19 ABSTRACT (Continue on reverse if necessary and identify by block number) The energy spectrum of a noise is known to be an important variable in determining the effects of a traumatic exposure. However, existing criteria for exposure to impulse noise do not consider the frequency spectrum of an impulse as a variable in the evaluation of the hazards to the auditory system. This report presents the results of a study that was designed to determine the relative potential that impulsive energy concentrated at different frequencies has in causing auditory system trauma. One hundred and eighteen (118) chinchilla, divided into 20 groups with 5 to 7 animals per group, were used in these experiments. Pre- and post-exposure hearing thresholds were measured at 10 test frequencies between 0.125 and 8 kHz on each animal using avoidance conditioning procedures. Quantitative histology (cochleograms) was used to determine the extent and pattern of the sensory cell damage. The noise exposure stimuli consisted of six different computer-generated narrow band tone bursts having center frequencies located at 0.260, 0.775, 1.025, 1.350, 2.450, and 3.550 kHz. Each narrow band exposure stimulus was presented at two to four different intensities. An analysis of the audiometric and histological data allowed a frequency weighting function to be derived.

19. (Cont'd)

The weighting function clearly demonstrates that equivalent amounts of impulsive energy concentrated at different frequencies is not equally hazardous to auditory function. Comparison of this weighting function with the A-weighting function showed that A-weighting overestimates the hazard from low frequency impulses. Volume 1 of the report describes the study and discusses the results. This Volume 2 contains individual threshold shifts and sensory cell loss data. It is available upon request from the SIC USAARL.

## Preface to Volume II

This report is separated into two volumes. Volume I describes the study, presents the analyzed results and discussion. This Volume, Volume II, contains threshold shifts and sensory cell loss data for individual subjects. Volume II is organized by exposure group:

Group exposed to 260 Hz center frequency at 146 dB peak SPL . . . . .	1
Group exposed to 775 Hz center frequency at 134 dB peak SPL . . . . .	.20
Group exposed to 775 Hz center frequency at 139 dB peak SPL . . . . .	.38
Group exposed to 775 Hz center frequency at 144 dB peak SPL . . . . .	.57
Group exposed to 1025 Hz center frequency at 129 dB peak SPL . . . . .	.76
Group exposed to 1025 Hz center frequency at 134 dB peak SPL . . . . .	.95
