PREFACE

This document is the fourth volume of a four volume report covering the results of a one year study contract to determine a program planning methodology for the evaluation of highway safety countermeasures. The present volume contains a bibliography of documents pertinent to the development of countermeasures in each of the sixteen Highway Safety Program Standard areas.

INTRODUCTION

This bibliography of Highway Safety Countermeasures contains approximately 1000 references, grouped according to the Highway Safety Program Standards. Within each Standard area, the references are arranged by the HSRI Library accession number. References that fall into more than one group are duplicated. Contained in this compilation are general discussions of the problems and attitudes common to the state highway safety standards, reports on current and proposed countermeasures, evaluations of pertinent methodologies, and presentations of factual data on actual programs.

Background

This bibliography was prepared as an initial step in the planning for concentrated implementation of highway safety countermeasures project for the National Highway Safety Bureau in order to establish an information base on the state of the art in highway safety countermeasure development. A broad search of the 15,000 catalogued documents in the HSRI Library was conducted first. The initial compilation was reviewed by the HSRI Project staff as background information in the Phase I program development. Each document is on file in our library, so, while some important contributions to the field may not be represented, the documents themselves were on hand and used by the staff. This literature compilation preceded the program development efforts and so may not fully reflect changes in interests resulting from these efforts.
