20. ABSTRACT (Continue on reverse side if necessary and identify by block number)
The project determined the military adaptability of the Code E-430 engine through laboratory testing and evaluation. The engine was installed in a dynamometer test cell at US Army Tank-Automotive Command (TACOM) and conventional dynamometer testing procedures were used to determine basic engine characteristics. The characteristics determined were: full-load performance, fuel economy at full-load and part-load, engine oil consumption, engine heat rejection, and exhaust smoke density.

DD FORM 1 JAN 73 1473 EDITION OF 1 NOV 65 IS OBSOLETE

UNCLASSIFIED

SECURITY CLASSIFICATION OF THIS PAGE (When Data Entered)

During pre-endurance testing, the Code E-430 engine produced 170 observed kW (227.9 BHP) at full-load, at rated speed of 3000 RPM. The maximum torque during full-load operation was 609 Nm (449 lb-ft) at 1800 RPM. Minimum brake specific fuel consumption at full-load occurred at 2200 RPM and was 221 g/kWH (0.363 lb/BHP-HR).

Part-load fuel economy evaluation demonstrated that the minimum (overall) brake specific fuel consumption was 203.8 g/kW-hr (0.335 lb/BHP-hr).

Maximum full-load brake specific heat rejection measured .659 W/W (28.0 BTU/BHP-MIN) at 1400 RPM. The total heat rejected was 101.8 kW (5789 BTU/MIN) at 3000 RPM.

The total lube oil consumption during the 400-hour NATO endurance test was 15.42 kg (34 lb). Smoke density, measured at the end of test was found to have a maximum value of 2.4 on the Bosch smoke meter scale. (4.5 maximum permissible limit).

After the NATO Endurance Test the engine produced 174.3 observed kW (233.8'BHP) at full-load and rated speed (3000 RPM). The maximum torque was 618 N-m. (456 lb-ft) at 1800 RPM.

Following the test, visual inspection indicated that the major engine parts were in good condition.

The CODE E-430 engine successfully completed the 400-hour NATO endurance test. It accumulated a total of 494 hours.

PREFACE

This test program was supervised and conducted by the US Army Tank-Automotive Command, R&D Center, Propulsion Systems Division, under CRN RU10013C in test cell No. 6 of Bldg. 212. The test was started on 29 Apr 82 and ran until completion on 30 Jul 82.

1.0. INTRODUCTION

The Military Adaptation of Commercial Items (MACI) program was originated at TACOM in 1975. The program's objectives are selection and simulated field test evaluation of current advanced technology engines to replace or update military engines in current vehicle programs. Responsibility for engine testing was given to the Propulsion Systems Division.

2.0. OBJECTIVE

The test objective is to determine full- and part-load performance characteristics and engine durability through the standard 400-hour NATO test program (AEP-5 dated June 1980) using high (1±0.05 percent) sulfur fuel.

3.0. CONCLUSIONS

The engine performed satisfactorily throughout the 400-hour NATO endurance test and throughout the performance tests scheduled at 100-hour test intervals. The engine met manufacturers listed performance values of power, torque, fuel economy, and heat rejection. The 400-hour NATO endurance test was successfully completed. The engine accumulated a total of 494 operating hours.

4.0. RECOMMENDATIONS

Steps should be taken to determine and correct the cause of high blowby observed during the tests.

5.0. ENGINE SPECIFICATIONS

5.1. Test Material.

5.1.1. Engine

- Serial Number: 20227520
- Code: E-430
- Model: VTA-504-C
- Maximum Output (500 ft and 85°F (150m & 29°C)) - BHP (kW): 235 (175)
- Speed @ Maximum Output - RPM: 3,000
- Type: Compression Ignition; 4-cycle; 90° V; 8-Cylinder
- Aspiration: Turbocharged
- Bore-in (mm) x Stroke-in. (mm): 4.625 (117) x 3.750 (95)
- Displacement - in^3 (litre): 504 (8.3)
- Compression Ratio: 16.0:1
- Dry Weight (with Standard Accessories) - lb, (kg): 1,565 (711)

5.1.2. Lubricating Oil: Grade 30, MIL-L-2104-C
Referee Grade: 30
Imperial Oil Co.
(APPENDIX E)

5.1.3. Fuel: MIL-F-46162B (ME) (14 Aug 81)
0.95-1.05 percent Sulfur by Weight
(APPENDIX B)

5.2. Test Equipment.

Controls, equipment, and associated instrumentation of cell No. 6, Building 212, TACOM.

5.3. Test Procedure.

5.3.1. Propulsion Systems Division Test Program: Engine Operating Limits and Adjustments. (APPENDIX A)

5.3.2. NATO Test Specification: Allied Engineer Publication (AEP-5 June 1980, NATO Standard Engine Laboratory Test for Gas Turbine Engines and Diesel and Gasoline Engines. (APPENDIX D).

6.0. RESULTS AND DISCUSSION

6.1. Pre-endurance Test Performance Evaluation.

6.1.1. Full-load Performance. All data are presented as observed without corrections. The engine developed 170 observed kW (227.9 BHP) at its rated speed of 3,000 RPM. Peak torque was 609 N-m. (449 lb-ft) at 1,800 RPM. Performance details are presented in Figures 1 and 2 and on Table 1.

6.1.2. Part-load Performance. The minimum observed brake specific fuel consumption (BSFC) was 219.0 g/kW-hr (0.360 lb/HR-hr) at 1,800 RPM, at 70 percent load.

6.2. Performance and Endurance Evaluation During NATO Test.

6.2.1. Full-load Performance after 100 hours. The engine developed 172.1 kW (230.8 BHP) at 3,000 RPM. The maximum torque occurred at 1,800 RPM and was 621.0 N-m. (458 lb-ft). Peformance details are presented in Figures 3 and 4 and Table 2.

6.2.2. Full-load Performance after 200 hours. The engine developed 175.3 kW (235.1 BHP) at 3,000 RPM. The maximum torque occurred at 1,800 RPM and was 630.5 N-m. (465 lb-ft). Performance details are presented in Figures 5 and 6 and Table 3.

6.2.3. Full-load Performance after 300 hours. The engine developed 176.2 kW (236.3 BHP) at 3,000 RPM. The maximum torque occurred at 1,800 RPM and it was 631.9 N-m. (466.0 lb-ft). Performance details are presented in Figures 7 and 8 and Table 4.

6.2.4. Full-load Performance after 400 hours. The engine developed 174.3 kW (233.8 BHP) at 3,000 RPM. The maximum torque value was 617.9 N-m. (455.7 lb-ft)

at 1,800 RPM. Performance details are presented in Figures 9 and 10 and Table 5.

6.2.5. Endurance Test (400 hours). The engine successfully completed the endurance test. It accumulated a total of 494 hours.

6.2.6 Visual and Dimensional Inspection of Major Engine Components Following Endurance. At completion of the test, the engine was completely dissassembled, cleaned and all critical parts were visually examined, dimensionally checked and photographed. Visual inspection and measurements revealed that virtually all components were in satisfactory condition. Description of engine components and their condition follows (See APPENDIX F for related photographs and APPENDIX G for dimensional inspection sheets).

- o Pistons - Pistons and rings are in satisfactory condition. Rings have no breakage and are free to move in the ring grooves. Ring grooves are still tight. Piston skirts are clean.
- o Piston Pin - No visual wear.
- o Cylinders - Satisfactory condition with light scratching and wear indicated.
- o Crankshaft Main Journals - Satisfactory condition - some scratching is evident.
- o Crankshaft Rod Journals - Satisfactory condition - some scratching is evident.
- o Main and Rod Bearings - Some scratching and overlay breakthrough.
- o Cylinder Head Intake and Exhaust Valve Seats - Satisfactory condition.
- o Intake and Exhaust Valve Faces - Satisfactory condition - some light pitting is evident.
- o Camshaft - lobes and bearing surfaces are in satisfactory conditon.
- o Gears - Crankshaft, Camshaft, Oil Pump Drive and Injection Pump Drive are in good condition.

6.2.7. Engine Oil Consumption. Oil consumption during the test was recorded by using the method of adding oil to the engine as required before engine start-up. Oil consumption was light. Results are shown in Table 6.

6.2.8. Oil Spectrographic Analysis. Oil samples were taken at various intervals and forwarded to the Petroleum Field Office East, New Cumberland, Pennsylvania for analysis. Report findings met NATO requirements as shown in APPENDIX E.

6.2.9. Full-load Heat Rejection. Maximum full-load brake specific heat rejection measured 0.583 W/W (25 BTU/BHP-MIN) at rated speed of 3,000 RPM. The total heat rejected was 101.8 kW (5,789 BTU/MIN). Full-load heat rejection characteristics are shown in Figures 11 and 12.

6.2.10. Engine Smoke Density. Exhaust smoke samples were taken and evaluated with Bosch smoke density meter Model EFAW-68 before endurance and at each subsequent 100-hour period. Smoke reading values are shown on Table 7. The NATO test specification indicated that a smoke sample reading of 4.5. should not be exceeded during full-load performance test. No smoke reading exceeded this value.

6.2.11. Crankcase Pressure. The engine crankcase pressure at the start of endurance testing was 9.8 inches of water. During the 400 hours of testing, the pressure gradually climbed and reached a high of 17.4 inches of water at test completion. Results are shown in Table 8.

6.2.12. Fuel Map - Data shown in Figures 13 and 14.

6.2.13. Performance data sheets required by NATO specification. Data are shown in APPENDIX H.

APPENDIX A - TEST PROGRAM

PROPULSION SYSTEMS DIVISION

Test Program E-430 Diesel Engine
(Cell 6)

TITLE: MACI Evaluation of the Code E-430 Engine

PURPOSE:

To determine the military adaptability and performance characteristics of Code E-430 Commercial Diesel Engine.

OUTLINE OF TESTS:

1./ Prepare Code E-430 engine for performance and endurance tests.

2./ Install instrumentation.

3./ Calibration of instrumentation and equipment.

4./ Engine operating limits, adjustments and instrumentation checkout.

5./ Engine instrumentation and full-load operational checkout.

6./ Full-load performance.

7./ Part-load performance.

8./ Full-load heat rejection. (At completion of durability test.)

9./ Four-hundred-hour NATO endurance test.

10./ Disassembly and visual inspection of engine.

11./ Evaluation of results and final report.

TEST MATERIAL:

1./ Engine Code E-430	235 HP @ 3000 RPM, 450 lb-ft @ 2200 RPM Governed speed
Type	V
Number of cylinders	8
Bore and stroke, -in.	4.625 and 3.75
Displacement - cu-in	504
Method of operation	
Compression ratio	16.0:1

2./ Lubricating oil - Referee, grade 30, conforming to Military Specification MIL-L-2104C. (Imperial Oil Company)

Fuel - Federal Specification MIL-F-46162B (high sulfur)

TEST EQUIPMENT:

Test Cell No. 6, dynamometer, controls, associated instrumentation and equipment, Bldg. 212.

TEST PROCEDURES:

1./ Prepare engine for performance tests.

a./ Obtain dry weight of engine and record. Install engine in test cell and make connections to dynamometer. Make necessary fuel, exhaust, and intake air connections. Install cooling tower and fuel throttle and shut-down connections. Make provisions for taking smoke readings and measuring air flow.

b./ Install all required thermocouples, pressure lines, speed and load cell connections. Install warning light, shutdown system for critical temperature, pressure and RPM limits on engine and dynamometer equipment.

c./ Cooling tower will utilize a sight glass in the lower pipe (engine inlet) filled with water and antifreeze. A 10-15 PSI pressure cap will be used and shop air, through a regulator, will supply approximately 7 PSI pressure to the cooling system.

d./ During heat rejection tests, an engine thermostat (180°) will be used. The cooling tower will be adjusted to maintain 205°F ±2° engine out temperature. (Do not let oil temp exceed limits).

e./ Engine blowby and/or crankcase will be closely monitored during full power performance run to check proper engine operation. In addition, engine oil temperature and pressure will be closely monitored.

2./ Instrumentation - Install instrumentation to obtain and record data at each specified speed.

a./ Temperature, F	Range in °F	Accuracy in °F
(1) Air, cell ambient	60-120	± 2
(2) Air cleaner, inlet	60-120	± 2
(3) Air cleaner, outlet	60-120	± 2
(4) Air, Entrance to Air Meter	60-120	± 2
(5) Air, Turbo Outlet	120-500	± 2

Temperature, F		Range in °F	Accuracy in °F
(6)	Exhaust, After Turbo	200-1500	±10
(7)	Exhaust, Ports (8)	200-1500	±10
(8)	Oil Sump	60-300	±2
(9)	Fuel, Before Secondary Filter	60-120	±2
(10)	Coolant, Engine Inlet **	120-250	±2
(11)	Coolant, Engine Outlet **	120-250	±2
(12)	Cooling Water, Tower Inlet *	35-100	-
(13)	Cooling Water, Tower Outlet *	35-250	-
(14)	Engine Oil Gallery	60-300	±2
(15)	Instrumention Bath	200	±1
(16)	Fuel Spill	60-160	±2

** Indicates Quartz Temperature Probes in addition to regular thermocouple
* Indicates Quartz Temperature Probes

b./ Pressures, Gauge		Range	Accuracy
(1)	Air, Test Cell In. H_2O	0 to -1	±1
(2)	Air, After Air Cleaner(In. H_2O)	0 to -25	±1
(3)	Air, Across Air Meter Entrance (In. H_2O)	0 to -20	±1
(4)	Air at Air Meter Center	0 to -20	±.01
(5)	Air at Turbo Entrance (In. H_2O)	0 to -30	±1
(6)	Air, Crankcase (In. H_2O)	0 to +10	±1
(7)	Exhaust Outlet In. H_2O	0 to 60	±1
(8)	Fuel Supply (At Secondary Filter) PSI	0 to 10	±.5
(9)	Fuel Rail PSI	0 to 280	±2
(10)	Engine Oil Gallery (Manifold) PSI	0 to +100	±2

Pressures, Gauge	Range	Accuracy
(11) Coolant Pump Outlet PSI	0 to +50	±2
(12) Coolant Pump Inlet PSI	0 to ±25	±1

c./ Miscellaneous

(1) Engine speed, (RPM)	0 - 4000	±10 RPM
(2) Dynamometer load, (ft-lb)	600	±1%
(3) Fuel flow (lb/hr)	0 - 125	±1%
(4) Blowby (CFM)	0 - 10	±.2
(5) Air Flow	-	-

d./ Special Instruction Considerations

(1) Dymec data acquisition system to be used for data gathering.

(2) Quartz Ther mometers to be used for heat rejection test.

(3) Load cell to be used for measuring torque.

(4) Digital Cox fuel weigh system to be used for measuring fuel.

(5) Cooling water weigh system 0-250, lbs.

(6) Smoke density, Bosch system.

(7) Blowby meter for measuring engine blowby.

(8) Meriam air flow meter.

(9) Temperature reference bath (Maintain at 200° F).

3./ Calibration of instrumentation and equipment.

All instrumentation and equipment will be calibrated prior to start of test and at ranges specified in the previous paragraph 2.

4./ Engine operating limits and adjustments.

a./ Observe the following engine operating limits and test conditions for performance and endurance tests.

(1) Oil Gallery Temperature : 250° F warning, 260° F manual return to idle and contact test engineer.

(2) Oil pressure at idle: 15 PSI warning, 10 PSI shutdown. Oil pressure at normal operation: 40 to 75 PSI above 1000 RPM, 30 PSI warning, 25 PSI shutdown.

(3) Air cell ambient as close as possible to 77°F.

(4) Coolant outlet temperature 205 ± 5°F, warning 210°F, manual return to idle at 215°F. Cooling system will be pressurized to 7 PSI.

(5) Fuel temperature before pump: 85°F ± 5°F.

(6) Exhaust outlet pressure at rated conditions: 16 in. H_2O ± 3.

(7) Crankcase pressure maximum 5 in. H_2O. Blowby maximum 6 CFM.

(8) Nominal fuel flow 90 lb/hr at 3000 RPM.

(9) Exhaust port outlet temperature 1300°F maximum.

b./ Maintain and record the following adjustments at completion of each 100 hour interval of endurance test.

(1) Idle speed 650 RPM

(2) Governed speed 3400 RPM

(3) No load speed

Speeds will be verified after break in.

5./ Engine Run-In and Instrumentation Checkout.

a./ Engine will be run to check leaks, instrumentation, recording and printout systems. The following temperatures and pressures will be maintained:

(1) Ambient air (maintain as close as possible to 77°F)

(2) Inlet air (maintain as close as possible at 77°F)

(3) Air pressure at engine inlet at rated conditions, -5 ± 1 in. H_2O.

(4) Exhaust pressure outlet at rated conditions, 16 ± 3 in. H_2O.

(5) Coolant outlet temperature 205°F ± 5°F.

(6) Fuel temperature before pump 85°F + 5°F.

b./ Full-load operational check will be conducted according to the following schedule. During break-in monitor blowby in CFM and/or pressure. Do not continue test if blow-by exceeds allowed maximum. For each break-in period take complete data and record on log sheet. All conditions as above.

BREAK-IN SCHEDULE

TIME IN MINUTES	ENGINE SPEED RPM	TORQUE LB-FT	H.P.
20	650 (Idle)	0	0
20	1200	46	(10.6)
20	1400	94	(25)
20	1600	99	(30)
20	1800	117	(40)
20	1900	138	(50)
20	2000	158	(60)
20	2200	215	(90)
20	2400	263	(120)
20	2600	323	(160)
15	2800	375	(200)
10	3000	420 + Full Rack	(240)
10	2600	323	(160)
10	1900	455 + Full Rack	(180)
10	1200	46	(10.6)
10	650	0	0

c./ Check governor for full- and no-load speeds and notify test engineer prior to making adjustments.

6./ Performance Test (Nominal 235 BHP)

Conduct performance tests with full rack, under the conditions listed in paragraph 4. Record all data listed under instrumentation for engine speeds of 1400 RPM to 3000 RPM in 200 RPM decrements with a reading also at peak torque - 1900 RPM. At each setting the engine should be run for a sufficient time for stabilization. Part-load performance will be conducted following this performance test and at completion of durability test. Heat rejection test will be conducted at completion of the durability test.

7./ Part-Load Performance Test (Nominal 235 BHP)

Conduct part load performance tests at 85, 70, 60, 50, 40, 25 and 15 percent loads using speeds from 1400 RPM to 3000 RPM in 200 increments (also 1900 RPM). Paragraph #5 conditions will be maintained during runs. Perform an idle fuel consumption test run with complete printout at the end of part load performance tests.

8./ Heat Rejection Tests (Perform at Completion of Durability Test)

Determine heat rejection at full load, 205° ± 2°F, engine coolant out temperature at the following speeds: 3000 RPM to 1400 RPM in 400 RPM decrements. Remaining conditions as specified in paragraph #4. (Engine operating limits and adjustments.).

9./ Four Hundred (400) Hour NATO Endurance Test

a./ The 400 hour NATO endurance test will be divided into four periods of 100 hours each. Each 100-hour period is to consist of ten (10)-hour periods as shown in test schedule A. (New NATO cycle).

TEST SCHEDULE A

Period	Percent Rated Speed	Percent Load	Time Hours
1	Idle (650 RPM)	0	½
2	100 (3000 RPM)	100	2
3	Governed Speed	0	½
4	75 (2250 RPM)	100	1
5	Idle ↔ 100	0 ↔ 100 4 min. 6 min.	2
6	60 (1800 RPM)	100	½
7	Idle	0	½
8	Governed Speed	70	½
9	Max. Torque Speed (1900 RPM)	100	2
10	60 (1800 RPM)	50	½
		TOTAL DURATION	10

Conduct 400-hour NATO endurance test according to Test Schedule A. Values of speeds and torque to be provided by test engineer following completion of performance test.

b./ During 400-hour endurance test, the following pressures and temperatures will be regulated to the values as indicated.

(1) Pressures

a./ Air pressure after the air cleaner shall be -5 ± 1 in. H_2O at rated conditions.

b./ Exhaust outlet pressure at rated conditions through speed range 16 ± 3 inches H_2O, restriction held at other speeds.

(2) Temperatures

a./ Ambient air as close as possible to $77^{\circ}F$

b./ Inlet air as close as possible to $77^{\circ}F$

c./ Coolant outlet temperature $205^{\circ}F \pm 5^{\circ}F$

d./ Fuel before diaphragm pump $85^{\circ}F \pm 5^{\circ}F$

c./ Take eight-ounce oil sample before starting endurance and every 100 hours thereafter, take two ounces oil sample at 25-hour intervals. (Purge oil sample line and take sample from oil gallery with engine idling. Replace the removed sample oil with same amount and type new one.

d./ Check engine oil level and appearance at completion of every shift and before engine is started for a new day of tests.

e./ Data will be recorded during the last five minutes of each of the ten periods listed in Test Schedule A; and just before stopping engine.

f./ The following maintenance and adjustments to engine will be conducted after each 100-hour test period and before power check:

(1) Change oil

(2) Replace oil and fuel filters

(3) Record oil added (less sample) to bring to required level

(4) Maintain adjustments as indicated on pages A-5 and A-6.

(5) Inspect engine for leaks, breaks, noise, vibration, etc.

g./ The 100-hour power check tests shall be conducted under temperature and pressure conditions listed. Record all data listed under "Instrumentation" for engine speeds from 1400 RPM to 3000 RPM in 200-RPM decrements, up and down and at idle speed and 1900 RPM. At each setting, the engine should be run for a sufficient time for stabilization. In addition, smoke density samples will be taken at each speed setting.

10./ Obtain photographs of engine test set up.

Disassembly and Inspection of Engine. Record breaking torques - and photograph parts if required during disassembly.

11./ Evaluation of Results and Report.,

a. Consolidate and evaluate data.

b. Prepare report.

c. Obtain photographs of engine wear surfaces.

JOB ASSIGNMENTS:

1. DRSTA-TB will be responsible for gathering data, maintaining a daily log book and test data log, directing personnel and general execution of test.

2. DRSTA-RGES will be responsible for day to day technical decisions, monitoring test, evaluation of data and preparing a report.

3. Any changes in the above test program shall be mutually agreed upon by DRSTA-TB and DRSTA-RGES and confirmed by a supplement to this basic test program. Each supplement will be evaluated for potential cost and for schedule revisions.

APPENDIX D - NATO ENGINE TEST SPECIFICATIONS

NATO STANDARD ENGINE LABORATORY TEST

(GAS TURBINES ENGINES)

AEP-5

EDITION JUNE 80

CHAPTER 1

PURPOSE AND APPLICABILITY

SECTION 1-1. PURPOSE

The purpose of this document is to define a test method and standard conditions to enable all NATO countries to conduct tests using an identical method or to analyse the tests conducted in the laboratories of other NATO countries on the basis of this method.

The method described below is independent of existing national test methods, which may be used for supplementary testing.

When an engine has met the requirements of the tests under the present code, its power rating should be indicated as follows: "Power rating. . .Kw (. . .metric HP) at. . .RPM, in accordance with NATO code AEP 5. Edition June 1980."

SECTION 1-2 APPLICABILITY

These test conditions apply to all service vehicle (combat and transport) propulsion gas turbine engines with free power turbines.

NOTE : SI units will be used.

CHAPTER 2

TEST REQUIREMENTS

SECTION 2-1 - GENERAL COMPOSITION AND ORDER OF TEST

2.1.1. Engine reception.
Running-in in accordance with manufacturer's instructions.
Performance test, complete (full and part loads).
Endurance test.
Performance test, complete (full and part loads).
Disassembly, inspection and measurement.
Report.

NOTES : (1) Engine measurements may be carried out before running-in.

(2) The manufacturer is responsible for defining the running-in programme and the engine should have been run-in before it is submitted for testing.

(3) In so far as possible, the manufacturer's drawings and technical data will be supplied with the engine, to assist inspection and measurement of components.

(4) It is normal practice for the engine to be given a preliminary performance test immediately after receipt, to check acceptability.

(5) The initial, if accomplished, and final inspection of the engine should be carried out by the same inspection team using the same gauges.

2.1.2. During performance and durability testing, the following variables will be monitored :

a - Main values
Speed
Torque (engine output shaft)

b - Ambient conditions
Temperature of ambient air
Atmospheric pressure
Humidity

c - Air and gases
Inlet air temperature
Inlet depression
Inlet air flow (performance test only)
Exhaust temperature
Exhaust back pressure
Gas temperatures at points influencing fuel control (if required)

d - Lubrication and cooling
Oil temperatures and pressures
Temperatures into and out of external coolers
Flow rates of fluids to cooling devices external to the engine (for heat rejection calculations)
Oil consumption (during endurance tests only)

e - Fuel
Fuel temperature
Fuel consumption

f - Miscellaneous
Smoke density
Other parameters which influence fuel control
Vibration

2.1.3. Regulated parameters

Inlet Air Depression * at rated power :
$25 \pm 2{,}5$ mbar

Exhaust Back Pressure at rated power :
$20 \pm 2{,}5$ mbar

Fuel Temperature at Fuel Pump Inlet :
$30° C \pm 3° C$

Inlet Air Temperature :
See Section III

* Depression differential between static atmospheric air pressure and the total pressure at the point of measurement.

2.1.4. TEST CONDITIONS

Measuring is to be done in normal and stable operating conditions.

The temperature of the air entering the engine (ambient air) is to be measured at a maximum distance of 0,15 m from the air filter inlet or, if there is no filter, 0,15 m from the air inlet nozzle. The thermometer or thermocouple must be protected against heat radiation and be located directly in the air jet. Testing must be carried out in an adequate number of positions to give a representative inlet temperature.

Once an output speed has been selected for measurement purposes, its value must not vary by more than ± 1 % or ± 10 r.p.m. (whichever of these limits is the higher) during measurement.

The readings for brake load, fuel consumption and inlet air temperature are to be taken simultaneously, the value recorded being the average of two stabilized results, obtained in succession with brake load and fuel consumption differing by less than 2 %.

When a device fitted with an automatic starting system is used for measuring speed and fuel consumption, the duration of measurement must be at least 30 seconds ; if the measuring device is manually operated, the duration must be at least 60 seconds.

The exhaust gas outlet temperature must be measured at a point downstream and less than 100 mm from the flange (s) of the exhaust manifold (s).

Lubricant temperature is to be measured at the inlet and outlet of the heat exchanger if there is one. Otherwise it must be taken preferably in the lubrication system. The measuring point will be specified in the test report.

Fuel temperature must be read at the fuel pump inlet.

Auxiliary power take-offs may be loaded and measured if desired.

2.1.5. MEASUREMENT ACCURACY

- TORQUE

  The torque must be accurate within ± 0,5 % of the highest value recorded.

- OUTPUT SPEED

  Measurement must be accurate to within ± 0,5 %.

- FUEL CONSUMPTION

  ± 1 % for all apparatus used.

- TEMPERATURES

  Intake air ± 1°C.

- PRESSURE

  Atmospheric pressure ± 0,7 mbar
  Air and gas pressure ± 50 mbar
  Induction and exhaust pressure and depression ± 0,250 mbar
  Pressure of other fluids ± 250 mbar

SECTION 2-2 - DEFINITION OF ENGINE

Engines will be equipped only with such auxiliary equipment as is strictly essential to their operation (see table of auxiliary equipment at Annex A).

SECTION 2-3 - PERFORMANCE TEST

The performance test maximum load curve will be plotted from measurements taken at a minimum of five speed settings, one of these settings being the rated speed.

For each setting, the engine should be run for a sufficient time to allow the operating parameters to stabilize.

Part-load data is to be recorded at the same pre-selected speeds as was used for the full-load test. The part loads for each speed point are to be calculated at least for 85 %, 70 %, 50 % and 25 % of the full load at the given speed.

During this test, the smoke emission as measured on the Robert BOSCH Scale shall not exceed 4.5.

No correction factor will be applied and the test results must include air temperature and atmospheric pressure.

The inlet temperature shall be maintained as close as possible to 25°C.

SECTION 2-4 - ENDURANCE TEST

2.4.1. The endurance test duration is 400 hours, divided into four periods of 100 hours each. At the completion of each period, the engine shall be submitted to a full-load performance check.

During the endurance test, the inlet temperature will be kept as near as possible to 25° C or, when this is not practical, prevailing ambient.

2.4.2. Normal maintenance and adjustment will be permissible after each 100 hour test period.

2.4.3. Engine oil and filters may be changed after each 100 hour period.

2.4.4. The four 100 hour périods which make-up the endurance test are to be carried out with the fuel and lubricant defined in Chapter 3.

2.4.5. Each 100 hour period is to comprise ten 10 hour cycles. Each 10 hour cycle will be carried out in accordance with the programme (section 2.5).

2.4.6. Data will be recorded during the last five minutes of each of the sub-cycles included in the basic 10-hour cycle, with the exception of sub-cycles 3, 4, 7, 8, 10, 11.

2.4.7. No interruptions are permitted during any of the sub-cycles, but the engine may be switched off on completion of any sub-cycle.

2.4.8. One-hundred percent power (load) will be governed by maximum fuel control setting, not adjusted to published maximum power.

SECTION 2-5 - PROGRAMME OF 10 HOUR CYCLE

Period	Rated Speed %	Rated Load %	Duration (hours)
1	Idle (1)	Idle (1)	0,5
2	100	100	1
3	50 ⟷ 100 3 min 3 min	100	1
4	Stop		0,25
5	70	100	1
6	Idle	Idle	0,5
7	Idle ⟷ 100 2 min 3 min	Idle ⟷ 100	2
8	Stop		0,25
9	100	100	1
10	Stop		0,25
11	Idle ⟷ 100 2 min 3 min	Idle ⟷ 100	2
12	Idle	Idle	0,25
		Total	10

At least 5 times during each 100 hour period, the engine will be shut down for a minimum of 6 hours.

(1) Manufacturer's published idle or as specified by vehicle installation.

ANNEX A

DETAILS OF PRODUCTION AUXILIARY EQUIPMENT

Inlet System Air Filter System Inlet Silencer	Optional
Exhaust System Piping Silencer Exhaust Pipes	Test Bench Equipment
Fuel Feed Pump	Optional
Fuel Injection Equipment Prefilter Filter	Yes, or test bench equipment
Electrical Equipment	If necessary

ANNEX B

INFORMATION TO BE INCLUDED

IN TEST REPORT

A complete report covering all the tests, servicing, maintenance, rectification of faults and the condition of the engine at the strip examination including the measurements of the principal wearing parts will be compiled.

The report will also include the following :

1. A statement of the build standard of the engine, with drawings and a parts list.
2. Photographs of the engine from four different views.
3. Photographs of the test installation at least four different views.
4. A list of equipment fitted to the engine.
5. Sample test sheets and a summary with a list of faults and the remedial action taken.
6. An engine condition report at end of test with photographs of the condition of major parts such as combustion chamber, compressor wheels and diffusers, turbine wheels and nozzles, reduction gear with any other components of interest.
7. A history chart of lubricating oil used during the endurance tests.
8. Analysis of new and used lubricating oil, the latter to be taken at approximately 100 hours intervals.
9. Fuel analysis.
10. Any other relevant data.

NATO STANDARD ENGINE LABORATORY TEST

(DIESEL and GASOLINE ENGINES)

AEP-5

EDITION JUNE 80

CHAPTER 1

PURPOSE AND APPLICABILITY

SECTION 1-1 - PURPOSE

The purpose of this document is to define a test method and standard conditions to enable all NATO countries to conduct tests using an identical method or to analyse the tests conducted in the laboratories of other NATO countries on the basis of this method.

The method described below is independent of existing national test methods, which may be used for supplementary testing.

When an engine has met the requirements of the tests under the present code, its power rating should be indicated as follows : "Power rating .... Kw (... metric HP) at .... r.p.m., in accordance with NATO code AEP 5. Edition June 1980".

SECTION 1-2 - APPLICABILITY

These test conditions apply to all service vehicle (combat and transport) propulsion Diesel and gasoline engines.

NOTE : SI units will be used.

CHAPTER 2

TEST REQUIREMENTS

SECTION 2-1 - GENERAL COMPOSITION AND ORDER OF TEST

2.1.1. Engine reception.

Running-in in accordance with manufacturer's instructions.

Performance test, complete (full and part loads).

Endurance test.

Performance test, complete (full and part loads).

Disassembly, inspection and measurement.

Report.

NOTES : (1) Engine measurements may be carried out before running-in.

(2) The manufacturer is responsible for defining the running-in programme and the engine should have been run-in before it is submitted for testing.

(3) In so far as possible, the manufacturer's drawings and technical data will be supplied with the engine, to assist inspection and measurement of components.

(4) It is normal practice for the engine to be given a preliminary performance test immediately after receipt, to check acceptability.

(5) The initial, if accomplished, and final inspection of the engine should be carried out by the same inspection team using the same gauges.

2.1.2. During performance and durability testing, the following variables will be monitored :

a - Main values
Speed
Torque (engine output shaft)

b - Ambient conditions
Temperature of ambient air
Atmospheric pressure
Humidity

c - Air and gases
Inlet air temperature
Induction or cylinder inlet depression
Inlet air flow (performance test only)
Air temperature and pressure in the inlet manifold
Exhaust temperature
Exhaust back-pressure
Gas temperatures at points influencing fuel control (if required)

d - Lubrication and cooling
Oil temperatures and pressures
Temperatures into and out of external coolers
Flow rates of fluids to cooling devices external to the engine (for heat rejection calculations)
Oil consumption (during endurance tests only)

e - Fuel
Fuel temperature
Fuel consumption

f - Miscellaneous
Blow-by
Smoke density

2.1.3. Regulated parameters

Outlet liquid coolant temperatures :
96°C ± 3°C

Induction depression at rated power :
25 ± 5 mbar

Exhaust back pressure at rated power :
40 mbar ± 5

Fuel temperature at injection pump inlet :
30°C ± 3°C

2.1.4. TEST CONDITIONS

Measuring is to be done in normal and stable operating conditions.

The temperature of the air entering the engine (ambient air) is to be measured at a maximum distance of 0,15 m from the air filter inlet or, if there is no filter, 0,15 m from the air inlet nozzle. The thermometer or thermocouple must be protected against heat radiation and be located directly in the air jet. Testing must be carried out in an adequate number of positions to give a representative inlet temperature.

Once an output speed has been selected for measurement purposes, its value must not vary by more than ± 1 % or ± 10 r.p.m. (whichever of these limits is the higher) during measurement.

The readings for brake load, fuel consumption and inlet air temperature are to be taken simultaneously, the value recorded being the average of two stabilized results, obtained in succession with brake load and fuel consumption differing by less than 2 %.

When a device fitted with an automatic starting system is used for measuring speed and consumption, the duration of measurement must be at least 30 seconds ; if the measuring device is manually operated, the duration must be at least 60 seconds.

The exhaust gas outlet temperature must be measured at a point downstream and less than 100 mm from the flange (s) of the exhaust manifold (s).

Lubricant temperature is to be measured at the inlet and outlet of the heat exchanger if there is one. Otherwise it must be take preferably in the lubrication system, or, failing this, in the crank case. The measuring point will be specified in the test report.

Fuel temperature must be read at the injection pump inlet, or carburettor inlet.

Cooling condition for air cooled engine will be in accordance with manufacturers specification.

Auxiliary power take-offs may be loaded and mesured if desired

2.1.5. MEASUREMENT ACCURACY

- TORQUE

  The torque must be accurate within ± 0,5 % of the highest value to be measured.

- OUTPUT SPEED

  Measurement must be accurate to within ± 0,5 %.

- FUEL CONSUMPTION

  ± 1 % for all apparatus used.

- TEMPERATURES

  Intake air ± 1°C.

- PRESSURE

  Atmospheric pressure ± 0.7 mbar
  Air and gas pressure ± 50 mbar
  Induction and exhaust pressure and depression ± 0,250 mbar
  Pressure of other fluids ± 250 mbar

SECTION 2-2 - DEFINITION OF ENGINE

Engines will be equipped only with such auxiliary equipment as is strictly essential to their operation (see table of auxiliary equipment at Annex A).

SECTION 2-3 - PERFORMANCE TEST

The performance test maximum load curve will be plotted from measurements taken at a minimum of five speed settings, the fifth setting being the rated speed.

For each setting, the engine should be run for a sufficient time to allow the operating parameters to stabilize.

Part-load data is to be recorded at the same pre-selected speed as was used for the full-load test. The part loads for each speed point are to be calculated at least for 85 %, 70 %, 50 % and 25 % of the full load at the given speed.

During this test, the smoke emission as measured on the Robert BOSCH Scale (or equivalent) shall not exceed 4.5.

No correction factor will be applied and the test results must include air temperature and atmospheric pressure.

The inlet air temperature shall be maintained as close as possible to 25°C.

SECTION 2-4 - ENDURANCE TEST

2.4.1. The endurance test duration is 400 hours, divided into four periods of 100 hours each. At the completion of each period, the engine shall be submitted to a full-load performance check.

2.4.2. Normal maintenance and adjustment will be permissible after each 100 hour test period.

2.4.3. Engine oil and filters shall be changed after each 100 hour period.

2.4.4. The coolant outlet temperature is to be held at 96°C ± 3°C or a higher temperature if proposed by the manufacturer. The coolant is to be water plus antifreeze in egal volume.

2.4.5. The engine oil temperature is to be measured in the lubrication system. The temperature measurement location shall be specified.

2.4.6. The four 100 hour periods which make up the endurance test are to be carried out with the reference fuel defined in Chapter 3.

2.4.7. Each 100 hour period is to comprise ten 10 hour cycles. Each 10 hour cycle will be carried out in accordance with the programme (section 2-5).

2.4.8. Data will be recorded during the last five minutes of each of the sub-cycles included in the basic 10 hours cycle, with the exception of sub-cycle 5.

2.4.9. No interruptions are permitted during any of the sub-cycles, but the engine may be switched off on completion of any sub-cycle.

SECTION 2-5 - PROGRAMME OF 10 HOUR CYCLE

Sub Cycle	% Rated Speed	% Load (3)	Duration in hours
1	IDLE	0	½
2	100	100	2
3	governed speed (1)	0	½
4	75	100	1
5	IDLE ⟷ 100	0 ⟷ 100 4 MIN 6 MIN	2
6	60	100	½
7	IDLE	0	½
8	governed speed (2)	70 (3)	½
9	Max torque speed	100	2
10	60	50 (3)	½
		Total	10

NOTES :

(1) The speed shall be that attained with the engine at full throttle and with minimum load (residual brake load).

(2) The speed shall be the steady speed of the engine at full throttle and 70 % load.

(3) Part loads (70 and 50 %) shall be taken from the initial performance test.

CHAPTER 3

FUELS AND LUBRICANTS AND ANTIFREEZES

301 Engines are to be tested on Reference Fuels and Lubricants and antifreezes as specified by the relevant NATO Authority.

CHAPTER 4

DEFINITION OF TEST FAILURE

401 A major failure is a failure of any part or component of the engine assembly that leads to a final stoppage of the test or that brings about as loss of power which cannot be rectified to give at least 95 % of rated power.

Any major failure will lead to termination of the test and any retest must start at 0 hour.

Major failures and corrective action are to be reported to the proper National Authority.

402 A minor failure is a defect which leads to a loss of power or degradation of the operation of the engine and which it is possible to remedy within the scope of normal maintenance and adjustment. If 95 % of the rated power cannot be obtained after normal maintenance then the test will be terminated. The minor failures and the measures taken to overcome them must be included in the report.

403 The suitability of an engine for NATO AEP5 Approval is to be the responsibility of the National Authorities after completion of the 400 hours test and consideration of the final condition of the engine.

ANNEXE A

DETAILS OF PRODUCTION AUXILIARY EQUIPMENT

(To be included as applicable)

Inlet system	
Inlet manifold	Yes
Air filter	Optional
Inlet silencer	Optional
Blowby gas recirculation intake ...	Optional
Exhaust system	
Manifold	Yes
Piping	Test bench equipment
Silencer	Test bench equipment
Exhaust pipes	Test bench equipment
Fuel feed pump	Yes
Carburettor	Yes (details of adjustment will be specified)
Ignition system	
Distributor	Yes
Spark-plugs	Yes
Coils	Yes
Suppressor	Yes
Fuel injection equipment	
Prefilter	Yes or test bench equipment
Filter	Yes or test bench equipment
Pump	Yes
High-pressure pipes	Yes
Injector	Yes

Liquid cooling equipment	
Radiator	No
Fan	
Water pump	Yes
Thermostat	Yes
Air cooling equipment	
Streamlining	Yes
Blower	Yes
Temperature regulating device	Yes
Electrical equipment	If necessary
Supercharging equipment	
Compressor driven directly or indirectly by the engine and/or exhaust gas	Yes
Charge cooler	Yes
Cooling pump or fan ..... (engine driven)	Yes
Device for regulating flow of cooling fluid	Yes

ANNEX B

INFORMATION TO BE INCLUDED

IN TEST REPORT

A complete report covering all the tests, servicing, maintenance, rectification of faults and the condition of the engine at the strip examination including the measurements of the principal wearing parts will be compiled.

The report will also include the following :

1. A statement of the build standard of the engine, with drawings and a parts list.

2. Photographs of the engine from four different views.

3. Photographs of the test installation at least four different views.

4. A list of equipment fitted to the engine.

5. Sample test sheets and a summary with a list of faults and the remedial action taken.
   Full load performance data will be show in the format indicated.

6. An engine condition report at end of test with photographs of the condition of major parts such as pistons, bearings, valves, camshafts, crankshafts, cylinder bores together with any other components of interest.

7. A history chart of lubricating oil used during the endurance tests.

8. Analysis of new and used lubricating oil, the latter to be taken at approximately 100 hours intervals.

9. Fuel analysis.

10. Any other relevant data.

DEFINITION OF SHORTS

- t0 : ambient temperature
- p0 : ambient pressure
- n : engine speed
- M : engine torque
- P : output power
- pme/bmep: brake mean effective pressure
- Cs/bsfc : specific fuel consumption
- Qc : volume of fuel per injection
- qm : mass fuel flow per hour
- tH : oil temperature
- pH : oil pressure
- te : coolant temperature into engine
- ts : coolant temperature out of engine
- t1 : air temperature after filter (or compressor inlet)
- p0 - p1 : inlet depression
- t2 : compressor discharge temperature
- p2 : compressor discharge pressure
- t2' : air temperature after charge cooler
- p2 - p2' : pressure of across charge cooler
- t3 : exhaust gaz temperature (turbine inlet)
- p3 : exhaust gaz pressure (turbine inlet)
- t4 : turbine discharge temperature
- p4 - p0 : Exhaust back pressure
