SECTION 1

BACKGROUND AND SUMMARY

Since 1969 the Highway Safety Research Institute (HSRI) has been under contract to the National Highway Traffic Safety Administration (NHTSA) to edit and computerize accident reports resulting from in-depth investigations conducted by multidisciplinary accident investigation (MDAI) teams sponsored by the NHTSA throughout the United States. Criteria for case investigation over the ten-year period have varied somewhat and, with the emphasis in recent years on vehicles equipped with passive restraint systems (ACRS and passive belts), the number of NHTSA cases eligible for file building has diminished.

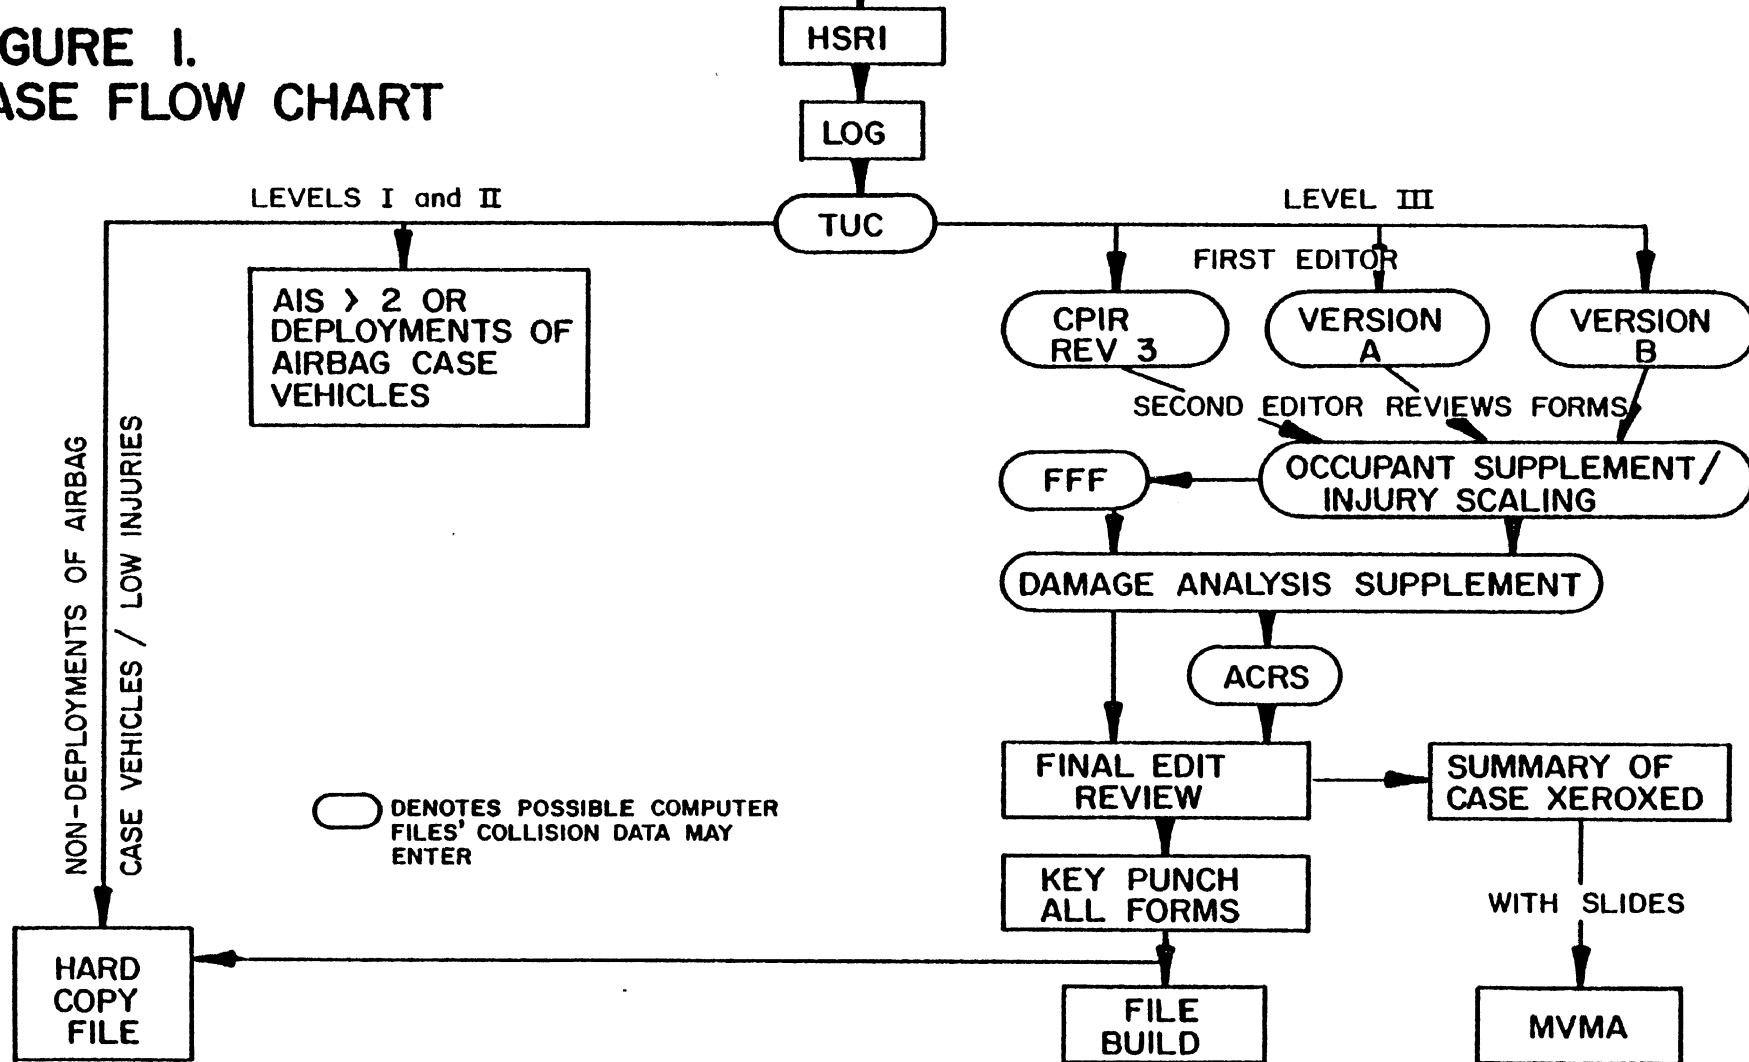

During the period covered by this report (July 1, 1977 to December 30, 1978), two hundred sixty-three new cases were received and processed. Eighty of these cases were sent to HSRI for logging and entry into the "TUC" inventory data set and HSRI's extensive library of hard-copy cases. These were Maryland cases not involving passive restraint vehicles and having few back-up materials attached. The remaining 183 collisions involved passive-restraint-equipped vehicles or school buses. Many of the 183 crashes were investigated at Level I and Level II (levels established by the NHTSA signifying various levels of back-up data available, late notification of crash occurrence, non-cooperation of driver, or non-deployments or inadvertent deployments of air-cushion restraint systems and no injuries sustained).

HSRI has logged all these cases, and has added them to the TUC inventory data set as well. All Level-III investigations have been completely processed and added to the applicable computer files. For Level II investigations, only those crashes in which the air bag deployed, or the injury sustained was greater than AIS 2, were computerized (see case flow chart, Figure 1).

In addition to the case processing and file-building tasks completed under this contract, a separate cross-index file of DOT-HS numbers by team identification number has been maintained. This file

**FIGURE I.
CASE FLOW CHART**

has proved invaluable in the retrieval of cases for anyone interested in specific cases where the analyst has only the DOT-HS number in his possession, or the team ID without the DOT-HS number. HSRI maintains, in addition, a listing of published volumes and can refer the analyst to the correct volume by number and date in which he can find this specific case summary. The DOT-HS cross-index is presented in Appendix A of the report.

SECTION 2

DATA PROCESSING ACTIVITIES

During the final phase of the contract, procedures for computerizing MDAI cases have followed the established pattern set forth in previous years. This procedure has proven to be an efficient and cost-effective method for the minimization of errors in the many data sets involved in MDAI case processing. Each MDAI case is handled separately and may appear in as many as nine separate data sets (8 of which are computerized).

For three of the data sets (CPIR Revision 3, Truck-Version B and Bus-Version A), the forms are edited by a "first editor" who reviews the lengthy narrative and slides furnished by the NHTSA to HSRI. The editor may have to transcribe data from an improper form to the acceptable CPIR version for file building (e.g., a pick-up truck improperly placed by a team on a Version B form; a motor home placed on a CPIR-Revision 3 form; or a van-type school bus belonging in the CPIR-Revision 3 file but improperly placed on a large truck form). Once the editor has completely reviewed all vehicle forms involved in the crash, the case is edited a second time by a senior editor. The accident case (with all case vehicles on proper forms) is then processed by the injury editor, who reviews injuries sustained to occupants and scales these injuries in accordance with the American Medical Association's Abbreviated Injury Scale (AIS-76).¹

Once the case has been completely edited, the slides and a copy of the summary portion are either returned to the National Highway Traffic Safety Administration, or are forwarded to the Motor Vehicle Manufacturers Association if the slides are a duplicate set.

¹The Abbreviated Injury Scale (AIS), 1976 Revision, developed by a Joint Committee of The American Medical Association, The Society of Automotive Engineers, and The American Association for Automotive Medicine, American Association for Automotive Medicine, Morton Grove, Illinois, 1976.

The detailed procedures for processing a case and a brief discussion of the nine resultant data sets created from these cases are described below for each different report form utilized.

2.1 Case Logging

As shipments of cases arrive at HSRI, each case is entered into a log book. This record documents the following basic information: date of receipt, investigating team, type of case (bus, truck, CPIR, air bag), and level of investigation. This information is used on a monthly basis to tabulate current program status. (See Table 1.)

2.2 Traffic Unit Compendium (TUC) Data Set

While the TUC data set was originally conceived as an inventory file for internal (HSRI) use, the fact that nearly 100 variables were recorded made it tempting for analysts to access this data set when searching for specific information. As this practice became more and

more prevalent, it was jointly agreed by the NHTSA and HSRI to reduce the number of variables to only those needed for inventory purposes. Analytic uses of the larger TUC data set could easily misdirect a user since cases are entered prior to editing and gross errors can occur (number of occupants, number of vehicles, highest AIS, number of fatalities, make-model code, etc.).

Case vehicles for each crash are added to the TUC inventory file. At this point the editor determines which of the additional data sets should contain information for this case vehicle. The accident (or crash) is handled as a unit but, depending upon the types of case vehicles in this crash, information may be entered into several data sets. It is not rare to have an investigating team use an incorrect file-build-form for a vehicle and it is the editor's responsibility to transcribe this data to the proper form.

The TUC data set currently consists of 13,157 vehicles. Copies of the most recent TUC code book are available from HSRI.

2.3 CPIR-Revision 3 and CPIR Supplement

All case vehicles designated as CPIR vehicles are entered into the Revision 3 data sets. CPIR vehicles are currently passenger cars, pick-up trucks, vans, and four-wheel drive vehicles having a GVW of less than 10,000 lbs. The scope of editing procedures remained unchanged during the contract and follows editing protocols set forth in Volume I of the 1976 Editing Manual.² Case editing continued to be performed by specialists with an average of 3.5 years of editing experience.

The CPIR file currently contains 9,222 case vehicles involving 15,683 occupants. A breakdown of NHTSA-sponsored crashes processed

²Multidisciplinary Accident Investigation Data File Editing Manual and Reference Information, Vol. I, 1976 Reference Information, Contract Number DOT-HS-5-01134, NHTSA, Washington, D.C., March, 1976.

from 1969 to the present for each investigating team is shown in Table 2. Two new teams have been added under the current contract—Dynamic Sciences and the NHTSA AID "GO" Team.

2.4 CPIR-Version B (Large Truck)

The large-truck file contains vehicles with a GVW rating of over 10,000 lbs. and currently consists of 390 vehicles. Vehicle types represented are: 3 motor homes, 1 van delivery, 16 van delivery walk-ins, 149 straight trucks, and 221 truck-tractors.

A listing of case vehicles found in the Large-Truck file and investigated by MDAI teams can be found in Table 3.

2.5 CPIR-Version A (Bus File)

As a part of this last year's effort, new data sets have been developed to permit computerization of school buses reported on the CPIR Version-A Bus form. Editing and data processing of the school-bus reports is discussed in detail in Section 3.

2.6 Occupant Supplement File

Currently, this file contains information on 7,594 occupants. These occupants are found only in CPIR-Revision 3 case vehicles.

Occupants of Version-A and Version-B vehicles do not appear here, nor do motorcycle occupants or pedestrians.

2.7 Fatal Factors Form (FFF) Data Set

When the injury editor is reviewing the case for injuries sustained in this collision and a fatality is found, the Fatal Factors Form (FFF) is filled out as well. There have been 1095 crashes added to the FFF data set to date. The final report of March, 1977, on Contract DOT-HS-6-01303 describes this Fatal Factors Data Set in some detail. All case vehicles involved in a crash appear under one case ID in this file. Work under the last modification to the contract added 91 cases to the 1004 fatal crashes previously recorded.

In addition, because the first 141 cases completed by NHTSA/AID staff personnel and the subsequent 192 coded at HSRI were completed before the 1976 AIS revision was published, it was necessary to redo the injury scaling on these first 333 cases. (A suggested revision was available earlier, but there were fairly significant changes made in the final version.)

One of the significant results of this program is that a major project has been completed utilizing the AIS-76 Injury Scaling revision. One specific intent of the AAAM-AMA committee recommending revision was to separate the issues of injury severity and patient mortality. The completed data reflect this more accurate description of overall injury severity.

A listing of the 1095 crashes found in the FFF is presented in Appendix B of the report.

2.8 Damage Analysis Supplement (DAS) Data Set

The editor with expertise in Damage Analysis reviews the crash kinematics and carefully evaluates the assigned Collision Deformation Classification (CDC). The original CDC assigned by the investigating team is corrected only when gross errors have occurred (such as a right side designated when left is intended). The DAS data set

attempts to portray a more complete view of damage incurred by case vehicles than that found in the CPIR Revision 3 data sets. The file identifies the vehicle by investigating team, report sequence number, and case vehicle number, and allows for a direct comparison of concurrent damage between "case vehicle" and associated "other vehicle." The Collision Deformation Classification (CDC), inches of crush, configuration, crash event number, and impact speed for the primary and secondary deformation of the case vehicle, along with corresponding CDC, crush, and speed for the "other vehicle," are recorded. Associated with each CDC for the case vehicle is a CDC sequence number. The sequence number denotes which accident event produced that particular CDC.

The "Sequence of Crash Events" in the DAS file (variable 2108 to 2119) describes the chronological sequence of the crash, beginning with the first damage- or injury-producing event and the object contacted in that event.

Side-door beams are addressed in this supplement. Variables describe whether or not the vehicle was equipped with door beams, whether the door was damaged, the inches of crush the damage produced, and the involvement of the door beam.

2.9 Air Cushion Restraint System File (ACRS)

ACRS supplements are sometimes completed by investigating teams. More often they are not. The CDC editor (Damage Analysis Supplement) reviews this form for accuracy and completeness, if presented, or completes the form if none has been supplied by the team. Only case vehicles equipped with air bags are entered into this data set, which currently records 105 air-bag case vehicles.

Information documented in the ACRS file (649 vehicle variables and 942 occupant variables) addresses such issues as air-bag performance and occupant injuries sustained through contact with passive-restraint components.

SECTION 3

THE CPIR VERSION-A BUS DATA SETS

For a number of years, MDAI and other in-depth accident investigation teams in the United States and Canada have been recording crash details for buses involved in motor vehicle accidents on the CPIR Version-A bus form. Since these accident reports have not been computerized, however, the data have been largely ignored and underutilized.

Buses, like other vehicles of public conveyance, are (or should be) safer than private vehicles because of the possibility of injury to a significant number of people. This is particularly true of school buses which are used to carry a segment of our population that is both captive and of immediate concern to everyone.

To make the detailed crash information gathered by the investigative teams available to vehicle designers and other interested analysts, HSRI has developed editing protocols and computer processing techniques for the production of school-bus crash data sets derived from the CPIR Version-A forms. Subsequent sections will discuss the case editing procedures and computer-processing techniques used to generate the data sets, as well as a brief critique of the resulting data.

3.1 Editing Procedures

Prior to editing, it was necessary to identify school-bus crashes investigated by MDAI teams. Initially, the Traffic Unit Compendium (TUC) file was searched for buses. This data set documented all bus cases received at HSRI after 1974.

Because MDAI teams began investigating crashes in 1969, and because crashes prior to 1975 were not listed in the TUC file, it was necessary to search the CPIR Revision 3 file and the Truck Version-B file for buses as "objects contacted," or as "other vehicles."

Once all crashes involving buses were identified, hard copies were located to determine if the bus was a school bus and a case

vehicle. Sixty-two reports involving sixty-three school buses were then prepared for editing and computerization.

Form Version A was completed for each of the sixty-three case vehicles. Many of the vehicles had been incorrectly placed on the Large Truck Version B Form or the CPIR Form, and these had to be transcribed to a Version A Form. Most cases did not have occupant pages completed for each occupant of the bus, and these pages had to be completed as well.

Narratives were carefully read for each crash and a second editor reviewed the coding assigned by the first editor. Injury severity codes were assigned for each occupant in accordance with the AIS 76 Injury Scaling Procedures.

Several variables contained in the initial Version-A Bus Form were expanded by HSRI to encompass a wider selection of responses. Basically, the Form was left as originally written. A copy of the Version-A Form can be found in Appendix C, where variable numbers are assigned to each coded response. Editing followed the same standard practices set forth in the MDAI Accident Investigation Data File Editing Manual, Vol. I, 1976.

Following is a listing of corrected or expanded responses for specific variables:

V15	(00) Dry changed to (01) Dry
V19	(1) 5-10MPH to 5-25MPH
V65	Added by HSRI to allow vehicle link-up with other case vehicle, if one exists
V74	Passenger capacity includes bus driver
V78	Coded as Vehicle Occupancy rather than original intent regarding loading weight because no references were available on bus load weights
V131-V136	Addresses contacts outside the bus only
V192-V231	Body-frame displacement expanded to include additional responses
V234-V237	Should read RIGHT doors instead of LEFT
V336-V338	Back frame and back rest heights redefined
V383	Added by HSRI to specify original Team Case Identification

V1001	Specific three-digit number differentiates between occupants of the bus and pedestrians or discharged passengers
V1003	Clarified (prior two-digit number could not adequately respond to unknowns)
V1005	Expanded to clarify unknown responses
V1010	Eliminates the words "LAP BELT" and animals as a response
V1027	Eliminates all (07) to (10) codes to comply with AIS 76 coding scheme

Occupant injury cards have been changed to denote occupant number by a three-digit code to agree with occupant number at V1001.

In addition, a "not applicable" response is offered for each variable V138 through V382 to allow for "Alert Instructions" at the bottom of page 8.

In addition to this initial file build of sixty-two school-bus crashes, HSRI has since received or identified approximately twenty more crashes involving school buses. It is HSRI's intent to continue editing these crashes as they arrive, and to maintain this data set in a timely manner. The MDAI teams sponsored by the NHTSA continue to investigate these crashes as an ongoing task of the air-cushion restraint teams' work statement, and it would seem advisable to forward these cases to HSRI for inclusion into this data set, which should be of interest to all.

3.2 Computer Processing

After the bus reports are edited, they are keypunched in strict adherence to the card format defined by the printed CPIR Version A. The resulting deck of punched cards is subsequently read into a computer file for processing by an HSRI-developed reformatting program.

In concept, the reformatting program was designed to provide a simple translation of card image records to final occupant format, fixed-length records with a minimal amount of error checking and derivation of new variables. For this reason, numeric variables are only checked to ascertain that the punched card images do, in fact, contain numeric characters. Because of the low volume of case reports to be

processed at any particular file update, the existence of invalid, or "wild" codes, is detected by a manual check of the reformatted data. Inter-variable consistency is adequately verified by the editing process.

Derived variables (i.e., variables not in the CPIR Version-A form, but derived from such information) are utilized in only three sections: (1) expansion of the CDC, (2) collapse of the card 11 seating information, (3) reformatting of the extensive injury detail matrix. Each category of derived variables will be discussed separately below.

As recorded in the Version A form, Collision Damage Classification's (or CDC's) are a seven-digit alphanumeric field. In addition to preserving the entire seven-digit field in the output as an alphabetic variable, the following numeric variables are derived for each CDC:

- 1) The Impact Force Clock (first two digits)
- 2) A numeric recode of "General Area Damaged" (third digit)
- 3) A numeric recode of "Horizontal Area Damaged" (digit three and four)
- 4) A numeric recode of "Vertical Area Damaged" (digit five)
- 5) A numeric recode of "Damage Type" (digit six)
- 6) The Damage Extent code (digit seven)

A huge amount of detail concerning vehicle seat occupancy and seat damage is recorded on card number 11 in the Version-A form. Rather than preserve all this information in the output data set, a total of 18 summary variables were derived from the card 11 information (variable 343 to 360). These variables are documented in the annotated data form presented in Appendix C.

Similarly, the occupant injury detail page (cards 15 to 49) contains too much information to be of practical use to the analyst. As with the seat information, therefore, a number of summary variables have been created.

Variable 1029, "Body Regions Injured," is a count of the number of body regions that were injured for each occupant.

Variable 1030, "Ten Distinct Contacts," is a ten-response variable that records the first ten distinct areas contacted by the occupant. The contacts are recorded by order of body region as indicated on page 31 (occupant injury page, see Appendix C). If more than ten distinct contacts occur, only the first ten are recorded.

Variables 1031-1042 record the number of each type of injury sustained by the occupant. Injury type is defined on page 31 of the Version A Form (abrasion, bruise, etc.). Injury severity is not recorded for these injuries—only the number of injuries of each type.

Variables 1043-1051 record a number of pertinent items of information for the Primary, Secondary, and Tertiary AIS sustained by the occupant. For the Primary AIS, for example, the highest AIS level sustained by the occupant is recorded in Variable 1043, the body region receiving the injury is recorded in Variable 1044, and the four areas of contact are recorded in Variable 1045.

Since the number of derived variables was purposely kept at a minimum, there are few vehicle-level summary variables. For instance, a vehicle-level variable giving the worst injury in the vehicle would be useful in analysis. Hopefully, such derived variables can be added to the data sets in the future.

3.3 Data Overview

The 63 school-bus case vehicles included in the first file build involved the efforts of 21 MDAI teams in the United States and Canada. A total of 28 of the vehicles were investigated by teams funded by Transport Canada.

The 63 vehicles involved a total of 1,835 occupants for an average occupancy rate of 29 persons per vehicle, although the maximum number of occupants in a single vehicle was 64. Occupants ranged in age from a minimum of two years old to a maximum of 67, with an average age slightly under 14.

Considering injuries, a total of 56 or 3% of the occupants were killed. On the other hand, a total of 20 received untreatable (AIS=6) injuries, while another 821 received injuries from AIS=1 to AIS=5. Two occupants received some injury to 14 body regions.

Some questions on the Version-A Form have little applicability to school buses but would, of course, be pertinent to other bus types. For example, none of the school buses had mid- or rear-side doors. In general, however, the quality of the data appears to be good. More detailed expositions of the data will be released in future reports.

SECTION 4

CONCLUSIONS AND RECOMMENDATIONS

While the rate of case investigations conducted by MDAI will continue to remain low, processing of these cases should continue in order to allow analysis of performance of current model year vehicles. No other such in-depth data are available and it seems inadvisable to continue sponsoring in-depth teams, thereby creating crash data on current-model vehicles, and not to computerize the data collected by these experts.

The cost of maintaining data banks is relatively low when compared to the cost of in-depth investigation, and without this valuable new information, current users can make no comparisons nor form any conclusions regarding performance factors of current automobiles.

Several of the files currently maintained can be dropped to lower the cost of case editing if future case processing is considered. However, basic files such as CPIR-Revision 3, Version B and Version A, should continue. The passenger car, large truck, and school-bus files should prove extremely useful to analysts, the NHTSA, and the automotive industry as long as in-depth investigations are continued.

The dropping of supplementary files such as Damage Analysis (DAS), Occupant Supplement (OS), FFF, and air bag (ACRS) would cut costs considerably and still provide computerized documentation of all vehicles investigated.

HSRI has recently created a replacement to the CPIR-Revision 3 which it feels is superior in format and content and includes expanded variables in areas such as intrusion and fire. This new format will be used for crash investigations sponsored by the MVMA and has been discussed with the Canadian Ministry of Transport.

COLLISION PERFORMANCE AND INJURY REPORT

THIS FORM WAS DEVELOPED BY GENERAL MOTORS TO PROMOTE WIDESPREAD INTERCHANGE OF STANDARDIZED, COMPREHENSIVE FIELD DATA AMONG PROFESSIONAL RESEARCH PEOPLE ENGAGED IN ACCIDENT INVESTIGATION AND IS DESIGNED TO BE USED IN CONJUNCTION WITH DIGITAL COMPUTERS. COMPANION FORMS FOR RECORDING CAR AND TRUCK COLLISION DATA ARE ALSO AVAILABLE. PROFESSIONAL ACCIDENT RESEARCHERS CAN OBTAIN MORE INFORMATION ON THIS ACCIDENT INVESTIGATION SYSTEM BY WRITING TO:

SAFETY RESEARCH & DEVELOPMENT LABORATORY
GM-ADAP
GENERAL MOTORS PROVING GROUND
MILFORD, MICHIGAN 48042

GENERAL INSTRUCTIONS

THE FIELD INVESTIGATOR SHOULD:

MAKE A COMPLETE PHOTOGRAPHIC DESCRIPTION OF THE VEHICLE. (SEE PAGE 36 FOR INSTRUCTIONS.)
SEE PAGE 27 FOR OCCUPANT INFORMATION SECTION INSTRUCTIONS.
THERE ARE EIGHT BASIC TYPES OF QUESTIONS THAT YOU WILL BE ASKED. READ THE FOLLOWING EXAMPLES, BASED ON A FICTITIOUS ACCIDENT, ILLUSTRATING HOW THESE QUESTIONS SHOULD BE ANSWERED.

ACCIDENT: *A forward control school bus containing 25 passengers and 1 driver was involved in an accident on a dirt country road in Arizona. The 2 service doors (forward and mid) did not jam and were used to discharge the occupants. The left interior sidewall was damaged as a result of the collision but was not contacted by any occupant.*

EXAMPLES:

- A.** ENTER THE NAME OF THE STATE (ARIZONA) IN THE BLANK. ENTER NOTHING IN THE ADJACENT "PUNCH CODE" COLUMN BECAUSE ALL GREY AREAS WILL BE FILLED IN BY THE ANALYSIS GROUP.
- B.** THE WORD "AREA" IS AN IMPLIED MULTIPLE CHOICE "QUESTION". SINCE THE ANSWER "(2) RURAL" BEST DESCRIBES THE AREA, ENTER A "2" ON THE BLANK IN THE "PUNCH CODE" COLUMN. A "2" WILL LATER BE PUNCHED IN COLUMN 20 OF A COMPUTER CARD IN RESPONSE TO YOUR ANSWER.
- C.** THE CORRECT ANSWER FOR THE EXAMPLE SHOWN IS NOT IN THE LIST, SO WRITE THE WORD "DIRT" IN THE BLANK AFTER "(4) OTHER: _____". ALSO ENTER "4" IN THE "PUNCH CODE" COLUMN BECAUSE THE COLUMN IS NOT SHADED GREY THIS TIME.
- D.** THIS TYPE OF QUESTION IS WRITTEN IN A WAY THAT WILL SAVE YOU TIME. THE QUESTIONS AND ANSWERS ARE GROUPED TOGETHER AT THE HEADS OF THE THREE ANSWER COLUMNS, (THE QUESTION COULD HAVE BEEN WRITTEN, "WAS THERE A FORWARD SIDE SERVICE DOOR AND WAS IT UNDAMAGED SO IT COULD BE USED FOR EGRESS AND WAS IT ACTUALLY USED?) THE POSSIBLE ANSWERS "(1,2,0)" ARE SHOWN UNDER THE QUESTION "EQUIPPED." THE CODE KEY FOR (1,2,0) IS GIVEN AT THE BOTTOM OF THE PAGE. SINCE 1 MEANS "YES", ENTER "1" IN THE ANSWER BLANK BECAUSE ACCORDING TO OUR ACCIDENT EXAMPLE THE BUS WAS SO EQUIPPED.
- E.** EXAMPLE E ASKS IF THE REAR SIDE SERVICE WAS AVAILABLE FOR EGRESS. THE CODE KEY FOR (1,2,3) IS ALSO GIVEN AT THE BOTTOM OF THE PAGE. SINCE THIS BUS WAS NOT EQUIPPED WITH A REAR SERVICE DOOR (DON'T CONFUSE WITH EMERGENCY EXITS), THE ANSWER "3" IS CHOSEN TO INDICATE THAT THE QUESTION IS "NOT APPLICABLE."
- F, G.** THESE EXAMPLES PERTAIN TO THE LEFT SIDE INTERIOR. EXAMPLE F ASKS IF THE LEFT INTERIOR SIDE WALL WAS DAMAGED. SINCE THE WALL WAS DEFORMED, MARK THE BLANK IN THE "DAMAGED" COLUMN WITH A "1". EXAMPLE G ASKS IF THE SIDE WALL WAS CONTACTED BY AN OCCUPANT. SINCE THERE WAS APPARENTLY NO OCCUPANT CONTACT, ENTER "2" IN THE OCCUPANT CONTACT COLUMN. ("CONTACT" IMPLIES PROBABLE CONTACT.)
- H.** EXAMPLE H OFFERS NO MULTIPLE CHOICES. SO ENTER THE ACTUAL ANSWER IN THE BLANK. SINCE THERE WERE 26 OCCUPANTS, ENTER "26" IN THE BLANK. NOTICE THAT THE ANSWER IS TO BE ENTERED AS FAR TO THE RIGHT AS POSSIBLE AND THE LEADING BLANK SHOULD BE FILLED WITH A ZERO, IF APPLICABLE.

FIELD INVESTIGATOR INSTRUCTIONS:

1. INDICATE CRUSHED AREAS CAUSED BY THE COLLISION, BY OUTLINING NEW PERIMETER OF VEHICLE AND SHADING THE DAMAGED AREAS ON THE SKETCH BELOW. USE AS MANY SKETCHES AS NECESSARY TO COMPLETELY DESCRIBE THE DAMAGE.
2. ENTER THE DIMENSIONS ON THE SKETCH(ES) MEASURED TO THE POINT OF MAXIMUM PENETRATION BY THE OBJECT(S) CONTACTED. USE THE EXAMPLES ON THE FACING PAGE AS A GUIDE.
3. ENTER THE THREE DIMENSIONS TO THE CENTER OF THE WHEELS (WHEELBASE, FRONT AND REAR OVERHANGS) ON BOTH SIDES OF THE BUS.
4. ADD OTHER DIMENSIONS AS NECESSARY TO COMPLETELY DESCRIBE THE DAMAGE.
5. DESCRIBE AND LOCATE DAMAGE CAUSED BY ANYTHING OTHER THAN THE COLLISION AND NOTE CAUSE (E.G. PRE-COLLISION DAMAGE, TOWING DAMAGE, DAMAGE DUE TO EXTRICATION, ETC.).

SOURCE OF INFORMATION _____

VARIABLES DERIVED FROM THE OCCUPANT INJURY DETAIL

- 1) Variable 1029: BODY REGIONS INJURED
The number of body regions for which an occupant injury report card was filled out.
- 2) Variable 1030: TEN DISTINCT CONTACTS
The first ten distinct contact codes from columns 15-22 but not including the value "99."
- 3) Variables 1031 - 1042: NUMBER OF ...
The number of recorded concussions, lacerations, etc., recorded for all body regions irrespective of injury level.
- 4) Variable 1043: PRIMARY AIS
The highest AIS value recorded in "Overall Injury to Region" or the first recorded maximum value.
- 5) Variable 1044: PRI BODY REGION INJURED
The specific body region that sustained the primary AIS.
- 6) Variable 1045: PRI AREAS OF CONTACT
The four possible areas of contact for the primary AIS.
- 7) Variables 1046 - 1048
Same as Variables 1043 - 1045 for the Secondary AIS.
- 8) Variables 1049 - 1051
Same as Variables 1043 - 1045 for the Tertiary AIS.

COLOR PHOTOGRAPHS TO BE TAKEN OF CASE VEHICLE BY FIELD INVESTIGATOR

PHOTO RECORDS ARE ESSENTIAL BECAUSE IF DATA INTEREST SHIFTS TO OTHER AREAS NOT LISTED ON THE FORM. PHOTO INTERPRETATION CAN UPDATE THE REPORT. THEY ALSO VERIFY THE REPORTED DATA. IT IS RECOMMENDED THAT YOU USE AT LEAST ONE 20-EXPOSURE ROLL OF COLOR FILM (SLIDES PREFERRED) ON THE VEHICLE.

- FOR A COMPLETE PHOTOGRAPHIC RECORD OF THE CASE VEHICLE, IT IS RECOMMENDED THAT DESCRIPTIVE PHOTOGRAPHS OF THE INSIDE AND OUTSIDE OF THE VEHICLE BE TAKEN FROM THE CAMERA POSITIONS SHOWN AND EXPLAINED BELOW:

- TAKE THE 8 OVERALL EXTERIOR PHOTOS AS INDICATED ABOVE AS A MINIMUM. ALL VIEWS SHOULD SHOW THE ENTIRE VEHICLE, AS SEEN FROM EACH POSITION. CLOSE-UPS OF SPECIFIC DAMAGE AREAS SHOULD ALSO BE TAKEN ON AN INDIVIDUAL BASIS.
- INTERIOR PHOTOS SERVE TO DOCUMENT THE BUS FURNISHINGS WHICH ARE OPTIONAL IN MOST BUSES. IT IS THEREFORE ESSENTIAL TO OBTAIN A MINIMUM NUMBER OF PHOTOS EVEN THOUGH THE INTERIOR IS UNDAMAGED. OCCASIONALLY, SEVERAL VIEWS FROM DIFFERENT ANGLES ARE HELPFUL TO ILLUSTRATE DAMAGED AREAS OF INTEREST, DUE TO THE TWO DIMENSIONAL LIMITATIONS OF MOST PHOTOGRAPHS. THE FOLLOWING GUIDE IS RECOMMENDED:

<ul style="list-style-type: none"> • INTERIOR SURFACES <li style="padding-left: 20px;">SIDES <li style="padding-left: 20px;">ENDS <li style="padding-left: 20px;">ROOF <li style="padding-left: 20px;">FLOOR <li style="padding-left: 20px;">LUGGAGE RACKS • DRIVER AREA & CONTROLS 	<ul style="list-style-type: none"> • SEATS <li style="padding-left: 20px;">TYPE <li style="padding-left: 20px;">DAMAGE <li style="padding-left: 20px;">OCCUPANT <li style="padding-left: 20px;">CONTACT SITES • GLASS DAMAGE 	<ul style="list-style-type: none"> • ALL OCCUPANT CONTACT SITES • LOOSE CARRY-ON ITEMS (LUGGAGE, BOOKS, ETC.) • FULL-LENGTH VIEW FROM EACH END
--	--	---
- EXTRA PHOTOS SHOULD BE TAKEN OF EACH DAMAGED AREA AND ALL OCCUPANT CONTACT AREAS AT ANGLES DIFFERENT FROM THOSE IN THE ABOVE PHOTOS.
- IF THE VEHICLE WAS IMPACTED NEAR THE FUEL TANK, PHOTOGRAPH THE TANK WHETHER DAMAGED OR NOT.
- PHOTOGRAPHIC COVERAGE OF OTHER ITEMS YOU CONSIDER IMPORTANT OR INTERESTING IS ENCOURAGED

AMERICAN MEDICAL ASSOCIATION *
Abbreviated Injury Scale

SEVERITY CODE	SEVERITY CATEGORY/INJURY DESCRIPTION	POLICE CODE
0 (Zero)	NO INJURY	0 or D
1	MINOR	C
	<p>GENERAL</p> <ul style="list-style-type: none"> --Aches all over. --Minor lacerations, contusions, and abrasions (first aid--simple closure). --All 1st or small 2nd or small 3rd burns. <p>HEAD AND NECK</p> <ul style="list-style-type: none"> --Cerebral injury with headache; dizziness; no loss of consciousness. --"Whiplash" complaint with no anatomical or radiological evidence. --Abrasions and contusions of ocular apparatus (lids, conjunctiva, cornea, uveal injuries); vitreous or retinal hemorrhage. --Fracture and/or dislocations of teeth. <p>CHEST</p> <ul style="list-style-type: none"> --Muscle ache or chest wall stiffness. <p>ABDOMINAL</p> <ul style="list-style-type: none"> --Muscle ache; seat belt abrasion; etc. <p>EXTREMITIES</p> <ul style="list-style-type: none"> --Minor sprains and fractures and/or dislocation of digits. 	
2	MODERATE	B
	<p>GENERAL</p> <ul style="list-style-type: none"> --Extensive contusions; abrasions; large lacerations; avulsions (less than 3" wide). --10-20% body surface 2nd or 3rd burns. <p>HEAD AND NECK</p> <ul style="list-style-type: none"> --Cerebral injury with or without skull fracture, less than 15 minutes unconsciousness; no post-traumatic amnesia. --Undisplaced skull or facial bone fractures or compound fracture of nose. --Lacerations of the eye and appendages; retinal detachment. --Disfiguring lacerations. --"Whiplash" - severe complaints with anatomical or radiological evidence. <p>CHEST</p> <ul style="list-style-type: none"> --Simple rib or sternal fractures. --Major contusions of chest wall without hemothorax or pneumothorax or respiratory embarrassment. <p>ABDOMINAL</p> <ul style="list-style-type: none"> --Major contusion of abdominal wall. <p>EXTREMITIES AND/OR PELVIC GIRDLE</p> <ul style="list-style-type: none"> --Compound fractures of digits. --Undisplaced long bone or pelvic fractures. --Major sprains of major joints.
