURE**

When the use of a members privately owned vehicle is necessary or desirable for the performance of official police duty:

**MEMBER OF  
THE SERVICE**

1. Submit four (4) copies of report to commanding officer.
  - a. Name, rank, shield number and command
  - b. Year, make, model and number of cylinders
  - c. Registration number of vehicle
  - d. Name and address of registered owner (Include relationship if owner other than member).

**COMMANDING  
OFFICER**

2. Review report.
3. List any restrictions in the use of vehicle on all copies.
4. Indicate Approval/Disapproval
5. File original.
6. Forward copy to next higher command and Deputy Commissioner - Administration.
7. Return remaining copy to member.

**NOTE**

If a commanding officer revokes the authorization, or if the member no longer wishes to volunteer the use of the vehicle, a signed, dated notation of this fact will be made by the commanding officer on the command file copy, and notification made to the next higher command maintaining a file copy of the original authorization, and Deputy Commissioner - Administration.

**ADMINISTRATIVE GUIDE**

PROCEDURE NO.

325-15

<b>VEHICLE IDENTIFICATION PLATES AND GAS AND OIL FOR PRIVATE VEHICLE</b>			
DATE ISSUED 4-5-76	DATE EFFECTIVE 4-5-76	REVISION NUMBER	PAGE 1 of 4

**PURPOSE**

To identify private vehicles used on official business and supply these vehicles with gas and oil.

**DEFINITION**

Department Vehicle Identification Plate is made of laminated cardboard, approximately 4 by 10 inches, and has a white background with blue print. Two (2) types of plates may be requested:

- a. **INDIVIDUAL PLATE** - issued to members of the service whose duties require frequent use of plate
- b. **POOL PLATE** - retained in command and issued to members as necessary.

**PROCEDURE**

When Vehicle Identification Plates are required:

**COMMANDING OFFICER**

1. Determine minimum number of plates.
2. Request plates, as follows:
  - a. **POOL PLATE**
    - (1) Prepare report listing the number of plates required, command and justification
    - (2) Forward request, through channels, to Deputy Commissioner-Administration.
  - b. **INDIVIDUAL PLATES**
    - (1) Have member concerned submit four (4) copies of request addressed to Commanding Officer, Motor Transport Division, containing:
      - (a) Name, rank, shield number and command
      - (b) Reason for request - permanent or temporary
      - (c) Owner of vehicle
      - (d) Address of owner
      - (e) Address of member of service concerned (if different from item d)
      - (f) Year and make of vehicle
      - (g) Registration number
      - (h) Estimated monthly mileage for official business.
    - (2) Endorse request and include justification.
    - (3) Forward request, through channels, to Deputy Commissioner-Administration.

**DEPUTY COMMISSIONER-ADMINISTRATION**

3. Review and forward approved requests to Commanding Officer, Motor Transport Division

**COMMANDING OFFICER, MOTOR TRANSPORT DIVISION**

4. Process approved requests:
  - a. **POOL PLATES** - forward plate number to all dispensing stations for addition to "master list". Gas and oil is authorized for pool plates at all dispensing stations.
  - b. **INDIVIDUAL PLATES** - indicate on all copies of request the dispensing station authorized; file the original request and forward remaining copies as follows:
    - (1) Dispensing station designated
    - (2) Member's commanding officer
    - (3) Member.

<b>VEHICLE IDENTIFICATION PLATES AND GAS AND OIL FOR PRIVATE VEHICLE</b>			
<small>DATE ISSUED</small> 4-5-76	<small>DATE EFFECTIVE</small> 4-5-76	<small>REVISION NUMBER</small>	<small>PAGE</small> 2 of 4

**MEMBER OF SERVICE**

5. Display plate when necessary to identify vehicle on official business.
6. Comply with traffic regulations except in cases of urgent police business.
7. Safeguard plate.
8. Leave plate and ignition key in custody of station house officer when garaging vehicle at a precinct facility.

**S.H. OFFICER**

9. Make entry in COMMAND LOG.
  - a. Make subsequent entry when picked up.

**MEMBER OF SERVICE**

- 10. Obtain gas and oil at designated location.
  - a. Obtain authorization to use an alternate station from Motor Transport Division if designated station is closed for an extended period of time
  - b. Carry copy of authorization in vehicle and display to dispenser
  - c. Report on four (4) copies change in vehicle or registration number, through channels, to Commanding Officer, Motor Transport Division indicating:
    - (1) Year and make of vehicle
    - (2) New registration number.
  - d. Do not obtain gas and oil after first day of June each year unless authorization has been renewed.

**COMMANDING OFFICER**

- 11. Maintain a CONTROL LOG including name of member, vehicle description, destination, distance traveled and gas and oil received.
- 12. Subdivide LOG and account for each plate, both POOL and INDIVIDUAL, assigned to command.
- 13. Prepare and forward four (4) copies of report through channels, to Commanding Officer, Motor Transport Division when need for INDIVIDUAL plate no longer exists. Include:
  - a. Name, rank and shield number of member
  - b. Department plate number
  - c. Location where gas and oil obtained
  - d. Date of discontinuance.
14. Forward plate by messenger to Commanding Officer, Motor Transport Division.
  - a. Obtain receipt and file with copy of original approved request.
15. Forward report to Commanding Officer, Motor Transport Division if plate is reassigned to another member of command, indicating:
  - a. Number of plate
  - b. Information required, in step 2, INDIVIDUAL PLATES, subdivision b, above.

**ADMINISTRATIVE GUIDE**

**COMMANDING OFFICER**  
(continued)

- 16. Prepare and forward report in duplicate to the Commanding Officer, Motor Transport Division, through channels, if a Department Identification Plate is lost or stolen, including:
  - a. Details of the incident, and
  - b. COMPLAINT REPORT number, and
  - c. Request for a new plate if required.
- 17. Request renewals through channels before March 15 of each year including:
  - a. Name, rank and shield of member concerned
  - b. Owner of vehicle
  - c. Address of owner
  - d. Address of member of service concerned if different from above
  - e. Year and make of vehicle
  - f. Registration number of vehicle
  - g. Certification by unit commander that need still exists
  - h. Date of current authorization
  - i. Total mileage vehicle driven on police business during current authorized period
  - j. Total amount of gas and oil received from Police Department during period.
- 18. Forward consolidated request for renewals, in duplicate, to Commanding Officer, Motor Transport Division no later than April 1st using following format:

RANK	NAME	SHIELD	COMMAND	MAKE/YEAR OF VEHICLE	REGISTRATION NUMBER
------	------	--------	---------	----------------------	---------------------

- 19. Forward expired plates to parent command before June 30 with report indicating number of plates returned.
  - a. Parent command will forward plates to Commanding Officer, Motor Transport Division with report no later than June 30 each year.

**NOTE**

Any discrepancies between the number of Vehicle Identification Plates issued and the number returned will be explained and the COMPLAINT REPORT serial number included, if appropriate.

**COMMANDING OFFICER DISPENSING STATION**

- 20. Forward report, by the 5th day of each month to Commanding Officer, Motor Transport Division and commanding officer of member receiving gas and oil, indicating:
  - a. Total gas and oil dispensed to each authorized member during previous month
  - b. Total gas and oil dispensed to all members of command concerned.

**ADMINISTRATIVE GUIDE**

PROCEDURE No

325-15

<b>VEHICLE IDENTIFICATION PLATES AND GAS AND OIL FOR PRIVATE VEHICLE</b>			
DATE ISSUED 4-5-76	DATE EFFECTIVE 4-5-76	REVISION NUMBER	PAGE 4 of 4

**COMMANDING  
OFFICER –  
AUTHORIZED  
MEMBERS**

- 21. Compare reports received from commanding officer, dispensing stations with entries in CONTROL LOG.
  - a. Verify gas and oil consumption conforms to following:
    - (1) Approximately one (1) gallon of gas for each ten (10) miles of service connected driving should be maintained over an extended period of time
    - (2) Approximately one (1) quart of oil for each two hundred (200) miles of service connected driving.

**NOTE**

Consideration may be given to the type vehicle used.

**DEPUTY  
COMMISSIONER  
AND AREA  
COMMANDERS**

- 22. Submit consolidated quarterly report to Commanding Officer, Motor Transport Division. These reports are due 30 days after end of quarter. State:
  - a. Mileage incurred was for official duty
  - b. Gas and oil disbursement was consistent with mileage.

**COMMANDING  
OFFICER –  
MOTOR TRANSPORT  
DIVISION**

- 23. Submit quarterly report to the Police Commissioner indicating the disposition of all Department Vehicle Identification Plates.

POLICE DEPARTMENT  
CITY OF NEW YORK

August 16, 1976

TO ALL COMMANDS

Subject: DISPENSING GASOLINE

1. Often times department gasoline dispensing facilities are closed, causing a reduction in the number of radio motor patrol cars available for patrol, because:

- a. Authorized gas dispenser is not performing duty
- b. Fuel supplies are depleted
- c. Pumping equipment is malfunctioning or inoperative due to water in the main gas tank.

2. The elimination of these problems will increase the number of cars available for use while enhancing safety and security at dispensing stations. Therefore, commanding officers of commands with dispensing facilities will:

- a. Instruct gasoline dispensers and station house officers to comply with the provisions of Patrol Guide procedures 125-11 (Delivery of Gasoline to Station House) and 125-12 (Daily Gasoline Summary).
- b. Designate a supervisory officer and/or the patrol supervisor on each tour of duty to supervise gasoline operations at frequent and irregular intervals.
- c. Ensure that gasoline is dispensed either by or under direct supervision of a member of the department possessing a Certificate of Fitness issued by the Fire Commissioner.

3. The Administrative Code (Section C19-70.0) does not require the actual dispenser of gasoline to possess a Certificate of Fitness. It is sufficient that the member possessing the Certificate is present to supervise the pumping of gasoline. Therefore, to insure that department gasoline dispensing facilities do not close due to the unavailability of qualified gas dispensers, commanding officers concerned shall submit a request for Certificate of Fitness as per Administrative Guide procedure 320-16 (Certificate of Fitness - Gasoline Dispenser) for lieutenants, sergeants, station house officers and civilian personnel having custodial job titles assigned to their commands.

4. Members of the department assigned to dispense or supervise the dispensing of gasoline will:

- a. Comply with the provisions of Patrol Guide procedure 103-2, page 18 (Duties and Responsibilities - Gasoline Dispenser)
- b. Request operators of unmarked, converted or private vehicles displaying vehicle identification plates to identify themselves prior to dispensing gasoline to such vehicles
- c. Report defective pumping equipment promptly to Building Maintenance Section and make follow up report if equipment is not repaired within reasonable time
- d. Post "NO GAS" sign when less than ninety (90) gallons of gasoline remains in tank.

5. In addition, to eliminate engine problems caused by water being pumped into gas tanks of radio motor patrol cars, gasoline dispensers WILL NOT:

- a. Pump gas during or for a minimum of one hour after gasoline has been delivered
- b. Dispense gas when less than ninety (90) gallons remains in the tank.

6. Commanding officers concerned will assign a ranking officer to supervise a monthly test which is conducted to determine the amount of water in the gasoline storage tank. The Building Maintenance Section will provide equipment and necessary instructions to conduct these tests. An entry will be made in the Command Log and two (2) copies of a report indicating results of the test will be prepared on Typed Letterhead and forwarded to the Deputy Commissioner-Administration, DIRECT.

7. Commanding officers concerned will also prepare two (2) copies of a report on Typed Letterhead and forward, through channels, to the Deputy Commissioner-Administration, listing all available information concerning vendors who do not respond to a request for delivery of gasoline.

8. Any provision of the Department Manual or other department directive in conflict with this order is suspended.

9. Operations Order 103, series 1974 is REVOKED.

BY DIRECTION OF THE POLICE COMMISSIONER

All Commands

INTERIM ORDER NO. 33

POLICE DEPARTMENT  
CITY OF NEW YORK

March 27, 1981

TO ALL COMMANDS

Subject: COMPUTERIZED FUEL DISPENSING SYSTEM

1. The department has developed a Computerized Fuel Dispensing System which will be phased in on a borough by borough basis. The effective date of implementation within each borough will be announced via transmission of a TELETYPE and FATN message. The new system will provide the following benefits:

- a. Eliminate the need for:
  - (1) Gas receipt books
  - (2) Locks and keys for gas pumps
  - (3) Re-ordering fuel at precinct level
  - (4) Quarterly vehicle mileage reports
  - (5) Gasoline summary entries in Command Log
  - (6) Telephone notifications of amount of fuel on hand
  - (7) Monthly and quarterly reports of gasoline and oil dispensed to authorized private vehicles
- b. Alleviate the "No Gas" problem
- c. Reduce out of service time to re-fuel department vehicles
- d. Permit reassignment of personnel currently involved in dispensing fuel
- e. Provide more efficient and accurate records of dispensing operations.

2. Under the Computerized Fuel Dispensing System, members of the service qualified to operate a department vehicle, and designated by their commanding officers, will be issued a plastic Operator Card, similar to a credit card, which will uniquely identify the member to whom issued; each department vehicle will be assigned a Vehicle Card which uniquely identifies the vehicle concerned. While the major portion of fuel dispensing operations will be accomplished utilizing these two cards alone certain specific re-fueling and recording transactions indicated in the procedure contained herein will require the issuance of two (2) additional cards - a Master Card and a Private Vehicle Card - to each fuel dispensing facility within the department.

3. It is emphasized that these plastic cards are an integral part of the new system; without them, it will be impossible to re-fuel at any department facility. Conversely, possession of a valid OPERATOR CARD by a person other than the member to whom issued, affords that person access to fuel at any department facility; the computer will record any fuel so obtained as having been received by the member to whom the card was issued. Thus, it is incumbent upon each member concerned to exercise due care in safeguarding cards from loss and/or damage at all times. However, should a card be misplaced, lost or damaged, the member concerned must immediately notify the Fuel Control Center, Motor Transport Division (476-7524), so that the card may be invalidated and a new one issued. Prompt notification will eliminate the possibility of unauthorized use.

4. To further ensure the integrity of the system, the commanding officer of a member to whom an OPERATOR CARD has been issued will require the surrender of such card when the member concerned:

- a. Retires, resigns or dies
- b. Is suspended or dismissed
- c. Has been granted indefinite military leave or extended leave of absence.

After taking possession of an OPERATOR CARD in any of the foregoing circumstances, the commanding officer concerned will notify the Fuel Control Center, by telephone, so that the card may be invalidated and then forward the card to that unit, via department mail.

5. Upon transfer of a member authorized to obtain fuel for a private vehicle, the private vehicle fueling privilege will be invalidated automatically by Fuel Control Center personnel on the basis of current Personnel Orders; no action on the part of the member or his former commanding officer is required. The member will retain his original OPERATOR CARD for use in re-fueling department vehicles, but private vehicle fueling transactions will be rejected by the computer. Reinstatement of the private vehicle fueling privilege will require a Typed Letterhead from the member's new commanding officer to the Commanding Officer, Motor Transport Division.

6. Commands concerned are advised that at the time the system becomes operational, they will no longer be required to re-order motor vehicle fuel. This will be accomplished automatically by the Fuel Control Center when the computer indicates fuel on hand has reached a prescribed level. However, VENDOR'S INVOICES indicating fuel delivery to department facilities will continue to be FORWARDED TO AUDITS & ACCOUNTS SECTION THE NEXT DAY AFTER DELIVERY. Additionally, commanding officers concerned will designate responsible members to monitor the supply of engine oil available and re-order additional oil, as required, through Motor Transport Division.

7. All members of the service concerned are advised that when the Computerized Fuel Dispensing System first becomes operational, the initial insertion of the VEHICLE CARD into the computer terminal will result in the appearance of an "Error Light" because the computer has insufficient recorded data pertaining to the vehicle. No fuel can be obtained until the procedure is repeated in its entirety. Upon completion of the required procedure the second time, the pump lever may be activated and fuel obtained.

8. In the event of a computer breakdown or other emergency, MANUAL OVERRIDE procedures have been developed by Motor Transport Division to ensure continued availability of fuel for department vehicles.

9. Accordingly, upon implementation of the Computerized Fuel Dispensing System, all members of the service concerned will comply with the following:

**PURPOSE** To obtain fuel for department and/or authorized private vehicles.

**DEFINITIONS** OPERATOR CARD (white) - Issued to members qualified to operate department vehicles AND designated by their commanding officers; uniquely identifies member concerned.  
VEHICLE CARD (blue) - Issued to each department vehicle; uniquely identifies the vehicle to which assigned.

PRIVATE VEHICLE CARD (red) - Issued to each fuel dispensing facility within the department for use in conjunction with the OPERATOR CARD to obtain fuel and/or oil for authorized private vehicles, including department ambulances.

MASTER CARD (green) - Issued to each fuel dispensing facility within the department for use in conjunction with the OPERATOR CARD, to:

- a. Permit re-fueling of department vehicle when assigned VEHICLE CARD is MISPLACED, LOST OR DAMAGED.
- b. Record fuel deliveries.
- c. Verify and record fuel on hand in in-ground storage tanks, as indicated by "dip stick" readings.
- d. Provide fuel for small machinery not having a department vehicle identification number, i.e., snow blowers, generators, etc.

PROCEDURE

When motor vehicle fuel is required:

MEMBER OF THE SERVICE

- 1. Verify that "System Light" is on, indicating that system is operational.
  - a. Notify Fuel Control Center (476-7524) if inoperative.
- 2. Insert OPERATOR CARD in "Card Entry" slot on face of computer terminal and remove smartly.

NOTE

When any of the above defined cards is inserted in the "Card Entry" slot on face of terminal, the magnetic tape strip MUST FACE UPWARD AND TO THE RIGHT.

- 3. Push "Pump Select" button for fuel desired.
  - a. Wait for amber "Wait Light" to go out.
- 4. Enter odometer mileage reading to NEAREST WHOLE MILE, using thumbwheels on face of terminal.
  - a. Thumbwheel positions NOT REQUIRED to record mileage MUST BE SET AT ZERO, eg., 001234, 012345, etc.
- 5. Insert Vehicle Card in "Card Entry" slot and remove smartly
- 6. Push same "Pump Select" button as in step 3
  - a. Wait for amber "Wait Light" to go out and green "Pump Select Light" to appear.
- 7. Activate pump lever and obtain required fuel.
  - a. If re-fueling is not commenced in a timely fashion, system will shut down and require that procedure be repeated to obtain fuel.

NOTE

If a "Error Light" appears, correct the error and repeat procedure

TO OBTAIN FUEL FOR AUTHORIZED PRIVATE VEHICLES

- 8. Obtain Private Vehicle Card (red) from station house officer/supervisory member.
- 9. Complete steps 1, 2 and 3, above.
- 10. Enter LAST FOUR (4) DIGITS OF SOCIAL SECURITY NUMBER ON RIGHT MOST THUMBWHEELS.
  - a. Set remaining LEFT MOST thumbwheels at ZERO, i.e., 00.

NOTE

Odometer mileage readings are NOT REQUIRED when using Private Vehicle Card to obtain fuel.

11. Insert Private Vehicle Card in "Card Entry" slot and remove smartly.
12. Complete steps 6 and 7 above
13. Return Private Vehicle Card to station house officer/supervisory member.

TO OBTAIN FUEL FOR DEPARTMENT VEHICLE WHEN ASSIGNED VEHICLE CARD IS MISPLACED, LOST OR DAMAGED

14. Obtain Master Card (green) from station house officer/supervisory member.
15. Complete steps 1, 2 and 3, above.
16. Identify type of vehicle by dialing appropriate digits on LEFT MOST thumbwheels, as follows:

<u>TYPE OF VEHICLE</u>	<u>ENTER ON LEFT MOST THUMBWHEELS</u>
Department auto, van, station wagon, truck, patrol wagon	00
Department scooter	009
Department motorcycle	0089
Auxiliary Police vehicle	0088

NOTE

When using the MASTER CARD IN LIEU OF ASSIGNED VEHICLE CARD to re-fuel department vehicles, ODOMETER MILEAGE READINGS WILL NOT BE ENTERED ON THUMBWHEELS.

17. Enter assigned department vehicle identification number in RIGHT MOST thumbwheel position(s).

NOTE

Thumbwheel positions NOT REQUIRED to indicate type of vehicle and/or assigned department vehicle identification number MUST BE SET AT ZERO.

18. Insert Master Card in "Card Entry" slot and remove smartly.
19. Complete steps 6 and 7, above.
20. Return Master Card to Station house officer/supervisory member.

TO RECORD ENGINE OIL OBTAINED FOR DEPARTMENT VEHICLES

21. Put required amount of oil into vehicle.
22. Enter number of quarts used on RIGHT MOST thumbwheel.
  - a. Set remaining thumbwheel positions at ZERO.
23. Insert OPERATOR CARD in "Card Entry" slot and remove smartly.
24. Push "Oil" button.
  - a. Wait for amber "Wait Light" to go out.
25. Insert VEHICLE CARD in "Card Entry" slot and remove smartly.
26. Push "Oil" button.
  - a. When "Wait Light" goes out, transaction has been recorded.

NOTE

When obtaining engine oil for a department vehicle whose VEHICLE CARD has been lost, misplaced or damaged, the Master Card can be used in lieu of the assigned VEHICLE CARD in step 25.

TO RECORD ENGINE OIL OBTAINED FOR AUTHORIZED PRIVATE VEHICLES

27. Complete steps 21 through 26, SUBSTITUTING THE PRIVATE VEHICLE CARD FOR THE VEHICLE CARD required in step 25.

ADDITIONAL DATA

As indicated in the DEFINITIONS, the MASTER CARD (green) is necessary to record certain other transactions, to wit:

TO RECORD FUEL DELIVERIES AT DEPARTMENT FACILITIES

28. Insert OPERATOR CARD in "Card Entry" slot and remove smartly.
29. Push "Pump Select" button.
30. Identify transaction by setting LEFT MOST thumbwheel at 90.
31. Indicate gallons of fuel delivered on RIGHT MOST thumbwheel positions, eg., 1500, 0900, etc.
  - a. Unused thumbwheel positions must be set at ZERO.
32. Insert MASTER CARD in "Card Entry" slot and remove smartly.
33. Push same "Pump Select" button.
34. Transaction is completed when amber "Wait Light" goes out.

TO RECORD FUEL ON HAND IN IN-GROUND STORAGE TANK PER "DIP STICK" READING

35. Complete steps 28 and 29, above.
36. Identify transaction by setting LEFT MOST thumbwheels at 70.
37. Enter gallons of fuel on hand ("dip stick" reading) by setting RIGHT MOST thumbwheels at appropriate digital positions, eg., 0090, 0450, 1000, 1100, etc.
38. Complete steps 32 and 33 above.
39. Transaction is completed when amber "Wait Light" goes out.

TO DISPENSE FUEL TO SMALL EQUIPMENT HAVING NO DEPARTMENT VEHICLE IDENTIFICATION NUMBER

40. Complete steps 28 and 29, above.
41. Identify transaction by setting thumbwheel positions at 009999 IN ALL INSTANCES.
42. Insert MASTER CARD in "Card Entry" slot and remove smartly.
43. Push SAME "Pump Select" button.
  - a. Wait for amber "Wait Light" to go out and green "Pump Select Light" to appear.
44. Activate pump lever and obtain required fuel.

10. Any questions pertaining to the foregoing procedure may be resolved by contacting the Fuel Control Center, Motor Transport Division, telephone (476-7524).

11. Any provisions of the Department Manual or other department directives in conflict with this order are suspended.

		TYPE	SIZE		
V	1	Alpha	1	File Identifier	"V" identifies the Vehicle File
V01	2-7	Numeric	6	Actuator Card Number	A serialized number magnetically encoded in the vehicle actuator card for uniquely identifying a record or vehicle in the vehicle file.
V02	8-10	Numeric	3	Agency Code	Identifies the agency within the City Government. Codes are defined in Appendix "C" of the Integrated Financial Management System Manual. Code for Police Dept. is "056".
V03	11-19	Alphanumeric	9	<u>Record ID</u>	
		Numeric	2	Classification Code (Pos. 11-12)	A classification grouping of vehicles. See classification Code Table attached
		Numeric	4	Vehicle Number (Pos. 13-16)	A reuseable number assigned by the Police Department to identify each police vehicle.
		Alpha	1	Active or Inactive Record Identifier (Pos. 17)	"A" indicates the active record on file. "I" indicates inactive record (s) on file. There can be multiple "I" records on file but only one (1) "A" record.

		TYPE	SIZE		
V101	294-299	Numeric	6	<u>REPAIR COSTS</u> Air Conditioning, Heating and Ventilating System	Cost for repair as indicated. Includes all fans, hoses, thermostats, ductwork, etc., associated with the environmental control of the vehicle cab.
V102	300-305	Numeric	6	Cab and Sheet Metal	Includes all cab and sheet metal required to cover the major vehicle components. This category includes all integral bodies and pickup type beds normally supplied by the vehicle manufacturer. It also includes windshields, glass, reflectors, mirrors, seats and interior cab equipment. It does not include special bodies such as pumps and containers.
V103	306-311	Numeric	6	Instrument and Gauges	Includes all instruments, gauges and warning devices.
V111	312-317	Numeric	6	<u>CHASSIS</u> Axles Front - Non-Driven	Begins at, but does not include, the front springs and includes all components up to but not including the wheel bearings.
V112	318-323	Numeric	6	Axles Rear - Non-Driven	Begins at, but does not include, the rear springs and includes all components up to but not including the rear hubs and bearings.

Appendix F  
SYSTEM SPECIFICATIONS  
AND  
CHANGE ORDERS

SPECIFICATIONS  
FOR FURNISHING ALL LABOR AND MATERIAL  
NECESSARY AND REQUIRED FOR  
INSTALLATION OF AUTOMATED VEHICLE  
FUELING SYSTEM FOR VARIOUS  
POLICE PRECINCTS  
LOCATED IN  
FIVE BOROUGHS  
CITY OF NEW YORK\*

\*Pages 1-34 are City of New York General Conditions Governing  
All Contracts.  
Page 53 was skipped in numbering.

SECTION NO. 1  
SPECIFIC REQUIREMENTS

The "General Conditions Governing All Contract" shall apply to all work.

1. Scope of Work

- a) Installation of an automated on line fuel dispensing and accounting system to serve the City-wide vehicle fuel pumping stations of the Police Department, City of New York.

- b) Sequence of Contract

The contract work will be done by Boroughs.

Phase No. 1	-	Queens
Phase No. 2	-	Bronx
Phase No. 3	-	Manhattan
Phase No. 4	-	Brooklyn
Phase No. 5	-	Staten Island

- \* See Change Order C-1, Item 25

Contractor must install all terminals in one phase before proceeding with the next phase. Contractor can only bring up the next phase after the previous phase is operational.

- c) Specifications Sections

Following is a brief outline of the work to be done under the contract.

Section No. 1	-	Specific Requirements
Section No. 2	-	Fuel Dispensing System
Section No. 3	-	Pump location and sketches
Section No. 4	-	Test and acceptance.

- d) The Contractor, before bidding, shall verify all dimensions and conditions in the field for the purpose of including in his proposal any allowance necessary to take care of contingencies or conditions affecting the completion of the work shown or specified. No allowance shall be made by the City if the contractor fails to make such examination.

2. Scope of Work

The work of this section shall consist of furnishing all labor, materials, equipment and appliance necessary and required to completely execute the "Specific Requirements" described herein.

## 3. Related Work Not In Contract

Transmission lines to be leased from the New York Bell Telephone Company by the City.

## 4. Notification

- a. The Contractor shall notify the Commissioner at least 48 hours in advance of the time he intends to start work. Notice shall also be given by the Contractor upon completion of his work that he is ready for test as required in the "General Conditions Governing All Contracts".

## 5. Supervision

- a. The Contractor shall provide a competent supervisor, who shall be at P.D. Central Repair while work is in progress.

## 6. B.G.E. Job Number

- a. The B.G.E. job number for this Contract is given in the "General Conditions Governing All Contracts".

## 7. Bulletins and Sketch Drawings

- a. Bulletins and Sketch Drawings shall be submitted as specified under the "General Conditions Governing All Contracts".

## 8. Shop Drawings and Samples

- a. Procedure: The procedure for submitting shop drawings and samples for approval is given under the "General Conditions Governing All Contracts".
- b. Drawings To Be Submitted: The Contractor shall submit for approval, among others, shop drawings of all equipment to be installed.

## 9. Samples

- a. Procedure: Samples shall be submitted in accordance with the "General Conditions Governing All Contracts".
- b. Samples To Be Submitted: The samples to be submitted for approval shall include the following materials, fittings, devices and appliances:
  - (1) Cable and Wire.
  - (2) Conduit, and Fittings.

- (3) Electrical Devices and Appliances.
- (4) Outlet Boxes and Covers.
- (5) Receptacles and Plugs.
- (6) Switches and Circuit Breakers.
- (7) Pressure Connectors.
- (8) Fuses.

c. All Other Samples: Samples of any equipment may be required if deemed necessary to establish compliance with the intent of the Specifications, and will be requested by the Commissioner.

10. Schedule of Materials, Fittings and Equipment

a. A schedule of materials, fittings and equipment shall be submitted for approval, in sextuplet. This schedule should show quantity, make, catalogue number and finish of all materials.

11. Inspection

a. Before submitting a proposal for the work, the Contractor shall inspect the site and examine any and all adjoining structures and properties for the purpose of including in his proposal any allowance necessary to take care of contingencies or conditions affecting the completion of the work as shown or specified. No allowance shall be made if the Contractor fails to make such examination.

12. Intent of Specifications and Sketches

a. This specification is not intended to describe nor the sketches to show every conduit, fitting or appliance. The Contractor shall furnish and install all equipment, accessories, supports, connections, fittings, testing, adjusting, etc., as herein specified or required to make the various systems complete and ready for proper operation. Any item or work called for in the specification but not shown on the sketches, or vice versa, shall be furnished and installed as items both specified and/or shown.

b. All wires, conduit, given are minimum sizes. If these sizes are not available the next larger size shall be installed without extra cost to the Owner.

13. Painting

a. All exposed conduits, boxes, cabinets, junction boxes and all other surfaces of equipment furnished under this Contract shall be painted as

required by the "General Conditions Governing All Contracts". This shall apply to painted, baked on, or integral metal finishes.

14. Balancing of Load
  - a. Special care shall be exercised by the Electrical Contractor in balancing all loads on phases, mains, feeders, sub-feeders, etc.
15. General Conditions Governing All Contracts
  - a. The Contractor shall thoroughly familiarize himself with the "General Conditions Governing All Contracts".
  - b. The Contractor shall give particular attention to the following items in the "General Conditions Governing All Contracts" and carry out their requirements in the performance of his work:
    - (1) Approval of materials and drawings.
    - (2) Tests.
    - (3) Temporary Structures.
    - (4) Sleeves and Hangers.
    - (5) Cutting and Patching.
    - (6) Scaffolding and Ladders.
    - (7) Hoists and Hoistways.
    - (8) Protection of Equipment.
    - (9) Electrical Installation Procedures.
    - (10) Approval of Materials and Manufacturers.
    - (11) Information to Suppliers.
    - (12) Responsibility for Care and Protection of Equipment.
    - (13) Removal of Rubbish.
16. Cutting and Patching
  - a. The Contractor shall perform all cutting and patching required by the installation of his work, as defined in the "General Conditions Governing All Contracts" and as indicated on the Drawing. He shall assume full responsibility for the work and make all arrangements and pay all charges to other

trades that he may find necessary to use, due to jurisdictional requirements.

17. Interruption of Fuel Service

- a. Where the work makes temporary shut-down of individual fuel pumping locations unavoidable the vendor shall confer with the Police Department's representative to schedule the shut-down to minimize interference with established operational routine.
- b. The contractor shall arrange to work continuously including overtime if required to assure that services will be shut-down only during the time actually required to make the necessary connections to existing work.
- c. In no case will the shut-down of fuel pumping locations exceed the number and locations approved by the Police Department representative. Ample notice shall be given to permit the Police Department to institute alternate procedures during the shut-down period.

18. Evening and Weekend Work

- a. All cutting and chopping in floor, wall or ceiling surfaces, required for any installation, shall not interfere with normal operation of the building in working hours.
- b. Any work which may interfere with normal operation shall be done in the evening or during the weekend.
- c. Weekend or evening work shall be performed at the Contractor's expense and at no extra cost to the City.
- d. The Contractor shall obtain permission from the building custodian at least forty-eight hours in advance of performing any evening or weekend work.

19. Installation

All fuel dispensing equipment shall be installed in strict accordance with the manufacturer's instructions and wiring diagrams, and the latest Rules and Regulations of the Board of Standards and Appeals.

20. Acceptance Test

Upon completion of the system, a satisfactory test of the entire system installation shall be made by a factory trained representative of the manufacturer who,

upon completion of such test shall file a letter indicating that the system(s) functions and complies to these specifications.

21. Certificates

All certificates of inspection required by all Agencies having jurisdiction for the system installation in this Section shall be the responsibility of this Contractor, as to their acquisition and processing.

22. Instruction Manuals

This Contractor shall provide three complete sets of all service notes, instructions books, installation and schematic diagrams pertaining to system equipment and operation, resetting etc. to the representative of the Commissioner.

23. Guarantee

All apparatus shall be guaranteed to be free of inherent mechanical or electrical defects in accordance with the "AGREEMENT" of this Contract.

24. Instructions to Vendors for Preparing and Submitting Proposals

The instructions included in this section describe the format for proposals and outline the approach for their development and presentation. These instructions are designed to insure the submission of information essential to the understanding and to the comprehensive evaluation of the system and equipment proposed. There is no intent to limit the content of proposals and these instructions permit the inclusion of any additional data or information the vendor deems pertinent.

a) Economy of Preparation

Proposals should be prepared simply and economically providing a straightforward and concise explanation of capabilities which will satisfy the requirements of this contract bid. Technical literature pertaining to hardware, software, and other elements of vendor support should be included as part of the proposal. Emphasis should be placed on completeness and clarity of content. This process makes provision for limited discussion with vendors. However, this will be limited to clarification of their proposals and will not permit revisions in content. All illustrative or pictorial material must be reproduced or presented in such a way as to be clearly legible for evaluation.

b) Vendor Cost to Develop Proposal

Cost for preparing and submitting proposals in response to this specification are entirely the responsibility of the vendor and will not be chargeable in any manner to the City.

c) Format of Vendor Proposal

Vendors responding to this bid must submit a proposal which provides a separate response to each and every numbered paragraph contained in the specification. All answers or responses must be complete and unequivocal in content. In instances where a response is not required or where material is not applicable to a specific proposal, the only acceptable responses will be, "no response required" or "not applicable".

\* \* \* \* \*

\* *Amended to reflect compliance with Section No. 2, Items 3 and 4.*

## SECTION NO. 2

## FUEL DISPENSING SYSTEM

The "General Conditions Governing All Contracts" shall apply to all work under this Section.

## 1. Scope of Work

- a) The work under this section shall consist of furnishing and installing a "TURNKEY" automated on-line fuel dispensing computer driven and accounting system to serve the City-wide vehicle fuel pumping stations for the Police Department, City of New York.
- b) The vendor is expected to propose a fuel dispensing and accounting system. This will include the installation of all hardware and wiring. The vendor shall supply all labor, material, hardware, system design, software, programming and any pump modifications required.
- c) Vendor may use existing computer system 7, or provide his own alternate computer provided it can interface with the existing back-end equipment.

\* *Amended to use stand-alone IBM Series 1 supplied by vendor.*

## 2. Competence of Vendors

The vendor must demonstrate prior expertise and industry experience to the satisfaction of the city in the development and installation of On Line Fuel Data Gathering and Monitoring Systems. This guide line considers the competence and reliability of the vendor to deliver, install, maintain, and support the hardware and software. The vendor must have a "Live" operational system currently in use and available to the city for inspection.

## 3. Program Overview

- a) The vendor's proposal shall be directed to the installation of a system in the five (5) Boroughs of the City of New York, controlled from a computer located at the Police Departments, Central Repair Shop in the Borough of Queens. The system shall be required to control the fueling of approximately 4,000 vehicles at 70 fueling stations by approximately 28,000 authorized personnel.
- b) The system bid must have "add-on" capabilities. It shall be possible to expand the basic system to control any additional fueling stations. The system shall be so designed that any expansion of the system shall not require abandonment or replacement of any part of the basic system.

- c) The system shall be relatively easy to operate by personnel who are not trained as professional computer systems operators. It must be fully automated and operate completely unattended 24 hours a day, 7 days a week. It must be user oriented free of the need for programmers. User interaction must be simple and straight-forward. The language structure must be easy to learn and use. New Users should be able to use the system within a week.

4. System Functions

The system at a minimum shall be capable of performing the following transactions.

- a) Control and Record fuel dispensing, automatically from the fueling locations.
- b) Input of dispensing transactions from Central Control.
- c) Record delivery of fuel by entry at the pump terminal or central control.
- d) Print reorder message at central control.
- e) Inventory Check Transactions.
- f) Shut down and activate pumps and/or locations.
- g) Record vehicles in/out of service from Central Control.
- h) Trouble messages at Central Control.
- i) Audible alarm and printed messages.
- j) Vendor's software must be capable of interfacing with city developed software residing on an IBM 370 host computer utilizing CICS.

\* *Item (j) not applicable.*

5. Description of the Functional Requirements of the System

- a) General: The following system description is offered to delineate the required functions and capabilities. The vendors are invited to offer alternative methods of performing them, in order to attain, at a minimum the desired results.
- b) Dispensing Fuel: The Police Department intends to use plastic cards with an encoded magnetic stripe as an input medium. The system shall operate with two (2) cards, one for personnel identification (Operator Card), and the other for vehicle identification (Vehicle Card), for fueling operations. Other cards specifically encoded for different purposes will be required to record each transaction, such as:
  - (a) Delivery Cards
  - (b) Inventory Cards
  - (c) Master Override Cards

\* *See Change Order C-1, Item 22.*

- c) In order to dispense fuel at a pumping station, the operator will be required to "dial" or "key" in as variable data the current vehicle mileage on the pump terminal dials or key pad, this will be subject to an instantaneous reasonable mileage validity check from stored information. The operator will then insert the vehicle and operator cards in the card reader on the terminal. The cards will be checked for validity at the terminal and/or computer. When these conditions are successfully met the equipment will automatically activate the selected pump for fuel dispensing by the operator. When fueling has been completed the equipment must deactivate the pump and record and store the entire fueling transaction.
- d) In addition to capturing the operator and vehicle identification and vehicle odometer reading, the equipment must automatically include in the transaction record the: transaction number, date(month/day), time (military), location, product, and total gallons dispensed to the tenth of a gallon.
- e) The entire record will be stored in a mass storage device for further sorting, computation, and reporting. A hard copy report of transaction for a given period must be available for call up at the central control unit. The system must be capable of up-dating a permanent record which in turn will be used for on-line to-date inquiries from a city-owned host computer.
- \* *Amended to delete and add: All transactions to be written to disk or diskette for printing on as-required basis.*
- f) The system must provide the ability to input all transactions from the Central Control room terminal keyboard. In the case of dispensing transactions initiated at the central control key board, the program must recognize the input location and not perform a reasonable mileage check.
- g) It is the intention to maintain fueling control records for every fuel dispensing, delivery and inventory transaction and therefore each manual recording will be input from the keyboard when a pump or remote terminal is inoperative, after the fact.
- h) Reorder and Shutdown Point: Upon completion of each and every dispensing transaction the system must automatically update and test the inventory at the location to determine if the reorder point or shut-down point has been reached for that dispensing location.
- i) Reorder: As each dispensing transaction occurs, the inventory must be automatically updated with the gallons pumped, the on-hand gallons computed

and the results tested to determine if the on-hand balance is equal to, or less than the reorder point but greater than the shut-down point for that location. When this condition occurs, a reorder flag must be placed in the file and be included in the reorder report that will be printed several times a day automatically and on demand listing all locations that have reached their reorder and/or shut-down point.

- j) Shutdown Point: Again with every dispensing transaction at a location the inventory must be tested and updated to determine if the shutdown point has been reached (10% of capacity) and when this condition occurs, the pump is to be automatically shutdown and a shutdown flag placed in the file with a notification message printed at the control center displaying the reason for the shut down condition and the on-hand balance for that location. Under this shut down condition, reactivation should only take place when a Delivery Transaction is entered into the system at the affected location or at central control.
  - k) Delivery Recording and Reporting: Fuel delivery reporting at a fueling station will be accomplished by the use of a uniquely formatted "Delivery Card" that will be used in place of the Vehicle Card in the terminal at the pumping station. The use of this card in conjunction with an operator card will signal a Delivery Transaction. The number of gallons delivered will be entered on a manual key pad of dials and immediately update the Delivery File and if the pump has been shut down because it had reached the shutdown point this transaction would automatically reactivate the pumps. A message will be displayed at the control center including the number of gallons delivered and the new on-hand balance and the current status of the pumps at the location. The same procedure will occur if the delivery is entered at central control. System shall be designed to prevent entries of deliveries above the capacity of the location or tank.
  - l) In/Out of Service Transactions: The central Control Center shall be capable of changing the operational status of vehicles. It shall have the capability of notifying the computer when a vehicle is In or Out of Service, restrict fueling based on the vehicle status.
- \* See Change Order C-1, Item 7.
- m) Inventory Transaction: Checking the system inventory against a physical dipping of the tanks shall be accomplished by the use of a specially encoded "Inventory Card". The card will be entered in conjunction with the Operator Card of the person conducting the inventory at the location tested. A message displaying the current inventory for that location according to the system shall be printed at Central Control to be compared

with the dipping results. Central Control shall be capable of updating or changing inventory.

- \* *Amended to delete "Inventory Card" use and procedure.*
- n) Central Control Capabilities: In addition to the above the Central Control shall be capable of up-grading, entry input, changes and other functions' required to control the system. This shall be accomplished by use of a C.R.T. with a menu type format and hard copy print-out if requested.

#### 6. Validity Checking, Lockout and Operational Features.

At a minimum, certain validity checks must be made both on the operator and vehicle cards on each and every attempt to gain access to the fuel pumps.

- a) Input Card Validity Check: The system must have the capability of rejecting any card which does not contain the proper security code. If a card is accepted into the system it must be checked by the computer to insure the card is, in fact on the file, is legal and the operator and/or vehicle is permitted to receive fuel. The encoded data must contain a check which will, when checked by the computer determine whether the data has been properly read from the card and insure communication integrity.
- b) Odometer Check: The system must have the capability of the entry of a six digit odometer reading at the pumping stations and once the data is received perform a reasonableness check based on a predetermined vehicle range and flag those records that fall outside the predetermined range for exception reporting purposes. In this case, fuel will be dispensed in the second attempt to activate the pump.
- c) Vehicle Gallon Limitations: The system must have the capability of testing gallon limitations and not permit fuel dispensing in excess of a predetermined limitation for that vehicle, usually its fuel tank capacity.
- d) Time Shutdown: Pumps must have a built-in predetermined automatic time shutdown to prevent accidental excessive spillage. It shall also shutdown if the pumping does not start in a reasonable time after the pump is activated by the system.
- e) Response Time: The time required from a successful card read to pump actuation should not exceed (4) seconds if all remote terminals are used simultaneously.
- \* *See Change Order C-1, Item 20.*
- f) Communication Lines: The system should operate over standard type 3002, voice grade, 4 wire, full duplex

multidrop telephone lines at a rate of 1200 baud.

- g) System Failure: Malfunctions shall be indicated by an "OFF" indicator on the remote terminal and trouble messages at the control center with some indication or diagnosis of the problem. System failures should prohibit the dispensing of fuel at only the locations affected by the failure. An override switch should be included in the remote terminals to permit manual operations. A message will be displayed at the central center when the override switch is actuated at any location, accompanied by an audible alarm.
  - \* See Change Order C-1, Item 15.
- h) Flexibility: The system must allow for the possibility of program modifications as required for the addition of terminals, memory, input/output devices, online capabilities. The system shall be such that expansion can be accomplished with existing software and with a minimum of interruption to the existing program.
- i) Multi-Programming: The ability to handle programs (processes/tasks) on a priority basis. A program invoked by the operator should be interrupted by another program on real time clock.
- j) Priority Setting: The system must be controllable. System use will be allocated based upon assigned priority levels.
- k) Power Failure Provisions: The system shall provide a method of reloading the program into the computer in the event of power failure or other failures which may cause the program to become inoperational.

## 7. Hardware and Equipment

The vendor will supply and install all the equipment outlined in the following paragraphs. All equipment must be warranted for one (1) year from the date of final acceptance. In the event some of the equipment supplied does not carry a one year warranty the vendor will arrange for a service contract of the said equipment for the period beyond their warranty to the one year required.

- (a) Fuel Dispensing Terminals: The vendor will supply and install the number of fuel dispensing terminals required to control the dispensing of fuel at the seventy (70) locations. The terminals are to be weatherproof devices of high reliability which are tamper resistant and reasonably protected from vandalism. Terminal doors shall be equipped with a high quality lock or locking device subject to approval of the Police Department. They are to be constructed and finished in a workmanship-like manner. They shall

include card reader, dials or keypads, indicator lights, selector switches, operator instructions, override switch, and any other controls as may be required to perform the functions outlined in this specification.

- b) Installation: The terminals shall be installed in close proximity to the pumps controlled. They shall be installed to conform to all New York City Regulations that may apply. The installation of each terminal as to location must be approved by the Police Department.
- c) Pump Modification: The vendor shall install and wire into the pumps any and all equipment as may be required to measure the fuel dispenses to one tenth (1/10) of a gallon and activate and shut down pumps. If the vendor's equipment is not compatible with, or cannot use any or all of the pumps now installed at the fueling pumps, the cost of the required replacement pumps shall be included in the vendor's total bid.
- d) Actuator Cards: The vendor must furnish specially designed and properly encoded magnetic stripe cards with a signature block on the back side, of highest quality in the following amounts:

Vehicle Cards	10,000 each
Operator Cards	50,000 each
Master Vehicle Cards	250 each

- \* See Change Order C-1, Item 11.

Representatives from Department of General Services and Police Department will confer with the successful vendor within 10 days after the award of contract to discuss and arrive at the design and artwork for the actuator cards.

- e) Computer Room Hardware: The vendor shall supply and install the following equipment at the Police Dept's central repair shop, to control, monitor, load input, generate reports, and generally run the system.
- 1) Two (2) Cathode Ray Tube Terminals each with 1920 character display for use with IBM S/370 or S/370 compatible equipment.  
Teletypewriter compatible.  
12-inch rectangular screen.  
Standard 24 line display with 80 character lines.  
59 Key Keyboard.  
RS 232c Interface

Full/Half duplex asynshronous operation.  
Generate all ASCII CODES.  
64 character display.  
Data entry on progressive lines.  
Complete Cursor Control.

Two (2) keyless line printers attached to the CRT Terminals specified above to call-for and generate reports from the host and front end computers, to print at the rate of 150 cps.

One (1) thirty (30) character per second typewriter terminal ASCII, buffered. This unit to receive transactions from pumping stations, changing pump/location status, receive error messages and other functions concerned with the front end portion of the system.

One (1) Color CRT Display Terminal equal to model #8001G as manufactured by Intelligent Systems Corp., of Norcross, GA.  
19 inch Display Tube.  
80 Character by 48 line page.  
Eight (8) foreground colors.

This terminal to show a constant color display of the system status on a location by location basis. It will show at a minimum Location Identification, Loc. Tank Capacity, Loc. Current Inventory, Location Status (one of the following) a) On Line, b) Off Mechanical Problem, c) Off No fuel, d) Communications Problem, e) Pump In Override. It will also indicate by a flashing signal when the pump is actually in use. Monitoring 96 locations via split screen format.

Color will indicate the different status conditions for each location. Vendor will confer with the Police Department at to color to be used for each status situation.

All the above mentioned equipment to be installed in Computer Room, Room 218, Central Repair Shop, 53-15 58th St., Woodside, New York 11377.

\* For final List of Equipment see page \_\_\_\_\_.

- f) Inquire Terminals: The vendor will supply three (3) Inquire CRT Terminals with twelve (12) inch rectangular display tubes. The terminals will be hard wired to the computer. They will be located in offices in the building at which the front end computer is located, terminals must contain interface RS232C to permit hard wire hook-up to 2,000 feet from the computer.

The CRT's shall be located in the following rooms at the Central Repair Shop:

One in Room 205 - Director's Office  
 One in \_\_\_\_\_ - Central Computer Control

- g) Other Hardware: The vendor shall supply and install all other components i.e., Pulsers, multiplexers, modems, etc. as may be required to support and operate the system.
- h) Environmental Requirements: The remote terminals and all equipment exposed to the ambient temperature shall operate efficiently within a temperature range of minus 20 degrees and plus 75 degrees Centigrade at 95 per cent relative humidity. The case of the RTU must be constructed to provide maximum protection from dust, water, corrosive materials, and seasonal condition.
- i) Spare Parts: The vendor shall supply spare parts for all internal components of the fueling terminals, CTUs, and Pump Installed Components. This supply shall be Ten Percent (10%) of the total number in use in the system. The spare parts will be replaced as used during the warranty period without charge. After the warranty period the vendor shall assure the availability of replacement parts for a period of ten (10) years. The vendor shall supply a price list and conditions of purchase or trade of parts.
- j) Repair Tools and Test Equipment: The vendor shall supply four (4) complete sets of special tools and test equipment required to effect repairs to be performed by the trained Police Department Personnel.

#### 8. Fuel Monitoring System Report Requirements

The following report requirements are defined as a minimum requirement for the Fuel Dispensing System. These reports will be the responsibility of the vendor and will contain at a minimum the data elements defined and format and frequency will be subject to the approval of the Department of General Service and the Police Department.

- a) Daily Transaction Report: A transaction report will be displayed at the Central Control Unit each and every time a transaction is made. The report will define the type of transaction and will display:
  - a) Sequential Number of the Transaction
  - b) Date
  - c) Time (Military)
  - d) Actuator Card Numbers

- e) Gallons Pumped (Last 24 hours)
  - f) Number of Transactions (Last 24 hours)
  - g) Average Gallons per Transaction
- c) Fuel Billing Report: To generate a biweekly report to compare against vendor biweekly bills. This report will display the following data elements:
- Each delivery transaction by date and time within each location for the biweekly time period reported, i.e.,
- a) Location, Tank, and Product
  - b) Date and Time of Delivery
  - c) Number of gallons delivered
  - d) Operator Card Number of Department member who receipted for each delivery transaction
  - e) Total gallons delivered by product type for reporting period
  - f) Grand total gallons delivered for reporting period.
- d) Reorder Report: The Reorder Report should be automatically generated at scheduled intervals three (3) times daily:
- at 0800 each morning
  - at 1400 each afternoon
  - and again at 1630 daily
- it should display each location that has reached the reorder or shut down point and should display the following data elements:
- a) Location, pump, and fuel grade
  - b) Command
  - c) Gallons in Inventory
  - d) In ground capacity
  - e) The reorder point
  - f) Whether or not the pump has been shutdown because of insufficient fuel
  - g) The address and telephone number of the Command..
- e) Actuator Card Status Report: An inquiry report displaying the data record on file of either the Vehicle Record or Operator Record.

NOTES FOR SKETCHES E-1 & E-2

1. When contractor has to modify existing pump motors, he shall provide one spare motor with all modifications for every ten or less motors modified of each type.
2. Contractor shall submit a wiring diagram of proposed installation for approval. Diagram shall include all wiring, conduit, boxes, etc.
3. The installation shall be in accordance with all City codes having jurisdiction for hazardous location Class 1 explosion proof.
4. Provide #18 shielded cable for signal wiring. Bond shield at all boxes.
5. Outlet box size as per N.Y. Electrical code.
6. Contractor shall provide and install all wiring, conduit, fittings, explosion proof fittings, boxes and explosion proof boxes required for a complete installation at each gasoline pump location.

SECTION NO. 4

TEST AND ACCEPTANCE

The "General Conditions Governing all Contracts" shall apply to all work under this contract.

1. Scope of Work

The work of this Section consists of furnishing all labor, materials, equipment and appliances necessary and required to perform all tests and adjustments to make the system operational.

2. Final Acceptance and Performance

- a) It is the responsibility of the contractor to install a complete and fully operational system meeting all of the performance specifications included in another section of these specifications. Before final payment the contractor will be required to perform system performance quality measurements in the presence of representative of the Police Department and Department of General Service, City of New York. The contractor shall furnish all test equipment necessary for the performance of the system test.

The measurements, and distortion measurements shall be recorded and submitted to the City as final proof of the system performance.

- b) At the conclusion of all initial tests and adjustments, the City shall be notified that the entire system fulfills the specifications and is ready for complete acceptance tests. The acceptance tests shall consist of the following:
1. The operation of the complete system, including all equipment shall be demonstrated.
  2. Objective tests are required to determine compliance with the specifications.
  3. All final "as built" drawings, run sheets, manuals, and documents shall be submitted.
  4. In the event further adjustment is required, or defective equipment is to be repaired or replaced, tests shall be suspended until repairs are completed.
- c) The equipment to be provided as part of this contract will be interconnected with existing equipment. All equipment is to operate together as a complete system.

### 3. Warranty

- a) The contractor shall warrant the complete operation of individual components and the complete system for a period of one year from final acceptance by the City. This Warranty shall include tubes and transistors and shall encompass parts and labor.
- b) In the event of a component failure, the contractor's designated representatives will be notified by the Police Department. The contractor is expected to have a qualified service engineer to repair the equipment within twenty-four (24) hours.

The defective equipment shall be repaired in the most expeditious manner and at no cost to the City. If an item requires more than twenty-four (24) hours for repair, the contractor shall provide another functioning unit until repairs are completed.

- c) The Warranty shall commence on the date of final acceptance. The contractor shall further warrant that he maintains an inventory of major replacement parts for the items included in these specifications.

### 4. Maintenance

As stated earlier under the section entitled "WARRANTY" the contractor is required to perform whatever maintenance necessary to insure a complete operating and functional system for a period of one year. In addition the contractor shall schedule a routine maintenance and system check-up six (6) months and one year after the system has been accepted by the City.

### 5. Inspection

Personnel from Department of General Services, Police Department, City of New York, or their authorized representatives, have the right to inspect the work and premises at any time during the installation. If the standards and specifications are not being met to the satisfaction of the City of New York, such deviations will be brought to the attention of the contractor who shall take the necessary corrective measures.

### 6. Drawings and Instruction Books

- a) The contractor shall furnish the following drawings after the installation has been completed:
  1. Functional diagram showing all signal paths, cable numbers and other detail for the complete installation.
  2. Detailed wiring and functional drawings of all data transmitting and receiving equipment.

- b) Two sets of instruction books for each item of equipment shall be provided. Instruction books shall include a material guide which shall contain replacement part numbers and description of all components used. Also included should be functional diagrams showing all test points, voltage readings and other detail for maintenance and operation of the equipment.

7. Instruction

The contractor shall provide a minimum of five (5) days instruction in the operation and maintenance of the components of the system. Such instruction should include, but not be limited to the following:

- 1. Overall system operation techniques.
- 2. Complete detailed instructions shall be provided to the Police Department technicians in trouble shooting, maintenance and repair of all equipment provided in the system.

8. Documentation

Documentation will cover all facets of the system including the various manuals provided by the manufacturers. All documentation should provide information in such depth that a system analyst having worked with the vendor can thoroughly understand the system.

\* \* \* \* \*

\* See Change Orders C-1 through C-7 which reflect the following:

*Revision of number of pumping stations to 68*

*Expansion of files and file formats*

*Provision of additional inquiry and display capability*

*Provision of additional report capability*

*Revision of card format*

*Addition of equipment*

*Addition of Motor Oil data*

*Back-up power supply for modems*

*Modifications to telephone lines*

*Provision of plastic card holders for vehicles*

*Provision of stanchions to protect remote terminals*

*Provision of duplicate colored CRT*

*Conduit installation*

*N.B.: The full documentation report clarifies the specification package and change orders thereto.*

POLICE DEPARTMENT  
CITY OF NEW YORK

March 1980

From: Commanding Officer, Support Services Bureau  
To: Deputy Commissioner, Management and Budget  
Subj: CHANGES TO THE AUTOMATED VEHICLE FUELING SYSTEM,  
PROJECT NO. P.D.-182.

I When the Dept.-wide Automated Vehicle Fueling System (Project No. P.D.-182) was prepared and submitted for bid in 1979, storage for files and reports were to be generated by a host computer (Sect. 2 page 44 of bid specification) this storage capability is no longer available. In order to have this system stand alone, the vehicle, operator, and tank files must be expanded to include data which was to be previously resident on an I.B.M. 370 host computer. To have these expanded data files and the ability to generate necessary reports the following additions to the original specification are needed:

- A. Expand the Vehicle File to include fields for:
- 1) On or Off line
  - 2) Command assigned
  - 3) Classification

- B. Expand the Operator File to include fields for:
  - 1) On or Off line
  - 2) Last name and 1st initial
  - 3) Borough assigned
  - 4) Command assigned
  - 5) Date of last status change
  - 6) Operator type
  
- C. Expand the tank - pump file to include fields for:
  - 1) Tank site name
  - 2) Order fuel call flag
  
- D. Expand the fuel transaction format to include:
  - 1) Vehicle classification
  - 2) Miles per gallon per transaction
  
- E. Provide inquiry capability to each file and the ability to display individual records at the Central Control CRT and the Director's CRT.
  
- F. Provide the capability to search:
  - 1) Vehicle File by:
    - a) Vehicle Card Number
    - b) Vehicle Number
    - c) Vehicle Last Odometer
    - d) Vehicle Command
    - e) Vehicle Classification

- 2) Operator File by:
  - a) Operator Card Number
  - b) Operator Identification Number
  - c) Operator Command
- 3) Fuel Transactions by:
  - a) Transaction type
  - b) Month
  - c) Month & Day
  - d) Vehicle Number
  - e) Site/Pump Location
  - f) Fuel Type
  - g) Operator Card Number
  - h) Vehicle Classification
- G. Provide that an audible alarm be sounded on each logged transaction that the computer reads and detects as unacceptable or as a transmission error.
- H. Provide the ability to indicate when a diskette is nearing its storage capacity and print a message when this condition occurs.
- I. Provide the ability to list reasons why a vehicle has been placed offline.
- J. Provide a separate Master Card to be used when an operator fuels a privately owned vehicle and a

special coding in the Operator File to distinguish which operators are authorized to fuel such vehicles.

- K. Provide that a fuel receipt entered from a remote terminal will not exceed the in-ground tank capacity. In the event of such an occurrence a transaction error of "Invalid Receipt" will be printed on the transaction record and an audible alarm be sounded. Additionally insure that control keyboard entries to adjust the "On Hand Balance" will not exceed the tank capacity.
- L. Provide the following Report Capability:
  - 1) Vehicle File Reports
    - a) List vehicle numbers and card numbers (by span or all)
    - b) List the complete vehicle file (by span or all)
    - c) List vehicles by command
    - d) List vehicles by classification
    - e) List vehicles and their current mileage
    - f) List vehicles by odometer (10,000 mile increments)
    - g) List vehicles off line

- 2) Operator File Reports
  - a) List Operator S.S. # and Card numbers  
(by span or all)
  - b) List complete Operator File (by span or all)
  - c) List operators by command
  - d) List operators by command with private  
fuel privilege
  - e) List operators offline
- 3) Tank Pump File Reports
  - a) Compare computer inventory to actual  
inventory (dipping tank) and compute  
percentage of variation
- 4) a) List monthly or on demand by Operator  
within a command, private fueling  
transactions. Operator's name will be  
included in transaction. Subtotal of  
gallons used should be given for each  
operator and total gallons used for  
command. A separate sheet should be  
produced for each command.

II For security the following additions are needed:

- A. Provide the capability for each of the 68 remote  
terminals to sense or detect the unlocking or  
opening of the terminal door and send an intrusion  
alarm message to the transaction printer and insure  
that an audible alarm is sounded at the time of the

printed transaction at the Central Computer Control Center.

- B. Provide a variable access code to insure that only personnel with knowledge of these codes can enter and function the system for reasons of reporting, displaying or updating files.
- C. Provide each of the 68 terminals with an identifying serial number.

III The addition of the following item will provide management with a complete fueling transaction:

- A. Provide the ability to transact motor oil dispensed at a vehicle and operator level through the use of existing actuator cards and further provide the capability of reporting oil dispensed at an individual or vehicle level through the transaction file. The face of the sixty-eight (68) remote terminals will be modified to provide an "oil" button.

IV The following changes to the Computer Room hardware (Sect. 2, page 49 of Bid Specification) are needed because the system will no longer be used in conjunction with a host computer:

A. Equipment Deletions

1. Two Cathode Ray Tube Terminals for use with IBM S/370
2. Two keyless line printers attached to the above mentioned CRT Terminals
3. One inquiry terminal hard wired to the central computer (Room 209-Operations Office)
4. Bi-synchronous board supplied with the IBM Series I computer which was to be utilized for interfacing with host computer.

B. Equipment Additions

1. A high speed line printer to be operated by the central control computer which will generate various reports. It should be a free standing impact printer with a base. It should have a variable width forms tractor for feeding continuous forms up to 15 inches in width with a printer forms control and paper jamb detection. Character spacing should be 10 per inch with up to one hundred thirty-two (132) print positions per line.
2. One hundred fifty (150) diskettes for use with central control computer to store transactions for history reporting. Diskettes will also be used to back-up system operating programs.

- C. The inquiry terminal located in Room 120 Vehicle Control Office will be moved to Room 210 Central Computer Control Room.

- V The number of locations should be reduced from seventy (Addendum no. 1 - Specification) to sixty-eight. The Street Crime Unit on Randalls Island which was added under Addendum no. 1 to Phase 3 - Manhattan was already in the specification under Phase 2 - Bronx.

The Police Department has relinquished control  
of Parking Enforcement Pier 76, N. River Phase 3 -  
Manhattan.

CITY OF NEW YORK  
 DEPARTMENT OF GENERAL SERVICES  
 DIVISION OF PUBLIC STRUCTURES

**CONTRACT CHANGE ORDER NO. C-1**  
**ORDER TO PROCEED AND CONTRACTOR'S PROPOSAL**

**CONTRACTOR:** E.J. Ward, Inc.  
**ADDRESS:** 8801 Tradeway  
San Antonio, Texas 78217

**PROJECT:** PO-182 Auto Fueling Systems  
**CONTRACT:** Electrical (Computer)  
**REG. NO.:** XC01157 BOROUGH Various Boroughs

In accordance with Article 25 of the Agreement the Contractor is directed to proceed with the work of furnishing all labor, material, equipment and other things necessary or required to effectuate the change described herein. Payment will be made in the completion of the work on a Time and Material basis in accordance with the first three paragraphs of Article 26 of the Agreement. The Contractor is furthermore directed to the requirements of filing daily reports to the Resident Engineer in accordance with Article 28 of the Agreement. Failure to comply strictly with these filing requirements shall constitute a waiver of any claim for extra compensation or damages on account of the performance of such work.

As an alternative, submit within 14 calendar days of receipt of the work order a proposal for the work of furnishing all labor, material, equipment and other things necessary or required to effectuate the change on a negotiated price basis in accordance with the fourth paragraph of Article 26 of the Agreement. The Contractor must, however, proceed with the work in accordance with the first paragraph, pending the negotiation of said proposal. Should Agreement not be reached on a negotiated price within 30 calendar days of submission by the contractor of the cost proposal, or the contractor fails to submit his cost proposal within the time period prescribed, payment for the work will be made on a completion of the work on an audited Time and Material basis.

Payments for change order work must be requested separately from payment for work required under the original contract. Partial payments for change order work will only be made in those cases involving an agreed or negotiated price.

The Contractor is forwarded six (6) copies of this form and is instructed to submit four (4) copies of it with the proposal, or final costs of the work as determined on a Time and Material basis, to the Commissioner. Four (4) copies of the Contractor's breakdown of costs are also to be submitted.

If the total amount of the change orders issued for the contract exceeds 5% of the contract amount or \$15,000 whichever is greater, it will be necessary for the Commissioner to obtain from the Board of Estimate authority to expend additional funds required before payment can be made for that portion of the change order (or orders) which exceeds the amount authorized. The Department will proceed in accordance with instructions from the Office of the Mayor and the Office of Management and Budget to expedite such spending authority.

Item	DESCRIPTION OF CHANGE	
	Furnish all labor and materials required to do the following work:	
1	Expand the vehicle file to include fields for the following: a - Command assigned b - Classification	
2	Expand the operator file to include fields for the following: a - Last name and first initial b - Borough assigned c - Command assigned d - Date of last status change e - Operator type	
3	Expand the tank pump file to include fields for the following: a - Tank site name

 ORDER TO PROCEED AND CONTRACTOR'S PROPOSAL

CONTRACTOR: E.J. Ward, Inc.  
 ADDRESS: 8801 Tradeway  
San Antonio, Texas 78217

PROJECT PO-182 Auto Fueling Systems  
 CONTRACT: Electrical  
 REG. NO.: XC01157 BOROUGH Various  
Boroughs

In accordance with Article 25 of the Agreement the Contractor is directed to proceed with the work of furnishing all labor, material, equipment and other facilities necessary to effectuate the change described herein. Payment will be made at the completion of the work on a Time and Material basis in accordance with the first three paragraphs of Article 26 of the Agreement. The Contractor's attention is directed to the requirement of filing daily reports with the Resident Engineer in accordance with Article 25 of the Agreement. Failure to comply strictly with these filing requirements shall constitute a waiver of any claim for extra compensation or damages on account of the performance of such work.

Should an alternate submit within 14 calendar days of receipt of the work order a proposal for the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change on a negotiated price basis in accordance with the fourth paragraph of Article 26 of the Agreement. The Contractor must, however, proceed with the work in accordance with Paragraph 1 above pending the negotiation of said proposal. Should Agreement not be reached on a negotiated price within 30 calendar days of submission by the contractor of his cost proposal, or the contractor submit his cost proposal within the time period prescribed, payment for the work will be made at completion of the work on an audited Time and Material basis.

All payments for change order work must be requested separately from payment for work required under the original contract. Partial payments for change order work will only be made in those cases involving an agreed on negotiated price.

The contractor is forwarded six (6) copies of this form and is instructed to submit four (4) copies of it with his proposal, or final costs if the work is performed on a Time and Material basis, to the Commissioner. Four (4) copies of the Contractor's breakdown of costs are also to be submitted.

The total amount of the change orders issued for the contract exceeds 5% of the contract amount of \$15,000, whichever is greater, it will be necessary for the Commissioner to obtain from the Board of Estimate authority to expend additional funds required before payment can be made on that portion of the change order (or orders) which exceeds the aforesaid limit. The Department will proceed in accordance with directives from the Office of the Mayor and the Office of Management and Budget to expedite such spending authority.

Item	DESCRIPTION OF CHANGE
4	Expand the fuel transaction format to include the following: a - Vehicle Classification b - Miles per gallon per transaction
5	Provide inquiry capability to each file and the ability to display individual records at the Central Control black and white CRT and the Director's black and white CRT.

Payment will be made at the completion of the work on a Time and Material basis in accordance with the first three paragraphs of Article 26 of the Agreement. The Contractor's attention is directed to the requirement of filing daily reports with the Resident Engineer in accordance with Article 25 of the Agreement. Failure to comply strictly with these filing requirements shall constitute a waiver of any claim for extra compensation or damages on account of the performance of such work.

The Contractor may as an alternative submit within 14 calendar days of receipt of the work order a proposal for the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change on a negotiated price basis in accordance with the fourth paragraph of Article 26 of the Agreement. The Contractor must, however, proceed with the work in accordance with Paragraph (1) above pending the negotiation of said proposal. Should Agreement not be reached on a negotiated price within 30 calendar days of submittal by the contractor of his cost proposal, or the contractor fails to submit his cost proposal within the time period prescribed, payment for the work will be made at completion of the work on an audited Time and Material basis.

Any payments for change order work must be requested separately from payment for work required under the original contract. Partial payments for change order work will only be made in those cases involving an agreed on negotiated price.

The contractor is forwarded six (6) copies of this form and is instructed to submit four (4) copies of it with his proposal, or final costs if the work is performed on a Time and Material basis, to the Commissioner. Four (4) copies of the Contractor's breakdown of costs are also to be submitted.

If the total amount of the change orders issued for the contract exceeds 9% of the contract amount or \$15,000, whichever is greater, it will be necessary for the Commissioner to obtain from the Board of Estimate authority to expend additional funds required before payment can be made on that portion of the change order (or orders) which exceeds the aforesaid limit. The Department will proceed in accordance with directives from the Office of the Mayor and the Office of Management and Budget to expedite such spending authority.

Item	DESCRIPTION OF CHANGE	
Cont'd	4 - List vehicle by odometer (10,000 mile increments)	
	5 - List vehicle off line

PROJECT: PO-182 Auto. Fueling System  
CONTRACT: Computer System  
REG. NO.: XC01157 BOROUGH: Various Boroughs

In accordance with Article 25 of the Agreement the Contractor is directed to proceed with the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change described herein. Payment will be made at the completion of the work on a Time and Material basis in accordance with the first three paragraphs of Article 26 of the Agreement. The Contractor's attention is directed to the requirements of filing daily reports with the Resident Engineer in accordance with Article 26 of the Agreement. Failure to comply strictly with these filing requirements shall constitute a waiver of any claim for extra compensation or damages on account of the performance of such work.

The Contractor may as an alternative, submit within 14 calendar days of receipt of the work order a proposal for the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change on a negotiated price basis in accordance with the fourth paragraph of Article 26 of the Agreement. The Contractor must, however, proceed with the work in accordance with Paragraph (1) above pending the negotiation of said proposal. Should Agreement not be reached on a negotiated price within 30 calendar days of submittal by the contractor of his cost proposal, or the contractor fail to submit his cost proposal within the time period prescribed, payment for the work will be made at completion of the work on an amended Time and Material basis.

- 1. Any payments for change order work must be requisitioned separately from payment for work required under the original contract. Partial payments for change order work will only be made in those cases involving an agreed on negotiated price.
- 2. The Contractor is forwarded six (6) copies of this form and is instructed to submit four (4) copies of it with his proposal, or final costs if the work is performed on a Time and Material basis, to the Commissioner. Four (4) copies of the Contractor's breakdown of costs are also to be submitted.
- 3. If the total amount of the change orders issued for the contract exceeds 5% of the contract amount or \$17,000, whichever is greater, it will be necessary for the Commissioner to obtain from the Board of Estimate authority to expend additional funds required before payment can be made on that portion of the change order (or orders) which exceeds the aforesaid limit. The Department will proceed in accordance with directives from the Office of the Mayor and the Office of Management and Budget to exercise such spending authority.

Item	DESCRIPTION OF CHANGE
	Furnish all labor and materials necessary and required to do the following work.
1.	Provide a bi-synchronous board for host computer compatibility.
2.	Provide a KSR 4320 teletype printer with programming. This printer shall be interchangeable with existing printer.
3.	Provide 5000 plastic card holders for the vehicles. Holder shall be approximate 3 1/4 inches by 2 1/4 inches. Submit sample for approval.

ORDER TO PROCEED

The Contractor is hereby directed to proceed with the work described under "Description of Change" in accordance with Paragraphs 1 to 5 above.

CONTRACT CHANGE ORDER NO. 64  
 ORDER TO PROCEED AND CONTRACTOR'S PROPOSAL

CONTRACTOR: E J Ward  
 ADDRESS: P.O. Box 17888  
San Antonio Texas 78217

PROJECT: PQ-182 Auto Fueling System  
 CONTRACT: Electrical  
 REG. NO.: IC0157 BOROUGH: 5 Boros

- In accordance with Article 25 of the Agreement the Contractor is directed to proceed with the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change described herein. Payment will be made at the completion of the work on a Time and Material basis in accordance with the first three paragraphs of Article 26 of the Agreement. The Contractor's attention is directed to the requirement of filing daily reports with the Resident Engineer in accordance with Article 28 of the Agreement. Failure to comply strictly with these filing requirements shall constitute a waiver of any claim for extra compensation or damages on account of the performance of such work.
- The Contractor may as an alternative, submit within 14 calendar days of receipt of the work order a proposal for the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change on a negotiated price basis in accordance with the fourth paragraph of Article 26 of the Agreement. The Contractor must, however, proceed with the work in accordance with Paragraph (1) above pending the negotiation of said proposal. Should Agreement not be reached on a negotiated price within 30 calendar days of submission of the contractor's proposal, or the contractor fail to submit his cost proposal within the time period prescribed, payment for the work will be made at completion of the work on an Adjusted Time and Material basis.
- Any payments for change order work must be requisitioned separately from payment for work required under the original contract. Partial payments for change order work will only be made in those cases involving an agreement on the final price.
- The Contractor is forwarded six (6) copies of this form and a constructed estimate form showing a breakdown of costs are also to be submitted.
- If the total amount of the change orders issued for the contract exceeds 5% of the contract amount of \$15,000, whichever is greater, it will be necessary for the Commissioner to obtain from the Board of Estimate authority to expend additional funds required before payment can be made on this portion of the change order (or orders) which exceeds the original limit. The Department will proceed in accordance with directives from the Office of the Mayor and the Office of Management and Budget to secure such pending authority.

Item	DESCRIPTION OF CHANGE
	Provide labor and material to perform the following work:
1.	Install 1" conduit. For new home run from existing gas pump to existing junction box in following precincts  50th Precinct Bronx 105th Precinct Queens

ORDER TO PROCEED

CONTRACT CHANGE ORDER NO. C-5  
ORDER TO PROCEED AND CONTRACTOR'S PROPOSAL

CONTRACTOR: E.J. Ward Inc.  
ADDRESS: 8801 Tradeway  
San Antonio, Texas 78212

For Police Dept.  
PROJECT PO-182 Automatic Fueling System  
CONTRACT: Computer System  
REG. NO.: XCOL157 BOROUGH Var. Boros.

In accordance with Article 25 of the Agreement the Contractor is directed to proceed with the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change described herein. Payment will be made at the completion of the work on a Time and Material basis in accordance with the first three paragraphs of Article 26 of the Agreement. The Contractor's attention is directed to the requirement of filing daily reports with the Resident Engineer in accordance with Article 28 of the Agreement. Failure to comply strictly with these filing requirements shall constitute a waiver of any claim for extra compensation or damages on account of the performance of such work.

The Contractor may as an alternative, submit within 14 calendar days of receipt of the work order a proposal for the work of furnishing all labor, material, equipment and other facilities necessary or required to effectuate the change on a negotiated price basis in accordance with the fourth paragraph of Article 26 of the Agreement. The Contractor must, however, proceed with the work in accordance with Paragraph (1) above pending the negotiation of said proposal. If no Agreement is reached on a negotiated price within 30 calendar days of submittal by the contractor of his cost proposal, or the contractor does not submit his cost proposal within the time period prescribed, payment for the work will be made at completion of the work on an audited Time and Material basis.

Payments for change order work must be requisitioned separately from payment for work required under the original contract. Partial payments for change order work will only be made in those cases involving an agreed on negotiated price.

The Contractor is forwarded six (6) copies of this form and is instructed to submit to it (4) copies of it with his proposal, or final costs if the work is completed on a Time and Material basis, to the Commission. Four (4) copies of the Contractor's breakdown of costs are also to be submitted.

The total amount of the change orders issued for the contract exceeds 5% of the contract amount or \$15,000, whichever is greater, it will be necessary for the Commissioner to obtain from the Board of Estimate authority to expend additional funds required before payment can be made on that portion of the change order (or orders) which exceeds the above limit. The Department will proceed in accordance with the provisions of the Office of the Mayor and the Office of Management and Budget to procure such spending authority.

Item	DESCRIPTION OF CHANGE	
	<p>Furnish all labor and material necessary and required to do the following work:</p> <ol style="list-style-type: none"> <li>At each location of remote terminal unit installation, provide a separate feeder to the remote terminal unit interface control unit. This feeder shall be spliced from pump motor feeder ahead of pump shut off switch. Feeder shall be controlled by a 20 AMP keyed toggle switch (with pilot light) in cast box enclosure. Location of switch to be determined in the field.</li> <li>At various locations as directed provide one or two post barriers to protect RTU from vehicle damage. Post barriers will be 4" diameter conduit, concrete filled and capped, set 18" into ground/slab incased in the ground with a 4" concrete envelope. Post barrier to be 42" above grade of ground/slab. Approximately 62 post barrier required.</li> </ol>

DESCRIPTION OF CHANGE

- 3. Provide the following additions to computer program
  - a. Re-program the "Borough Assigned" field in the "Operator Authorization File" to accept a sequential number that provides the ability to track the number of cards identified as the "Card Sequence Number". Ensure that update programs will reflect this change.
  - b. Re-design program to:
    - 1. List all attempted invalid fuel receipts from the "Octane" terminals.
    - 2. Indicate invalid fuel receipts at the Control Center by an audible alarm on the K S R printer.
    - 3. Show SS# of person entering the invalid fuel receipt.
  - c. Change programs and associated logic to ensure that all manual fuel entries and manual fuel receipts (i.e., entered from the control console) and accepted by the IBM Series I, sends the appropriate message to the Color CRT monitor to reflect the new current status of the tank Pump Files.

CONTRACT CHANGE ORDER NO. C-5  
ORDER TO PROCEED AND CONTRACTOR'S PROPOSAL

CONTRACTOR: E.J. Ward Inc.  
ADDRESS: 8801 Tradeway  
San Antonio, Texas 78212

For Police Dept  
PROJECT PO-182 Automatic Fueling System  
CONTRACT: Computer System  
REG. NO. XCOL157 BOROUGH Var. Boros

in accordance with Article 24 of the City Code on the Contract Change Order No. C-5, which provides for the furnishing of labor, material, equipment and other necessary or required to carry out the change described in the Contract Change Order No. C-5, and the contractor's proposal, and the work on a Time and Material basis in accordance with the first three paragraphs of Article 24 of the City Code. Failure to comply strictly with these bidding requirements shall constitute a breach of any claim for extra compensation or damages on account of the performance of such work.

The contractor may as an alternative to the work described in the Contract Change Order No. C-5, propose to furnish the work of furnishing all labor, material, equipment and other facilities necessary to carry out the change described in the Contract Change Order No. C-5, and the contractor's proposal, in accordance with the fourth paragraph of Article 24 of the City Code. The contractor's proposal, however, provided for the work described in the Contract Change Order No. C-5, shall be pending the negotiation of a final proposal agreement. The contractor's proposal, however, provided for the work described in the Contract Change Order No. C-5, shall be pending the negotiation of a final proposal agreement. The contractor's proposal, however, provided for the work described in the Contract Change Order No. C-5, shall be pending the negotiation of a final proposal agreement.

Partial payment for work under the contract change order shall be made on the basis of the contractor's proposal, or final costs of the work, whichever is less, as provided in Article 24 of the City Code. The contractor's proposal, or final costs of the work, shall be the basis for the partial payment.

Time and Material costs shall be based on the contractor's proposal, or final costs of the work, whichever is less, as provided in Article 24 of the City Code. The contractor's proposal, or final costs of the work, shall be the basis for the partial payment.

The amount of the City's contribution to the contractor's proposal, or final costs of the work, shall be \$15,000, whichever is greater, to cover the contractor's proposal, or final costs of the work, and additional funds required hereafter for the work described in the Contract Change Order No. C-5, shall be provided in accordance with the provisions of the City Code on the Contract Change Order No. C-5. The Department will proceed in accordance with the provisions of the City Code on the Contract Change Order No. C-5.

DESCRIPTION OF CHANGE

- d. Modify private vehicle fueling transactions at the remote terminals to read low order digits of the operators social security number and compare those digits against the operator authorization file as an added security check before allowing private fuel transaction to occur.
- e. Provide one (1) duplicate Intercolor Date Terminal as per original specification. This is a necessary backup to monitor the fuel system in the event of failure of the existing monitor. Plug compatible with existing hardware and programs supplied.

ORDER TO PROCEED

Contractor is hereby directed to proceed with the work described under "Description of Change" in accordance with Paragraphs 1 to 5 above.

AN INTRODUCTION TO THE DEPARTMENTWIDE  
AUTOMATED FUEL MONITORING SYSTEM,  
MARCH 1980

an introduction to  
**The Department Wide  
Automated  
Fuel Monitoring System**

MARCH 1980

---

The following documents were prepared jointly by Sergeant Thomas Kiernan, New York City Police Department, and Mr. William McGrath, Naval Underwater Systems Center.

Sergeant Kiernan is in charge of the Fuel Monitoring System, Motor Transport Division, New York City Police Department.

Mr. McGrath, a computer systems analyst at the Naval Underwater Systems Center, is on assignment to the New York City Police Department through the Intergovernmental Personnel Act of 1970, and NYCPD Contract # 225724, sponsored by the National Science Foundation, Office of Intergovernmental Science and Public Technology, and is Project Leader.

In May of 1977, Mr. William McGrath began his assignment with the New York City Police Department. The Police Department requested that he study its Fueling System and make recommendations to improve the existing operation.

Questionnaires approved by the Chief of Operations were sent to all Police Department Fueling locations. An analysis of the information received revealed the following:

New York City  
Police Department  
**Fuel Dispensing Study**

# Questionnaire Pertaining to Fuel Dispensing

Command \_\_\_\_\_

Location \_\_\_\_\_

- 1. Number of personnel assigned to dispensing gasoline \_\_\_\_\_
- 2. The rank/title of the above personnel  
P.O. \_\_\_\_\_ MVO \_\_\_\_\_ Laborer \_\_\_\_\_  
Cleaner \_\_\_\_\_ Other \_\_\_\_\_
- 3. Are the gasoline dispensing duties full time or collateral?  
Full time \_\_\_\_\_ Collateral \_\_\_\_\_  
If collateral, what percentage of time spent in this duty? \_\_\_\_\_%
- 4. Number of pumps at your station \_\_\_\_\_
- 5. Total tank capacity \_\_\_\_\_
- 6. Number of privately owned vehicles permitted to get fuel at your station \_\_\_\_\_

7. Specify the amount of gasoline delivered by the vendor to your tanks on each of the listed dates as per Precinct Log Entries.

- 1977
- Jan. 1 \_\_\_\_\_ Jan. 9 \_\_\_\_\_ Jan. 17 \_\_\_\_\_ Jan. 25 \_\_\_\_\_
  - Jan. 2 \_\_\_\_\_ Jan. 10 \_\_\_\_\_ Jan. 18 \_\_\_\_\_ Jan. 26 \_\_\_\_\_
  - Jan. 3 \_\_\_\_\_ Jan. 11 \_\_\_\_\_ Jan. 19 \_\_\_\_\_ Jan. 27 \_\_\_\_\_
  - Jan. 4 \_\_\_\_\_ Jan. 12 \_\_\_\_\_ Jan. 20 \_\_\_\_\_ Jan. 28 \_\_\_\_\_
  - Jan. 5 \_\_\_\_\_ Jan. 13 \_\_\_\_\_ Jan. 21 \_\_\_\_\_ Jan. 29 \_\_\_\_\_
  - Jan. 6 \_\_\_\_\_ Jan. 14 \_\_\_\_\_ Jan. 22 \_\_\_\_\_ Jan. 30 \_\_\_\_\_
  - Jan. 7 \_\_\_\_\_ Jan. 15 \_\_\_\_\_ Jan. 23 \_\_\_\_\_ Jan. 31 \_\_\_\_\_
  - Jan. 8 \_\_\_\_\_ Jan. 16 \_\_\_\_\_ Jan. 24 \_\_\_\_\_

8. Please enclose MT 9 (Gasoline and Oil Receipt Book or Books) for the period January 1 through January 31, 1977, with the completed questionnaire. At the completion of this study the MT 9 will be returned.

## **General Recording Problems Noted During Analysis**

**Infrequent instances of  
recording errors were  
noted in the following areas:**

- Receipts without gallons dispensed posted
- Vehicles not identified properly
- Protective counter readings not recorded or recorded after-the-fact
- Incomplete entries
- Postings illegible
- Pages missing
- Dates skipped yet gas delivered during period
- Receipt books poorly maintained

## **Major System Problems**

- System lacks capability to correlate deliveries and dispensing on both a continuing and demand basis for control and/or audit purposes
- No final accounting, control or overall managerial responsibility of total gas dispensing system
- No systematic ordering procedure or delivery scheduling
- Statistical data on fuel consumption for various classes and types of vehicles not readily available

## Manpower & Labor Cost

Manpower	No. Personnel Involved	*** Equivalent Man Years
Police Officers	111	52.27
Motor Vehicle Operators	6	3.9
Cleaners	32	12.74
Others	8	4.95
<b>Total Manpower</b>	<b>157</b>	
<b>Total Equivalent Man Years</b>		<b>73.86</b>

\*\*\*  
 Figures based on the percent  
 of time dispensing fuel as  
 indicated on questionnaires

### Cost

Labor Per Gallon Dispensed	19 <sup>c</sup>
Monthly Labor Cost for Jan 1977	\$94,478 <sup>1,2</sup>
Projected Annual Labor Cost	\$1,133,762 <sup>1,2</sup>

<sup>1</sup>Figures are in 1977 dollars.

<sup>2</sup>Labor costs are unaccelerated salaries.

The Police Department determined that an automated on-line fuel monitoring system offered the best opportunity to reduce operating costs and improve the management of fuel. The automated system will:

- Strictly control fuel deliveries
- Record usage
- Produce Management Reports

There has been a pilot system in operation on Staten Island since November 1978 and a contract has now been awarded for installation of a Department-wide system.

**What the Automated  
Fuel Monitoring System  
will do for you**

## Benefits

**1. Release Personnel:** Those people presently involved in the dispensing of fuel will be available for reassignment to other tasks.

Title	No. of Personnel	Man Years
P.O.	111	52.27
M.V.O.	6	3.9
Cleaners	32	12.74
Others	8	4.95

**2. Eliminate Certain Procedures:** This system will remove a major portion of the documentation and responsibility involved in the dispensing and ordering of fuel. There will be no need for:

- Gas receipt books
- Locks and keys for gas pumps
- Ordering fuel
- Quarterly vehicle mileage reports
- Entries in the Command Log requiring gasoline summary
- Reporting the quantity of gasoline to C.U.
- Private vehicles to use Department I.D. Plates to obtain fuel
- Monthly and quarterly reports for gasoline and oil dispensed to private vehicles

**3. Reduce Out of Service Time:** There will be no need for Department vehicle operators to search for gas dispensers, gas books or keys. In most cases there will be no need to enter the station house. A fueling transaction will only require the time it takes the operator to pump the fuel

**4. Alleviate The "NO GAS" Problem:** The computer will test the inventory of the tank after each dispensing transaction. When the level of fuel reaches a pre-determined reorder point, a message will be displayed at the control center and fuel will be ordered. This will enable us to schedule deliveries before inventories are depleted.

**5. Control Fuel Dispensed to Private Vehicles:** The system will produce, on a periodic basis, reports for your use, identifying by name and command, the amount of fuel dispensed to authorized private vehicles. This will give you the ability to effectively manage gasoline used in private vehicles.

## Annual Operating Systems Comparison

	OPERATIONAL COST		SYSTEM CAPABILITY			SOLVE SYSTEM PROBLEMS			
	Salaries & Materials	Per Gallon	Control	Detect Tank Leakage	Detect Vendor Dishonesty	General Recording Problems	MAJOR PROBLEMS		
						Centralized Contl/Resp	Audit Trail	Compile Retrieve & Report Readily	
* CURRENT SYSTEM	1,133,762	19¢	Diverse	No	No	No	No	Extremely Difficult	No
** AUTOMATED ON LINE SYSTEM	196,142	03¢	Complete & Centralized	Yes	Yes	Yes	System Demands	Automatic	Yes

\* Salaries based on pay rates in 1977<sup>1</sup>

\*\* Initial cost of Automated System \$667,000

<sup>1</sup>Salary figures are unaccelerated.

# **The Automated Fuel Monitoring System**

TR 6567-11

# What you can do for the Automated Fuel Monitoring System

It is essential to realize that implementing a fuel monitoring system on a Department-wide basis will require your cooperation.

- Records of 25,000 operators and 4,000 vehicles will have to be compiled.
- Each member of the Department will have to be trained.
- Procedures and pertinent orders will have to be revised.
- Actuator cards will have to be issued.

The major responsibility for accomplishing these tasks will lie with us but we will need your support to make this system a success.

TR 6567-II

Appendix I

OPERATIONS MANUAL

I-1/I-2  
Reverse Blank

INDEX  
of  
DIRECT C.P.U. COMMANDS

<u>COMMAND</u>	<u>DEFINITION</u>	<u>NOTES</u>	<u>PAGE</u>
> ART	AUTO RESTART TERMINAL	SEE CAUTIONS (*) (**)	3
> IPL	EXECUTE ORDERLY SHUTDOWN	SEE CAUTIONS (*) (**)	1
> MID	EXECUTE MIDNIGHT WORK	SEE CAUTIONS (*) (**)	2
> MFE	ACCEPT MANUAL FUEL ENTRIES		7, 8
> MFR	ACCEPT MANUAL FUEL RECEIPTS		9
> REQ	ENABLES OPERATOR REQUESTS	SEE INDEX OF REQUESTS	3
> SET	PRINT OVERLAY MESSAGES		6
> TPT	PRINT TRANSACTIONS	REQUIRES CLARIFICATION	4, 5
> UNS	INHIBIT OVERLAY MESSAGES		6
> INH	SUPPRESS ERROR MESSAGES		2
> INS	ALLOW ERROR MESSAGES TO PRINT		2

(\*) SEE IMPORTANT CONSIDERATIONS BEFORE USING THIS COMMAND.

(\*\*) USE ONLY WITH PROPER AUTHORITY.

THE ABOVE ENTRIES ARE AVAILABLE ONLY AT THE CONSOLE TYPEWRITER.

>IPL EXECUTE ORDERLY SHUTDOWN\*

This command directs the C.P.U. to Place All Active Lines OFF-LINE at the first available opportunity. Shut-down will occur when all pending transactions are completed, and the message "OK to IPL" is printed.

This command allows IPL sequence to be executed without disturbing data temporarily stored during transactions. It should be used only for loading new versions of the programs.

IMPORTANT CONSIDERATIONS:

1. Proper authority for use of this command is defined as; Under direction of a member of the E.J. Ward, Inc. programming staff.
2. The > IPL command cannot be cancelled after entry and will execute system shutdown.

EXAMPLE:

>IPL  
OK TO IPL

\* Command not necessary. System shuts down automatically.

>MID BUILD PERIOD REPORT AND MOVE TRANSACTIONS

Normally, the OCTANE SYSTEM will build a report daily and move transactions from TRNSAC1 to TRNSAC2 weekly. The program to do this comes in at midnight. However, if you should have a power failure and be down during the cutoff period, then you will need this feature to force the report.

>INH SUPPRESS ESI-ISB MESSAGES AND NOT ALLOW THEM  
TO PRINT

>INS WILL ALLOW THE PRINTING OF ESI-ISB MESSAGES

>REQ OPERATOR REQUEST

This command enables the operator to display data or status, make system changes, make equipment changes, or print reports. See Index of Operator Requests for the detailed outline of options.

The format is:

>REQ	-----	You Type
READY	-----	Computer Response

\*\*\* You respond after 'READY' prints with your particular request.

>ART AUTO RESTART TERMINAL

This command enables the operator to send an AUTO RESTART command to the terminal when it is in difficulty.

The entry is as follows

>ART	-----	You Type
READY	-----	Computer Response
TERM XX	-----	You Type (XX is Terminal Number)

NOTE: If the terminal is OFFLINE, you will also need to put it ONLINE. See Page 18.

> TPT PRINT TRANSACTIONS

This command directs the CPU to send fuel transactions to the remote typewriter as they occur. This printout contains all fueling transactions that are being recorded in the transaction file, and thus is useful for immediate verification of fuel terminal operation and validity of information received from that terminal. It is also useful for monitoring terminal activity.

IMPORTANT CONSIDERATIONS:

1. TPT can be used for only one terminal or all of them. Entering TPT command on a second terminal cancels the last one.
2. Printing transactions on the printer requires additional time; and, thus, slows system response.
3. TPT is conversational and requires some clarification.

Example:

>	TPT	.....	You enter.
T--	,ALL, or to cancel	.....	Computer response.
T01		.....	You enter.

THE PRINTOUT IS AS FOLLOWS:

325 00 09/30 09:57 C888 V1003 M000062 S 20 T1 F2 P1 G005.0 MPG00.0 PAC DC101 SS536-87-9104

(1)(2) ( 3 ) (4) (5) (6) (7)(8)(9)(10)(11)(12) (13)(14) ( 15 )

- 1- SEQUENCE #: TRANSACTIONS ARE FILED CONSECUTIVELY BEGINNING WITH #2.
- 2- TRANSACTION TYPE: ie..., 0 = NORMAL FUEL TRANSACTION, 20= MASTER CARD.  
ODOMETER FLAG: 0 = OK, 1 = LOW ODOM, 2 = HIGH ODOM., 05 = PVT.FUEL
- 3- DATE AND TIME.
- 4- VEHICLE COMMAND.
- 5- VEHICLE #.
- 6- ODOMETER ENTERED BY EMPLOYEE.
- 7- SITE #.
- 8- TANK #.
- 9- FUEL TYPE.
- 10- PUMP #.
- 11- GALLONS PUMPED.
- 12- CALCULATED MILES PER GALLON.
- 13- VEHICLE CLASSIFICATION
- 14- OPERATOR COMMAND
- 15- OPERATOR SOC. SEC. #

>SET PRINT OVERLAY MESSAGES

This command as well as its companion below was added to the system for debug purposes. You may at some time, therefore, be asked to use it by a programmer for diagnostic purposes. Ordinarily, the program is in the inhibited mode and certain messages are disabled.

>UNS INHIBIT OVERLAY MESSAGES

This command will disable the "SET" if it should ever be used.

## ACCEPT MANUAL FUEL ENTRIES

THIS COMMAND DIRECTS THE CPU TO ALLOW THE OPERATOR TO ENTER TRANSACTIONS INTO THE TRANSACTION FILE THROUGH THE KEYBOARD. THIS IS NECESSARY WHEN CIRCUMSTANCES HAVE PREVENTED TRANSACTIONS FROM ENTERING THE CPU THRU NORMAL CHANNELS, IE..., WHEN A TERMINAL IS SWITCHED TO MANUAL OR A VEHICLE IS FUELED OUTSIDE OF THE SYSTEM. MANUAL FUEL ENTRIES WILL THEN SHOW ON WEEKLY AND MONTHLY REPORTS AS TRANSACTION TYPE 30, AND BE INCLUDED IN MILES PER GALLON CALCULATIONS. ALSO CUSTOMER TANK PUMP TOTALS AND BALANCES WILL BE ADJUSTED IF ADEQUATE INFORMATION IS ENTERED IN THE CPU, IE..., TERMINAL # AND PUMP #.

## IMPORTANT CONSIDERATIONS:

1. The system can do only a minimal verification of the operators entries. It is therefore imperative that the operator verify each entry before commanding the CPU to post the entry as typed.
2. The operator has total control of the printer for input purposes. Should the system require the use of the printer for output, ie., Error messages, TPT Transactions, the operator must release control of the printer or the CPU will cease to poll until the printer is available for output.
3. Entries may vary in length but not in format. Vehicle # and fuel quantity must be entered for CPU to accept the entry, however, pressing Return Key at the end of any field after fuel quantity posts the transaction with zeroes in all following fields.

8.

NOTE: Field 3 & 4 (Term # & Pump #) must be entered for the CPU to update the customer tank-pump balances.

NOTE: MFE command prints the required heading at the beginning and operates conversationally. It requires operator to acknowledge or cancel each entry, and specify whether or not he wishes to make another entry.

## EXAMPLE:

```

> MFE                                     SS
VEH #, FUEL, TERM, PUMP, DATE, TIME, ODOM, OPR #, OPR CMND
XXXX, XXX.X, XX, XX, XX/XX, XX;XX, XXXXXX, XXXXXXXXXXX, XXX
ENTRY? Y
1002, 015.1, 12, 01, 10/08, 13;43, 035000, 124568888, 999
OK? Y
ENTRY? Y
1004, 008.5, 31, 01
OK? Y
ENTRY? Y
1009, 017.3, 81, 01, 10/08, 17;50
OK? Y
ENTRY? Y
1002, 009.5, 15, 01, 10/09, 20;03, 016402
OK? Y
ENTRY? N

```

>MFR ACCEPT MANUAL FUEL RECEIPTS

This command allows the operator at the computer to enter any fuel receipts that cannot be entered at the terminal for whatever reason. Manual fuel receipts will show on inquiry programs as transaction type 31.

If the receipt area in the tank is not full, and if the receipt does not exceed tank capacity, this receipt, manually entered, will be added to the tank record.

An example follows:

```
> MFR
SITE, TANK, RECEIPT
XXX, XX, XXXX
ENTRY? Y
020,01,0800
ENTRY? N
```

INDEX  
of  
OPERATOR REQUESTS  
for  
EQUIPMENT AUTHORIZATION FILE CHANGES

<u>REQUEST</u>	<u>PAGE</u>
1. ACQUISITION OF NEW VEHICLE EQP, ACQ, CXXXXX, VXXXX, KXX, MXXX, RXXXXXX, TX, TX, COXXX, CLXXX, GXX	10

- \* DO NOT ENABLE PUMP UNTIL ODOMETER IS ENTERED CORRECTLY.
- \*\* TAKE ODOMETER READING ON SECOND TRY AND TAG AS HIGH OR LOW IF IN ERROR.

TO CHECK THE ACQUISITION ENTRY, RUN AN ESR ON THIS CARD #.

>REQ  
READY ESR, C00009  
EQUIPMENT STATUS REPORT 10/02/80 10:25:14

EQUIP NO.	CARD NO.	EQPT STAT	FUEL TYPE	ODOMR CODE	MILES LIMIT	ODOMETER READING	CLASS	COMND	GALLON LIMIT	1-LOST 2-SHOP	3-ACC 4-CNDM
1009	9	ON	2-	7	250	1	TEY	999	23		

11.

EQUIPMENT AUTHORIZATION FILE CHANGES  
CHANGE EQUIPMENT STATUS

>REQ  
READY      EQP,OFF,C00001,V1001,S2\*

THE ABOVE ENTRY PUT VEHICLE 1001 IN AN OFFLINE MODE,  
I.E., CARD # 1 ASSOCIATED WITH THAT VEHICLE NUMBER CANNOT  
BE USED AT THE PRESENT TIME. THIS ACTION MIGHT BE NECESSARY  
IF THE CARD IS LOST, BUT YOU HAVE HOPES OF FINDING IT.

IF THE CARD IS FOUND, THE REVERSING ENTRY IS:

>REQ  
READY      EQP,ONN,C00001,V1001

CHANGE CARD NUMBER

IF THE ABOVE CARD IS LOST AND WILL NOT BE FOUND, YOU  
SHOULD ASSIGN THIS VEHICLE A NEW CARD # WITH THE FOLLOWING  
ENTRY. ASSUME THAT CARD # 12 IS AVAILABLE.

>REQ  
READY      EQP,NCN,C00001,V1001,N00012

NOW, VEHICLE 1001 HAS A NEW CARD NUMBER ASSOCIATED  
WITH IT, AND THAT IS CARD # 12.

WE CAN CHECK THE NCN CHANGE BY USING ESR.

\*S IS THE STATUS INDICATOR OF WHY IT IS OFFLINE.

EQUIPMENT AUTHORIZATION FILE CHANGES

> REQ  
 READY ESR,C00012  
 EQUIPMENT STATUS REPORT 10/02/80 10:39:18

EQUIP NO.	CARD NO.	EQPT STAT	FUEL TYPE	ODOMR CODE	MILES LIMIT	ODOMETER READING	CLASS	COMND	GALLON LIMIT	1-LOST 2-SHOP	3-ACC 4-CNDM
1001	12	ON	9-	7	250	99514	ABC	999	15		

AND THE OLD CARD # 1 WILL LOOK LIKE THIS:

> REQ  
 READY ESR,C00001  
 EQUIPMENT STATUS REPORT 10/02/80 10:39:45

EQUIP NO.	CARD NO.	EQPT STAT	FUEL TYPE	ODOMR CODE	MILES LIMIT	ODOMETER READING	CLASS	COMND	GALLON LIMIT	1-LOST 2-SHOP	3-ACC 4-CNDM
1002	1	OFF	0-	0	0	0		0	0	1	

WHICH INDICATES THAT CARD # 1 IS NO LONGER IN SERVICE AND THE EQUIP. NO. IS ACTUALLY SHOWING THE DATA IT WAS OUT OF SERVICE, OR DISPOSED OF.

DISPOSE OF A VEHICLE

IF THE VEHICLE IS ACTUALLY DISPOSED OF (AS FAR AS THE FUELING SYSTEM IS CONCERNED), THE ENTRY IS:

> REQ  
 READY EQP,DSP,C00012,V1001,S4

13.

## EQUIPMENT AUTHORIZATION FILE CHANGES

## EQUIPMENT DATA CHANGE

THE FOLLOWING ENTRY WILL CAUSE A CHANGE TO BE MADE TO THE EQUIPMENT AUTHORIZATION FILE. PROBABLY THE MOST LIKELY ELEMENT TO CHANGE IN THE FILE RECORD IS THE MILES LIMIT. THEREFORE, THE ENTRY IS AN EXAMPLE OF THIS.

&gt;REQ

READY ESR,C00005

EQUIPMENT STATUS REPORT 10/02/80 10:41:57

EQUIP NO.	CARD NO.	EQPT STAT	FUEL TYPE	ODOMR CODE	MILES LIMIT	ODOMETER READING	CLASS	COMND	GALLON LIMIT	1-LOST	2-SHOP	3-ACC	4-CNDM
1005	5	ON	2-	7	250	111856	JRS	555	25				

NOW, WE WOULD LIKE FOR CARD # 5 TO HAVE A MILES LIMIT OF 300.

&gt;REQ

READY EQP,CHG,C00005,V1005,I04,300

NOW, LET'S CHECK IT.

&gt;REQ

READY ESR,C00005

SYSTEM CHANGES

PUT LINE ONLINE OR OFFLINE

YOU MAY AT SOME POINT NEED TO PUT AN ENTIRE LINE OFFLINE.  
AN EXAMPLE OF HOW YOU WOULD DO THIS FOLLOWS:

```
>REQ  
READY    SYS,OFF,L2
```

THERE WILL BE NO CONFIRMATION PRINTED OUT. WE RECOMMEND  
THAT YOU WATCH THE MODEM ATTACHED TO LINE 2. THE LINE IS OFF-  
LINE WHEN THE CARRIER DETECT LIGHT STOPS PULSING.  
TO PUT THE LINE BACK ONLINE:

```
>REQ  
READY    SYS,ONN,L2
```

HERE AGAIN, YOU SHOULD WATCH THE MODEM FOR LINE 2 AND MAKE SURE  
THE CARRIER DETECT LIGHT STARTS PULSING ON AND OFF.

PUT TERMINAL ONLINE OR OFFLINE

TO PUT A TERMINAL OFFLINE FOR MAINTENANCE OR OTHER REASONS:

```
>REQ  
READY    SYS,OFF,TERM01
```

AND TO PUT THE TERMINAL BACK ONLINE:

```
>REQ  
READY    SYS,ONN,TERM01
```

SEE NOTES ON FOLLOWING PAGE.

## SYSTEMS CHANGES

NOTE 1. IF THERE IS ONLY ONE TERMINAL ON THIS LINE, YOU MUST ALSO PUT THE LINE ONLINE AFTER PUTTING THE TERMINAL ONLINE.

NOTE 2. THERE WILL BE A MESSAGE ON THE CONSOLE TYPEWRITER SHOWING DATE, TIME, TERMINAL NUMBER AND "POWER RESTART" IF THE TERMINAL WAS TURNED OFF AND BACK ON AT THE UNIT.

## PUT MASTER CARD ONLINE OR OFFLINE

YOU MIGHT LOSE A MASTER CARD AND WISH TO PUT THAT NUMBER OFFLINE. AN EXAMPLE FOLLOWS:

```
>REQ
READY   SYS,OFF,C20002
```

WE HAVE JUST PUT MASTER CARD # 20015 OFFLINE. THEN LATER, IF THE CARD IS FOUND, YOU MAY WANT TO PUT IT BACK ONLINE.

```
>REQ
READY   SYS,ONN,C20002
```

## PUT PVF CARD ONLINE OR OFFLINE

AS IN THE CASE OF THE MASTER CARD A PVF CARD CAN BE PUT OFFLINE IN THE FOLLOWING MANNER:

```
>REQ
READY   SYS,OFF,C30001
```

THEN LATER IF WE NEED TO PUT THE CARD BACK ONLINE:

```
>REQ
READY   SYS,ONN,C30001
```

SYSTEM CHANGES

PUT TANK ONLINE OR OFFLINE

A TANK, IN THIS CASE TANK NUMBER 1 AT SITE 120 MAY BE PUT OUT OF SERVICE WITH THE FOLLOWING COMMAND:

```
>REQ  
READY    SYS,OFF,SITE120,T01
```

TO RESTORE THE TANK TO SERVICE:

```
>REQ  
READY    SYS,ONN,SITE120,T01
```

LIKewise, A PARTICULAR PUMP ON THAT TANK, SITE AND FLEET MAY BE PUT OFFLINE:

```
>REQ  
READY    SYS,OFF,SITE120,T01,P01
```

WE HAVE JUST TAKEN PUMP NUMBER 1 ON THAT TANK OUT OF SERVICE. TO RESTORE IT:

```
>REQ  
READY    SYS,ONN,SITE120,T01,P01
```

## SYSTEM CHANGES

## TANK FILE CHANGES

TO MAKE A CHANGE TO THE TANK FILE:

TWO POSSIBILITIES ARE:

- 107 INDICATES A CHANGE TO OPENING BALANCE - THE NUMBER IS ENTERED MULTIPLIED BY 10.  
I.E. TO CHANGE IT TO 3000, ENTER 030000.
- 109 INDICATES A CHANGE TO REORDER POINT - THE NUMBER IS ENTERED MULTIPLIED BY 10.  
I.E. TO CHANGE IT TO 1000, ENTER 010000.

EXAMPLES ARE:

> REQ  
READY       SYS,CHG,SITE120,T01,I07,030000

> REQ  
READY       SYS,CHG,SITE120,T01,I09,010000

FOR ALL OTHER CODES, SEE THE INDEX.

INDEX  
of  
OPERATOR REQUESTS  
for  
OPERATOR FILE CHANGES

<u>REQUEST</u>	<u>PAGE</u>
1. ACQUISITION OF NEW OPERATOR OPR,ACQ,CXXXXX,SSXXXXXXXXXX,CXXX,IX,NXXXXXXXXXX	22
2. CHANGE OPERATOR STATUS TO OFF/ON/DSP OPR,OFF,CXXXXX,SSXXXXXXXXXX OPR,ONN,CXXXXX,SSXXXXXXXXXX OPR,DSP,CXXXXX,SSXXXXXXXXXX	22
3. CHANGE CARD NUMBER OPR,NCN,CXXXXX,SSXXXXXXXXXX,NXXXXX	23
4. OPERATOR DATA CHANGE OPR,CHG,CXXXXX,SSXXXXXXXXXX,IXX,(NEW DATA)	23

\*\* (I CODES FOR OPR CHANGES)

I02,XXXXXXXX	CHG. SOC. SEC. #
I03,XXX	CHG. OPERATOR COMMAND
I04,X	CHG. PVC STATUS
I05,X,XXXXXXXX,X	CHG. NAME AND INITIAL
I06,XX	CHG. # OF CARDS ISSUED

22.

## OPERATOR FILE CHANGES

## ACQUISITION OF NEW OPERATOR

>REQ  
 READY OPR,ACQ,C01011,SS467666315,C123,IP,NCHAMBERLAIN

WHERE: C01011	IS CARD NO. 1011
SS467666315	IS SOC. SEC. NO.
C123	IS COMMAND 123
NCHAMBERLAIN	IS THE OPERATOR'S NAME
IP	IS THE OPERATOR'S INITIAL

CHANGE OPERATOR STATUS TO OFF/ON/DSP

TO PUT THE OPERATOR CARD OFFLINE, YOU WOULD MAKE  
 THE FOLLOWING ENTRY.

>REQ  
 READY OPR,OFF,C01011,SS467666315

THEN IF FOR SOME REASON, CARD NO. 1011 IS NEEDED BACK  
 IN THE SYSTEM, YOU WOULD MAKE THE REVERSING ENTRY.

>REQ  
 READY OPR,ONN,C01011,SS467666315

IF THE OPERATOR IS DROPPED FROM THE SYSTEM YOU WOULD  
 DISPOSE OF THE CARD IN THE FOLLOWING MANNER:

>REQ  
 READY OPR,DSP,C01011,SS467666315 .

## OPERATOR FILE CHANGES

## CHANGE CARD NUMBER

IF THE CARD IS LOST, THE FOLLOWING ENTRY WILL NOT ONLY PUT THE OLD CARD # OFFLINE BUT ALSO PUT THE NEW CARD# ONLINE AND MOVE ALL THE INFORMATION FROM THE OLD RECORD TO THE NEW ONE.

&gt;REQ

READY OPR,NCN,C01011,SS467666315,N02590

TO CHECK THIS ENTRY, YOU CAN FIRST DO AN OSR ON CARD # 2590:

&gt;REQ

READY OSR,C02590

OPERATOR STATUS REPORT 10/17/80 16:58:46

CARD NO.	STAT	OPERATOR NUMBER	CMND	PVF	LAST CHNG	NAME	# OF CARDS
2590	ON	467-66-6315	123	NO	10/17	CHAMBERLAIN,P	1

AND THEN DO AN OSR ON CARD # 1011:

&gt;REQ

READY OSR,C01011

OPERATOR STATUS REPORT 10/17/80 16:59:01

CARD NO.	STAT	OPERATOR NUMBER	CMND	PVF	LAST CHNG	NAME	# OF CARDS
1011	OFF	-----	0	NO	10/17	0	

## CHANGE AN ELEMENT IN THE OPERATOR FILE

AN EXAMPLE OF A CHANGE TO THE OPERATOR FILE FOLLOWS:

&gt;REQ

READY OPR,CHG,C01011,SS467666315,I03,888

WHERE I03 INDICATES A CHANGE TO THE OPERATOR COMMAND FOR CARD #1011.

IPL PROCEDURE	25,26
MIDNIGHT PROCEDURE	27
PROCEDURE FOR HANDLING OIL	28
ORDERING FUEL	28
TERMINAL TIMER ROUTINE	29
SECURITY CODES	29
REQUESTING PRINTOUT	30
PVC CARD	30
ERROR MESSAGES	31-37
SYSTEMS UTILITY COMMANDS	38

GENERAL DESCRIPTION

CARD ENTRY AT THE TERMINAL

Since you have a 2-card system, a timer will start when you enter the first card (employee card). You then have 15 seconds to enter the second card (vehicle card).

If you get an error on the second card, you will need to start the card entry process all over by entering employee card first.

FUEL RECEIPT AT THE TERMINAL

Fuel receipts are entered at the terminal, using an operator card and a master card for card entry and entering the gallons received (no tenths) right justified in the thumb wheel switches. A "9" is set into the leftmost thumb wheel switch, and finally you press a pump button associated with the tank that received the fuel.

If the fuel receipt is accepted by the octane system, you will see the wait light go out for confirmation. If it is not accepted, you will see one error light - pump error.

## GENERAL DESCRIPTION

## IPL PROCEDURE

We recommend the following procedure for initial program load or IPL.

1. Press the blue load button on the computer.
2. You should then see the following printout:

```
*** EVENT DRIVEN EXECUTIVE ***
```

```
VOLSER TYPE IODA STATUS
EDX002 PRI. 0003 ONLINE (IPL)
EDX003 SEC. 0003
ASMLIB SEC. 0003
          PRI. 0002 UNUSABLE
```

```
STORAGE MAP
PART# START SIZE
  1  30976 34560
  2  65536 57344
```

```
SET DATE AND TIME USING COMMAND $T
```

```
$INITIAL ENDED AT 00:00:02
```

3. Now enter > \$T
4. You should then see the following printout:
 

Date (M.D.Y.):                      (Here enter month, day,  
  and year, i.e. 02.21.79)
5. You will then see:
 

Time (H.M.)                           (Here enter hour and  
  minute, i.e. 08.30)\*
- \* If it is after noon, be careful to enter time for a 24-hour clock, i.e., 3:30 p.m. is entered as 15.30.

## GENERAL DESCRIPTION

6. Next, enter:  
     > \$L OCTANE
7. The program will begin to load now and you should see the following printout:

```

    $L OCTANE
OCTANE      4P,16:50:29, LP=7900
NUCLEUS     147P,16:50:32, LP=2000
16:50:35

```

```

CNTLR PREP PASSED, CODE = FFFF
BWI         9P,16:50:37, LP=7000
CNTLR RESET PASSED, CODE = FFFF
16:50:40 START COMPLETED
BW2         9P,16:50:41, LP=8600
COLORIPL    16P,16:50:44, LP=B300

```

```

OCTANE ENDED AT 16:50:45
COLRUPDT    17P,16:51:11, LP=8F00

```

```

COLORIPL ENDED AT 16:51:13

```

8. When you see the message:  
     "Start Completed"  
     your program is online, and you should be polling  
     terminals.
9. > \$CP 2
10. >TPT (TO PRINT FUEL TRANSACTIONS)
11. >INH (TO INHIBIT ERROR MESSAGES)

## GENERAL DESCRIPTION

## MIDNIGHT OPERATION

At midnight, a program comes in to build the report. When this process is complete, a message will be printed on the typewriter:

## REPORT READY

If for some reason, the system is down during the cutoff period, there is an emergency procedure to handle this problem. See "MID" on Page 2 for a full description.

The report built during this phase can be accessed by entering:

> REQ

READY RPT

See page 17 for a full description of RPT.

On a weekly basis, (i.e. cutoff dates are 1,8,15, and 22). The transactions are also moved from TRNSAC1 to TRNSAC2.  
(current week) (last week)

You will then see a second message on the typewriter:

EOD COMPLT

## GENERAL DESCRIPTION

## PROCEDURE FOR HANDLING OIL

The use of oil can be registered at the fuel terminal. It is a two-card entry like your regular fueling request, but no pump is enabled. You simply enter the number of quarts used in the right-most thumb wheel switch position before you enter the VEHICLE CARD. Pump button 5 on every terminal is reserved for this purpose. The oil issue is registered at the computer as a transaction, type '10'.

## ORDERING FUEL

To inform the computer of fuel orders, an entry is made when the order is called in for that tank at that site.

An example follows:

```
> REQ  
READY   ORD,SITE001,T01
```

indicating that fuel was ordered for TANK 1 at SITE 120.

## GENERAL DESCRIPTION

## TERMINAL TIMER ROUTINE

Fuel terminals that have gone offline due to some communication problem or terminal malfunction will try to go online every 15 minutes. To abort this attempt to restart, you can put the terminal offline with:

```
>REQ  
READY  SYS,OFF,TERMXX
```

## SECURITY CODES

To enable the console typewriter, enter your security code at the Black & White CRT in the computer room. When it exhibits 'READY' enter 'KSR,LOGON' and the console should be enabled.

To disable the same unit, enter 'KSR,LOGOFF'

NOTE: At either Black & White CRT, you must enter your security code each time you request a report.

GENERAL DESCRIPTION

REQUESTING PRINTOUT

All status reports will come back to the unit requesting them, with the exception of 'RPT' which goes to the printer.

The black and white CRTS can request the following reports: PPS,STT,ESR,OSR, and PFR.

All error messages will print on the console typewriter and all TPT lines (fueling transactions) will print on the other typewriter.

All INQUIRY programs will print on the 4973 line printer.

PVC CARD ENTRY AT THE TERMINAL

This is a 2-card entry as are all others. The Employee Card is entered first for verification. The PVC card is then entered with the last 4 digits of your social security # right justified in the thumb wheel switches.

## ERROR MESSAGES

The Octane System can generate several different types of error messages. All of the messages are of the form:

HH:MM:SS mmmmmmm LN aaaa TRM bbbb ECB cccc ISB dddd CSSWS eeee ffff gggg

where

HH:MM:SS	is the time in hours, minutes and seconds
mmmmmm	is the message type, which can be either
	a) ESI-ECB
	b) ESI-ISB
	c) LCKERR
	d) LINE#ER
	e) MATCHER
	f) TR LINE
	g) TREPOL1
	h) TREPOL2
	i) TREPOL3
	j) VALIDCK
aaaa	is the line number
bbbb	is the terminal number
cccc	is the ECB code where the 1st two digits = line number the 2nd two digits = error code
	a) C0 is device not attached
	b) C1 is device busy
	c) C2 is device busy after reset
	d) C3 is I/O command reject
	e) C5 is interface data check
	f) C6 is I/O controller busy
	g) D0 is I/O controller
	h) D2 is exception
	i) FF is OK
dddd	is the ISB word where the 1st two digits = ISB the 2nd two digits = device address
	a) 21 is Line 1
	b) 22 is Line 2
	c) 23 is Line 3
eeee ffff gggg	is the cycle steal status words (CSSWS)

1. The ESI-ECB message indicates that the ECB return code was not FF or D2.
2. The ESI-ISB message indicates that the ECB return code was D2, but the ISB code was not A0.
3. The LCKERR message indicates that the length of the message received was in error, (i.e. not 4, 8, or 20 bytes long). Lxxxx is at the end of the message and should tell you length received.
4. LINE#ER indicates a bad system error regarding this line.

## ERROR MESSAGES cont.

5. MATCHER indicates that the message received was not from the terminal polled.
6. TR LINE indicates that there has been a system error on this line.
7. TREPOL1 indicates that the octane system has taken line 1 OFFLINE.
8. TREPOL2 indicates that the octane system has taken line 2 OFFLINE.
9. TREPOL3 indicates that the octane system has taken line 3 OFFLINE.
10. VALIDCK indicates that Vehicle # for this total was 000000. Vehicle error occurs if a power failure requires IPL of the series/1 while a fueling is in progress. Vehicle # is lost in the power failure and a transaction is built showing VEH # as-1.
11. VEHERR indicates that Vehicle # for this total was 000000. Vehicle error occurs if a power failure requires IPL of the series/1 while a fueling is in progress. Vehicle # is lost in the power failure and a transaction is built showing VEH # as-1.

## EXAMPLE:

```

19:15:09 VEHERR LN 0001 TRM 0002 ECB 01D2 ISB A021 CSSWS C037 0040 F000
OUT 0044 00F0 IN F0F2 F9F0 F0F9 F40F F6F9 F6FB F1F0 F0F2 F4F4 F40F
42 0-0 05/07 19:14, V -1, M 750,S01,T1,F1,P2,F 1,G .4,MPG .0

```

## ERROR MESSAGES cont.

## GENERAL MESSAGES

1. POWER RESTART indicates DC. power to the fuel terminal microprocessor was interrupted & it's program was restarted.
2. AUTO RESTART indicates the fuel terminal microprocessor detected a program error & automatically restarted it's program.
3. TNKPMP FILE ERROR indicates a total was received from a pump not identified in the Series/1 base data.
4. TRMXXXX NO TOTAL CAME IN - PUMP X CARD XXXXX indicates that no total was received on this card after pump was enabled.
5. TRMXXXX INV CARD XXXXX XXXXX IDXX indicates that one of the card numbers listed is invalid.
6. TRMXXXX TXX REORDER is a warning that tank at this terminal has reached REORDER point.
7. TRMXXXX TXX SHUTDOWN indicates that tank at this terminal has reached SHUTDOWN point and the system has taken it offline.
8. TRMXXXX TXX SSXXX-XX-XXXX GXXXX RECV is a message corresponding to a fuel receipt manually input to a terminal. The word 'ERROR' will follow this message if the receipt was not accepted at the Series/1.
9. TRMXXXX TXX PRES XXXX DIP XXXX VAR = XXXX indicates that a dipstick reading has been manually entered to a tank. Printed is the present value in the S/1, the dipstick reading entered in the thumb wheel switches and the variance between the two.
10. TRMXXXX TXX ONLINE INDICATES THAT A fuel receipt has come in and raised the tank level above shutdown.
11. TRMXXXX TXX FUEL RECEIPT - BUFFERS FULL XXXXX GALLONS RECEIVED is a 2-line message that indicates the tank already has 4 receipts and could not accept a fifth one for this period.

## EXPLANATION OF BUFFER PRINTOUT

This printout follows Match Error, Validity Check, & Length Check.

The Series/1 communicates with the octane terminals by sending and receiving messages serially, using a frequency shift keying (FSK) technique. The inbound (2125Hz) and outbound (1170Hz) carrier frequencies are shifted above and below the center frequency to represent serial data bits (1's & 0's).

Bytes are 8 bits in length. Each byte transmitted is preceded by one start bit and followed by 2 stop bits for data synchronization. The start bit and stop bits are stripped off by the receiving hardware becoming invisible and thus will not be further mentioned.

The data format within each 8 bit byte is redundant HEX digits. Expressed another way each HEX DIGIT is repeated within the 8 bit byte ie: a four is transmitted (0100 0100). The only exception to this redundancy is the end of transmission character (EOT) which is a HEX 0F (0000 1111).

All outbound communications from the Series/1 consist of 4 bytes including EOT. There are two bytes of terminal address, one byte of control, and the EOT.

Inbound communications vary in length under three different conditions as follows:

1. Skip = 4 bytes. This is a response to a poll when the terminal requires no service. (2 bytes of terminal address, 1 byte of 0's, and EOT).
2. Total = 8 bytes. This is a response to a poll when a transaction is completed. (2 bytes of terminal address, 1 byte identifying pump #, 4 bytes of gallons dispensed including tenths, and EOT).
3. Request = 20 bytes. This is a response to a poll when the terminal request pending flag is set (wait lite ON). (2 bytes of terminal address, 1 byte identifying selection button, 10 bytes of card numbers, 6 bytes of thumbwheel switches, & EOT).

The Series/1 buffers all inbound and outbound messages while processing the information and dumps the contents of the buffers under certain conditions. Interpreting the information in these buffer dumps requires basic understanding of the buffer architecture, program logic flow, and data conversions.

The first Very Important Fact to understand is that in the transmission process the data bits are inverted end over end or FLIPPED. Example: when the terminal transmits a Redundant HEX 1 (0001 0001), it is received backwards (1000 1000) and thus becomes redundant HEX 8. The following is a HEX DIGIT conversion table for easy reference.

## HEX DIGIT CONVERSION TABLE

RECEIVED	TRANSMITTED	
0 (0000)	(0000)	0
1 (0001)	(1000)	8
2 (0010)	(0100)	4
3 (0011)	(1100)	C
4 (0100)	(0010)	2
5 (0101)	(1010)	A
6 (0110)	(0110)	6
7 (0111)	(1110)	E
8 (1000)	(0001)	1
9 (1001)	(1001)	9
A (1010)	(0101)	5
B (1011)	(1101)	D
C (1100)	(0011)	3
D (1101)	(1011)	B
E (1110)	(0111)	7
F (1111)	(1111)	F

Note EOT= F0 (1111 0000) (0000 1111) 0F

The buffer dump immediately follows the error message and is in the following format. At the left are 4 bytes (8 HEX digits, printed in two groups of 2 bytes each). They are what was in the output buffer when the error occurred. It is important to note that the bytes are redundant HEX and are FLIPPED because the transmission process inverts or flips the bytes. To determine the specific hex digits in this outbound poll, apply the conversion table provided. Also note the 4th byte is F0. This becomes 0F (EOT) when flipped in transmission.

The output and input buffer is separated by two blanks, (4040) on the printout.

The following 20 bytes (40 HEX digits, printed in 10 groups of 2 bytes each), are contents of the input buffer AFTER the error was detected.

Some important points to note are:

1. MATCHER is the first test of the input buffer and if in error NO byte flipping or conversion occurs. Note this on the logic flow diagram.
2. The data in the input buffer is overlaid with each new communication.
3. More than one error may occur in a transmission. The error message printed is the First error detected. See the logic flow diagram.
4. Note on the logic flow diagram that once an error is detected NO further byte flip or conversion occurs.

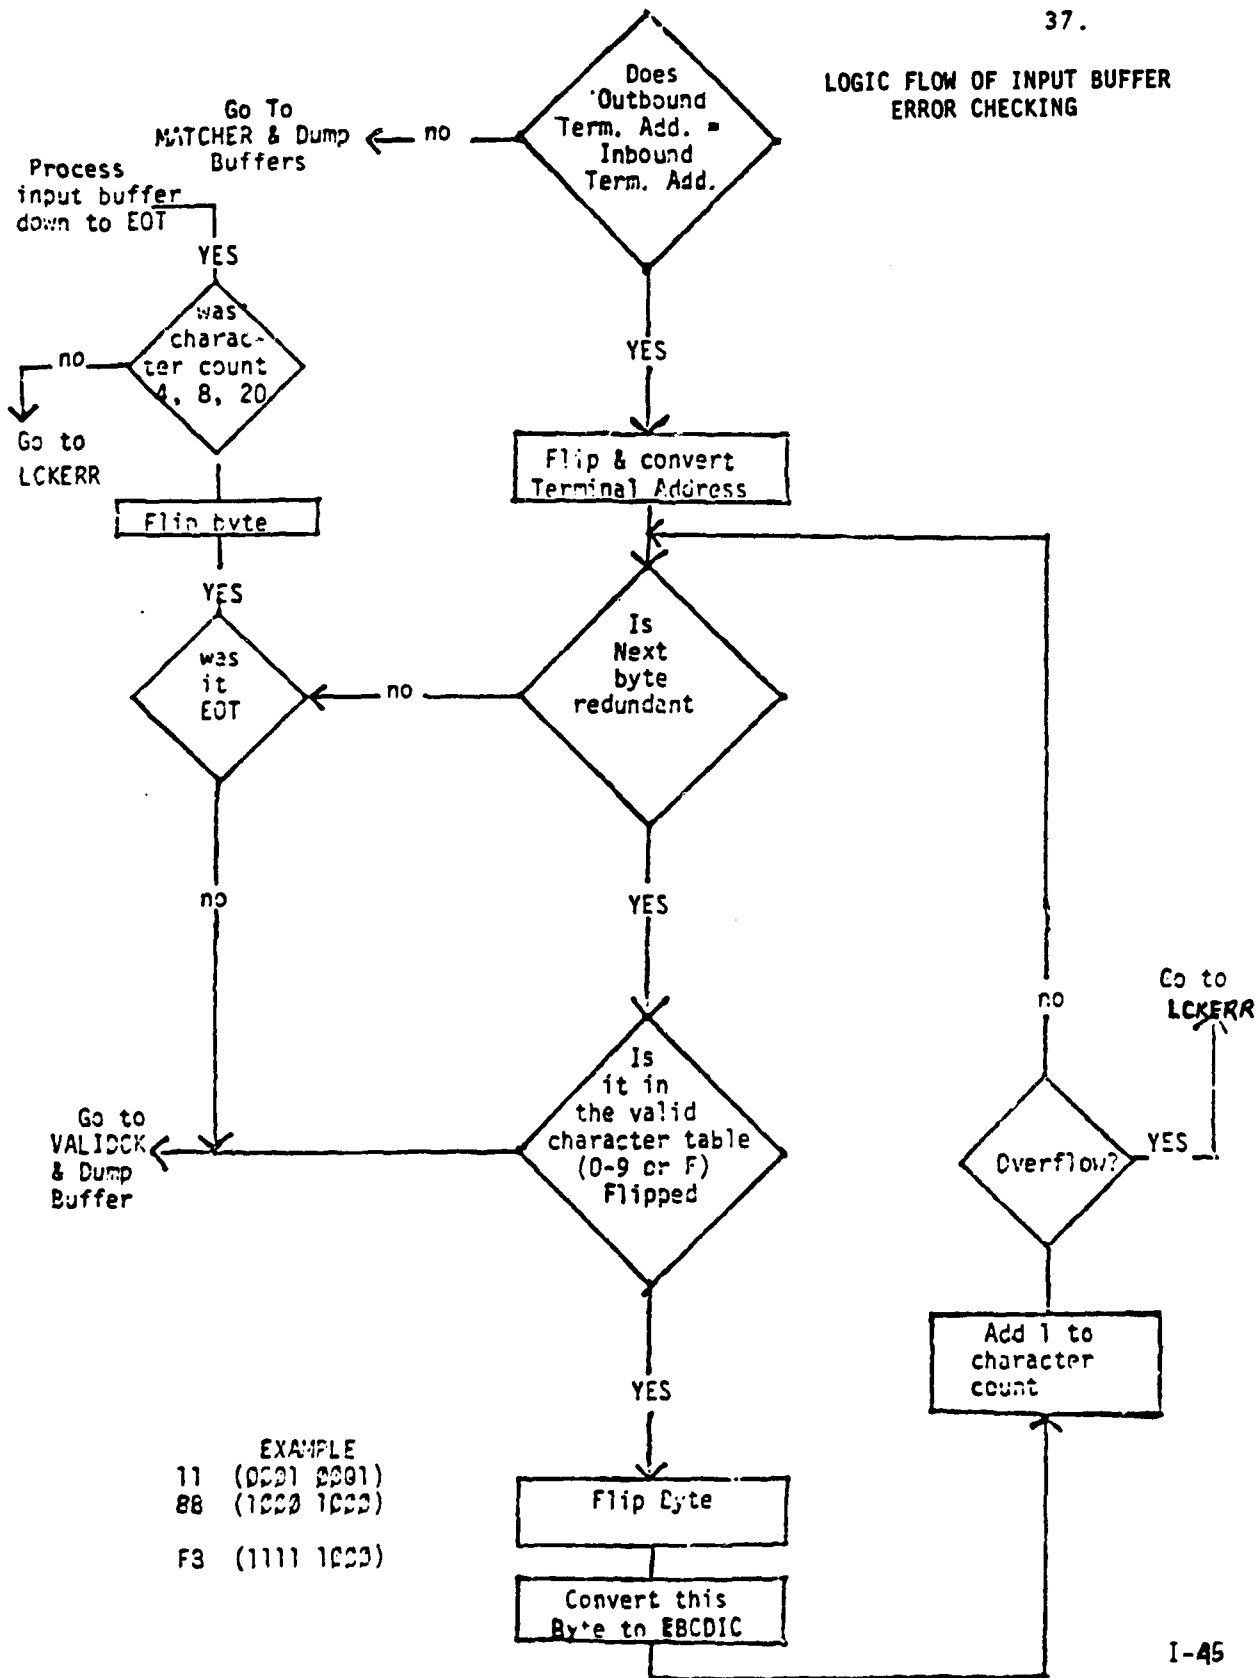

To identify the specific cause of error on MATCHER compare the outbound and inbound terminal address. Remember no conversions have occurred and the table must be applied.

To identify the specific cause of error on VALIDCK, locate the first byte which is not converted to EBCDIC. It will contain the error. Either the HEX digits are not redundant, or the byte will not flip to a valid character (0 - 9 or F). All bytes from that point through EOT are not flipped and must be applied to the table.

To determine if the error occurred on skip, total, or request, locate the EOT character. It will fall in the 4th, 8th, or 20th byte if the message length was not also in error.

LCKERR (length check error) prints the actual byte count at the right of the error message.

LOGIC FLOW OF INPUT BUFFER ERROR CHECKING

EXAMPLE  
 11 (0001 0001)  
 88 (1000 1000)  
 F3 (1111 1000)

## FILE INQUIRY

## OPERATOR INQUIRY (OPRINQ)

The operator inquiry program provides a variety of search or selection modes.

1. In all cases the program is started by:  
    >\$L OPRINQ
2. The program will ask for your inquiry type:  
    INQUIRY TYPE(?)\_

Enter the number for the report you want. If you are not sure of your choice, enter question mark ? and the program will display the options available to you. Make your selection or enter EN to end the program.

3. The program will begin processing your report (list all or list off-line status cards) or it will ask for necessary data (i.e. command # for 'list all in specified command'). In one case, 'list range of card numbers', the program will ask for two numbers - the beginning and the end of the required range.

## FILE INQUIRY

## EQUIPMENT INQUIRY (EQPINQ)

The equipment inquiry program provides a variety of search or selection modes.

1. In all cases the program is started by:  
> \$L EQPINQ
2. The program will ask for your inquiry type:  
INQUIRY TYPE (?)\_  
Enter the number for the report you want. If you are not sure of your choice, enter a question mark, ?, and the program will display available options. Make your selection or enter, EN, to end the program.
3. The program will begin processing your report (list all) or it will ask for necessary data (i.e. class for list all in classification). In one case, list range of odometer readings in command, 3 numbers must be entered.

FILE INQUIRY

TRANSACTION INQUIRY (TRINQ)

The transaction inquiry program will prepare several different types of reports.

1. The program is begun with:  
    >\$L TRINQ  
    DSI(NAME, VOLUME):  
    Where DS is the data set being processed, TRNSAC1 or TRNSAC2.
2. The program will ask for your inquiry type.
3. If additional data is necessary, the program will ask for it.

## FILE INQUIRY

## PRIVATE VEHICLE FUELING REPORTS (PVF)

1. This program is started by:  
    >\$L PVF  
    DS1(NAME,VOLUME):
2. The program will ask for command number in form XXX.
3. The report will list individuals in the command with PVF cards together with their transactions and a sub-total of fuel issued to them in this reporting period.
4. If an operator with a PVF card make no transactions in this period, 'no activity in this file' will be printed after his name.
5. Any transactions which cannot be matched with the name in the operator file (i.e. because of an operator delete, etc.) are listed separately with operator identification #.
6. To list private fueling in all commands:  
    >\$L ALL PVF  
    This program will list private fueling transactions for each command with subtotals for individuals and total for command.

## INDEX

Index program provides a listing of either operator card numbers and associated SS# or vehicle card numbers and associated equipment numbers.

1. The program is started by:

\$L INDEX

2. The program will ask:

INDICATE EQUIPMENT INDEX LISTING (EQ)

OPERATOR INDEX LISTING (OP)

OR END PROGRAM (EN)

Make selection or end program.

3. The program will then ask you to list the range of card numbers - the beginning and the end of the required range.

4. The program will then process your report on the high speed printer. The program will also show unassigned cards by a "0", disposed of cards with date, and offline cards with a \* next to SS#. Totals of online, offline, disposed, and unassigned cards will appear at end of this report.

PROCEDURE FOR MOVING TRANSACTIONS TO DISKETTE

Every month, on the 1st, 8th, 15th and 22nd day of that month, transactions must be moved to diskette. The procedure is as follows.

Take a Diskette from IBM box marked with yellow label. The label on the Diskette itself will read TRNDSKT 1922.

Put the Diskette in the computer and close the door - when the door has been closed properly, you will hear a noise.

Go to the System Control KSR and type the following:

>\$VARYON 2

the KSR will type the following message by itself:

SYS034 ONLINE

You then type:

>\$L MOVETRNS

The computer will then move the transactions to the Diskette.

When the transactions have been moved you will see the following message come up on the KSR:

MOVETRNS ENDED AT (whatever time it is)

You then open the door and remove the Diskette from the computer.

Write the date in the right hand corner of the Diskette label and put the used Diskette in the IBM box marked with red label.

>\$VARYON 2  
SYS034 ONLINE

>\$L MOVETRNS  
MOVETRNS 3P,07:33:39, LP= 7900

MOVETRNS ENDED AT 07:34:26

PROCEDURE FOR LOOKING AT THE TRANSACTIONS ON A USED  
DISKETTE

If at a later date, you should want to look at transactions from a previous week, month, etc. the following procedure is to be used:

Go to the IMB box with the red label on it which contains the used Diskettes.

Looking at the dates that are written on the right hand side of the Diskette label, take out the Diskette for the time period you want to look at.

Put the Diskette in the computer & close the door - when the door has been closed properly, you will hear a noise.

Go to the System Control KSR and type the following:

>\$CP 1 (you must be in partition #1)

>\$VARYON 2

The KSR will type the following message by itself:

SYS034 ONLINE

You then type the following:

>\$L TRINQ

The KSR will type the following:

DS1 (NAME, VOLUME):

You then type:

TRNSDKT, SYS034

When the KSR asks you for the search type, you reply with the code that corresponds to the type of information you want i.e., 03- All transactions for a given date.

If you don't know the proper code, when the KSR asks : SEARCH TYPE IS (?)

You type: ?

This will bring up all possible codes.

Transactions will be printed on high speed printer & when it is finished you will see the KSR type:

TRINQ ENDED AT (whatever time it is)

Remove Diskette from computer and put back in IBM box with red label.

Then change the partition back to partition 2 as follows:

>\$CP 2

> \$CP 1  
> \$VARYON 2  
SYS034 ONLINE  
> \$L TRINQ  
DS1 (NAME, VOLUME): TRNDSKT, SYS034  
TRINQ 50P, 11:34:04, LP= 9500

TRANSACTION FILES

TYPICAL OCTANE CONTROL UNIT INSTALLATION

INSTRUCTIONS

1. LOCATION SELECTION:

The Octane Control Unit (O.C.U.) should be installed in a location near the fuel pumps to be controlled. Preferably, install on the inland with the pumps or at either end of the island protected by guard post. If possible, the O.C.U. should be installed facing South, S.E., or East. This is to provide added protection from the elements.

2. INSTALLATION OF O.C.U.:

Custom Stand. The Stand should be bolted to finished surface using 4 - ½" expanding lead anchors or equivalent. (See custom stand diagram for dimensions.) Secure the O.C.U. to the top of the stand using 2 - ¾" bolts, nuts, & washers provided with stand.

Pipe Stand. See typical pipe stand drawings for floor and wall mounts. For floor mount stand, bolt stand to surface using 4 - ½" expanding lead anchors or equivalent. Wall mounting will depend on the type of wall the stand is being mounted on. See typical drawings. Secure O.C.U. by screwing it on the pipe stand. If there is not enough room to turn the O.C.U. remove the pipe flange adaptor from the bottom of the O.C.U. and screw it on the pipe stand first, then reattach the O.C.U. to the pipe flange. The pipe stands should be installed so the bottom of the O.C.U. is at least 53" above finished floor.

## 3. TELEPHONE LINES: (DATA PAIR)

If conditions permit, an aerial run may be made to a pole near the O.C.U. From that point the data pair should be run in steel conduit to the O.C.U. If conduit is required, run a separate  $\frac{1}{2}$ " conduit from the O.C.U. to the building where the telephone line terminal block is located. Pull one 2 conductor shielded cable in this conduit for the data pair. Do not run any A.C. lines in this conduit. (See Telephone Specification Sheet for Phone Line Specs.)

## 4. O.C.U. POWER

Power should be from a separate 115 VAC, 15 AMP circuit breaker. Run one  $\frac{1}{2}$ " conduit from O.C.U. to nearest available breaker panel. Pull three #12 THWN or THHN stranded, or approved gas & oil resistant wiring. At breaker panel end, tie one wire (BLK) to 115 VAC, 15 AMP breaker, one wire (WHT) to neutral bar, and one wire (GRN) to separate safety ground rod.

## 5. O.C.U. WIRING AND CONDUIT SCHEME

Single Nozzle Fuel Dispenser. Run two  $\frac{1}{2}$ " conduits to each dispenser from O.C.U. In one conduit pull one 3 conductor shielded cable, in the other pull four #14 THWN or THHN stranded, or approved gas & oil resistant wires.

Dual Nozzle Fuel Dispenser. Run two  $\frac{3}{4}$ " conduits to each dispenser from O.C.U. In one conduit pull two 3 conductor shielded cables, in the other pull eight #14 THWN or THHN stranded, or approved gas & oil resistant wires. Under certain conditions, AC wiring and shielded cable may be pulled in the same conduit. Conduit size may need to be increased. This wiring requirement is for O.C.U. control circuits only, and has nothing to do with the existing dispenser A.C. wiring requirement.

6. O.C.U. CONTROL WIRING CONNECTIONS:

See diagram on mother board connections. The wires are connected to the mother board by using  $\frac{1}{4}$ " push-on, solderless spade connectors.

- \* 3-CONDUCTOR SHIELDED CABLE. There should be a shielded cable used for each pump controlled. (1 through 5). In a standard color coded cable there is a red, white and black wire. In the O.C.U. attach the red wire to hook, white wire to pulse, and black wire to common. At the dispenser, connect the white wire to the pulser, red wire to the normally closed contact of the load complete relay, and the black wire to common of both the pulser and load complete relay.

Some pulsers are polarity sensitive. When using Unidynamic pulsers, the purple wires should be connected to positive D.C. voltage from the O.C.U. (white wire) and the orange and/or brown to negative D.C. voltage from the O.C.U. (black wire). The shields on all cables are to be above ground. In the O.C.U. tie all shields together and attach them to the common test terminal on the mother board. At the pump end cut the shields off even with the cable outer jacker and tape back to prevent any possibility of it coming in contact with ground.

- \* Pump Run Circuit. The pump run circuit on the O.C.U. mother board is enabled when the pump selector switch is in BYPASS, or by card access when the pump selector switch is in auto. The control wiring to the pump, should be connected to the desired pump run circuit 1 - 5 on the mother board. This control line in most instances should be tied to a set of N.O. contacts (switch or relay) that will close when the dispenser off/on switch is turned on and the register reset function is complete.

From the other side of the N.O. contacts, the control line should go to either an electric solenoid valve or a power control relay and back to the O.C.U. Neutral (Return). When these N.O. contacts are made they should permit the pump run potential to enable one of these devices.

TELEPHONE LINE SPECIFICATIONS

Private Line Channels for use as Octane System data circuits.

Communication circuits shall be split bridge multipoint 3002 unconditioned voice grade channels providing 2 wire interface with effective 2 wire facilities engineered for a Net Loss no greater than 16dB at 1000 Hz, suitable for use as one half duplex 300 BAUD data channels.

Frequency response - shall be 300-3000 Hz with Net gain of 3 dB to Net Loss of 12dB with respect to 1000 Hz test signal.

Frequency shift - shall not exceed +-5Hz.

Envelope delay distortion- shall be less than 1750 microseconds for 800 to 2600 Hz.

Impulse Noise- shall not exceed 15 counts in 15 minutes at a threshold of 6 dB below a -13 dB 1000 Hz test signal.

Phase Jitter - shall not exceed 10 degrees peak to peak.

All circuit parameters and design shall be equal to Southwestern Bell Telephone Company Type 422 Service.

Octane Control Unit Major Component Description:INTERFACE & POWER SUPPLY BOARD.

Purpose is to supply the DC potentials required for terminal operation & to interface the sense, control & display components on the terminal door with the terminal microprocessor circuitry, and to enable pump run circuits.

UART-MODEM

Purpose is to establish communications with the Series One computer under the direction of the microprocessor.

RANDOM ACCESS MEMORY BOARD (RAM)

It provides storage area for fueling transactions. It also provides the microprocessor with a scratch pad work area.

READ ONLY MEMORY (ROM)

Purpose is to provide hardware program control of microprocessor.

CENTRAL PROCESSOR UNIT (CPU)

Purpose is to control all terminal hardware under program supervision.

THUMBWHEEL SWITCH ASSEMBLY

Purpose is to provide a data input to the microprocessor. These inputs can be, but not limited to the following types: odometer reading, Vehicle number or Dip stick reading.

MOTHER BOARD

Purpose is to provide interconnection of microprocessor circuitry, pump enable By-Pass control, AC to DC supply with off/on switch & battery charge. It also provides dispenser sense & control wiring interface.

MAGNETIC STRIPE CARD READER

Purpose is to read the encoded information found on the magnetic striped card upon its removal,

PUSH BUTTON PUMP SELECT

Purpose is to allow the selection of dispenser.

PUMP ENABLE LIGHT

Purpose is to indicate which pump has been enabled.

SYSTEM ON LIGHT

Indicates O.C.U. is powered on when lighted.

COMM. FAIL LIGHT

Indicates O.C.U. is in an off-line condition when lighted.

ERROR LIGHTS

Self explanatory.

O.C.U. Terminal Circuit Operation

The microprocessor's reader senses a card in its reader that is being removed. This action causes the reader to read the encoded information and transfers this data to the RAM board via logic circuits of the Interface/Power board. Temporary storage is provided in RAM pending error checking and card information processing.

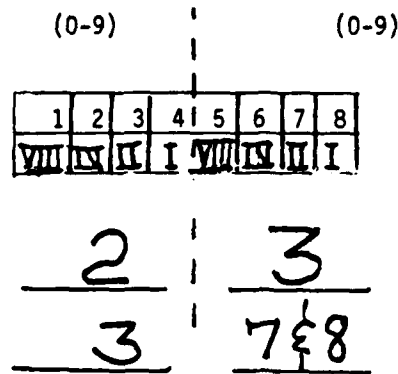

Assuming acceptance of this data (no card error), when the microprocessor senses a pump enable push button request, the wait light is turned on via the Interface/ Power board. It also builds a request message to be sent to the Series One computer. This request message is sent to the Series-One via the UART-MODEM board (Serial transfer, byte by byte under the control of the CPU board)

As the Series-One sees the request, it places it in a temporary validation input buffer. At this time validation of applicable data such as card type, on-line/off-line status, odom check, tank & pump status, fuel status etc. are checked. If an error is detected, the request is denied and an error is sent back to the O.C.U. terminal. If the request is valid, it is transferred to a specific pump buffer, and a control byte is sent back to the O.C.U. terminal. If it was an operators card, the control byte would be an acknowledgment of receipt of request. This would turn out the wait light and clear the data buffer in RAM for the next card request. If it was a vehicle card, the control bytes would be an acknowledgment of receipt of request. This would turn out the wait light, clear area in RAM, and enable the requested pump-run circuit. It would also store the number of gallons allowed for this particular card in a designated area in RAM.

When the microprocessor senses the common tie being removed from its associated hook sensing circuit it wakes up the pulse sense circuit. The pulse circuit transfers any incoming 1/10 gallon pulses to the RAM board where they are being constantly added up & compared with total gallons allowed by the Series-One for this particular vehicle card. When the gallons limit is reached the pump run potential will drop out. With the dispenser nozzle hung up properly the hook sense circuit will cause the microprocessor to build a TOTAL message which is sent to the Series-One. The Series One sends the O.C.U. an acknowledge at this point. This TOTAL message is married-up with the vehicle card request in the pump buffer. Once this total reaches the specific pump buffer a transaction is built and sent to disk as well as the TPT printer, if TPT report has been requested. It also clears the specific pump buffer to all zeros.

Another way a TOTAL can be built & sent to the Series-One is by at least 1/10 gallon of fuel being sensed by the pulse input circuit & the dispenser nozzle being hung up properly. This action causes the hook circuit to acknowledge a total.

ADDRESSING THE INTF/PWR BOARD

Dip Switch Numbered 1-8

Enter Term.

Address

Enter Dip Switches  
Placed On

EXAMPLE: Addressing : (Terminal 23, Push DIP switches 3,7, & 8)  
 Terminal 9 5, Push DIP switches 1 & 4 and 6 & 8  
 Terminal 07, Push DIP switches 6, 7 & 8 only.

NOTE: DIP switch addressing is done in two ½ bytes. The first ½ byte is reserved for the most significate digit (zero thru nine) and the other ½ byte is for the least significate digit, (zero thru nine).

COMMON ERROR MESSAGES

AUTO RESTART

Indicates the O.C.U. terminal detected an internal program error and automatically restarted its program.

This type of error may be accompanied by one or two other error messages. TNKPMP and/or VEHERR. If this occurs, especially if a VEHERR follows a valid transaction shown on TPT printout, no action should be taken unless it continues to happen frequently. If it does, first try replacing the RAM board. If problem persists insure wiring integrity meets standards set forth in the section covering INSTALLATION OF O.C.U.

INVALID CARD

Indicates the card number, its associated vehicle number, or its system identification number is not valid within this fuel systems software.

The most common cause of this occurring is person losing card, reporting it lost & later finding it and trying to use it. When reported lost it was taken-off line thereby becoming invalid.

Other problems causing an INVALID CARD are rare, but maybe isolated by following step by step procedure as shown below. Under no circumstances should a wholesale change-out of boards ever be attempted.

Defective Component:

- a. INTF/PWR
- b. RAM
- c. Card Reader

LCKERR

Indicates that the length of the message received by the Series One was in error.

These message length errors are rare but in some cases are caused by a "DIRTY" telephone line. If the telephone line has been checked out & determined to meet prescribed specification, yet errors persist then an O.C.U. circuit board may be at fault. Either the ROM or CPU board may be guilty of such error messages.

MATCHERR

Indicates the message received by the Series One did not match the O.C.U. terminal polled.

Matcher-line errors are the most common errors associated with a "DIRTY" telephone line. An O.C.U. terminal that has a constant carrier on the line will cause a steady stream of MATCHERR messages, to the point of taking every O.C.U. terminal on-line off-line. See "Comm. Fail" trouble Symptom for corrective action.

If the phone line has been checked out & determined to meet prescribed specification then try to determine the guilty O.C.U. terminal. A step by step procedure, of interrelated circuit board replacement, should be followed in order listed below:

- a. UART-MODEM
- b. INFR/PWR
- c. CPU
- d. ROM

NO TOTAL CAME IN

Indicates no total was received by the Series One (pump buffer) after this card enabled this pump at this terminal.

A common cause of an occasional no total error message is where a person enables a pump and waits longer than one minute to use it. A string of NO TOTALS against the same pump indicates a problem associated with just that dispenser. An example of this would be as follows:

- a. No power reaching pump motor
- b. Fuel tank empty
- c. Clogged fuel strainer.
- d. Pump lost its prime.

Note: Try in By-Pass to see if fuel can be dispensed.

Other problems that would cause a no total can be found in this guide under item 3 of Dispenser/Relay J-Box Related Problems.

Explanation of why a NO TOTAL CAME IN error message is created will be discussed next. Prior to reading this explanation make sure you have first read the section on the O.C.U. terminal Circuit Operation.

After a push button request has been validated & sent to its respected pump buffer in the Series One, it awaits a total message to complete the transaction. If there is never a total message sent by the terminal to the Series One, the request sits in the pump buffer until another card request (not same card as before) hits this specific pump buffer. At this time the original request is transferred out to make room for the new request message associated with the same push button & terminal. The Series One software notes it is an incomplete transaction lacking a total gallons fill & makes note of that on the Main console of the TTY as a NO TOTAL CAME IN.

TNKPMP FILE ERROR

Indicates a total was received by the Series One from a pump not identified in its Base Data file.

Follow logical steps below to isolate cause of error messages:

Q1 - Is more than one TNKPMP FILE ERROR being printed on main console?

YES

NO

└─ Take no action at this time as it may have been a fluke.

└─ Q2 - Were there any Auto Restarts preceding printouts?

YES

NO

└─ Take no action as AUTO RESTART may very well have been guilty of causing them.

└─ Perform a PFR against guilty site to confirm tank assignment is correct. Go to Q3.

Q3 - Did the PFR indicate the correct information?

YES

NO

└─ Contact E.J. WARD D.P. department.

└─ Replace the RAM board in O.C.U. terminal.

VALIDCK

Indicates that the message received by the Series One was not redundant as all message should be.

Service is not required unless these error messages persist. If this is the case, go to the offending O.C.U. terminal & start replacing the following boards in the order given.

NOTE: Circuit boards are very interrelated and the order shown is from most likely to least likely.

- a. ROM
- b. CPU
- c. UART-MODEM

VEHERR

Indicates that a total was sent to the Series One and found all zeros (no request) in the specific pump buffer. Because of this, it will print a vehicle number of a -1 (v -1) showing total number of gallons.

A good example of how a VEHERR could occur is by the phone line getting a "HIT" on it at the very time an acknowledge is being sent to an O.C.U. terminal for a total that had just been sent. The O.C.U. terminal never seeing this acknowledge sends the total message once again. By this time, the first total message had gone to the specifically assigned pump buffer & completed the transaction, returning the buffer to all zeros. The second (identical) total now hits the same buffer & finds no request message, only zeros. This will in turn create a VEHERR.

Other than a "DIRTY" phone line a UART-MODEM board can cause this error message. Take no action unless the error messages persist.

\* A VEHERR will subtract gallons from tank balance for each time it is printed.

Note: ESI= Error Sense Indication

ECB= Event Control Block

ISB= Interrupt Status Byte

\* See Commu Fail sections concerning ESI-ISB error messages.

STORAGE, HANDLING & SHIPPING

MAJOR COMPONENTS

STORAGE:

Try to keep circuit boards & other major components in a cool, dry, dust free environment free of static or magnetic fields. To further protect spare boards it is highly recommended to put them in static free bags or wrap in tin foil. Do not stack boards on top of each other.

HANDLING:

When handling circuit boards make sure you do not induce a static charge on the component you are handling or the terminal you are preparing to exchange it in. Discharge your body of static electricity prior to replacing circuit boards.

SHIPPING:

Insure each component is wrapped in some type of packing material that will protect it from any rough handling in shipment.

REPLACING/ADJUSTING MAJOR COMPONENTS:

E.J. WARD, INC.  
8801 TRADEWAY  
SAN ANTONIO, TEXAS  
78217  
(512) 824-7383

J-25

REPLACING MAJOR O.C.U. COMPONENTS

- BATTERY The battery can be replaced by removing the inverted L bracket that holds it in place & disconnecting the two battery leads.
- CARD READER The card reader can be replaced by first taking the ribbon connectors off & removing the +12VDC lead from the Mother board. Unscrew nuts that hold reader to door and remove reader.
- PUSH BUTTONS The Push button seals can be replaced by holding inside housing while turning seal counter clockwise.
- T/W SW. ASSY. The Thumb Wheel Switch Assembly can be replaced by first disconnecting the associated ribbon cable connector from the Interface/Power board & desoldering the four color coded wires at one end of the assembly. (Be sure to take note of colors & tie points). Unscrew nuts that hold assembly in place.
- DOOR LIGHTS The replacement of a terminal door light requires removing connecting wires & pulling light assembly towards you. It will snap out freeing itself. Observe polarity flat spot on L.E.D. bulb, it indicates negative polarity.
- MOTHER BOARDS The replacement of a mother board requires wires & cables to first be moved from all tie points & the circuit boards taken out. Take the By-pass/Auto switch loose from base of cabinet. Remove screws from two electronic components if mounted to cabinet base. Unscrew four nuts holding back panel in place. To install just reverse the above procedure.

Adjustment Instructions1. UART/Modem carrier level:

- a. Temporarily disconnect phone line and connect a 590 ohm resistor to tie points DR/DT on the mother board.
- b. Using a Simpson 260 (or equivalent) meter on the 2.5. volt AC scale connect leads across the 590 ohm resistor.
- c. See UART/Modem board and temporarily jumper from right side of R-6 to inside (Top) end of R-3. This should bring up the TX. Carrier.
- d. Observe db scale reading on meter and adjust the "Output Adjust" R-16 control for a reading of odbm.
- e. Turn power off to terminal to restore carrier off condition on UART/Modem. Reconnect phone line to DT/DR and power on terminal.

2. 12 Volt Power Supplies:

- a. Using a DC volt meter on 50 VDC scale, connect positive lead to +12V test point and negative lead to common.
- b. Meter should read +12 to +14 VDC.
- c. Switch leads and measure at the -12VDC test point.
- d. Meter should read -12 to -16 VDC.
- e. Remove battery fuse temporarily and measure charge voltage to battery between fuse holder & common. Requirement: +14 to +16 VDC.
- f. Measure battery voltage with fuse out. Requirement: +12 VDC to +14 VDC.
- g. Install battery fuse. Measure battery voltage under load with AC power to terminal off at CKT. breaker or safety switch. Requirement under load: Battery voltage should be +12 to

+13.5 volts after 20 minutes of operation. If it indicates under voltage, battery may be in discharged condition or defective. Investigate & take appropriate action to correct condition.

3. Factory Preset +5VDC Power Supply:

- a. Using a Simpson 260 (or equivalent, 20K ohm/Vmeter) 10VDC scale, connect positive lead to test point marked +5VDC on mother board and negative lead to test point marked common.
- b. Meter should be of a known 1% accuracy. The required reading should be 5.1 to 5.2 VDC. If the reading is outside of this range, but within the range of 4 to 7 volts, adjust the +5V adjust control on the interface/Power supply board (left side) for a meter reading of 5.15 volts. If the meter reading is not within the 4 to 7 volt range, the interface and power supply board is defective. Remove & replace interface and power supply board.

REPLACING RELAY (S) IN RELAY J-BOX

The small green top relay is used for sensing on-hook/off-hook condition. It is a plug in type relay that can be replaced by pulling (while rocking) it straight out from its base. A new relay can then easily be put in its place.

The large black relay is used to control power to a pump motor or electric solenoid valve. The wires must first be removed from it & placed to one side. It would be best to mark them for pin connection at this time. Removing the relay requires loosening one screw & pulling it straight out.

REPLACING A UNIDYNAMIC 5000-1 PULSER UNIT.

- STEP #1 Disconnect wires in explosion proof box observing color combinations.
- STEP #2 With large channel locks or a pipe wrench turn barrier assembly counter clockwise until it is free of explosion proof box.
- STEP #3 Remove register shield, then screw holding pulser sensing assembly until it can be removed. (Note the way it was installed with brass wheel meshed with the 1/10 gallon wheel.)
- STEP #4 To install a new unit, reverse the above steps.

DISPENSER MECHANICAL SWITCH  
ADJUSTMENT OR REPLACEMENT

The mechanical switch found in the dispensers (so equipped) are to sense the on-hook/off-hook condition of the dispenser. This status is accomplished by mechanically connecting the arm of the switch to the rod which turns on the pump motor after the register head has undergone a reset.

If this switch is out of adjustment one of two different conditions will result.

CONDITION 1: Switch not closing normally open contacts when register head has been reset & pump-on lever has been activated.

RESULT: Pump motor will not come on in bypass or auto.

CONDITION 2: Switch not deactivating after pump motor lever is returned to off position.

RESULT: In bypass no apparent problem, in "AUTO" customers get immediate pump error light (no wait light) when push button is depressed.

Optimum adjustment can best be made by monitoring the tie points Hook/Common on mother board with a DC voltmeter set to read 5 VDC. An on-hook condition of dispenser should result in a 0VDC reading. An off-hook condition should result in a + 5 VDC reading.

The mechanical switch should be adjusted so that 3/4 of the way through the condition of lever the + 5VDC will occur. It should drop out at bottom end approx. 1/4 way before pump lever is returned to full off position.

MARCH 4, 1981  
(REV. May 7, 1981)

N. Y. P. D. AUTOMATED

FUEL SYSTEM

SERVICE GUIDE

SECTION IV

MAINTENANCE OF SYSTEM:

E.J. WARD, INC.  
8801 TRADEWAY  
SAN ANTONIO, TEXAS 78217  
(512) 824-7383

PREVENTIVE MAINTENANCE

There is no time schedule for performing preventive maintenance. It should be performed at anytime a service technician is required to be on site.

The following items should be checked:

- Push button seals for cracks. Replace any that are cracked.
- Boards & ribbon cable connectors properly seated. Reset any that appear to have become partially unseated.
- Thumb Wheel Switch Assembly digit units (1-6) turn freely from 0 thru 9. Replace entire assembly if any one unit fails to turn freely.
- Door Face should be wiped clean, especially in area of operating instructions.
- Card Reader "Clean-Head" card should be run through reader several times.
- Pin cleaning of all boards with a standard pencil eraser.

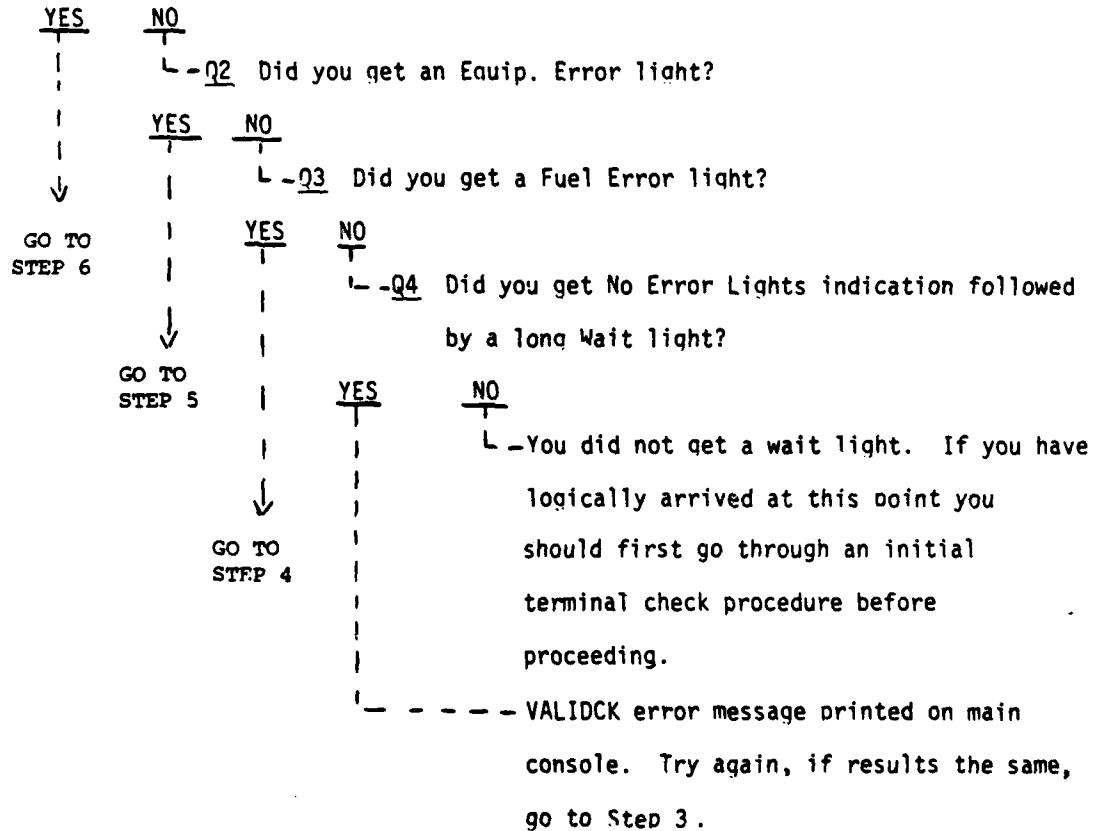

TEST CARD PROCEDURE

STEP #1 Insert test card in reader, remove rapidly.

STEP #2 Depress appropriate push button.

NOTE: Providing you were in miles limit (Thumb Wheel Switches) from last time you used test cards an Odom error should not occur following the wait light. If an Odom error does occur, simply try again without changing setting of Thumb Wheel Switches.

Q1 Did you get a Pump Enable light?

STEP 3 Replace components in following order to clear malfunction. Check between boards.

- a. ROM
- b. CPU
- c. UART-MODEM

STEP 4 Go to Trouble Symptom list under Fuel Error to isolate malfunction.

STEP 5 Go to Trouble Symptom list under Equip. Error to isolate malfunction.

STEP 6 Go enable pump & dispense gasoline. Test card should turn pump off at 1 gallon.

Q5 - Did this occur?

<u>YES</u>	<u>NO</u>
	L -
	<u>STEP 7</u>
	Go to Dispenser/Relay J-Box Related Problem section to isolate malfunction.

L -	<u>STEP 8</u>
-	Re-enable the pump & dispense 2 or 3 tenths of a gallon of gasoline.

STEP 9 Shut pump off.

STEP 10 Take pump back off-hook.

Q6 - Did pump motor come back on allowing you to pump more fuel?

<u>YES</u>	<u>NO</u>
	L -
	System operational, no further action required.

	-	<u>STEP 11</u>
	-	Check small Midtex relay in Relay J-Box, it may be staying energized.

\*Investigate & repair.

INITIAL TERMINAL CHECK PROCEDURE

This procedure is very useful in determining operational capability of the O.C.U. terminal. Before attempting to follow this procedure, power the O.C.U. off and clean the circuit board pin connections with a pencil eraser. In many cases this alone will correct the reported problem. If it did, take no further action.

STEP #1 Power off O.C.U. terminal.

STEP #2 Connect signal tracer (audio detector) to tie points on Mother board marked DT & DR. (Turn on signal tracer)

STEP #3 Power on O.C.U. terminal

Q1- Did you hear an audio tone lasting for about one second or less?

YES

NO

Q2- Did you hear an audio tone that was erratic, wavering or constant?

YES

NO

STEP #4 No tone was heard. May or may not spell trouble. Power O.C.U. off & on once again. If still no tone is heard, assume no problem at this time & go to Step 6 this section.

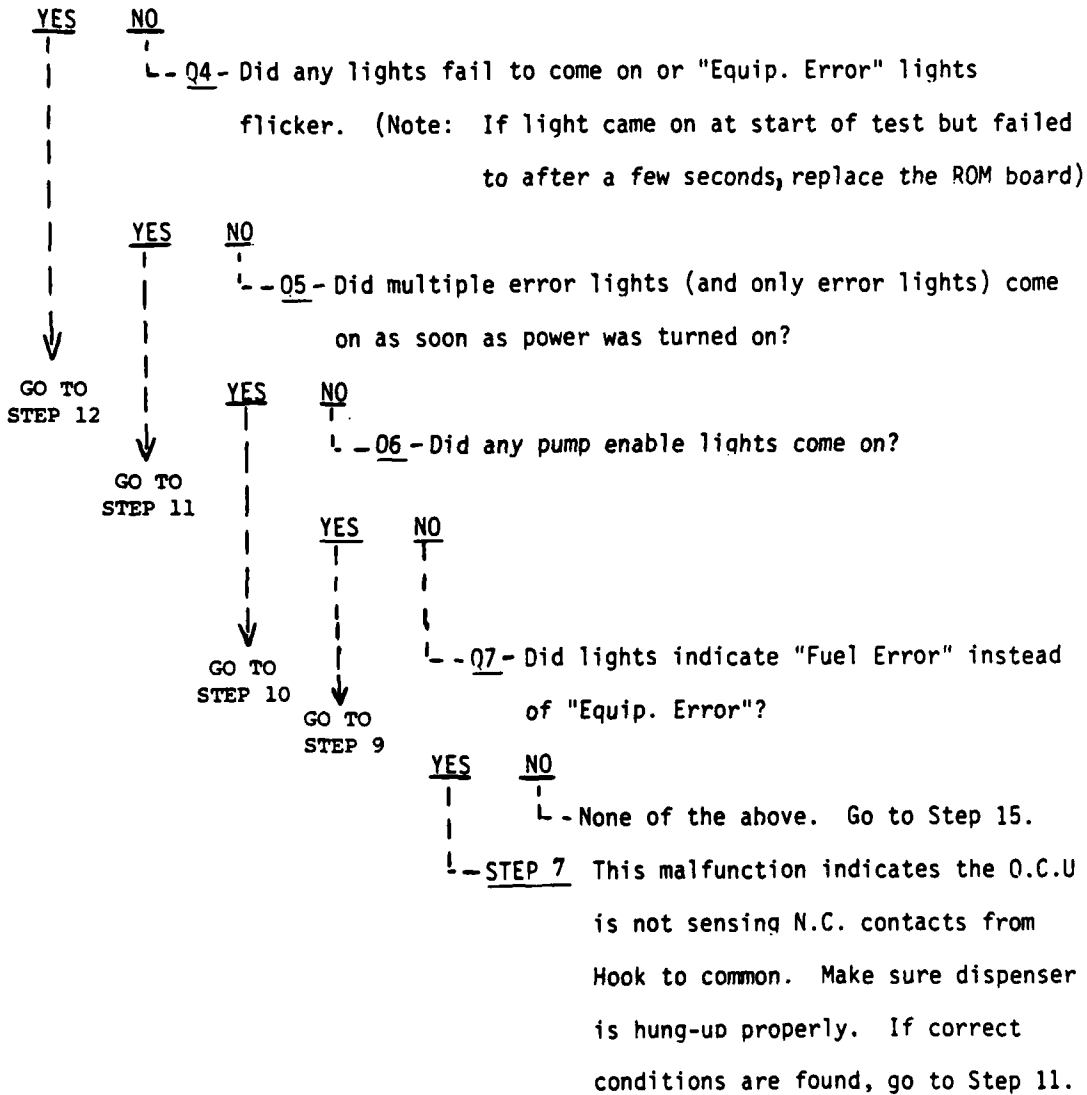

STEP #5 Before proceeding try power off & on the O.C.U. to see if malfunction will clear itself. If it did not correct itself, continue to follow instructions below:

- a. Erratic tone, replace CPU board.
- b. Wavering tone, replace ROM board.
- c. Constant carrier, replace (1) RAM board, (2) CPU board, (3) UART-MODEM board. (Check between boards).  
Constant tone persists, replace (1) INTF/PWR. board, (2) Mother board, watch Dog Timer, NE555.

↓  
GO TO  
STEP 6

STEP #6 Put AUTO/BY-PASS switch in the AUTO position. Turn off power to O.C.U. for 15 seconds & back on again. Close O.C.U. door. Push buttons 1 thru 5 for about 5 seconds each. On those buttons tied to a dispenser an "Equip. Error" light should light when the button is pushed. On those buttons not tied to a dispenser the "Fuel Error" light should light. Exception is push button #5. It should indicate "Equip. Error" when pushed even though it is not tied to a dispenser. Go to Q3

Q3 - Did above test prove satisfactory?

STEP 9 Replace the ROM board. (See note at bottom of page.)

STEP 10 Replace the CPU and/or power board.

STEP 11 a. Replace the INTF/PWR board.  
b. Replace UART-MODEM Board.

STEP 12 Put AUTO/BY-PASS switch in BY/PASS and push button 1-5 momentarily. Each should indicate a "Fuel Error" when depressed. Go to Q8.

Q8-Did above test prove satisfactory?

YES NO  
|    |  
|    |  
| --- Go to Trouble Symptom list this guide.

| --- STEP 13 Put AUTO/BY-PASS switch back in AUTO position. Power O.C.U. off & back on again. Put all zeros in Thumb Wheel Switch Assembly. Put appropriate Test Card in reader & remove. Press appropriate push button. The "Wait Light" should come on. A "Comm. Fail" light should come on about 20 + seconds later, followed by the wait light timing out in approx. 30 seconds. See IF statements below.

NOTE: If "Comm. Fail" light did not come on, replace ROM Board.

If "Wait Light" did not come on, replace INTF/PWR board.

If above test proved satisfactory continue with Step 14.

STEP 14 With unit now in "Comm. Fail" & "Wait Light" off push each button to insure no lights come on. Go to Q9.

Q9-Did the above step prove satisfactory?

YES NO  
|    |  
|    |  
| --- Go to Trouble Symptom list.

| --- Go to Polling Simulator (Pre-test) this guide.

NOTE: If the "Wait, "Fuel Error," "Equipment Error," & pump enable lights for 2 & 4 all come on, replace the RAM board----only if ROM board replacement did not correct the condition. If only pump enable light(s) are on & ROM replacement did not correct this condition; replace the PWR/INTF board.

Q12 - Do you have the correct readings?

YES

NO

— Bridge network defective.

STEP 20 Remove & replace network with servicable like item,  
or remove & replace entire Mother board.

— — SCR, or other power supply component defective.

STEP 21 Replace Mother board, no further action required.

STEP 22 Power unit off & on at least one more time to see if  
malfunction clears. If problem persist start replace  
circuit boards in the follow order until problem is  
eliminated:

- a. UART-MODEM
- b. INTF/PWR
- c. RAM

Polling Simulator (Pre-test)

Are other O.C.U. terminals polling on same comm. line as terminal undergoing test?

NO      YES

├── STEP 1 Connect Audio signal tracer to DT/DR tie points on mother board. Turn Audio tracer on.

└─ Q2 - Can other terminals be heard polling on this line.

NO      YES

├── STEP 2 Have person manning main console type terminal on line with SYS, ONN command.

└─ Q3 - Did Comm. Fail light go out and audio tracer indicate a proper polling sequence. Note: If you had previously just completed an Initial Terminal Check with no errors an "Odom Error" should light as soon as terminal is polled.

↓  
GO TO  
STEP 11

↓  
GO TO  
STEP 10

NO      YES

├── STEP 3 Use test cards to insure terminal is back in proper operation.

└─ Q4 - Did test card(s) function properly?

NO      YES

├── STEP 4 No further action required.

└── STEP 5 Go to Trouble Symptom list to isolate trouble.

└─ Q5 - Did computer error messages on main console print out ESI ISB with last two words of 0040 F000?

NO      YES

├── Q6 - Did you hear the terminal answering the poll.

NO      YES

├── STEP 6 Possible phone line problem. Go to Polling Simulator Test Procedure to confirm.

↓  
GO TO  
Q7

└── STEP 7 Terminal board problem. Go to polling simulator test procedure to isolate malfunction .

Q7-Did you hear the terminal answering the poll four times?

- |           |            |  |
|-----------|------------|--|
| <u>NO</u> | <u>YES</u> |  |
|           |            |  |
|           |            | - <u>STEP 8</u> If error messages on main console were MATCHERR then go to Trouble Symptom List under Comm. Fail to isolate malfunction. |
|           |            | If error messages were ESI-ISB, go to Polling Simulator Test Procedure to isolate malfunction.   |
|           |            |  |
|           |            | - - - <u>STEP 9</u> Terminal board problems, go to Trouble Symptom List under Comm. Fail to isolate malfunction.                         |
|           |            | <u>STEP 10</u> Telephone line problem. Turn problem over to those responsible for maintaining communications network (Telephone Co.)     |
|           |            | <u>STEP 11</u> Connect audio signal tracer to DT/DR tie points on mother board and turn tracer on.                                       |

Q8-Can you hear the steady tone of computer data set?

- |           |            |  |
|-----------|------------|--|
| <u>NO</u> | <u>YES</u> |  |
|           |            |  |
|           |            | - <u>STEP 12</u> Have a person at main console put terminal and line on-line with SYS,ONN commands. Go to Question 3 above.                |
|           |            |  |
|           |            | - - - <u>STEP 13</u> Telephone line problem. Turn problem over to those responsible for maintaining communications network (Telephone Co.) |

POLLING SIMULATOR TEST PROCEDURE

- STEP #1 Remove audio signal tracer from DT/DR tie points.
- #2 Disconnect telephone pair from DT/DR.
  - #3 Connect Polling Simulator line to DT/DR.
  - #4 Re-address Interface/Power Supply board for terminal 01.
  - #5 Turn simulator (Tape Recorder) on.
  - #6 Turn volume control up to approx. 40%

QUESTION #1

Did terminal come out of comm. fail status

NO      YES

- - - - -Telephone line problem. Call person responsible for communication network (Telephone Company)
- - - - -Repeating test procedure between board replacement, start replacing boards one at a time in the following order:
  - a. UART-MODEM
  - b. INTRF/PWR
  - c. ROM
  - d. CPU

NOTE: Remember to re-address INTF/PWR board to its proper terminal number once this procedure is completed.

POLLING SIMULATOR SUBSTITUTION

This procedure can be used for a terminal which is on the same line with other terminals that are polling. The procedure should be used with one precaution. It is likely that if the phone line is acceptable between terminal under test & Series One computer, error messages will occur on the line to extent of taking the line off-line. This will not occur if instructional steps are followed closely.

STEP #1 Temporarily change address of terminal (via dip sw: on INTF/PWR Bd) to any address number of a terminal that you know to be polling on same line. Do so while terminal is powered on. One of 3 conditions will occur.

CONDITION 1: Terminal will come out of Comm. Fail status.

CONDITION 2: You will hear steady audio tone.

CONDITION 3: No change, terminal still in Comm. Fail with no accompanying steady tone on phone line.

Q1 - Did you cause condition 2 to occur?

NO

YES

|  
|  
|  
|

- STEP 2 Quickly put dip switch back to correct address or power off terminal. Go to Step 7.

- Q2 - Did you cause condition 1 to occur?

NO

YES

|  
|  
|  
|  
|

- STEP 3 Telephone line problem on pair (Four line facility) returning poll to Series One computer equipment.  
Call telephone company to have problem corrected.

- - - STEP 4 Condition 3 is very rare but does happen occasionally.  
This condition indicates the db level of the poll being received is too low for the UART modem to respond to, or the UART-MODEM board is defective.  
Corrective Action: Replace UART-MODEM. Go to Q3.

IV-12

J-43

Q3 - Did replacing the modem give you a condition other than condition 3?

NO    YES

|            | - STEP 5 Go to that condition & proceed.

|            | - - - - STEP 6 Report db level trouble to telephone company.

STEP 7 The terminal established communications with the Series One computer.

Have person at main console perform SYS,ONN command for terminal  
once correct address has been placed on dip switch of Interface &  
Power Supply board.

Q4 - Did the terminal now come out of Comm. fail status?

NO    YES

|            | - Use test cards to insure terminal is operating properly. See

|            |            Test Card Procedure this guide.

|            | - - - - Replace Interface Power Supply Board.

COMMON O.C.U. TROUBLE SYMPTOMS

Using this section one should keep in mind that a microprocessor is a very intricate device having many interrelated circuits. A particular trouble can not always be pinpointed to the same circuit board which may have previously corrected the problem; therefore, this section is organized to list the most likely causes for a given trouble symptom.

Before attempting to use this section be sure to gather as much information as possible about the reported problem. Ask these questions of yourself:

- \*Can I correct the problem at the main console?
- \*Is it a telephone line problem?
- \*Is it a problem with the O.C.U. terminal or with the dispenser?
- \*If it is a problem with the O.C.U. terminal does it occur before or after a wait light?

Questions like these will help you make better use of this section in isolating the particular malfunction.

<u>SYMPTOM</u>	<u>PAGE</u>
SYS. ON LIGHT .....	IV-15
COMM. FAIL LIGHT.....	IV-17
WAIT LIGHT.....	IV-20
ERROR LIGHTS.....	IV-22
PUMP LIGHT.....	IV-20
PUMP MOTOR SHUTTING OFF TOO SOON (AUTO) .....	IV-25

PUMP MOTOR WON'T SHUT OFF (AUTO) .....	IV-25
OTHER TROUBLE SYMPTOMS.....	IV-26

SYMPTOM (1 of 2)

SYS. ON Light Off, no comm. fail indication at main TTY console or at OCU terminal.

STEP #1 Use a test card to enable a pump

Q1- Did you get a wait light?

NO

YES

- |  
|  
|  
|  
|  
|  
|  
|  
|
- └ -Terminal operating. Probable cause of malfunction is one of the following conditions:
    - a. Leads on SYS. ON light shorted together.
    - b. Open in ribbon cable or 16 pin connector to SYS. ON light.
    - c. Defective IC on Intf/Pwr. board.
    - d. Defective SYS. ON L.E.D.

STEP #2 Insure the following conditions exist before preceeding any further.

- a. Power fuse & battery fuse good.
- b. The off/on switch has not been turned off.
- c. The AC to terminal has not been turned off.

If any of these conditions were found & corrective action taken — —

Q2- Did this clear the malfunction?

NO

YES

- |  
|  
|  
|  
|
- └ -Have person at main console put terminal back on line with SYS, ONN command. Use test cards to insure unit is functioning properly.

└ STEP 3 Replace Intf/pwr. board with serviceable spare.

Q3- Did this action clear the malfunction?

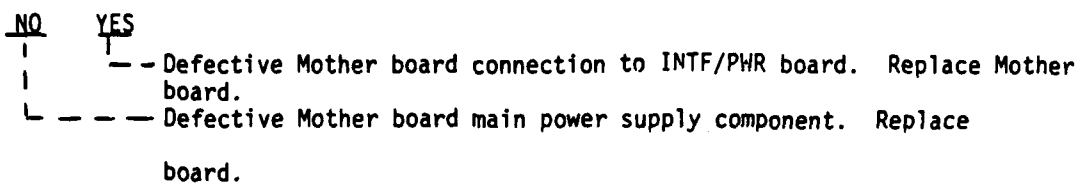

NO

YES

- |  
|  
|
- └ -Go to Yes under Q2.

└ STEP 4 Take voltage measurement at +12VDC test point to common tie on Mother Board.

Q4 Did you read +12VDC or greater?

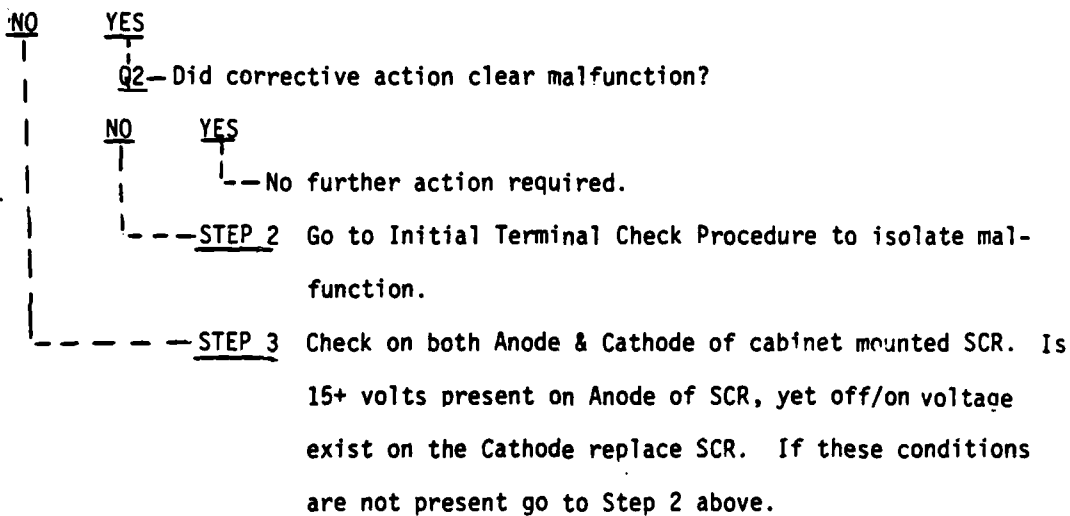

SYMPTOM (2 of 2)

SYS. ON Light blinking on & off again.

STEP 1 Check following conditions first.

- a. No AC power getting to Mother board.
- b. Power fuse on Mother board defective

Q1- Did either of these conditions exist?

SYMPTOM (1 of 1)

COMM. FAIL LIGHT ON:

STEP 1 Perform an STT on main console.

Q1- Does the O.C.U. show an OFF-LINE status?

YES    NO  
|        |  
L - STEP 2 Double check main console printout to see if TERM-CK program  
          hasn't put the O.C.U. back On-Line.

Q2- Did TERM-CK put the O.C.U. back On-Line?

YES    NO  
|        |  
|        L - STEP 3 Go to Initial Terminal Check Procedure in this guide.  
|        |  
|        L - STEP 4 No further action required.  
|        |  
L - STEP 5 Place the O.C.U. ON-LINE with SYS, ONN command at main  
          console.

Q3- Do five error messages print on the main console?

YES    NO  
|        |  
L - Q4- Are there also other O.C.U. terminals operating on this line at  
          this time?

YES    NO  
|        |  
L - STEP 6 Place the line ON-LINE with the SYS, ONN command at  
          main console.

Q5- Do numerous error messages printout on the main console?

YES    NO  
|        |  
|        L - Go to STEP 7  
|        |  
L - Go to Q6

L - STEP 7 No further action required. O.C.U. is communicating.  
          This can be verified with an STT request.

L - Q6- Are the first four error messages ESI-ISB type?

YES    NO  
|        |  
↓        |  
GO TO    |  
STEP 21 |  
          L - Q7- Are the error messages MATCHERR?

YES    NO  
|        |  
L - GO TO Q8  
L - GO TO Q10.

Q8 - Are the error messages VALIDCK, LCKERR or INVALID CARD 29990?

YES NO

L - Q9 - Are the error messages TNKPMP FILE ERROR or VEHERR?

YES NO

L - STEP 8 Go to Initial Terminal Check Procedure.

L - STEP 9 Go to Explanation of Common Error messages this guide.

L - STEP 10 Replace ROM board.

Q10 Are there other O.C.U. terminals communicating on this line sending MATCHERR messages?

YES NO

GO TO STEP 15

L - Q11 - Is the CD lamp on the Data set associated with this line burning steady?

YES NO

GO TO STEP 14

L - STEP 11 Place all O.C.U. terminals on this line OFF-LINE. Place terminal in question & line ON-LINE.

Q12 - Do MATCHERR'S still occur?

YES NO

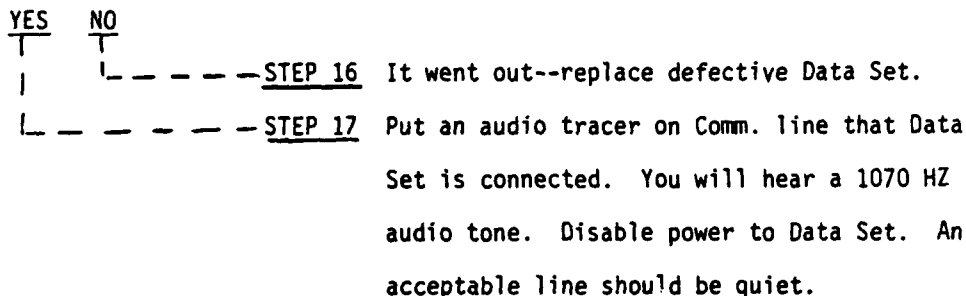

L - STEP 12 Start putting O.C.U. terminals ON-LINE individually until offending unit is identified. Once identified, go to Initial Terminal Check Procedure to help in isolating malfunction.

L - STEP 13 If the messages are persistant and the phone drop is not suspect, go to O.C.U. & replace the UART-MODEM. If this does not clear the error messages replace the INTF/PWR. board.

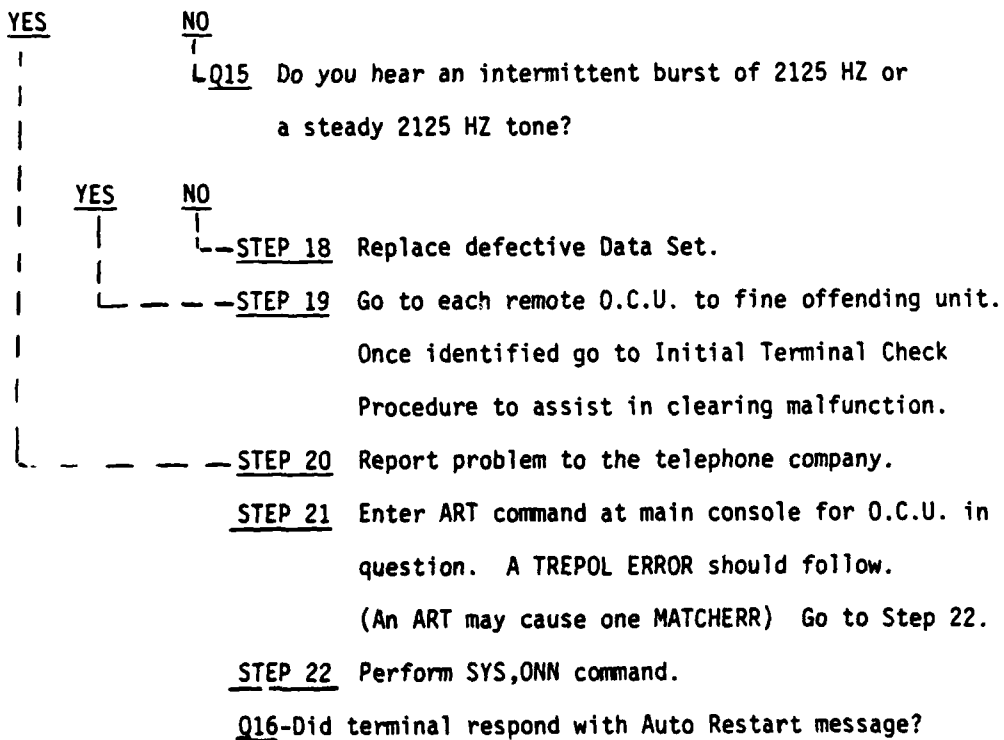

STEP 14 Go to Initial Terminal Check Procedure, this guide, to help isolate the malfunction.

STEP 15 Place the line OFF-LINE.

Q13 - Does the CD lamp on the Data Set flicker intermittently or even burn steady?

Q14- Do you hear background noises such as voices, ringing, busy tones, music or frequent static?

Wait light (1 of 1)

1. No wait light with card request, yet request honored.
  - a. Check leads on wait light, may be shorted.
  - b. Replace INTF/PWR Board.
  - c. Defective LED bulb.
2. No wait light with card request, request not acknowledge.
  - a. Check ribbon cable connections.
  - b. Replace INTF/PWR Board.
  - c. May be any board in O.C.U. to include card reader.

Pump Enable Light(s) (1 of 1)

1. Come on without being selected
  - a. Replace ROM board.
  - b. Replace INTF/PWR board.
  - c. Replace RAM board
2. Won't go out after pump nozzle is hung back up properly & at least 1/10 of a gallon of gasoline was dispensed.
  - a. Replace INTF/PWR board (If light times out)
  - b. Replace ROM board. (If light will not time out)
3. Will go out almost immediately after being enabled.  
\*Replace INTF/PWR board.
4. Pump Enable X causes Pump Enable Y to drop-out when dispenser X is returned to On-Hook condition. (Example next page)

Example: Dispenser #1 & #2 being used. Dispenser #1 reaches its gallon limit or is hung up. It causes dispenser #2 to shut off also.

\*Replace the ROM board.

5. Won't come on, yet system functions normally in BYPASS.
  - a. Replace INRF/PWR board.
  - b. Replace L.E.D. bulb.
6. Very dim and control device not activated. System functions normally in BYPASS.
  - a. Replace L.E.D. bulb.
  - b. Replace INTF/PWR board.

SYMPTOM (1 of 3)

Equip. Error Light Upon removing card from magnetic stripe reader, before any push button is depressed.

STEP #1 Use Test cards .

Q1- Does this problem persist?

<u>NO</u>	<u>YES</u>	
		└─ Replace INTF/PWR board.

| Q2- Does problem persist?

		<u>NO</u>	<u>YES</u>	
				└─ Replace ROM board &/or Magnetic Stripe reader.

| └─ - - No further action required.

| - - - - Card(s) being used have become defective or are not encoded for this fuel system.

SYMPTOM (2 of 3)

Equip. Error Light after removing card & depressing push button. (After "Wait Light").

STEP #1 Use test cards.

Q1- Does this problem persist?

<u>NO</u>	<u>YES</u>	
		└─ Possible defective RAM board.

└─ - - - - Card has been put off line.

SYMPTOM (3 of 3)

Equip. Error Light after removing card & depressing push button (No "Wait Light")

STEP #1 Use test cards.

Q1- Does this problem persist?

<u>NO</u>	<u>YES</u>	
		└─ a. Replace Card Reader.
		b. Replace ROM board.

└─ - - - - Operator Error.

SYMPTOM (1 of 2)

Fuel Error light immediately follow push button request. (No wait light)

Q1 - Is the dispenser nozzle hung up properly & the off/on lever turn completely off?

YES | NO  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |

Q2 - Do you still get a Fuel Error?

YES | NO  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |

Q3 - Is the Hook & Common lines properly secured to the tie points on the Mother board?

YES | NO  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |

Q4 - Do you still get a Fuel Error?

YES | NO  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |

Using a DC voltmeter check for zero volts between hook & common on tie points for dispenser in question. A zero volt reading should occur when dispenser is properly hung-up & a +5VDC when it's off-hook.

Q5 - Do you have +5VDC present even when dispenser is not off hook?

YES | NO  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |  
| |

Possible problem is mechanical sense switch maladjusted or Load Complete Relay not kicking out do to contact sticking. Solution: Adjust mechanical sense switch or replace Load Complete Relay.

SYMPTOM (2 of 2)

Fuel Error Light after wait light.

Q1 - Using test cards, does problem persist?

NO

YES

- L - Replace Interface/Power board
- L - — — — Card being used has been assigned wrong fuel type.

ODOM ERROR LIGHT (1 of 1)

For almost every card used even though correct odom reading is begin inserted in Thumb Wheel Switches.

STEP #1 Using test card insert all ones in Thumb Wheel Switch Assembly units (1-6). Do same for two, fours & eights.

Note: Push each pump enable button a second time to have transaction sent to TPT console in each of above cases.

STEP #2 Call person manning TPT print to determine if correct digits were printed out for each transaction.

Q2 - Were all digits reported correctly?

NO

YES

- L - Replace interface/Power supply board.
- L - Replace Thumb Wheel Switch assembly.

MULTIPILE ERROR LIGHTS (1 of 1)

- a. Replace CPU board
- b. Replace INTF/PWR. board

ERROR LIGHT(s) FAIL TO TIME OUT (1 of 1)

- a. Replace ROM board
- b. Replace INTF/PWR board
- c. UART-MODEM board

TR 6567-II

SYMPTOM (1 of 3)

Pump Motor Shutting off in approx. 1 (one) minute from when it was enabled:

STEP 1 Go to Dispenser/Relay J-Box Related Problem section, see Item 3.

Do so before preceeding to Step 2.

STEP 2

- a. Replace INTF/PWR Bd.
- b. Replace RAM board.
- c. Replace ROM board.

SYMPTOM (2 of 3)

Pump Motor won't come on in Auto.

Q1- Will pump motor come on in By-pass?

SYMPTOM (3 of 3)

Pump motor can be reactivated after fueling transaction.

- a. Replace ROM board.
- b. Replace INTF/PWR Bd.

OTHER TROUBLE SYMPTOMSSlow Poll or Erratic Poll response from a given O.C.U.:

- a. Replace ROM board
- b. Replace RAM board
- c. Replace CPU board
- d. UART-MODEM board
- e. Mother board

Erratic Terminal Operation:

- a. See explanation under Cold Starts this section.
- b. Replace CPU board
- c. Replace ROM board

Wrong Number of Gallons being recorded by O.C.U. terminal, varified by Test Card Procedure.

- a. See Dispenser/J-Box Related Problems section before preceding.
- b. Replace RAM board.
- c. Replace INTF/PWR board.

Loss of all O.C.U. terminals on one line which will not respond to SYS,ONN command for terminal & line. (Assuming no constant carrier on Line).

- a. Replace UDS Series-One mounted Data Set with spare before preceding.
- b. If above action did not correct the problem call telephone company to report defective phone line circuits.

VALIDCK message sent to Series One when O.C.U. terminal is put in BY-PASS

\*Replace the ROM board.

Intrusion Alarm reporting to Series One erratic or not reporting at all.

- a. Check for loose mounting of switch or bad connections.
- b. Replace the ROM board.
- c. Replace the INTF/PWR board.

DISPENSER/RELAY J-BOX RELATED PROBLEMS:

1. Unable to obtain fuel even in By-Pass.

NOTE: Check associate pump run fuse on mother board first.

- a. Mechanical switch in dispenser maladjusted or defective.
- b. Midtex relay in J-Box defective.
- c. Power control (BLACK) relay defective.

2. Pump will not shut-off when in By-Pass.

- a. Mechanical switch in dispenser maladjusted.
- b. Midtex relay contacts (sticking) defective.
- c. Power control relay defective.

3. Error messages on main console TTY. NO TOTAL CAME IN. Pump times out in approx. 1 (one) minute.

STEP 1 Using a DC voltmeter check to see if pulses are arriving at the Mother board (Measured between associated pulser & common tie) while dispensing fuel.

Q1 — — Were pulses arriving at the Mother board?

YES

NO

└ Defective pulser, bad connection or pulser sense head assembly improperly mounted.

└ STEP 2 Using a DC voltmeter check between hook & common for a reading of 5 VDC when dispenser is in the off-hook condition.

Q2 — — Did you get the correct reading?

NO

YES

└ Go to O.C.U. Common Trouble Symptoms.

└ — — — Replace Midtex relay in J-Box.

- \* THUMB WHEEL SWITCH ASSEMBLY CHECK.....See  
Trouble Symptoms under "Odom Error" light.

COLD STARTS

A "Cold Start" is when power has been turned off for several minutes to a terminal at temperatures below freezing. A terminal undergoing a cold start will perform erratically until an optimum temperature is reached in the terminal cabinet. The best method for dealing with cold starts is to replace all the circuit boards with (WARM) known good spares or leave the terminal on for 4 to 6 hours before trying to perform an Initial Term. Check.

\*Note: A dead battery (Blown Fuse or defective Batt.) will also cause erratic terminal operation. Check: (a) fuse, (b) charge voltage, (c) battery voltage under load conditions...This can be done by removing AC power to terminal (leave OFF/ON s.w. on)  
Voltage should not be below 12 volts.

(11.9 VDC not acceptable) If fuse is blown and battery appears to be ok, then allow 1-2 hours for charge before performing Initial Term. Check or replace with (WARM) known good spare.
