FOREWORD

This report documents a thermal stress analysis conducted at the Naval Surface Weapons Center/White Oak (NSWC/WO) between January and April of 1984. The objective of the study was to determine the effects of heating and mechanical pressure loading on the flow restrictor plate used in the Mach 14 leg of NSWC/WO Hypervelocity Wind Tunnel (Tunnel #9). Of concern were the compressive and tensile yielding that might be occurring during tunnel runs for different supply conditions.

Included in this report are the procedures for model generation using PATRAN-G, model translation into ABAQUS format, transient heat transfer analysis and thermal stress analysis input decks, results translation from ABAQUS to PATRAN-G, and any problems encountered while performing some of the above analyses. It also outlines the method used to determine the heat transfer film coefficients needed for ABAQUS. The results of these analyses were then reviewed and appropriate recommendations were made for future analyses.

This work was performed in support of the Wind Tunnel Safety Committee for the Aerodynamics Facilities Branch (K23).

INTRODUCTION

A blowdown wind tunnel subjects many components to compression and expansion waves due to the sudden expansion of high pressure gas. Sometimes, as an expansion wave moves against the flow of air in the tunnel, components in the flow path can be damaged by the oscillating pressure load, coupled with high gas temperatures. In the Mach 14 leg of the Naval Surface Weapons Center/White Oak Hypervelocity Wind Tunnel (NSWC/WO Tunnel #9), a flow restrictor plate was introduced to alleviate this problem. It lessened the effect of the high pressure expansion wave on the heater element by reducing the magnitude of the expansion wave. This reduced the loading effects on the heater element. However, this causes a pressure drop across the flow restrictor which resulted in a pressure load on the plate. Under normal conditions, this pressure drop is about 2000 psi.

What has become of interest is the pressure drop across the plate that can be run at a certain temperature. Different pressure drops will give different tunnel conditions, and thus enhance the capabilities of the wind tunnel. Unfortunately, as the pressure drop goes up, so does the load across the flow restrictor. This causes a problem as undesirable effects, such as material yielding, can occur on the flow restrictor. In Tunnel #9, the flow restrictor plate is made out of Columbian C-103 and is 5.25 inches in diameter with a 2.79 inch thickness (see Figure 1). Because of the flow restrictors location in the wind tunnel, it encounters high temperatures due to the flow of the supply gas passing through it. The thermal stresses from these high temperatures, coupled with the pressure loading, can result in yielding that leads to fatigue failure at a later time. Thus the question arises, how large a pressure drop can be safely run at a given temperature.

The analysis conducted addresses this problem. This was accomplished by first making a transient heat transfer analysis. After this was completed, a particular temperature gradient field was selected and a thermal stress analysis made which included pressure loading. The procedure used to make the necessary computer runs are included in this report. Also included are some of the problems encountered while making the computer runs. Lastly, the results of the analysis are reviewed with conclusions and recommendations made for future studies. This will help define what conditions could be run in future wind tunnel tests.

FIGURE 1. MECHANICAL DRAWING OF MACH 14 FLOW RESTRICTOR PLATE

MODEL GENERATION

The finite element model that was used in this analysis was created using PATRAN-G. PATRAN-G is an interactive solids modeling graphics program and is supplied by PDA Engineering of Santa Ana, CA. The model dimensions were taken from a mechanical drawing of the Mach 14 flow restrictor plate (see Figure 1). Due to the symmetry of the plate, a 30 degree wedge was used for the final finite element model. The section that was used is shown in Figure 2. Figure 3 shows the finite element model used in this analysis.

The procedure for generating the finite element model is given in Appendix A. This appendix includes the listing of the commands input to PATRAN-G to develop the geometry of the model and then the finite element model. These are the session files generated while using PATRAN-G.

It was decided to use 20 node bricks for the finite element model. There were 2 main reasons for this choice. The first was that less elements would be needed to make up the model. This was an important consideration as the number of elements affects the run time for a computer analysis. Even with the increased number of integration points for a 20 node brick (27 as compared to 8 for the 8 node brick), less time was used to obtain a reasonably accurate solution. With 8 node bricks, 8 times as many elements would have been needed for the same number of nodes. This, in turn, would have increased the wavefront number in ABAQUS and dramatically increased the run time. The second reason was that 3 node sides allowed for quadratic equations to define the side of an element. This meant that a curved surface, such as a half-circle, could be exactly defined. This was desired as the model became more realistic than if 8 node bricks had been used, which have straight sides.

After the model had been completed, a neutral file was created using PATRAN-G. This was necessary in order to use the translators available at this time. Also, it is important to have a property identification (PID) number associated with each element. This can be done at the same time that elements are generated for the model using the PFEG command. If there is no PID number, the translator will give a warning message to the terminal screen for each element without a PID number. Refer to Appendix A as to where this command occurs in the finite element generation process.

MODEL TRANSLATION FROM PATRAN-G TO ABAQUS

Once the finite element model was completed and a neutral file existed, a process was gone through to obtain the node and element data for an ABAQUS input deck. This was initiated by using 1 of 2 commands. These are PATNAS and PATCOS, and are part of the translator capability supplied by PDA Engineering with PATRAN-G. Both will result in the creation of a NASTRAN bulk data file. It was found that only PATCOS is capable of translating 20 node brick elements.

FIGURE 2. SECTION OF FLOW RESTRICTOR USED FOR FINITE ELEMENT MODEL

FIGURE 3. FINITE ELEMENT MODEL OF MACH 14 FLOW RESTRICTOR PLATE

The translation process is started by typing the command

\$ PATCOS

and answering the menu according to what is desired at the time. The underlined letters represent the users response. The other part of a command line is the prompt issued by PATCOS, or the system as is the case with the \$. After PATCOS has been initiated, it responds with a menu selection that the user must select from for the translation to start. For this analysis, a menu response of

Selection > 1

was first selected, which requests translation to be done. The response to the questions following are dependent on what has been done while using PATRAN-G.

PATRAN-G Neutral File name?
 (Just <ret> if latest "PATRAN.OUT")
 >FRABAQ.OUT

FLOW RESTRICTOR ANALYSIS

16-JAN-84

10:02:45

1.5

Is this the correct file? (Y/N)

> Y

Enter title for the bulk data file.
 Just <ret> to use the neutral file title.
 > <ret>

TRANSLATION INITIATED

1952 GRID record(s) written on "NASTRAN.BDF".

328 CXXXX record(s) written on "NASTRAN.BDF".

----- Translation done -----

2280 logical records (2936 card images) have been written on file "NASTRAN.BDF".

Hit <ret> to continue. > <ret>

At this point, the NASTRAN bulk data file has been created and is called NASTRAN.BDF. This is the default name given by PATCOS. The file FRABAQ.OUT is the neutral file output from PATRAN-G. Its original name, PATRAN.OUT, was changed so as not to confuse it with other existing neutral files. After the response to continue, the PATCOS menu again presents itself to the user. A response of

Selection > 6

was chosen since the translation was completed at this time. PATCOS responds to this with the message

PATCOS execution completed

and the user will be returned to the regular system \$ prompt. This ends the PATCOS translation process.

As a result of this translation, PATCOS has created a couple of new files. These were the NASTRAN bulk data file NASTRAN.BDF and PATCOS.MSG. The second of these files, PATCOS.MSG, is just an informational file of what has been done by PATCOS. A listing of PATCOS.MSG is included in Appendix B.

It was now possible to create an ABAQUS input deck by using the translator COSABA. A procedure file, TRANSL1.COM, was used for setting up and submitting COSABA via another procedure file TRANSL.COM. Copies of COSABA, TRANSL1.COM, and TRANSL.COM can be found in Appendix B.

In order to use TRANSL1.COM, an INPUT.DAT file must exist with at least two lines of information. These two lines

4
C3D20

are the element identifier number (4) and the element type (C3D20). These two lines are needed for every different type of element used in the NASTRAN.BDF file with the first element type used first, the second element type used second, and so on.

With this file and NASTRAN.BDF available, it was possible to use TRANSL1.COM. This was done by typing the command

\$ @TRANSL1

and responding to the questions asked by the procedure file.

Input data file (or RETURN for INPUT.DAT):<ret>
 NASTRAN input file name (or RETURN for NASTRAN.BDF):<ret>
 ABAQUS output file identifier (or RETURN for ABAQUS.DAT):FRABAQ.DAT

TRANSL.COM was automatically submitted after all the questions were answered. This resulted in the creation of an ABAQUS input file which contained only the node and element data for the flow restrictor finite element model. The ABAQUS input file, FRABAQ.DAT, had to be edited and the remaining information input by the user. This included the rest of the model definition (such as node and element sets), material definition, and history definition. Each of these will be defined in the following sections of this report.

A flow chart of this forward translation process is given in Figure 4. With this figure and the files in Appendix B, the entire process can be understood. Special attention is directed to the informational notes contained in COSABA. These were of help in generating the proper INPUT.DAT file format.

ABAQUS CONSIDERATIONS

In completing the ABAQUS input file, a number of considerations must be made. These included what options will be used, model connectivity, and desired accuracy for the results. Each of these areas impact the analysis time, but in different ways. Some take longer computer time, while others require user supplied computer coding. In any event, care must be taken when assembling the remainder of the FRABAQ.DAT file.

The model definition of the input file is usually taken care of in PATRAN-G. Unfortunately, PATRAN-G does not always generate elements and nodes in the optimum way. Due to the way ABAQUS works, this can become critical in relation to the run time. ABAQUS optimizes on the element wavefront number. This means that consecutive numbering of adjacent elements is the optimum manner in which to number them. This, however, becomes somewhat difficult with a 3-dimensional model. The way to optimize the model is to start numbering the elements at one corner and continue sequentially along the shortest side. When that row of elements is numbered, start with the adjacent row in the next shortest side of the model. Continue in this manner until the first layer is finished. When the first layer of elements is done, go to the next layer and number them in the same manner as the first layer. Do this until all the elements are numbered. This will give a reasonable wavefront number that is

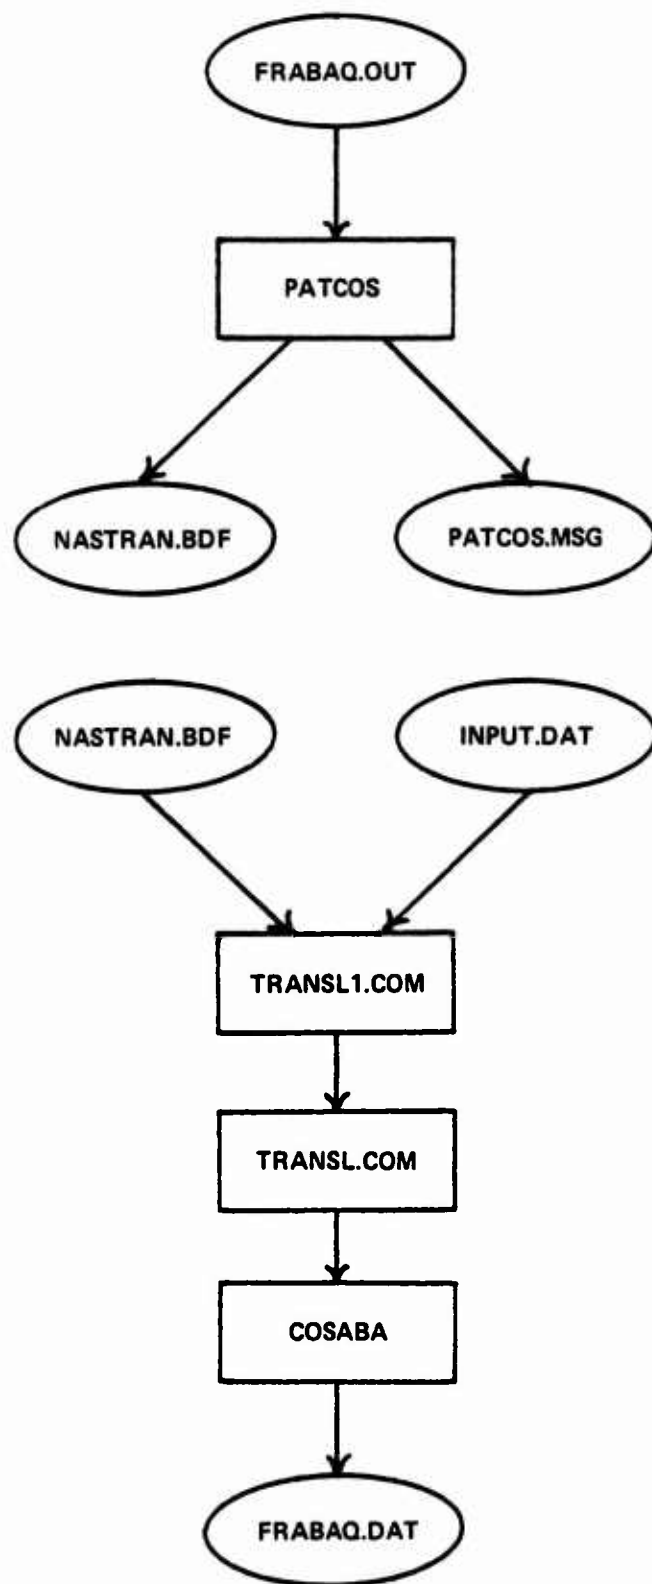

FIGURE 4. FORWARD TRANSLATION FLOW CHART

better than what would have been obtained from PATRAN-G directly without intervention. This was done on the flow restrictor model and saved substantial amounts of time for analysis runs.

Another part of the model definition was the boundary conditions. These consisted of symmetry conditions and actual constraints. The symmetry conditions were the x-z plane and this plane rotated 30 degrees in a counterclockwise direction about the z-axis. Both of these planes were constrained from motion perpendicular to the plane. For the x-z plane, this was simply a restriction in the y-direction. The rotated plane required the use of a *TRANSFORM option card. It was put into a cylindrical coordinate system with the θ -direction restricted from motion. Using the *TRANSFORM option meant that all output was then done in the cylindrical coordinate system for the transformed nodes. This caused some problems when using the reverse translator ABAPAT and viewing the displacement results. More will be said about this in a later section. The two outer circular edges were restricted from motion in the radial direction. This required the use of another *TRANSFORM card with the r-direction constrained from movement. Also, the x-y plane that connected these two edges was not allowed to move in the z-direction. This was all that was needed for the actual constraint conditions.

For the rest of the ABAQUS option cards mentioned, refer to the appropriate section where each is used for that part of the analysis. Those options that were used are listed below.

- *PLASTIC
- *HEAT TRANSFER
- *FILM
- *STEP, LINEAR=OLD
- *FIELD
- *TEMPERATURE

All of these options dealt with the history definition of the analysis except *PLASTIC. This was used in the material properties definition.

MATERIAL PROPERTIES OF COLUMBIUM C-103

The material definition of the model consists of the known mechanical properties. The material used for the Mach 14 flow restrictor plate is Columbiium C-103. What was needed by ABAQUS for the transient heat transfer and thermal stress analysis were the following:

1. Modulus of Elasticity as a function of temperature
2. Poisson's ratio as a function of temperature
3. Thermal conductivity as a function of temperature

4. Density
5. Specific Heat
6. Thermal Expansion Coefficient as a function of temperature
7. Yield Strength as a function of temperature
8. Plastic Strain as a function of temperature
9. Plastic Tangent Modulus as a function of temperature

Most of these properties were obtained from a memorandum written by Charles Rozanski (K23) on 23 December 1983. The rest were attained from graphs supplied by Robert Waser (K23). Appendix C gives the values for each of these properties along with the corresponding ABAQUS input. All of the * option cards used are well defined in the ABAQUS User's Manual except the *PLASTIC card. This one merits further explanation.

In order to arrive at the proper values needed on the *PLASTIC card, one must have available stress-strain curves at different temperatures. A minimum of two temperatures is sufficient, but the more available, the better. The values needed are the yield stress point, failure stress point, and the associated strain values at both of these points. Two lines are used for each temperature. The first line has the yield stress, a zero value, and then the temperature on it. The second line has the failure stress, difference between the yield strain and the failure strain, and the same temperature as the first line on it. In this manner, by repeating the properties at different temperatures, a fairly good material model can be made. If the stress-strain curve was to be more accurately modeled, segments could be done in a linear piecewise fashion.

USER SUBROUTINE FILM

In order to make a transient heat transfer analysis, it is necessary to supply ABAQUS with a heat transfer film coefficient. This can be done in two ways. One way is to assume a constant value per element face throughout the run time of the computer code. The other is to assume that the film coefficient is non-uniform and changes during the run. Since the film coefficient is pressure and temperature dependent, it was thought best to input the coefficient as non-uniform. Also, due to the geometry of the flow restrictor, three different equations were needed to calculate the coefficient at different locations. With these restrictions in mind, it was decided to make use of a user subroutine within ABAQUS.

The user subroutine that was used is called FILM. A listing of FILM.FOR can be found in Appendix D. The theory behind the subroutine coding is presented here as well as a way of checking the subroutine for accuracy. Also

included in this section is the methodology needed to change the subroutine for a different set of conditions.

There were three equations used to define the film coefficients for this model. A memorandum by Mark Opeka (K22) dated 23 January 1984 was used to obtain two of these equations. The other equation was obtained from a memorandum by Robert Kavetsky (K23) dated 23 April 1980. With these three equations, the film coefficients could be determined on all of the surfaces that would experience heating.

On the front surface of the flow restrictor, the following equation was used.

$$\bar{h}_F = 0.228 \frac{K_f}{d} \sqrt{1 + \frac{d}{D}} \left(\frac{U_\infty d \rho_f}{\mu_f} \right)^{0.731} (Pr)^{1/3} \quad (1)$$

The Bartz equation

$$\bar{h}_N = 0.052 \frac{C_p}{D^{0.2}} \frac{\mu_f^{0.2}}{Pr^{0.6}} (U_\infty \rho_f)^{0.8} \quad (2)$$

was used for the nozzle section of the flow restrictor. On the back side of the flow restrictor, the equation

$$\bar{h}_B = 0.221 \frac{K_f}{d} \left(\frac{U_\infty d \rho_f}{\mu_f} \right)^{2/3} (Pr)^{1/3} \quad (3)$$

was used. For the vertical section of the step inside the nozzle, an average of Equations (1) and (2) was used to determine the film coefficient. On the flange section that sticks out in the back, the coefficient was calculated as an average of Equations (2) and (3). These two equations take on the following form.

$$\bar{h}_V = \frac{1}{2} (\bar{h}_F + \bar{h}_N) \quad (4)$$

$$\bar{h}_f = \frac{1}{2} (\bar{h}_N + \bar{h}_B) \quad (5)$$

The variables used in Equations (1), (2), and (3) are defined below.

k_f = Gas thermal conductivity at film temperature

d = Effective wetted surface diameter

D = Diameter of external duct or nozzle

U_∞ = Free stream gas velocity

μ_f = Gas dynamic viscosity at film temperature

ρ_f = Gas density at film temperature

Pr = Prandtl number, taken as a constant equal to 0.74

C_p = Specific heat at constant pressure, taken as a constant equal to 0.295 Btu/lb °R

In calculating U_∞ , the mass flow rate used was for Mach 14 conditions. This is given as 128.3668 lbm/sec. The velocity is now found at any point by rearranging the mass flow equation.

$$U_\infty = \frac{\dot{m}}{\rho A} \quad (6)$$

where: \dot{m} is the mass flow rate

ρ is the density at the free stream temperature

A is the area of flow passage

The free stream temperature is defined by the user as the sink temperature. This is one of two variables defined by the user in subroutine FILM for use by ABAQUS. The other is the heat transfer film coefficient. The sink temperature follows the curve as depicted in Figure 5. At time equal to zero, the sink temperature is taken as being 70°F. It was found that a sink temperature of 0°F at time equal to zero caused numerical difficulties.

To calculate the area of flow at a particular point in the restrictor plate, one had to look at the dimensions of the plate. This was done for each surface that was seeing flow and tabulated in Table 1. Also included in Table 1 are the associated element sets and diameters used at these points. The wetted surface diameter is found from the surface area perpendicular to the gas flow. Knowing the surface area, the wetted surface diameter is the corresponding diameter that would give the same area.

In determining the pressure at a certain point, one must be aware of the wind tunnel run conditions. For this particular analysis, the pressure on the

FIGURE 5. SINK TEMPERATURE VS. TIME

FLNG2	2.745	2.3358	0.041097	20,000.0
RSUR2	---	1.7400	0.057610	20,000.0

front surface was 22,000.0 psi and 20,000.0 psi on the back surface. In between these two locations, pressure values were assigned between 20,000.0 and 22,000.0 psi. All of these values are listed in Table 1.

To calculate the remaining 3 values, gas thermal conductivity, dynamic viscosity, and density, a separate subroutine was used which is called FINTERP. This subroutine returns the value for each of these by interpolating from a user supplied table of values. These tabulated values are a function of pressure and temperature (see Tables 2, 3, and 4). At this point, the film temperature was used as an input to subroutine FINTERP. It is given as the average between the free stream (sink) temperature and the wall temperature.

$$T_f = \frac{1}{2} (T_\infty + T_w) \quad (7)$$

Given the pressure and temperature from Equation (7), the proper values are found by FINTERP and then used in subroutine FILM.

Subroutine FILM was written so that this procedure would be done transparent to the user. All of the theory behind the equations has been outlined above and coded in the subroutine. This was first checked out for accuracy by using the program FILMTEST which is included in Appendix D. All that FILMTEST did was to exercise subroutine FILM and give the user output. With this output, the user could make sure that subroutine FILM was working properly. This was accomplished without having to run ABAQUS and resulted in appreciable time and cost savings.

This subroutine was written solely for the Mach 14 flow restrictor problem and model. It was not intended to change except for different run conditions. Both the temperature and pressure are easily altered and doing this is straightforward. In changing the pressure values, all that is needed is a redefinition of the PRESSFS array values. Each location corresponds to one element set and the pressure differential should be divided in some way between them (see Table 1 for example). The temperature profile is not quite as easy, but not difficult nonetheless. As long as the profile can be put into equation form as a function of time, there is no problem. Just replace the coding for defining the sink temperature. Additional data may also be needed for the density table in FINTERP depending on the pressure values used in array PRESSFS. The program will extrapolate outside of the current values, but if more accuracy is desired, additional values will have to be added to the table. With these changes, many different run conditions can be analyzed to identify potential problems. All that is needed now is to complete the history definition of the ABAQUS input.

TRANSIENT HEAT TRANSFER ANALYSIS

In making a transient heat transfer analysis, there are a number of variables that need to be defined by the user. They have to do with either the accuracy of the solution or the time stepping of the analysis. All of these are associated with the *HEAT TRANSFER option card. The values input from this card and also the *FILM card make up the history definition for a run.

When choosing the values for the *HEAT TRANSFER card, one must be careful as these variables greatly impact the computer run time. The finite element model also determines to some extent the values used for the time step. For the values used, please refer to Appendix E. The time stepping values used are thought to be the best possible at this time. The values for TEMTOL and DELMAX are not necessarily the best. Further studies would have to be done, which were outside the scope of this problem, in order to determine the optimum values. What was chosen worked well for this particular analysis.

In contrast to the *HEAT TRANSFER values, those used in conjunction with the *FILM card are rigidly set by the problem. There should be no reason to change these values because of different wind tunnel conditions. These correspond to the face of each element that requires a film coefficient for transient heat transfer analysis. The fact that the description was taken as non-uniform automatically called user subroutine FILM. The user need do nothing except supply the subroutine FILM when making the computer run. This is done when the command procedure file ABAQUS1.COM is executed. Appendix F contains a listing of this file along with a listing of ABAQUS.COM.

Once the ABAQUS input file was completed, the analysis was submitted using the procedure files mentioned above. This is relatively straight-forward and will not be discussed here. After the analysis is completed and the results obtained, another translation was done between ABAQUS and PATRAN-G. This was done with the nodal results file and the procedure outlined in the next section.

RESULTS TRANSLATION FROM ABAQUS TO PATRAN-G

After the nodal results file was obtained, translation could be made back to PATRAN-G so as to look at the results graphically. This was done with the procedure files and program listed in Appendix G. The program, ABAPAT.FOR, will only translate nodal results. The capability to translate element results does not exist at present and will not in the near future. In order to get element values at node points, it was necessary to use the fourth card in the *EL FILE input stream. These were all nodal averaged values, and were helpful in visualization of the stress and strain fields of the flow restrictor.

One problem that occurred in translation from ABAQUS to PATRAN-G was with displacements. Because of the use of *TRANSFORM cards in applying some of the boundary conditions, difficulty arose in getting the proper coordinate system

and values for displaced nodes. ABAQUS does not translate displacements back into global coordinates for printed output or file results. The values were output in the local (transformed) coordinate system. In order to use PATRAN-G to look at the displacement results, it was necessary to translate the values back into the global coordinate system. This was done within the ABAPAT program by adding the coordinate frame transformation capability to the coding. With this addition to ABAPAT, the translation process could be completed.

The translation of results into the proper PATRAN-G format is initiated by typing the command

\$ @WRIT1

and then answering the questions asked by WRIT1.COM. The first one asked is about the TITLE.DAT file. This file consists of four lines with the first three being a title supplied by the user. These are 80 character lines that will be used as title information for any post-processing done with PATRAN-G. The fourth line is either .TRUE. or .FALSE., and depends on whether or not some nodal data needs to be transformed. This line will also determine the response to the next question asked by WRIT1.COM. This question will ask for the file containing the nodes to be transformed within ABAPAT. The first line of this file (TRANS.DAT in Appendix G) is the number of nodes. The second and following lines are the nodes that will need to have some results transformed into global coordinates. These are in I6 format with 15 values per line. After these two questions are answered, the last question asked is which nodal results file is to be used. This is the results file from the ABAQUS run. The results will then be translated and usable with PATRAN-G. Figure 6 is a flow chart of this reverse translation process.

TRANSIENT HEAT TRANSFER RESULTS

With both the visual results of PATRAN-G and the printed output (see Appendix H), a determination was made as to what increment of the step should be used for the thermal stress analysis. This was expected to occur sometime during the maximum sink temperature. In viewing the results of the heat transfer analysis, it was decided that the worst temperature gradient occurred near the 0.5 second mark in the run. Figure 7 shows this particular gradient. This was then used for the *TEMPERATURE input in the thermal stress analysis.

The computer run time for this analysis was about 18 cpu hours. The main reason for such a long run time was the large wavefront number of the model. Originally the wavefront was 843, but this was reduced to 528 by optimizing the element numbering. This was done in the manner outlined in a previous section. With this change in the wavefront number, it is expected the analysis would take approximately 6 cpu hours.

THERMAL STRESS ANALYSIS

The thermal stress analysis used the results of the transient heat transfer analysis. The temperature gradient selected not only supplied the proper thermal load, but also allowed material properties to be evaluated at the correct temperature. All of the material properties were temperature dependent, so this became an important factor. This was accomplished by using the *FIELD card.

In making the thermal stress run, it was decided to do the analysis in two parts. The first step was the pressure loading at the proper temperature. The pressure was put on the same element faces as the film coefficients using the *DLOAD card. The values used are those listed in Table 1. This step was taken to be linear and static as it was not expected that the pressure loading would cause any of the material to plastically yield.

Unlike the pressure loading, the thermal loading was not expected to be linear. But, due to the large run time involved with non-linear analysis, it was decided to also run the temperature load as linear static. Here is where the *TEMPERATURE card was used as input to apply the thermal load. This made up the second step of the thermal stress analysis.

Both of these steps were run within one ABAQUS analysis. The pressure was done first so as to see the effects on the flow restrictor plate. Then the thermal load was added for the combined effect. This was accomplished by using the option card *STEP, LINEAR=OLD. As a result of this card, ABAQUS does not recalculate the stiffness matrix for the new loading and saves an enormous amount of computer time in the process. Since both the *FIELD and *TEMPERATURE cards were used, ABAQUS tried to open too many scratch files. This caused a fatal error and an end of execution within ABAQUS. This problem was solved by adding CORE=1000000.0 to the *HEADING card. The analysis was run with reduced integration elements. Instead of 27 integration points per element, only 8 points were used. It was hoped this would also lower the cpu run time, but it seemed to have little, if any, effect. As a result though, less output would be available due to only 8 points per element. Some accuracy of results may have been lost, but the effects were not noticeable. Appendix I contains a listing of the thermal stress analysis input file.

THERMAL STRESS RESULTS

The results of the thermal stress analysis were viewed using PATRAN-G via the ABAPAT translator. This included the displacement results and the stress-strain fields. Figures 8-14 show some of these results and each of these will be discussed in the following paragraphs.

Figure 8 shows the Von Mises stress field due to the pressure loading. The range of values is 4,780 to 42,100 psi. Overall, not much of the plate is in

MACH 14 FLOW RESTRICTOR
 THERMAL STRESS ANALYSIS
 RUN M14FR031 --- PRESSURE LOAD

FIGURE 8. VON MISES STRESS FIELD -- PRESSURE LOAD ONLY

yielding at this temperature gradient for just the pressure loading. In looking at the deformed displacement plots corresponding to this stress field (see Figure 9), nothing surprising is seen. These correspond well to what happens according to classical theory and anticipated results.

The next figure (see Figure 10) is the Von Mises stress field for the combined thermal and pressure load. Here, much of the flow restrictor is yielding, and at very high magnitudes. The corresponding range of values is 4,400 to 205,000 psi. Even at room temperature, vast portions of the plate are yielding. By looking at Figures 11, 12, and 13, it is seen that most of this yielding is in compression. Figure 11 is the r-direction stress field and Figure 12 is the θ -direction stress field. These are the radial and hoop stress respectively. The z-direction stress field is shown by Figure 13 and represents the axial stress. The range of values for these three figures all fall between -298,000 and 84,300 psi. The greatest range occurs in the hoop stress (see Figure 12), with corresponding strain values of -0.005 to 0.015 inches per inch. This clearly shows what effect a large thermal gradient will have on a stress field. It becomes even more apparent when viewing the deformed displacement plots (see Figure 14). The bulge in the middle of the plate was not unexpected and corresponds well with what is seen in actual wind tunnel runs. The maximum displacement is about 0.006 inches.

Appendix J contains a listing of all the thermal stress results mentioned above. From this data and the corresponding figures presented in this report, it is found that severe compressive yielding is occurring in much of the flow restrictor plate. This is a potential yielding problem and warrants further study in the future.

RESULTS AND CONCLUSIONS

The results that were obtained with both of the analyses were expected and made sense. For the given supply conditions, the temperature gradient arrived at with the transient heat transfer analysis was within reason and proved to be accurate. It was proven by the results from the thermal stress analysis.

This analysis predicts that there is extensive compressive yielding occurring in a large portion of the Mach 14 flow restrictor plate. In reality this is true. The plate does have a permanent set in it after a wind tunnel run. The middle of the plate actually bulges out, just as exhibited in Figure 14. To my knowledge, the strains on the flow restrictor have never been measured, but I'm confident they would compare with those arrived at in this analysis.

In conclusion, I would say that this analysis was accurate and of value to the Wind Tunnel #9 Safety Committee. It verifies what has been observed by a computer analysis and gives at least relative numbers for stresses, strains, and displacements. It is a valid analysis and can be used as a guide for subsequent analysis at different conditions.

RECOMMENDATIONS

In order to further investigate this problem, more analysis needs to be done. Not only a nonlinear thermal stress analysis, but a fatigue analysis as well. The nonlinear analysis will give more accurate strain and stress values, as compressive yielding is obviously occurring in a large portion of the flow restrictor plate. The fatigue calculations will give some idea as to how many times the plate may be able to withstand this particular loading.

If the loading is changed for a wind tunnel run, this procedure can be used to arrive at preliminary results of stresses and displacements. It is my opinion that a larger pressure differential will cause even more compressive yielding. This in turn will weaken the plate and cause it to be unusable sooner. In view of this, care must be taken if structural integrity is to be maintained for this particular wind tunnel component. An analysis of this type should be completed for any new tunnel run condition before the run is actually made. Then, the possible effects may be seen and a decision made as to whether or not the tunnel will be run at the new conditions.

EACH PAIR OF CARDS (IELMNT,name) IN INPUT DAT MUST CORRESPOND TO A PROPERTY ID IN THE NASTRAN BDF FILE. IN THE ORDER IN WHICH THE PROPERTY ID'S FIRST APPEAR. THIS CODE REARRANGES THE ELEMENTS TO BE GROUPED BY PROPERTY ID, RESULTING IN A DIFFERENT *ELEMENT,ELSET= CARD FOR EACH SET OF ELEMENTS.

- 4 INTERFACE ELEMENTS MUST BE FLAGGED WITH A "9" IN THE PROPERTY ID COLUMN (USE PFEG IN PATRAN). IN PATRAN, INTERFACE ELEMENTS ARE CREATED AS THEIR CORRESPONDING "REAL" ELEMENTS (eg. A 6-NODE 2D INTERFACE ELEMENT IS CREATED AS AN 8-NODE QUAD) THIS TRANSLATOR TAKES CARE OF SORTING OUT CONNECTIVITY WITHIN EACH ELEMENT.

C *****
C *
C * Latest revision : April 26, 1984
C *
C * This program is an ABAQUS-to-PATRAN results translator.
C * Nodal results (only), produced by *EL FILE or *NODE FILE cards
C * in ABAQUS, are translated into PATRAN post-processing format.
C *
C * INITF and DBFILE are subroutines in the ABAQUS library--this
C * code is linked with ABAQUS*DIR.ABAQLIB/LIB to produce the
C * executable. The ABAQUS output file must be located on UNIT 8
C * to be accessed by the ABAQUS subroutines.
C *
C * A three-record file, containing a title and two subtitles, must
C * be located on UNIT 4.
C *****

```

```

C *****
C *
C * VARIABLE DEFINITIONS
C *
C * 'ARRAY' is a single record from the ABAQUS output file
C *
C * NU is the number of data blocks in the ABAQUS output file.
C * NCARDS is the number of records in each data block.
C * NNODES is the number of nodes in each data block.
C * NDMAX is the node having the largest deflection.
C * MAXNOD is the highest node ID.
C * MAXDEF is the largest deflection (occurring at NDMAX).
C *
C * WRIT is the array of nodal results which have been translated
C * into PATRAN postprocessing format. A separate file is
C * produced for each increment, each is output on UNIT 10
C * In other words, there will be a separate FOR010.DAT output
C * by this program for every increment in the results file from
C * ABAQUS; the output files will be distinguishable on the basis
C * of version number.

APPENDIX H

ABAQUS HEAT TRANSFER ANALYSIS RESULTS

ABAGUS VERSION 4-4-67
MACH 14 FLOW RESTRICTOR
TRANSIENT HEAT TRANSFER ANALYSIS

DATE22-FEB-84

TIME18 05 51

PAGE 1

STEP 1

INCREMENT 1

STEP 1 TRANSIENT HEAT TRANSFER ANALYSIS

THE MINIMUM TIME INCREMENT ALLOWED IS 5.000E-02

THE MAXIMUM TIME INCREMENT ALLOWED IS 0.300

THE MAXIMUM TEMPERATURE CHANGE ALLOWED PER INCREMENT IS 500

THE CONVERGENCE TOLERANCE MEASURES ARE -

TEMPERATURE CORRECTIONS BETWEEN ITERATIONS 50.0

THE STEP IS TERMINATED IF THE LARGEST TEMPERATURE

CHANGE RATE IN AN INCREMENT IS LESS THAN 10.0

MAXIMUM NUMBER OF INCREMENTS ALLOWED IS 100

MAXIMUM NUMBER OF ITERATIONS ALLOWED IS 6

INCREMENT NUMBER 1 ATTEMPT NUMBER 1

TIME INCREMENT = 0.100

MAXIMUM TEMPERATURE CHANGE IN THIS INCREMENT IS 526 AND OCCURS AT NODE 537

THIS EXCEEDS THE TOLERANCE SPECIFIED

THE INCREMENT WILL BE RECYCLED WITH A TIME INCREMENT OF 5.701E-02

ABAGUS VERSION 4-4-67
MACH 14 FLOW RESTRICTOR
TRANSIENT HEAT TRANSFER ANALYSIS

DATE 22-FEB-84

TIME 18 05 51 PAGE 2

STEP 1 INCREMENT 1

INCREMENT NUMBER 1 ATTEMPT NUMBER 2
TIME INCREMENT = 5.701E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -20.5 AND OCCURS AT NODE 1274

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 5.701E-02. TIME INCREMENT COMPLETED IS 5.701E-02. FRACTION OF STEP IS 9.502E-02
TOTAL ACCUMULATED TIME IS 5.701E-02
TOTAL HEAT TIME IS 5.701E-02

RESTART INFORMATION WRITTEN IN STEP 1 AFTER INCREMENT 1

INCREMENT NUMBER 2 ATTEMPT NUMBER 1
TIME INCREMENT = 5.701E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -48.0 AND OCCURS AT NODE 1236

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.114. TIME INCREMENT COMPLETED IS 5.701E-02. FRACTION OF STEP IS 0.190
TOTAL ACCUMULATED TIME IS 0.114
TOTAL HEAT TIME IS 0.114

RESTART INFORMATION WRITTEN IN STEP 1 AFTER INCREMENT 2

 STEP 1 INCREMENT 3

INCREMENT NUMBER 3 ATTEMPT NUMBER 1
 TIME INCREMENT = 5.701E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -64.0 AND OCCURS AT NODE 1417
 THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 1.24 AND OCCURS AT NODE 1236

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.171 TIME INCREMENT COMPLETED IS 5.701E-02. FRACTION OF STEP IS 0.285
 TOTAL ACCUMULATED TIME IS 0.171
 TOTAL HEAT TIME IS 0.171

RESTART INFORMATION WRITTEN IN STEP 1 AFTER INCREMENT 3

INCREMENT NUMBER 4 ATTEMPT NUMBER 1
 TIME INCREMENT = 5.701E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -75.5 AND OCCURS AT NODE 1236
 THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 1.84 AND OCCURS AT NODE 1586

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.228 TIME INCREMENT COMPLETED IS 5.701E-02. FRACTION OF STEP IS 0.380
 TOTAL ACCUMULATED TIME IS 0.228
 TOTAL HEAT TIME IS 0.228

RESTART INFORMATION WRITTEN IN STEP 1 AFTER INCREMENT 4

 TRANSIENT HEAT TRANSFER ANALYSIS

DATE: 22-FEB-84
 TIME: 18 05 51
 PAGE: 16
 STEP: 1
 INCREMENT: 10

RESTART INFORMATION WRITTEN IN STEP 1 AFTER INCREMENT 10

INCREMENT NUMBER 11 ATTEMPT NUMBER 1
 TIME INCREMENT = 2.989E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 16.7 AND OCCURS AT NODE 1322

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.600 , TIME INCREMENT COMPLETED IS 2.989E-02, FRACTION OF STEP IS 1.00
 TOTAL ACCUMULATED TIME IS 0.600
 TOTAL HEAT TIME IS 0.600

NODE POINT OUTPUT SET ALL

TOTAL TEMPERATURES

R E S T A R T C O N D I T I O N

RESTART FILE WILL BE WRITTEN EVERY 1 INCREMENTS
RESTART IS MADE FROM STEP 1 INCREMENT 10 AT TIME 0 5701
NEXT INCREMENT WILL BE STEP 2 INCREMENT 1

ABAGUS VERSION 4-4-67
MACH 14 FLOW RESTRICTOR
TRANSIENT HEAT TRANSFER ANALYSIS

DATE24-FEB-84
TIME13 46.15
PAGE 1
STEP 2 INCREMENT 1

STEP 2 TRANSIENT HEAT TRANSFER ANALYSIS

TRANSIENT HEAT TRANSFER

AUTOMATIC CONTROL WITH -
A SUGGESTED INITIAL TIME INCREMENT OF 0.100
AND A TOTAL TIME PERIOD OF 2.50
THE MINIMUM TIME INCREMENT ALLOWED IS 5.000E-02
THE MAXIMUM TIME INCREMENT ALLOWED IS 0.300
THE MAXIMUM TEMPERATURE CHANGE ALLOWED PER INCREMENT IS 500.
THE CONVERGENCE TOLERANCE MEASURES ARE -
TEMPERATURE CORRECTIONS BETWEEN ITERATIONS 50.0
THE STEP IS TERMINATED IF THE LARGEST TEMPERATURE
CHANGE RATE IN AN INCREMENT IS LESS THAN 10.0
MAXIMUM NUMBER OF INCREMENTS ALLOWED IS 100
MAXIMUM NUMBER OF ITERATIONS ALLOWED IS 6

THE FILE OUTPUT WILL NOT BE A CONTINUATION OF THE PREVIOUS FILE
BECAUSE THAT FILE WAS NOT MADE AVAILABLE

INCREMENT NUMBER 1 ATTEMPT NUMBER 1
TIME INCREMENT = 0.100

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 76.7 AND OCCURS AT NODE 1322

ABAGUS VERSION 4-4-67 DATE24-FEB-84 TIME13 46 15 PAGE 2

MACH 14 FLOW RESTRICTOR STEP 2 INCREMENT 1
TRANSIENT HEAT TRANSFER ANALYSIS

THIS EXCEEDS TOLERANCE
MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -2.63 AND OCCURS AT NODE 1571

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.100 , TIME INCREMENT COMPLETED IS 0.100 , FRACTION OF STEP IS 4.000E-02
TOTAL ACCUMULATED TIME IS 0.670
TOTAL HEAT TIME IS 0.670

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 1

INCREMENT NUMBER 2 ATTEMPT NUMBER 1
TIME INCREMENT = 0.100

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 51.8 AND OCCURS AT NODE 1322
THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -1.73 AND OCCURS AT NODE 1571

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.200 , TIME INCREMENT COMPLETED IS 0.100 , FRACTION OF STEP IS 8.000E-02
TOTAL ACCUMULATED TIME IS 0.770
TOTAL HEAT TIME IS 0.770

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 2

INCREMENT NUMBER 3 ATTEMPT NUMBER 1
TIME INCREMENT = 0.100

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 37.3 AND OCCURS AT NODE 1322

ABAGUS VERSION 4-4-67 DATE 24-FEB-84 TIME 13:46:15 PAGE 3

MACH 14 FLOW RESTRICTOR STEP 2 INCREMENT 3
TRANSIENT HEAT TRANSFER ANALYSIS

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.300 , TIME INCREMENT COMPLETED IS 0.100 , FRACTION OF STEP IS 0.120
TOTAL ACCUMULATED TIME IS 0.870
TOTAL HEAT TIME IS 0.870

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 3

INCREMENT NUMBER 4 ATTEMPT NUMBER 1
TIME INCREMENT = 0.100

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 26.8 AND OCCURS AT NODE 1322

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.400 , TIME INCREMENT COMPLETED IS 0.100 , FRACTION OF STEP IS 0.160
TOTAL ACCUMULATED TIME IS 0.970
TOTAL HEAT TIME IS 0.970

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 4

INCREMENT NUMBER 5 ATTEMPT NUMBER 1
TIME INCREMENT = 0.200

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 44.2 AND OCCURS AT NODE 1317

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.600 , TIME INCREMENT COMPLETED IS 0.200 , FRACTION OF STEP IS 0.240
TOTAL ACCUMULATED TIME IS 1.17
TOTAL HEAT TIME IS 1.17

TRANSIENT HEAT TRANSFER ANALYSIS

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 5

INCREMENT NUMBER 6 ATTEMPT NUMBER 1
TIME INCREMENT = 0.200

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -43.0 AND OCCURS AT NODE 1571

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.800 . TIME INCREMENT COMPLETED IS 0.200 . FRACTION OF STEP IS 0.320
TOTAL ACCUMULATED TIME IS 1.37
TOTAL HEAT TIME IS 1.37

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 6

INCREMENT NUMBER 7 ATTEMPT NUMBER 1
TIME INCREMENT = 0.200

MAXIMUM TEMPERATURE CHANGE IN THIS INCREMENT IS -1.065E+03 AND OCCURS AT NODE 535
THIS EXCEEDS THE TOLERANCE SPECIFIED
THE INCREMENT WILL BE RECYCLED WITH A TIME INCREMENT OF 5.633E-02

INCREMENT NUMBER 7 ATTEMPT NUMBER 2
TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -18.4 AND OCCURS AT NODE 1571

 FRACTION OF STEP IS 0.343
 TOTAL HEAT TIME IS 1.43

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 7

INCREMENT NUMBER 8
 ATTEMPT NUMBER 1
 TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -22.4 AND OCCURS AT NODE 1237

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.913
 TOTAL ACCUMULATED TIME IS 1.48
 TIME INCREMENT COMPLETED IS 5.633E-02
 FRACTION OF STEP IS 0.365
 TOTAL HEAT TIME IS 1.48

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 8

INCREMENT NUMBER 9
 ATTEMPT NUMBER 1
 TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -37.0 AND OCCURS AT NODE 1422

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 0.969
 TOTAL ACCUMULATED TIME IS 1.54
 TIME INCREMENT COMPLETED IS 5.633E-02
 FRACTION OF STEP IS 0.388
 TOTAL HEAT TIME IS 1.54

STEP 2 INCREMENT 9

RESULTS IN FLOW RESISTANCE
TRANSIENT HEAT TRANSFER ANALYSIS

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 9

INCREMENT NUMBER 10 ATTEMPT NUMBER 1
TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -48.1 AND OCCURS AT NODE 1422

NODE POINT OUTPUT SET ALL

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 10

INCREMENT NUMBER 11 ATTEMPT NUMBER 1
TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -59 2 AND OCCURS AT NODE 1237
THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -1.05 AND OCCURS AT NODE 1237

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 1.08 TIME INCREMENT COMPLETED IS 5.633E-02, FRACTION OF STEP IS 0.433
TOTAL ACCUMULATED TIME IS 1.65
TOTAL HEAT TIME IS 1.65

ABAGUS VERSION 4-4-67 MACH 14 FLOW RESTRICTOR TRANSIENT HEAT TRANSFER ANALYSIS

DATE 27-FEB-84 TIME 17:37:43 PAGE 1

STEP 2 INCREMENT 1

STEP 2 TRANSIENT HEAT TRANSFER ANALYSIS

TRANSIENT HEAT TRANSFER

AUTOMATIC CONTROL WITH -
A SUGGESTED INITIAL TIME INCREMENT OF 0.100
AND A TOTAL TIME PERIOD OF 2.50
THE MINIMUM TIME INCREMENT ALLOWED IS 5.000E-02
THE MAXIMUM TIME INCREMENT ALLOWED IS 0.300
THE MAXIMUM TEMPERATURE CHANGE ALLOWED PER INCREMENT IS 500
THE CONVERGENCE TOLERANCE MEASURES ARE -
TEMPERATURE CORRECTIONS BETWEEN ITERATIONS 50.0
THE STEP IS TERMINATED IF THE LARGEST TEMPERATURE CHANGE RATE IN AN INCREMENT IS LESS THAN 10.0
MAXIMUM NUMBER OF INCREMENTS ALLOWED IS 100
MAXIMUM NUMBER OF ITERATIONS ALLOWED IS 6

THE FILE OUTPUT WILL NOT BE A CONTINUATION OF THE PREVIOUS FILE BECAUSE THAT FILE WAS NOT MADE AVAILABLE

INCREMENT NUMBER 12 ATTEMPT NUMBER 1
TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -68.1 AND OCCURS AT NODE 1417

ABAQUS VERSION 4-4-67 DATE 27-FEB-84 TIME 17:37:43 PAGE 2
MACH 14 FLOW RESTRICTOR STEP 2 INCREMENT 12
TRANSIENT HEAT TRANSFER ANALYSIS

THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -1.48 AND OCCURS AT NODE 1237

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 1.14 . TIME INCREMENT COMPLETED IS 5.633E-02, FRACTION OF STEP IS 0.455
TOTAL ACCUMULATED TIME IS 1.71
TOTAL HEAT TIME IS 1.71

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 12

INCREMENT NUMBER 13 ATTEMPT NUMBER 1
TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -93.5 AND OCCURS AT NODE 1422
THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -3.30 AND OCCURS AT NODE 1236

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 1.19 . TIME INCREMENT COMPLETED IS 5.633E-02, FRACTION OF STEP IS 0.478
TOTAL ACCUMULATED TIME IS 1.76
TOTAL HEAT TIME IS 1.76

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 13

INCREMENT NUMBER 14 ATTEMPT NUMBER 1
TIME INCREMENT = 5.633E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -62.0 AND OCCURS AT NODE 1236

ABAGUS VERSION 4-4-67 DATE27-FEB-84 TIME 17 37 43 PAGE 3
MACH 14 FLOW RESTRICTOR STEP 2 INCREMENT 14
TRANSIENT HEAT TRANSFER ANALYSIS

THIS EXCEEDS TOLERANCE

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -1.73 AND OCCURS AT NODE 1237

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 1.25 . TIME INCREMENT COMPLETED IS 5.633E-02, FRACTION OF STEP IS 0.500
TOTAL ACCUMULATED TIME IS 1.82
TOTAL HEAT TIME IS 1.82

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 14

INCREMENT NUMBER 15 ATTEMPT NUMBER 1
TIME INCREMENT = 0.113

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -37.6 AND OCCURS AT NODE 1337

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 1.36 . TIME INCREMENT COMPLETED IS 0.113 . FRACTION OF STEP IS 0.545
TOTAL ACCUMULATED TIME IS 1.93
TOTAL HEAT TIME IS 1.93

RESTART INFORMATION WRITTEN IN STEP 2 AFTER INCREMENT 15

INCREMENT NUMBER 16 ATTEMPT NUMBER 1
TIME INCREMENT = 0.113

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE -23.2 AND OCCURS AT NODE 1341

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 1.48 . TIME INCREMENT COMPLETED IS 0.113 . FRACTION OF STEP IS 0.590
TOTAL ACCUMULATED TIME IS 2.05
TOTAL HEAT TIME IS 2.05

 TRANSIENT HEAT TRANSFER ANALYSIS

DATE: 27-FEB-84
 TIME: 17 37 43
 STEP 2 INCREMENT 21
 PAGE 15

INCREMENT NUMBER 21 ATTEMPT NUMBER 1
 TIME INCREMENT = 4.798E-02

MAXIMUM ESTIMATED CHANGE IN TEMPERATURE IN NEXT ITERATION WOULD BE 0.679 AND OCCURS AT NODE 1375

CONVERGENT SOLUTION

TIME COMPLETED DURING THIS STEP 2.50 TIME INCREMENT COMPLETED IS 4.798E-02, FRACTION OF STEP IS 1.00
 TOTAL ACCUMULATED TIME IS 3.07
 TOTAL HEAT TIME IS 3.07

NODE POINT OUTPUT SET ALL

APPENDIX J

ABAQUS THERMAL STRESS ANALYSIS RESULTS

ABAQUS VERSION 4-4-72
MACH 14 FLOW RESTRICTOR
STRESS ANALYSIS ---- PRESSURE LOAD ONLY

DATE 15-MAY-84
TIME 10:37:29
PAGE 1
STEP 1 INCREMENT 1

STEP 1 STRESS ANALYSIS ---- PRESSURE LOAD ONLY

STATIC ANALYSIS

USER SPECIFIED INCREMENTS OF 1.00 FOR A TIME PERIOD OF 1.00
SMALL DISPLACEMENT THEORY WILL BE USED
MAXIMUM NUMBER OF INCREMENTS ALLOWED IN THIS STEP IS 10
MAXIMUM NUMBER OF ITERATIONS ALLOWED PER INCREMENT IS 1
PRINT OF INCREMENT NUMBER, TIME, ETC., EVERY 1 INCREMENTS

INCREMENT NUMBER 1 ATTEMPT NUMBER 1
TIME INCREMENT = 1.00

TIME COMPLETED DURING THIS STEP 1.00
TOTAL ACCUMULATED TIME IS 1.00
RESTART INFORMATION WRITTEN IN STEP 1 AFTER INCREMENT 1

FRACTION OF STEP IS 1.00

ARAGUS VERSION 4-4-72
MACH 14 FLOW RESTRICTOR
STRESS ANALYSIS --- PRESSURE AND TEMPERATURE LOAD
