### PART ONE. OVERVIEW OF THE REGION'S ECONOMY

INTRODUCTION .....	3
<i>Chapter</i>	
I. THE INTERNATIONAL ECONOMIC SITUATION .....	4
A. Growth of output .....	4
B. Trade, payments and finance .....	4
C. Prospects for 1987 .....	5
II. OVERALL TRENDS IN DEVELOPING AFRICA .....	7
A. An update on 1985 recovery .....	7
B. The situation in 1986 .....	8
C. Policy issues and the structural adjustment problem .....	10
D. Outlook for 1987 .....	12
III. THE EXTERNAL SECTOR .....	15
A. Total exports and imports of merchandise .....	15
B. Commodity structure of trade .....	16
C. Trade prices .....	17
D. Direction of trade .....	18
E. The balance of payments .....	19
F. Exchange rates .....	19
G. External resource flows .....	20
IV. FISCAL, MONETARY AND PRICE DEVELOPMENTS .....	22
A. Fiscal developments .....	22
B. Monetary developments .....	24
C. Price developments .....	25

### PART TWO. PRODUCTION OF GOODS

V. DEVELOPMENTS IN AGRICULTURE, FISHING AND FORESTRY .....	29
A. Agriculture .....	29
B. Fishing .....	34
C. Forestry .....	35
D. External trade .....	35
E. Agricultural policies .....	36
VI. DEVELOPMENTS IN THE MANUFACTURING INDUSTRY .....	39
A. Introduction .....	39
B. Growth of the manufacturing industry, 1980-1986 .....	39
C. Sectoral share in gross domestic product .....	40
D. Industrial branch structure .....	41
E. Investment .....	44
F. Employment .....	45
G. External trade .....	45
H. Industrial policies .....	45
I. Prospects for 1987 .....	46

<i>Chapter</i>	<i>Page</i>
VII. ENERGY AND MINING DEVELOPMENTS .....	47
A. Introduction .....	47
B. Energy exploration and consumption trends .....	47
C. Electricity generation .....	48
D. Mining in the context of developing Africa .....	48
E. The mining scene in 1985-1986 .....	49
F. Review of selected non-fuel minerals .....	52
G. Prospects for 1987 and beyond .....	54

### PART THREE. OTHER ACTIVITIES

VIII. TRANSPORT AND COMMUNICATIONS .....	57
A. Introduction .....	57
B. Transport traffic flows .....	57
C. Communications services .....	62
D. Transport problems .....	63
E. The United Nations Transport and Communications Decade in Africa, 1978-1988 .....	64
IX. THE SOCIAL SECTOR: SELECTED ISSUES .....	66
A. Introduction .....	66
B. Development of human resources .....	66
C. Protection and management of the environment .....	72
STATISTICAL ANNEX .....	75

### LIST OF TABLES

	<i>Page</i>
I.1 Growth of the world economy, 1985-1987 .....	5
II.1 Frequency distribution of the region's countries according to GDP growth rate, 1984-1987 .....	7
II.2 GDP share and growth rate in developing Africa by subregion and economic grouping, 1985-1987 .....	13
II.3 Supply and demand in developing Africa, 1985-1987 .....	13
III.1 Merchandise trade of developing Africa, 1985-1987 .....	15
III.2 Exports by selected African countries, 1984-1986 .....	15
III.3 Imports by selected African countries, 1984-1986 .....	16
III.4 Exports and imports of developing Africa by commodity class, 1983-1984 .....	16
III.5 Wholesale price indexes for selected commodities, 1984-1986 .....	17
III.6 Direction of developing Africa's trade, 1985 .....	18
III.7 Structure of intra-African trade, 1984 .....	18
III.8 Balance of payments of developing Africa, 1985-1987 .....	19
III.9 Net resource flows to sub-Saharan Africa .....	20
IV.1 Major fiscal indicators in developing Africa, 1984-1986 .....	23
IV.2 Frequency distribution of selected countries according to growth rates of government expenditures, 1985-1986 .....	23
IV.3 Weighted average growth rates of monetary indicators in selected African countries, 1984-1985 .....	24
IV.4 Frequency distribution of selected countries according to growth rates of money supply (M1), 1980-1985 .....	25
IV.5 Evolution of consumer prices, 1982-1985 .....	25
IV.6 Frequency distribution of selected countries according to the rate of increase in consumer prices, 1982-1985 .....	25
V.1 Growth rates of agricultural production, by subregion .....	29
V.2 Production of food items in developing Africa, 1985-1986 .....	29
V.3 Production of raw cocoa in developing Africa, 1983/1984-1986/1987 .....	30

	<i>Page</i>
V.4 Cotton production, exports and consumption: selected countries, 1984/1985-1986/1987 .....	31
V.5 Coffee production, 1983-1986 .....	32
V.6 Cereal imports by developing Africa, 1984/1985-1986/1987 .....	36
VI.1 Value added by manufacturing industry, by subregion and economic grouping, 1980-1986 .....	39
VI.2 Frequency distribution of African developing countries according to manufacturing sector and GDP growth rates, 1980-1985 .....	40
VI.3 Developing Africa: share of manufacturing industry in GDP and value added per capita 1980-1985 .....	41
VI.4 Ranking of major manufacturing countries in developing Africa, 1965 and 1985 .....	41
VI.5 Value added in manufacturing sector and in consumer-goods production: 25 selected African countries, 1985 .....	42
VI.6 Value added in capital- and intermediate-goods production: 25 selected African countries, 1985 .....	42
VI.7 Relative shares of industry branches in value of gross output and value added in manufacture, 1985 .....	43
VI.8 Investment in manufacturing industry in selected African developing countries .....	44
VI.9 Trade of developing Africa in manufactured goods, 1981 and 1985 .....	46
VII.1 Oil and gas exploratory drilling in developing Africa, 1982-1984 .....	47
VII.2 Energy consumption in developing Africa, 1981 and 1984 .....	47
VII.3 Electricity production in selected African countries, 1981-1985 .....	48
VII.4 Oil production in developing Africa, 1982-1986 .....	49
VII.5 Mine production in developing Africa, 1981-1985 .....	50
VII.6 Mineral fuel prices, 1982-1986 .....	51
VII.7 Non-fuel mineral prices, 1982-1986 .....	51
VIII.1 Value added in transport and communication services, by subregion and economic grouping, 1980 and 1985 .....	58
VIII.2 Road networks in selected African countries .....	58
VIII.3 Motor vehicles in use in developing Africa, by subregion, 1960-1985 .....	59
VIII.4 International sea-borne shipping in selected countries, 1980-1985 .....	59
VIII.5 Freight and passenger traffic carried by railways in developing Africa, 1960-1985 .....	61
VIII.6 Pipeline transport, 1980-1985 .....	62
VIII.7 Number of telephones in use, by subregion, 1979-1985 .....	62
VIII.8 Radio and television broadcasting services in developing Africa, 1984-1985 ..	63
VIII.9 Implementation of the UNTACDA phase II programme: status at 31 July 1986 .....	65
IX.1 Major demographic indicators, by subregion, 1980-1985 .....	66
IX.2 Annual rates of growth of the economically active population, by sex and subregion, 1970-1990 .....	68
IX.3 Economically active population of developing Africa, 1985 .....	68
IX.4 Labour force distribution, by sector and subregion, 1960-1985 .....	68
IX.5 Employment in selected African countries, 1979-1984 .....	69
IX.6 School enrolment at various levels of education, 1970-1986 .....	70
IX.7 Public expenditure on education in developing Africa, 1965-1985 .....	70

### Explanatory notes

The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the secretariat of the United Nations Economic Commission for Africa concerning the legal status of any country, territory or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. Symbols which are preceded by the designation E/ECA/... indicate that the documents are issued under the auspices of the Economic Commission for Africa.

The following symbols have been used in the tables throughout the survey. Two dots (..) indicate that data are not available or are not separately reported. A dash (-) indicates that the amount is nil or negligible. A hyphen (-) indicates that the item is not applicable.

A hyphen (-) is used between dates representing years, e.g. 1983-1986, to signify the full period involved, including the beginning and end years, and a stroke (/) indicates a crop year, fiscal year or plan year, e.g. 1985/1986.

The term "billion" signifies a thousand million.

References to "tons" indicate metric tons, and to "dollars" (\$) United States dollars, unless otherwise stated.

## ABBREVIATIONS

The following abbreviations of organizations and subsidiary body are used in this survey:

CFA	African Financial Community
DAC	Development Assistance Committee (of DECD)
DIESA	Department of International Economic and Social Affairs (of the United Nations)
ECA	Economic Commission for Africa
EEC	European Economic Community
FAO	Food and Agriculture Organization of the United Nations
ICO	International Coffee Organization
IDA	International Development Association, an affiliate of the World Bank
IMF	International Monetary Fund
OAU	Organization of African Unity
OECD	Organisation for Economic Co-operation and Development
OPEC	Organization of Petroleum Exporting Countries
PTA	Preferential Trade Area for Eastern and Southern African States
SADCC	South African Development Co-ordination Conference
UAR	Union of African Railways
UNCTAD	United Nations Conference on Trade and Development

Besides the common abbreviations, symbols and terms, the following have been used in this Survey:

### *Economic and technical abbreviations*

b/d	barrels a day
GDP	gross domestic product
LASH	lighter and ship
LDCs	least developed countries
PHC	primary health care, i.e. non-hospitalized health care
Ro/Ro	roll on, roll off (means of transportation)
SDR	Special Drawing Right
t U	tons U308

### *Equivalents*

1 acre = 0.4 ha

The following other abbreviations have been used in this survey:

APPER	Africa's Priority Programme for Economic Recovery, 1986-1990
IDDA	Industrial Development Decade for Africa
ISIC	International Standard Industrial Classification of all economic activities
LPA	Lagos Plan of Action
PANAFTEL	Pan-African Telecommunications Network
UNPAAERD	United Nations Programme of Action for African Economic Recovery and Development
UNTACDA	United Nations Transport and Communications Decade in Africa

**Part One**

**OVERVIEW OF THE REGION'S ECONOMY**

## INTRODUCTION

1. With the return of the rains in most parts of the African continent in 1985, it was hoped that 1986 would witness the start of a steady recovery of the economies of developing Africa. It did not happen. External demand conditions turned for the worse, despite the exceptional case of coffee, the price of which rose because of drought in Brazil. Even the coffee boom was short-lived: prices peaked early in the year and were falling by year-end. On other markets, demand was poor and oversupply a general condition. Oil prices in particular literally collapsed. After the Organization of Petroleum exporting countries (OPEC) changed its strategy in December 1985 in defence of its market share, some member countries increasing production, oil prices declined rapidly. From around 29 dollars a barrel in early January 1986, they fell to only \$9.20 a barrel by the end of July, a level which in real terms was then below their 1979 pre-oil shock value. Oil prices recovered subsequently when OPEC members, faced with huge revenue losses, agreed on a new quote structure. By the end of 1986, though expected to rise to around \$18 a barrel, that level was still 43 per cent below the 1985 peak, with no near prospect of regaining it. The African oil-exporting countries were of course directly hit by the collapse of the market. According to available information, their export revenues were halved in some cases; some were forced to shoulder considerable debts; economic growth plummeted; and their prospects have dimmed. Inevitably, those developments had a profound impact on the fortunes of the region as a whole.

2. It is true that the 1986 season was generally good for agriculture all over the region and some countries recorded exceptional harvests. The broad trend of agricultural production over the years was resumed after the strong rise in 1985, which saw recovery from drought. The weakness of metal markets hit mineral exporters, which suffered from weak prices and demand in

the case of copper, cobalt, iron ore, bauxite and uranium. Some important non-mineral commodities fared no better.

3. There were some good performances which give ground for hope in the future: it seems, for example, that Côte d'Ivoire emerged from the slump of recent years, the weak external markets and the accumulation of huge foreign debt; and some countries which introduced drastic measures of structural adjustment fared rather well—Ghana is a good case in point. Even Zambia made significant gains, particularly in agriculture. Many countries remain in the throes of acute and deepening difficulties, however, and recovery appears to be a long and painful prospect.

4. The secretariat of the Economic Commission for Africa (ECA), forecast a year ago a growth rate for the region of no more than 2 per cent in 1986. The current estimate that output growth has been only 1.2 per cent in a sense confirms that forecast. In 1987, given higher oil prices, continuing adjustment efforts and the expectation of a better world economic climate, growth could rise to around 2.5 per cent. That would again fail to match population growth, however, and the decline in real incomes which started in the early 1980s would continue.

5. As usual, in presenting the 1985-1986 Survey the secretariat has to do so in the knowledge that much information is either lacking or deficient and hence that much remains to be done to improve it. Preparation of the Survey is carried out through field surveys by the staff of the Socio-economic Research and Planning Division of ECA, which also studies information available at the Commission from national and international sources. It is expected that, with the co-operation of all those involved, the quality and reliability of these surveys will improve with time.

## I. THE INTERNATIONAL ECONOMIC SITUATION

### A. GROWTH OF OUTPUT

6. At the beginning of 1986, there were high expectations about the stimulus to world growth which would come from lower oil prices and declining interest rates. In the event, though oil prices practically collapsed, it appears that economic growth in 1986 was either lower or barely higher than in 1985. The Department of International Economic and Social Affairs of the United Nations (DIESA) forecast in April 1986 that world output would grow slightly faster than in 1985,<sup>1</sup> 3.5 per cent compared to 3.1 per cent, and that expectation was shared by other international institutions, such as the International Monetary Fund (IMF) and the Organisation for Economic Co-operation and Development (OECD), as well as by the United Nations Conference on Trade and Development (UNCTAD). IMF forecast growth of 3.1 per cent compared to 2.9 per cent in 1985.<sup>2</sup> UNCTAD secretariat gave virtually the same forecast as IMF in its *Trade and Development Report 1986* (United Nations publication, Sales No. E.86.II.D.5). By the time 1986 was nearing its close, IMF had revised its forecast of world output downward to 2.8 per cent.

7. In the member countries of OECD, which are the main economic partners of African developing countries, output is estimated to have grown by 2.5 per cent in 1986, significantly slower than in 1985 (3.0 per cent). The economy of the United States of America remained weak throughout the year despite the depreciation of the dollar, which has yet to produce the hoped-for reduction of the current account deficit; output in 1986 grew by only 2.8 per cent, a far cry from the 6.4 per cent of 1984.

8. However, developing countries as a whole fared much better in 1986 than in 1985, but regional differences were marked: Africa and Latin America and the Caribbean faltered, while Asia and the Pacific improved on its 1985 performance. A major divide appeared between countries which export oil and those which do not: according to IMF the former were so badly hit by the fall in oil prices that the output of their economies declined by a full 1.2 per cent, while that of the latter continued to grow — more slowly in 1985 but at the relatively good rate of 4 per cent, which is a full 1 per cent more than their population growth. The African region, with oil contributing more than two thirds of exports, therefore suffered; its growth in output is estimated to have fallen by more than half, from 3.0 per cent in 1985 to only 1.2 per cent in 1986.

9. Despite the disappointments and the losses suffered by many developing countries, the fall in prices of oil and other commodities helped to slow the pace of inflation, at least in developed market economies, where it reached very low levels, negative rates being recorded in some cases.

10. According to *OECD Economic Outlook*, No. 40 (December 1986), inflation in member countries as a group was only 2.8 per cent in 1986 compared to 4.5 per cent in 1985. The rate fell to 0.8 per cent in Japan and to -0.8 per cent in the Federal Republic of Germany. As a

result, developing countries benefited from a decline in the price of exports, most of which are manufactures, from members of OECD.

11. Another positive trend is the lower level of interest rates in the OECD countries, a development which has eased somewhat the debt-servicing problems of developing countries, since in many cases a portion of the debt was contracted at variable interest rates. Interest rates both nominal and real have declined, as well as converging substantially. By the third quarter of 1986 real rates as estimated by OECD were around 3 per cent in the three largest member countries.

12. Exchange-rate adjustment was a major policy objective for the industrialized countries. The appreciation of the United States dollar during 1984 and the under-valuation of certain currencies, especially the Japanese yen, was perceived to have gone too far and to have contributed to the payment imbalances. In effect, a considerable realignment of the major currencies took place from 1985. The dollar lost 17.7 per cent of its value in trade-weighted terms in 1986. (Other bodies than OECD calculate that the dollar lost 13.6 per cent.) The dollar fell against the currencies of most developed countries. By January 1987 the Japanese yen had appreciated 26.4 per cent against the dollar and 16.7 per cent against major currencies, in trade-weighted terms. (*OECD Economic Outlook* had estimated the yen rise at 30.7 per cent.) However, some Asian newly industrialized countries (NICs), such as the Republic of Korea, have currencies pegged to the dollar and their export prices in dollar terms were therefore unaffected by the dollar depreciation.

### B. TRADE, PAYMENTS AND FINANCE

13. According to the latest OECD estimate, world trade grew in 1986 at roughly the same rate as in 1985, around 3.8 per cent in volume terms, which was half that recorded in 1984 when the world economy and trade were stimulated by expansion in the United States. IMF had forecast in April 1986 that world trade would grow only slightly more in 1986 than in 1985 (3.3 per cent in volume terms against 2.9 per cent) — broadly in line with the later OECD figures. The trend in trade was directly related to the slow growth of the world economy in general during 1986, after correction for the sharp contraction in imports by OPEC members, which are estimated to have fallen in volume by 14.5 per cent.

14. The movement of trade prices was dominated by the collapse of oil prices, the weakness of primary commodity prices, the lower inflation in industrialized countries and the changes in the exchange rates among major currencies, particularly those of the United States and other industrialized countries. As a result, developing countries as an economic grouping suffered a severe fall in their terms of trade, estimated by the United Nations secretariat at 10 per cent.<sup>3</sup> The main losers have been the oil-exporting countries which, according to IMF figures, suffered a fall of nearly 40 per cent in the purchasing

power of their exports in 1986.<sup>4</sup> On the other hand, export prices of manufactures fell for the first time since 1970—though when measured in dollars that fall, which OECD estimated at 2.8 per cent, becomes a rise of 18.8 per cent. For countries of the African region this is a substantial gain since most of their trade is with Europe, particularly the members of the European Economic Community (EEC).

15. Balance-of-payments movements in 1986 were marked by a large improvement in the current accounts of the OECD countries, reducing their collective deficit by half. Among developing countries the deficit of OPEC countries is estimated to have grown to \$52 billion in 1986 compared to only \$5 billion in 1985, while non-oil producers also improved their position very substantially, cutting their deficits from \$20 billion in 1985 to only \$5 billion in 1986. At issue, however, was the persistent deficit of the United States, which did not fall as had been hoped but even widened, according to information for November 1986. That may have been due to a more serious loss of competitiveness by the United States *vis-à-vis* its partners than had been thought. It must be added that the world balance of payments figures are to be interpreted with some caution, since there is a very large "residual balance", which includes discrepancies arising from under-reporting of some classes of transactions which concern oil-exporting countries in particular.

16. The search for a solution of the problems posed by the debt of developing countries remained at the centre of international attention. Major debtors such as Mexico had to negotiate with foreign creditors for special relief measures while a permanent solution was sought—and has yet to be found. There was a confirmation of previous trends: the rate of increase in the indebtedness of developing countries continued to decline, but as a proportion of exports it still rose, while the flow of bank lending to those countries again diminished. The latter development is extremely disturbing, since access to external resource flows is certainly a *sine qua non* for many countries if their development is to continue. For the African region, which has been the most affected by the reduction in financial flows, the matter is absolutely vital. According to IMF, net external borrowing by the region reached a peak in 1982 of \$18.4 billion but had fallen to a mere \$2.3 billion in 1985. It is expected to have grown in 1986 only because of the large current-account deficit incurred in that year. Net financial flows to sub-Saharan Africa had already been cut by half between 1981 and 1984 and IMF estimated that in 1986 they would attain only 63 per cent of their peak 1981 value, with the likelihood of a further fall in 1987.

### C. PROSPECTS FOR 1987

17. World output is expected to grow at around 3 per cent in 1987, the projections ranging according to source a high of 3.7 per cent by DIESA to 3.1 per cent by UNCTAD in the document cited and 3.1 per cent by IMF in *World Economic Outlook* (October 1986). Those projections embodied specific assumptions about the price of oil and may have already been overtaken by events, in the wake of the OPEC decision to raise prices to \$18 a barrel or more. The April 1986 forecast by DIESA displayed a growth pattern not very different from that obtaining in 1986, with developing countries achieving 3.5 per cent instead of 3 per cent—a substan-

tially improved performance in the Latin America and the Caribbean region and in Asia and the Pacific, the latter region's growth accelerating to 5 per cent, while in Western Asia (mainly the Middle East) growth would fall to 1 per cent because of lower oil prices.

18. The projections for 1987 presented in October 1986 by OECD were for moderate, though sustained, growth by member countries as a whole, at a rate slightly higher than in 1986. OECD saw current-account imbalances as the main international problem in 1987, pointing in particular to the current-account deficit, as well as the budget deficit of the United States. Inflation was expected to be slightly higher than in 1986, 3 per cent against 2.8 per cent.

19. A consequence of the above trends, if fulfilled, would be that world trade would not substantially improve in 1987 relative to 1986. In that case, demand for the commodities exported by developing Africa would not rise significantly in 1987 and the situation obtaining in 1986 would continue to prevail, would perhaps even worsen as the coffee windfall came to an end.

20. The debt situation of developing countries would remain fragile in 1987, despite the improvements brought about in 1986 by falling interest rates. Adjustment would remain a necessity for those countries. IMF projected in April 1986 that debt service would reach its peak during the year and fall slightly in 1987. For Africa (according to the IMF definition) the ratio of debt-service to exports of goods and services was expected to fall to 31.1 per cent, after attaining a high point of 32.3 per cent in 1986. The situation was expected to worsen in sub-Saharan Africa, however, where the debt-service ratio was seen reaching its highest level in 1987, at 31 per cent. The trend in the flow of resources to developing countries, cut back by public and private sources alike, is a worrying question. According to OECD figures, those flows declined, in current dollars, from \$138.6 billion in 1981 to \$80.1 billion in 1985; and though they were estimated to have increased in 1986, it was only by 6.7 per cent in real terms, not nearly enough

TABLE I.1. GROWTH OF THE WORLD ECONOMY, 1985-1987  
(Percentages)

Sources: *World Economic Survey, 1986* (United Nations Publication, Sales No. E.86.II.C.1); *OECD Economic Outlook*, No. 40 (December 1986); IMF, *World Economic Outlook* (April 1986 and October 1986); and ECA secretariat.

to compensate for the ground lost since 1981. Private flows, especially from banks, have fallen in a spectacular way. (Private flows in 1986 were 55 per cent of their 1981 level, but the bank component thereof was only 25 per cent in 1985 of its 1981 magnitude.) Some members of the Development Assistance Committee of OECD (DAC), particularly the United States, appear to be reducing their foreign aid programmes. There are, it is true, some portents of hope in the opening of new financing facilities at the IMF and in the successful replenishment of funds for the International Development Association (IDA), an affiliate of the World Bank, but action is clearly urgent.

21. Another cause for concern is the growth of protectionism in developed countries, which is a source of considerable loss for consumers in both developed and developing countries. Moreover, the protection of

agriculture in developed countries, in countries, an increasing financial burden on their consumers, constitutes a serious obstacle to the needed development of agricultural production in developing countries. Sugar is a glaring case: countries best situated to produce that commodity have been exposed to international prices sometimes below their marginal costs because markets in developed countries have been closed to them. The production thus protected is not clearly efficient and does not constitute the best use of resources in the developed countries. To abolish protection of agriculture in developed countries, on the one hand, and taxation of it in developing countries, on the other hand, would not be an easy task, fraught with considerable perhaps insuperable difficulties. But as shown in World Bank, *World Development Report 1986* (Washington, D.C., 1986) working in that direction would bring considerable benefits to all.

## II. OVERALL TRENDS IN DEVELOPING AFRICA

### A. AN UPDATE ON THE 1985 RECOVERY

#### 1. GDP growth

22. As indicated in the 1984-1985 Survey,<sup>3</sup> the regional economy did recover, however weakly, in 1985. GDP growth was slightly more than estimated then, 3 per cent instead of 2.8 per cent, which did at least halt for a year the downward slide in income per head in the region. According to available estimates, all subregions shared in the upturn, though there were significant variations. North Africa grew by only 2.3 per cent, in contrast to the 3.1 per cent achieved south of the Sahara and especially to the 4.4 per cent gain of the West Africa subregion. Those disparities were due in no small measure to differences in the importance of agriculture in the various subregions. The considerable size of the Nigerian economy relative to that of other West African countries means that its growth rate can likewise be a main cause of those disparities. (Nigeria's GDP represented in 1985 73 per cent of the West Africa output and 25 per cent of developing Africa's output.) The two economic groupings, oil exporters and other countries, experienced practically the same growth rate, but among the latter grouping there was a marked discrepancy between least developed countries (LDCs) and the rest: the former registered a mere 0.7 per cent growth in combined GDP while the latter achieved an increase of 4.4 per cent, an impressive figure against the background of recent performance in the region.

23. The frequency distribution of countries according to GDP growth rate has shifted significantly (see table II.1). While in 1984 the number with negative growth had shot up to 21 out of 50, in 1985 it rebounded to 11 and six countries even recorded growth of 8 per cent or more.

TABLE II.1. FREQUENCY DISTRIBUTION OF THE REGION'S COUNTRIES ACCORDING TO GDP GROWTH RATE\*, 1984-1987

	1984	1985	1986 <sup>a</sup>	1987 <sup>b</sup>

\* GDP measured at 1980 prices.

<sup>a</sup> Preliminary estimate.

<sup>b</sup> Forecast.

24. Excluding countries where the recovery from drought was the main determinant of growth, particularly good results were recorded in Algeria, Botswana, Cameroon, Côte d'Ivoire, Ghana, Malawi, Mauritius and Togo. Cameroon has traversed the recent

difficult years practically unscathed by the crises which affected other countries in the region. It was helped to a considerable extent by its oil wealth but prudent policies, particularly the refusal of the Government to increase current expenditure in line with the growth of oil revenues and its avoidance of onerous debt commitments, were of crucial importance. In Botswana, despite a persistent drought, GDP rose in 1985 by a considerable 15.5 per cent because of the remarkable expansion of the mining industry. The economic policies of that country over the years have been characterized by fiscal restraint, stability and consistency. Malawi continued to grow at a sustained pace, owing to a long-standing policy of providing incentives to agriculture and through competent economic management generally. In Mauritius, the government policy of using to the full the natural advantage of the island—an abundant and highly skilled workforce—paid off: industrial exports from the Export Processing Zone shot up, employment increased rapidly and GDP grew by more than 6 per cent in 1985. In Algeria, a major oil-exporting country, the main determinants of growth in 1985 were the diversification of the energy sector away from over-dependence on crude oil, the greater emphasis on efficiency in the manufacturing sector, where extensive reforms were carried out, and the incentives introduced for agriculture. Ghana continued to be successful in its adjustment policies, helped in no small measure by the return of normal weather, but that does not detract from the remarkable achievement which its recovery after a decade or more of economic decline represents. In Côte d'Ivoire the recovery from the recession which succeeded the ill-fated coffee boom of the 1970s started up at a strong pace, GDP growing in 1985 by 6.5 per cent. What is also noteworthy is the good performance of Nigeria in 1985; GDP grew by 4.1 per cent after falling 8.1 per cent in 1984. The result arose largely from higher oil production in 1985.

#### 2. Agriculture

25. Recovery of agriculture from drought has been the main cause of output rising in an exceptional fashion in 1985 in several countries. In the Sahel aggregate GDP jumped by 7.4 per cent in 1985. In Mali GDP rose by 8.2 per cent after four years during which agriculture declined by 30 per cent. In the Niger GDP gained 5 per cent, although the strong recovery in agriculture was offset by a crisis in the uranium industry. In Senegal GDP shot back 12 per cent, agriculture rising by nearly 20 per cent following a fall of similar proportions in 1984. Elsewhere, agriculture performed particularly well in Zambia, where value added rose by a considerable 9.2 per cent, helping the economy to achieve real growth despite the decline of copper mining. In Zimbabwe agricultural production rose even more strongly—by an exceptional 29.6 per cent—lifting GDP by 9.6 per cent over 1984 levels. In North Africa agriculture recovered strongly in the Maghreb, where drought had been a pro-

blem in 1983-1984; there were exceptional harvests in Algeria, Morocco and Tunisia. The Food and Agriculture Organization of the United Nations (FAO), reporting on the cereal crop in 1985, clearly documented the overall situation: cereal production in developing Africa rose 36 per cent to 73 million tons, with spectacular crops in the Sudan (193 per cent more) and Zimbabwe (doubled production at 3.6 million tons). In national accounting terms, agricultural value added is estimated to have grown by 4.1 per cent at 1980 prices, while gross agricultural production as measured by the FAO index increased by 7.3 per cent.

### 3. *Manufacturing industry*

26. The good performance of agriculture was reflected in a marked recovery of manufacturing industry in the region as a whole, because that sector largely dealt with the transformation of agricultural raw materials. It is estimated that manufacturing value added rose by around 5.9 per cent in real terms during 1985, all subregions sharing the recovery with the exception of Central Africa, where there was a 1 per cent decline. Higher efficiency following reforms did play a role in the recovery in a number of countries, for example, in Algeria, where a large part of the region's manufacturing output is generated. Nevertheless, in general the situation in manufacturing remained difficult because long-standing problems had not been solved. In fact, in many countries the process of adjustment either had not really started or was itself a source of difficulties—as in Zaire, where the sector was troubled by foreign competition and liquidity problems.

### 4. *Mining*

27. While manufacturing industry performed better, the mining industry suffered from virtual stagnation. Oil production was held down by OPEC quotas and poor demand in the main markets of the industrialized countries. (OECD estimated that in 1985 demand in its member countries was 45.3 million barrels a day (b/d) lower than in 1984 and only marginally higher than in 1983.) Other mineral production was also affected by poor external demand, as the behaviour of metal prices bears witness. The IMF price index for metals declined in 1985 by 6 per cent, with aluminium prices falling nearly 17 per cent and copper prices failing to recover from a sharp fall in 1984. The index of mineral prices in developing market economies, for its part, indicates a fall of 2.1 per cent in prices during 1985.<sup>6</sup>

### 5. *Consumption, investment and savings*

28. Internal demand conditions were generally sluggish. Domestic demand increased by 1.4 per cent, half as fast as GDP. Private consumption recovered (3.9 per cent growth), while public consumption continued to decline. Most importantly, the contraction of capital formation was unabated. Fixed capital formation is estimated to have fallen 1.7 per cent in real terms in 1985, to only 83.4 per cent of its 1980 level, in consequence of which total capital formation was only 18.3 per cent of GDP compared to 23 per cent in 1980. At the same time, the rate of domestic savings remained high at 24.5 per cent. At constant prices, the region as a whole showed a net surplus of goods and services amounting to around 5.2 per cent of GDP. As previous

Surveys have pointed out, it would be largely misleading to regard that surplus with approval. It was more the result of import contraction than export expansion; and the majority of countries in the region had low levels of savings and capital formation, combined with a net external deficit. The contrast here is extremely marked between oil exporters and the remaining countries. In the latter, savings were only 13.3 per cent of GDP and investment, at 15.8 per cent of GDP, had therefore to be financed by a net external inflow of 2.5 per cent of GDP. The domestic savings of oil exporters, on the other hand, equalled 30.4 per cent of GDP and they ran an external surplus of 9.3 per cent of GDP. The rapid contraction in investment by oil exporters since 1981 noted in previous Surveys was not halted in 1985, any more than the fall in export revenues to which it was a reaction.

### 6. *Persisting problems*

29. Despite the undeniable recovery in 1985, many countries went deeper into crisis or had to start exploring ways to reform their economies. Debt problems were particularly acute. Many countries, including large ones such as Egypt, Morocco, Nigeria and the Sudan, faced massive debt-service charges, some of them unsustainable. In many cases arrears of external debt accumulated—which explain to a certain extent the external surplus recorded by the region. The Gambia, Liberia and Sierra Leone suffered from difficulties mostly unrelated to drought or other climatic upset. In the Gambia, the rainfall pattern did indeed affect crop yields, but inadequate price incentives and institutional weaknesses also harmed the economy, leading to a fall in output of nearly 10 per cent. In Sierra Leone, the economy was in rapid decline. GDP fell by more than 10 per cent, production was lower in all sectors and inflation accelerated to 76.6 per cent. In Liberia, the economy suffered from declining demand for traditional exports (iron ore, rubber, coffee) and from political turmoil. Egypt was hurt by the slump in the oil market and the fall in remittances from its large expatriate community in the Arabian peninsula. External debt, estimated at \$38.3 billion in 1984/1985, required heavy service charges at the very time that Egypt experienced a lower level of external revenues. In the Congo, another oil-exporting country, declining oil revenues and rising debt-service charges led the Government to introduce the first step of an adjustment programme which was to lead later to a fully fledged agreement with the IMF. The Government of Nigeria outlined severe measures in the budget prepared for 1986, indicating its determination to deal with the deep-seated problems affecting the economy. In short, the respite brought by the ending of the drought had not solved any of the major problems of the region's economy and the need for change was felt acutely.

## B. THE SITUATION IN 1986

### 1. *Output and demand*

30. On the whole the trend in 1986 was very disappointing: growth faltered badly, at an estimated 1.2 per cent in real terms for regional product on the basis of the information available. Once again, an overall figure may easily mislead, as performance appears to have varied widely between oil exporters and the remaining

countries. According to ECA estimates, while the combined output of the former declined by around 0.3 per cent, the latter did rather well and their combined output rose by 4 per cent, the best figure since the beginning of the decade. The fall in oil prices was the main cause of both trends, since it sharply reduced external revenues for one economic grouping and significantly reduced import costs for the other. In addition, a sizable number of countries in the latter grouping shared in the windfall provided by the sharp rise in coffee prices at the beginning of the year. Looking at subregional estimates, North Africa's growth was only 1.6 per cent; the distinctly lower growth of sub-Saharan Africa owed much to the actual decline of 3 per cent in the GDP of Nigeria; the Central Africa subregion showed a disappointing growth of 1.6 per cent (mainly because oil exporters are prominent and contribute a large share of output); while East and southern Africa (with no oil exporter and the benefit of high coffee prices) showed a healthy 3.8 per cent growth.

31. The impact of lower oil prices on the region's economy is a consequence of the large share of oil in total exports and of oil exporters' GDP in regional product. The fall in oil prices during the year was such that talk of a collapse is entirely justified. (See chapter VII for a fuller discussion of the matter.) For oil exporters, the consequences showed up first in falling export revenues: from an estimated \$49 billion in 1985 to \$27 billion in 1986, a cut of 44 per cent. In Algeria, Nigeria and the Libyan Arab Jamahiriya exports were reportedly down by 40 per cent, 42 per cent and 47 per cent, respectively. In Egypt some estimates point to a drastic fall of net oil income from \$2,015 million in the 1985/1986 fiscal year to only \$600 million in 1986/1987. Such huge losses spread their effects quickly through the economies, compelling import cuts and a reduction in investment. Some oil exporters seem in fact to have underestimated the severity of the problem and only belatedly made the necessary expenditure cuts: in Gabon estimates of the price of oil made early in the year proved too optimistic and the new 1987 budget introduced an unprecedented 46 per cent cut compared to the revised 1986 budget; oil income is expected to bring in only 60 billion African Financial Community (CFA) francs compared to an average of CFAF 400 billion in the years 1984-1985.

32. The fall in the dollar price was compounded by the sharp depreciation of the dollar itself. Lower oil import costs immediately gave those countries which must import oil the opportunity to increase the volume purchased, hence to consume more energy and raise their level of activity. Subsequently, lower energy prices would permit more capital and intermediate goods to be imported, thus contributing to higher investment. Lower energy prices also mean lower production costs, paving the way for less inflation and higher productivity.

33. Many non-oil-exporting countries also benefited from the higher coffee prices obtainable in 1986. A good example is Kenya, whose coffee revenues in 1986 are estimated to have reached some 8.4 billion Kenyan shillings—nearly 82 per cent more than in 1985. The net effect is not easy to ascertain but may represent up to 1 per cent of GDP for most oil-importing countries. In Ethiopia, for instance, the crude oil bill represented 2.8 per cent of GDP in 1985 but may have been cut by as much as 48 per cent in 1986. In Kenya net petroleum imports took 5.4 per cent of GDP in 1985. Since prices fell

51 per cent in terms of national currency, the gain to the economy may have been as high as 2.5 per cent of GDP, though losses on exports of refined petroleum products have to be offset.

34. Agriculture benefited from generally good weather in 1986, and for developing Africa taken as a whole it is estimated that value added rose by 2.2 per cent. (Oil-importing countries improved their agricultural product by 5.2 per cent.) There are encouraging signs that the decisions taken in the recent past to give more priority to agriculture and improve incentives for agricultural producers have borne fruit in at least some countries. That is certainly the case in Zambia, where producer prices for basic agricultural products were sharply increased; and in Zimbabwe support for agriculture considerably helped the country to endure the drought with minor damage.

35. In other economic sectors, 1986 saw no significant change in the fundamentals of the situation. The extraction of non-fuel minerals was badly hurt by generally weak prices. Value added in manufacturing industry is estimated to have shown growth of around 4 per cent in 1986 but that regional performance does not reflect the continuing difficulties in many countries, which stem from deep-seated problems that require time for their solution, whether the enterprises operate in the private or the public sector. In oil-exporting countries such as Nigeria, reduced export revenues and the subsequent clamp down on imports sharply curtailed the supply of raw materials and many other imported inputs to manufacturing, leading to some labour redundancies and factory closures. There are also successes to report, however, one of the most spectacular being the Mauritius Export-processing Zone.

36. Developing Africa's current-account position has worsened, inevitably, in the face of sharply falling receipts from oil exports. The current-account deficit, which is estimated at \$7.1 billion for 1985, may have reached \$21.5 billion in 1986—some \$4 billion more than forecast in the last Survey—most of which was incurred by oil exporters. The current account of the other countries in the region slightly improved, some of them (e.g. Kenya) making substantial gains. The situation of those countries offers no grounds for complacency, however. Morocco, for example, reduced its current-account deficit in 1986 to an estimated 1.7 per cent of GDP compared to 8.2 per cent and 11 per cent in 1985 and 1984, respectively but it achieved that result not only because of a recovery in agriculture and savings on oil imports (26 per cent by value of imports in 1985) but also because of a debt-rescheduling exercise.

37. Internal demand conditions at the regional level barely changed in 1986, owing to the downturn in the relatively richer countries. Domestic demand is estimated to have increased by only 0.3 per cent; and public consumption continued to decline. The latter result was only to be expected in view of the general policy of expenditure restraint. Private consumption rose by 2.3 per cent—less, therefore, than in 1985 and significantly less than population growth. There was a further fall in gross fixed capital formation, estimated at 5 per cent but, significantly, capital formation in non-oil exporting countries substantially increased (7.3 per cent), whereas in oil-exporting countries it declined 9.4 per cent, the largest fall since 1983. The seriousness of the situation can be gauged by the report of the

Nigerian Government, when presenting its 1987 budget, of a 36.7 per cent fall in gross fixed capital formation during 1986. The contraction of investment is reflected in the fall of Nigerian imports of goods and services, which is estimated to have been 7 per cent in 1986, twice as severe as in 1985.

## 2. The debt issue

38. Debt service remained an acute problem in 1986, given the trends in current-account balances. Some countries found themselves in such difficulties that they accumulated arrears, further exacerbating the issue. The Sudan faced a particularly daunting problem: according to its 1986/1987 budget debt-service obligations were estimated at 300 per cent of anticipated exports of goods and services, at around \$2,500 million. Scheduled repayments in the fiscal year were \$830.7 million and arrears \$1,717.7 million. Even with a decision to limit repayments to 25 per cent of exports, the debt-service burden was still \$212.2 (equivalent to 520 million Sudanese pounds). The Sudanese debt currently totals around \$13 billion.

39. One indication of the severity of debt problems is the number of countries which entered into in rescheduling negotiations with external creditors, with or without IMF participation. Most of those creditors made rescheduling dependent on an agreement with IMF and the World Bank on a set of policy reforms. A notable case in this respect was the Congo which, after starting its own adjustment programme, reached agreement with IMF on a stand-by credit that provided badly needed relief while it negotiated with creditors belonging to the Paris and London Clubs about rescheduling the debts. In the context of the fall in oil revenues, total export receipts were insufficient to cover the charges for debt service alone. Nigeria—another large African debtor, though its debt is not large in relation to its revenues or compared to the liabilities of other international debtors—negotiated with IMF and the World Bank throughout the year; agreement is reported to be fairly imminent. In the course of those negotiations, two moratoria of three months were granted. In the end, agreements were reached with members of the London and Paris Clubs on government debts but at the year-end had not yet been finalized in respect of commercial debts. The simultaneous fall in oil revenues and emigrant workers' remittances created a difficult balance-of-payments problem for Egypt, where the current-account deficit will reportedly double between 1984/1985 and 1986/1987 to a level of some \$3 billion, according to latest forecasts. Foreign debt was put at \$38.6 billion in 1985/1986 and scheduled debt service at nearly \$4 billion per annum. However, substantial arrears are reported. The debt question figures prominently in current negotiations with IMF on a \$1 billion stand-by credit.

40. Estimates of the total regional debt are still controversial to some extent because data on external commitments are incomplete in certain cases. In the last Survey a figure of \$162 billion for the end of 1985 was put forward. Since commercial bank flows fell considerably, further accumulation of debt could have occurred only from arrears, new debt entered into as the result of rescheduling exercises, multilateral loans and some debt-creating official resource flows. As a provisional estimate, total regional debt may have reached

\$175 billion by the end of 1986. The servicing of those debts was scheduled to total around \$24 billion in 1986, a crushing burden. The actual debt service will certainly have been less, as decisions taken by some Governments (e.g. Zaire's) and debtors indicate. While scheduled debt service by Nigeria in 1986 was over \$3 billion, the actual sum was \$1.9 billion because of the moratoria and rescheduling negotiated by the Government.

41. A recent OECD survey<sup>7</sup> contains useful information on the structure of African debt. The total disbursed long-term and short-term debt of the African region is estimated to have been \$138 billion in 1984, of which North African countries owed \$67 billion (49 per cent) and sub-Saharan countries \$71 billion (51 per cent). On a country basis, the debt is extremely concentrated: 15 countries owing more than \$2 billion apiece accounted for 82 per cent of the total; 4 countries (Algeria, Egypt, Morocco and Nigeria) accounted for 53 per cent. Moreover, the debts were apparently long-term commitments and on concessional terms, for the most part. In percentage terms the position may be summarized as follows:

	Concessional long-term	Other long-term	Short term
North Africa .....	25	55	20
Sub-Saharan Africa .....	32	58	10
African region .....	29	56	15

The regional structure of debt was more favourable than that obtaining in Latin America and the Caribbean, where the corresponding percentages were: concessional long-term, 5; other long term, 79; short-term, 21.

42. However, structure is not the sole determinant of the character of debt problems. Nor are ratios such as Debt service/Exports (estimated at 27.1 per cent for the region in 1984)—good indicators though they are—totally trustworthy for predicting debt problems. It is better to investigate the extent to which a given country experiences difficulty in servicing its debt—a situation which can arise even with levels of debt that are low in absolute or relative terms. As a matter of fact, the usual indicators got worse in 1986. According to IMF the ratio of debt service to exports of goods and services in sub-Saharan Africa rose to 29.4 per cent compared to 28.6 per cent in 1985. A clearer sign is the large number of countries which entered into rescheduling negotiations during the year or took debt-related measures. The list includes the following: the Congo, Egypt, the Zambia, Madagascar, Nigeria, Morocco, Sierra Leone, Tunisia, Zaire and Zambia. They are the countries which undertook formalized negotiations, while many others engaged in direct contacts with creditors (banks or official creditors) without a specific framework for such negotiations.

## C. POLICY ISSUES AND THE STRUCTURAL ADJUSTMENT PROBLEM

43. The crisis in Africa and the need for policy reform were at the centre of international attention in 1986. In the previous year, in an unprecedented move, the Assembly of Heads of State and Government of the Organization of African Unity (OAU), at its twenty-first session, held at Addis Ababa in July 1985, had adopted Africa's Priority Programme for Economic Recovery, 1986-1990 (APPER). As already indicated in the last Survey (E/ECA/CM.12/5) APPER can be considered a turning point for the region, since the OAU Assembly

did not shrink from recognizing that policy failures bore some responsibility for the crisis and that reform was urgently needed. The Assembly called for priority to be given to agriculture, to which a sufficient share (20-25 per cent) of public investment should be allocated, as well as to price incentives for the farming population. At its thirteenth special session, held in May 1986 and devoted to the African crisis, the General Assembly of the United Nations adopted its Programme of Action for African Economic Recovery and Development, 1986-1990 (UNPAAERD). The Programme stressed the ultimate responsibility of African governments, while recognizing that international measures were necessary if reform was to succeed. Priority was given to agriculture and related sectors, with emphasis on remunerative produce-pricing policies and incentive schemes. The necessity to improve economic management was fully recognized: action had to be taken which would cover the whole range of public policy on public enterprises, domestic savings, fiscal administration and the like. The positive role of the private sector through "well-defined and consistent policies" was acknowledged, but it was affirmed that the role of the public sector would remain an important one in the economy of the African region. The international community was called upon to increase resource flows to the region, with particular emphasis on the issue of financial constraints stemming from debt service. It was agreed, in particular, that no donor of bilateral aid ought to be a net recipient of official capital flows from developing Africa. The cost of the programme has been estimated at \$128.1 billion, of which \$45.6 billion is expected to come from sources external to Africa.

44. During 1986 Governments have in general followed policies directed towards reform, sometimes even ones that introduced very radical and drastic changes. The framework established in APPER and UNPAAERD is a broad one and quite significant differences of approach can find room within it. Generally speaking, policy reforms were mainly directed along the following lines:

- (a) higher prices for agricultural products and more realistic pricing for industrial products;
- (b) reduction or elimination of subsidies;
- (c) privatization and/or reform in the public sector;
- (d) adjustment of exchange rates;
- (e) trade liberalization or rationalisation; and
- (f) control and, where feasible, reduction of government expenditure on current account.

45. Governments linked their reform policies in many instances to agreements with IMF and/or the World Bank, which provided financial support in the form of stand-by credit or aid in structural adjustment. Recourse to IMF was by no means a condition of reform, however: Governments defined their adjustment programmes on the basis of national considerations and even applied them without any support from, or co-ordination with international organizations.

46. The agreement reached in August 1986 between IMF and the Government of the United Republic of Tanzania on a stand-by credit represented a significant change in the development policy of that country. The signature of such an agreement had been held up by serious policy differences for a number of years. The vexing issue of currency devaluation was solved: a

devaluation by 57.5 per cent took place. The Government enacted a strict programme of fiscal austerity and instituted checks on deficit financing. In the field of agriculture, producer prices were raised very substantially and the marketing of agricultural products liberalized. Subsidies on basic commodities, as well as most price controls, were removed. Public enterprises had to submit to strict rehabilitation measures in order to bring to an end the mounting deficits, underutilization of capacity and over-manning which had characterized their operations in the past.

47. Another important step was the conclusion of an agreement between Tunisia and IMF. To deal with the economic crisis triggered by the combination of lower oil prices, a poor 1986 crop and disappointing revenue from tourism, the Government enacted a programme of stiff reforms which involved the dismantling of many controls, a devaluation of the Tunisian dinar and a downward revision of the budget. The devaluation by 10 per cent against the currencies of competitor trading countries was the first such move since 1964.

48. In another important case, IMF and the World Bank narrowed their differences with Nigeria during the year, enabling those institutions to offer support for the Nigerian Government's structural adjustment programme and for debt rescheduling. One of the immediate results was the introduction of the second-tier-foreign exchange market in which foreign currency has been auctioned. That measure produced an effective devaluation of nearly 73 per cent in October 1986. Other structural adjustments included:

- (a) the dissolution of agricultural marketing boards;
- (b) a start to the privatization of some public corporations, the Government selling its shares to private investors;
- (c) the removal of subsidies on petroleum products; and
- (d) a change in the import régime, with a view to abolishing import licences.

49. Negotiations are taking place between IMF and Egypt for a stand-by credit which could reach \$1 billion. The related structural adjustment programme proposed by IMF is reported to contain the following points:

- (a) the gradual floating of the currency over a period of 18 months, in order to eliminate the complex system of multiple exchange rates;
- (b) allowing interest rates to move over the 13 per cent mark now set for the central bank discount rate;
- (c) an increase in energy prices;
- (d) raising agricultural producer prices and phasing out gradually the government controls on agricultural production; and
- (e) greater incentives for industrial investment.

50. As may be seen, the programme would touch many sensitive policy issues, though for the time being skirting the difficult question of food subsidies. In any case, the Egyptian Government has raised serious objections to certain IMF conditions.

51. The Government of Zaire announced its decision to limit debt repayment to 10 per cent of export revenues. In effect, while the structural adjustment programme agreed upon with IMF and the World Bank has been applied strictly by Zaire, despite the very high costs involved, the anticipated foreign investment did not

materialize, leaving Zaire in the awkward and painful position of becoming a net capital exporter. That is clearly an unsustainable situation, as the success of the programme requires additional inflows of capital from external sources. In particular, the revamping and development of the country's transport network is impossible without very substantial external financial support.

52. By the end of September 1986, 16 African countries had concluded arrangements with IMF and others were to conclude similar agreements subsequently, including Tunisia, as well as Nigeria, which signed a letter of intent. The events of the year showed clearly the pitfalls and the dimensions of the sacrifices which the countries of the region have to confront on the way to recovery. IMF and World Bank conditions impose, in some instances, such high social costs that governments perceive them as difficult to sustain for various reasons — *inter alia*, the conflict with the interests of constituencies and social groups. The issue of subsidies is a particularly sensitive one in view of its direct impact on the living standards of the urban population.

53. The importance and intractability of the latter issue was demonstrated by the food riots which erupted in Zambian cities when the Government, after raising agricultural producer prices, eliminated subsidies on food, causing the price of maize meal, a basic staple, to rise by 100 per cent. The maize subsidy is reported to have been costed at 800 million kwacha or 36.1 per cent of recurrent expenditure in the 1986 budget estimates. The riots led to the rescinding of the measure and dealt a severe blow to the recovery programme: the gap in the budget is expected to rise to 30 per cent of GDP in consequence, whereas under the IMF sponsored programme it was planned to fall to 9 per cent. Zambia, dependent on copper for 90 per cent of its export revenues, was badly hit by the movement of copper prices, which have lost 60 per cent of their value in real terms over the last 10 years. The devaluation of the kwacha represented by the auction system which was introduced in 1985 cut deeply into the incomes of wage earners.

54. In Algeria, policy reforms took another direction, the Government being intent on avoiding debt rescheduling. Because of sharply reduced oil revenues, the 1986 budget was revised; investment, in particular, suffered a cut of 26.2 per cent to a level barely higher than in 1985. The import budget was cut by roughly 20 per cent. Those retrenchment measures are to be maintained in 1987, imports being cut by a further 17 per cent. Very strong measures were adopted in agriculture, where profound changes are taking place. Producer prices were raised by more than 50 per cent in the period 1984-1985. Private farmers secured considerably more credit and generally received stronger support from the authorities, which gave priority to agriculture in many ways, for example, by allocating more resources for the development of water supplies. In industry, the emphasis was on ways of reducing imports and increasing efficiency and productivity, in view of the severe limits imposed on the scope of projects by the sharply reduced oil revenues. Investment funds were switched increasingly from heavy industry enterprises to medium and small-sized units. With a rapidly increasing population, Algeria has also placed growing emphasis on social concerns, particularly job creation.

55. In Sierra Leone, the Government launched an Economic Recovery Programme 1986/1987-1988/1989 when introducing the 1986/1987 budget, in its endeavour to arrest the economic decline suffered by the country. A key measure was the decision in June 1986 to allow the exchange rate to float. Other measures included:

- (a) the elimination of subsidies on petroleum and rice, which account for a major share of the budget deficit;
- (b) the liberalization of the import licensing system;
- (c) raising producer prices of the major agricultural commodities;
- (d) rationalization of enterprises in the public sector;
- (e) phasing out many government controls, including those on prices; and
- (f) freezing the level of employment in government service.

56. In Gabon, likewise seriously hit by the decline in oil revenues, the Government introduced a structural adjustment programme for 1986-1987. In a context where its oil revenues were expected to fall to 60 billion CFA francs in 1987 compared to CFAF 285 billion in 1986 and CFAF 400 billion in 1985, the budget estimates for 1987 represented a reduction by 43 per cent. In addition, the Government seeks the rescheduling of the external debt and has defined a new development strategy for diversifying the economy. The measures to reduce expenditure included:

- (a) a drastic cut in the allowances and advantages of public servants; and
- (b) the limitation of subsidies and transfers, particularly those to public corporations, which are to be better controlled in future by making the grant of financial help contingent on results.

57. Declining oil revenues also brought the need for reform in Angola. The reforms envisaged in the planning system to improve the economy have been jeopardized, and the Government has put a 40 per cent clamp on imports to ward off pressure on the balance of payments.

58. Table II.2 summarizes the trends in GDP in 1985-1986 and forecasts for 1987, by subregion and economic grouping, while table II.3 similarly presents a picture of the principal elements of supply and demand for the region as a whole.

#### D. OUTLOOK FOR 1987

59. The developments in 1986 help to explain how uncertain the short-term economic prospects of the African region appear. As in the past, it is true that a number of domestic and external factors will shape regional growth. Externally, the demand for and prices of oil and other primary commodities exported by the region, the position adopted by the donor community in regard to the management of outstanding foreign debt, the prospects of obtaining additional external assistance — these are some of the particularly significant factors. Domestically, economic prospects for 1987 will depend crucially on the performance of agriculture and the pursuit of the corpus of policies already introduced with the aim of raising productivity in agriculture and improving economic management.

60. As to the demand for and prices of the region's exports, both are likely to continue in a depressed state.

<sup>c</sup> Index base 1980 = 100.

because the growth rate in the OECD countries is expected to remain more or less at its 1986 level (which was less than half that achieved in 1984). Regional export trade growth is projected to remain fairly sluggish, with markets for primary commodities suffering from over-supply and over-stocking in the developed market economies. The situation is expected to be particularly unfavourable for minerals and fibres. Beverages, particularly coffee, which enjoyed some buoyancy during 1986, are likewise expected to lose ground—in fact, coffee prices are already falling fast. A possible exception to the unpromising scenario which these comments suggest for 1987 might be the behaviour of oil prices. The OPEC target of \$18 a barrel or more may indeed be achieved. It does not depend solely, however, on the proviso that the current agreement by OPEC members

on production quota restrictions holds good throughout 1987. Other factors are in play, not susceptible to economic analysis. Exports of goods and services by African OPEC members are nevertheless forecast to rise in volume by 1.3 per cent in 1987 compared to a fall of 5.6 per cent in 1986. For the remaining countries of the region a rise of 5.6 per cent is anticipated, essentially owing to an expected rise in export volumes in countries such as Egypt, Kenya, Mauritius, Tunisia and Zimbabwe, whose export range also includes manufactured products. Likewise, the region's imports of goods and services are projected to rise in volume by about 2.2 per cent, after falling by about 6.8 per cent in 1986. The rise would be wholly accounted for by the rise of 4.4 per cent in imports by non-OPEC members. Potential import demand would imply a much greater increase, since most of the inputs for modern production and a sizable proportion of domestic consumption have to be met, if they can be met, from external sources. Unfortunately, the expected accrual of foreign exchange resources appears incapable of supporting potential demand in full. Moreover, even the projected increase in imports would depend critically on the realization of export expectations and, to some extent, on the degree of success achieved in negotiations for debt relief. If disappointed on that score, many countries—particularly the big debtors such as Côte d'Ivoire, Egypt, Morocco, Nigeria, the Sudan and Zaire—would have to cut their imports instead and lose some growth momentum as a result.

61. The stagnation in net resource flows, or their relatively slow growth, is expected to continue. That prognosis is based on the belief that major donors will still link the provision of further assistance to agreement on a repayment schedule for outstanding debts and even, sometimes, to the adoption of certain reform measures. Regrettably, that is happening even after African developing countries have collectively committed themselves, within the framework of APPER and UNPAAERD, to undertaking far-reaching policy reforms and when the international community for its part is committed to supporting the efforts of the African peoples to implement those programmes to the full.

62. Progress in 1987 in the various sectors of the economy is expected to be mixed. With the overall picture shaped to a great extent by developments in the agricultural sector which, after all, is the major source of export income for non-oil exporters and of raw materials for domestic industry.

63. In 1987, agricultural output is expected to grow by a substantial 5 per cent, in which almost all sub-regional and economic groupings would participate—in particular, West Africa, where strong growth is expected in Nigeria, and OPEC member countries. Central to that rather optimistic scenario is the assumption that weather conditions will continue to improve, now that Africa is out of its worst drought cycle. It is believed that the policy packages for reform instituted over the past two years or so will be more vigorously and widely pursued; they are already paying dividends in, for example, Algeria and Zambia. The food situation is expected to improve further, making the region self-sufficient overall in food grains. There would still be pockets of severe food shortage, however.

64. Although the supply of domestic inputs for manufacturing industry is expected to improve, particularly

for agro-industries, the problems of enterprises depending mostly on imported inputs are expected to persist. It should however be recognized that the policy reforms currently being pursued are beginning to remove some debilitating constraints in the areas of pricing, organization and management. In many countries measures have been introduced to improve productivity and the quality of manufactured products, particularly in the public sector.

65. The sluggish demand for minerals and the reluctance of many donors to finance new investment in the mining sector are expected to persist in 1987. On the other hand, rehabilitation efforts in countries such as Zaire and Zambia should consolidate present mining capacity and enhance the ability of the countries concerned to respond to demand changes.

66. Total domestic demand is projected to remain weak in general. Essentially, that will result from the continued contraction of public expenditure as a matter of policy in many countries.

67. It is forecast that gross fixed capital formation will rise by about 4.9 per cent in 1987, the first increase

since 1981. The recovery process, particularly in agriculture and transportation, will be materially helped thereby.

68. On the basis of all the foregoing elements, the ECA secretariat forecasts as a basic scenario a modest growth in regional GDP of 2.5 per cent. There is, however, another forecast by the secretariat, a second scenario which is decidedly more optimistic, based on the assumption that there will be a general improvement in the external environment in 1987 and that developing Africa, rather than having to "go it alone" in its efforts at economic recovery and development, will be greatly assisted by the international community through a substantial increase in ODA and other aid for capital development, through better commodity prices, both for minerals and non-minerals, and by the provision of substantial debt relief. It also assumes, as does the basic scenario, that oil prices will rise somewhat above \$18 a barrel in 1987, boosting the economies of the oil exporters without seriously hurting the oil-importing countries. In such circumstances, the overall rate of growth of GDP in 1987 might range between 3 per cent and 4 per cent.

PRICE

### III. THE EXTERNAL SECTOR

#### A. TOTAL EXPORTS AND IMPORTS OF MERCHANDISE

69. The value of developing Africa's merchandise exports declined very substantially, by 28.7 per cent, in 1986. As forecast in the last Survey, that was perhaps the largest percentage fall ever recorded for exports — and in fact was much more severe than forecast (16.9 per cent). In volume terms, exports declined by 3 per cent, after gaining 3 per cent in 1985.

70. Regional imports of merchandise declined by 9.3 per cent in value, a result again much worse than expected. In volume terms they fell 11 per cent.

71. Table III.1 shows those movements, as well as changes in the terms of trade and the purchasing power of exports. It also presents a preliminary forecast of growth in 1987.

<sup>c</sup> In dollar terms.

<sup>d</sup> At 1980 dollar prices.

72. The large fall in the value of exports in 1986 drove the trade balance into a deficit estimated at \$8 billion, compared to a surplus of \$5 billion in 1985. The fall in the price of oil was the major cause, since that commodity accounted for 76 per cent of regional exports in 1985. It is estimated that oil exports were worth around \$27 billion in 1986, compared to \$49 billion in 1985, a fall of roughly 44 per cent. The precipitous decline resulted on the one hand from a buyer's market and on the other hand from the OPEC decision in December 1985 to abandon its quota system and switch to a strategy of defending its market share, which had fallen considerably since the early 1970s. (A fuller discussion of the oil question appears in chapter VII.)

73. Table III.2 gives details of exports by the principal African developing countries concerned.

<sup>a</sup> Preliminary estimates.

74. In contrast to oil exporters, other countries of the region performed significantly better in 1986, their exports rising in value by 18.7 per cent to \$18.2 billion. The high level of coffee prices during the year was an important factor. For Côte d'Ivoire, Ethiopia and Kenya good prices brought significant growth in revenues: in Côte d'Ivoire an estimated 35 per cent and in Kenya 28 per cent, improving the balance of payments and providing a welcome stimulus to the economy. The unfavourable trend in most other commodity prices, however, hurt many countries, particularly non-fuel mineral exporters such as Zaire and Zambia.

75. Exports are forecast to grow in 1987 by around 10 per cent in value and 3.4 per cent by volume. Most of the improvement would come from higher prices for oil, those of other commodities being expected to remain low in over-supplied world markets.

76. Faced with declining export revenues, oil exporters have tended to restrict their imports, either through direct controls on imports or through the price mechanism (price increases brought about by devaluation or *de facto* depreciation of the currency). In Nigeria the import control system was fundamentally changed as part of the July 1986 structural adjustment programme, leading to a depreciation of the naira by more than 70 per cent since October 1986. It is estimated that

imports by oil exporters fell 14 per cent in value, Angola, the Libyan Arab Jamahiriya and Nigeria suffering particularly drastic reductions. Imports by other countries were static at roughly \$20 billion. That statement, however, conceals the substantial gains which they were able to make because of lower oil costs. According to the World Bank, oil imports by non-oil exporters in sub-Saharan Africa amounted to 372,000 b/d in 1985 and had been growing at around 2.4 per cent a year in the period 1982-1985. Those imports were therefore costing some \$3.7 billion in 1985, or 19 per cent of total imports, and the savings from lower prices in 1986 may have been as much as \$1.6 billion dollars or half the oil import bill.

77. Table III.3 gives details of imports by the principal African developing countries concerned.

TABLE III.3. IMPORTS BY SELECTED AFRICAN COUNTRIES, 1984-1986 (Billions of dollars)

<sup>a</sup> Preliminary estimates.

78. It is expected that regional imports will grow in 1987 on account of higher economic growth and greater purchasing power, their value by 4.2 per cent and their volume by 2.2 per cent. That would be a significant improvement after the large setback experienced in 1986.

#### B. COMMODITY STRUCTURE OF TRADE

79. The commodity structure of the region's trade showed no substantial change in 1984 (see Table III.4). Primary commodities provided the bulk (91.3 per cent) of exports. Mineral fuels alone were 71.2 per cent. In 1980 the share of primary commodities had been 93.2 per cent, oil accounting for 75.7 per cent. Manufactured goods other than chemicals provided only 6 per cent of exports in 1984 compared to 5.2 per cent in 1980.

80. On the import side, manufactured goods were 66.6 per cent and primary products 31.6 per cent of the 1984 total value. The increased share of food, beverages

<sup>a</sup> Including commodities not shown.

and tobacco in 1984 was directly related to the shipments of food aid, which started on a large scale in that year.

81. Data for 1985-1986 on the commodity structure of trade are still fragmentary, but some trends can be ascertained for the main products. The cereal trade of the region was heavily in deficit, imports far outstripping exports. In *Food Outlook*, FAO reported that in 1984/1985 exports of wheat and coarse grains increased to 2.1 million tons and imports decreased to 23.4 million tons from 29.2 million tons in the previous crop year. Nevertheless, the imbalance remained considerable. The situation in 1986/1987 seems to have improved: exports are expected to reach 3 million tons and imports to decrease further to 22.7 million tons. In value terms and including rice in the totals, regional exports of cereals are estimated at \$126 million in 1985 and imports at \$709 million.

82. In 1985 regional exports of coffee were around 1 million tons compared to 896,700 tons in 1984, an increase of 12.5 per cent. The very high prices during the 1985/1986 season may have enabled exports to bring in nearly \$3 billion dollars in 1985 and \$3.67 billion (24 per cent more) in 1986. Ethiopia, Côte d'Ivoire, Kenya and Uganda were particularly substantial beneficiaries. Kenya coffee exports in 1986 have been estimated at 8.4 billion shillings, 82.1 per cent more than in 1985. The International Coffee Organization (ICO) has stated that Kenyan exports in the first 11 months of 1985/1986 were 1,607,000 bags compared to 1,274,000 bags in the previous coffee year. The value of Kenyan exports would have amounted to some \$415 million or ShK 6.8 billion in 1985/1986. For Côte d'Ivoire, exports in the first 11 months of that coffee year are estimated at 3,539,000 bags, slightly more than in the corresponding period of 1984/1985 but up by 35.7 per cent in value.

83. Cocoa bean exports by the region were 9.6 per cent less in 1985 than 1984 at 813,600 tons. Prices were unfavourable, too, reducing receipts to \$1.8 billion, compared to \$2.8 billion in 1984. The value of exports in 1986 is provisionally estimated at \$2.1 billion.

84. Tea exports were up 10.7 per cent in 1985 at 217,100 tons. Their value, however, collapsed to \$437.2 million compared with \$686.4 million in 1984. In 1986, the unfavourable trend continued; revenues in Kenya are estimated to have been ShK 3.4 billion, compared to ShK 3.8 billion in 1985.

85. Sugar exports in 1985 totalled 2.65 million tons compared to 2.26 million tons in 1984, or 17 per cent more. At the EEC import price those exports were worth respectively \$940.9 million and \$803.1 million. The regional share in world exports was 9.6 per cent in 1985 compared to 8 per cent in 1984.

86. Exports of cotton lint reached 640,200 tons in 1985, a decline of 14.3 per cent on 1984 which reflects the world-wide trend—500,000 fewer bales entered world trade in 1984/1985 than in the previous crop year. However, some good results were posted: the Sudan shipped 750,000 bales in 1984/1985 compared to 666,000 bales in 1983/1984 and Egypt 837,000 bales against 560,000 bales over the same crop years.

87. Oil trade, of course, is in surplus for developing Africa as a whole but for oil importers—the majority of countries—oil imports are a very important part of the import bill. As already stated, oil imports of sub-Saharan African non-oil exporting countries are estimated by the World Bank at 372,000 b/d in 1985 (1.6 per cent more than in 1984), costing \$3.7 billion.

### C. TRADE PRICES

88. The major trend in trade prices in 1986 (needless to reaffirm) was the collapse of oil prices, which led to a steep fall in export prices for the region as a whole, accompanied by large losses in terms of trade and export purchasing power. According to provisional estimates, developing Africa's terms of trade declined by 27.9 per cent in 1986, while the purchasing power of exports fell by 30.1 per cent (as shown in table III.1). Import prices rose an estimated 2 per cent as inflation abated in industrialized countries.

89. The decline in oil prices when OPEC moved away from its quota system in December 1985 can only be described as breathtaking. With the suspension of official OPEC prices, spot prices are fully representative of market trends. Suez Blend, an Egyptian crude which had been priced at \$25.92 dollars a barrel in December 1985, was down to \$7.50 a barrel in the first week of August 1986—unprecedented since 1973—though it recovered afterwards. Brent oil, produced by the United Kingdom of Great Britain and Northern Ireland and very similar to Nigerian light crude, fell from \$27.75 a barrel on 7 January 1986 to a low of \$9.7 on 8 July 1986. For the period 7 January to 2 December 1986, the Brent average was \$14.20 or 50 per cent below its 1985 average. Another telling indication of the extent of the fall is given by the import price per barrel for OECD countries, which is estimated at an average \$15.75 for 1986 or 40.4 per cent below the \$26.45 of 1985.

90. The fall in the prices of crude exerted a strong downward pressure on all hydrocarbon prices, particularly on natural gas and refined petroleum products. As a result Algeria, which is a major gas exporter, had to lower its prices because they were determined on an oil-equivalent basis. Belgium, for example, renegotiated its agreement with Algeria, bringing down prices per million British Thermal Units to \$2.32 in the third quarter of 1986, against \$3.18 in the second quarter of that year.

91. Table III.5 shows the evolution of wholesale prices for oil and some of the main non-fuel commodities that enter into international trade.

92. In general, however, oil exporters strove to sell on a "net back" basis (which relates the price of crude to

<sup>a</sup> Estimates based on the number of months for which data are available.

the prices of refined products), a procedure which somewhat minimized their losses.

93. Apart from oil and coffee, commodity prices were weak. Coffee prices rose from late in 1985 to early in 1986, only to decline later as it became clear that the Brazilian crop would be larger than expected. The composite daily price compiled by ICO rose to around 250 cents per lb but fell below 140 cents per lb by December 1986, after Brazil offered discounts on coffee sales. (The latter price was actually below the ICO floor.)

94. Cocoa prices were disappointing. The market was under pressure from sizable stocks and average prices per lb were \$0.95 in 1986 against \$1.02 in 1985. A new development in the market was the signature by Cote d'Ivoire of the International Cocoa Agreement, which it had previously refused to sign.

95. Cotton prices fell sharply in 1985 and further declined in 1986 by an average of 23.6 per cent, according to the Liverpool cotton index. There was some recovery in the index by the end of the year.

96. Tea prices per kg, after rising to a peak of 147.49 pence in October 1986, then relapsed; and the average for the full year was down on that of 1985. For the first three quarters of 1986, the average auction price in London was 4.4 per cent below the 1985 price.

97. Copper prices per lb generally declined in 1986; in October London copper was 59.7 US cents compared to an average of 64.29 US cents in 1985, i.e. 7.1 per cent less.

98. Cobalt prices per lb fell in consequence of the decision by the African producers Zaire and Zambia to abandon their system of producer prices, reached a low of \$3 and then recovered. The free-market average price in 1986 was \$7 and a level of around \$8 is forecast for 1987.

99. A notable exception to the generally sluggish commodities was diamonds. The market was buoyant throughout 1986, registering an average rise of 7 per cent compared to 1985, with a similar rise predicted for 1987. However, diamond prices range widely according to the quality of the stones and Zaire, which is primarily a producer of industrial diamonds, apparently benefited little

because the higher prices were paid mainly for gem diamonds.

#### D. DIRECTION OF TRADE

100. The direction of the trade of developing African countries showed no fundamental changes in 1985. For both imports and exports, developed market economies were the main suppliers and customers (see table III.6). The stable pattern is rooted in the strong relationships that have been built up over the years.

TABLE III.6. DIRECTION OF DEVELOPING AFRICA'S TRADE, 1985  
(Percentage)

	Exports	Imports
Developed market economies .....	73.5	74.7
Of which:		
Europe .....	57.5	56.8
EEC .....	48.0	48.3
United States .....	12.9	8.8
Japan .....	1.4	5.6
Centrally planned economies .....	6.2	7.7
Of which:		
USSR .....	2.4	2.5
Others .....	3.7	5.2
Developing market economies .....	13.6	17.6
Africa .....	4.0	4.1
America .....	4.1	3.9
Asia .....	3.9	9.5
Not specified .....	6.8	—
TOTAL	100.0	100.0

Source: *Monthly Bulletin of Statistics*, vol. XL, No. 6 (June 1986).

101. Developed market economies took 73.5 per cent of exports and supplied 74.7 per cent of imports in 1985. The leading commercial partners were the EEC countries, whose trade with Africa was roughly 48 per cent of both exports and imports.<sup>8</sup> The United States took 12.9 per cent of regional exports, mostly oil, but supplied only 8.8 per cent of imports. In contrast, the region's trade with Japan was heavily in deficit—imports of \$3.5 billion and exports of \$902 million. Data from Japan show that the deficit continued in 1986, Japanese exports outstripping imports in the first half of the year by 66 per cent; but those exports were 22.5 per cent down on the corresponding months of 1985, in line with the overall decline in the region's imports. Within EEC, the Federal Republic of Germany was another important commercial partner, but here the balance was heavily in Africa's favour—exports of \$7.6 billion and imports of \$3.4 billion. The oil trade is the main component of exports to the Federal Republic of Germany and it declined sharply in 1986 by 21 per cent as estimated from data for the first six months.

102. Changes occurred in 1985 in the trade with centrally planned economies: those countries bought 6.2 per cent of regional exports compared to 3.7 per cent only in 1984 and their share of imports contracted to 7.7 per cent in comparison with 8.7 per cent in 1984.

103. Trade among developing countries was still below 20 per cent of both exports and imports. In particular, the region was in deficit with the Asian developing economies, which sold twice as much as they imported. In 1985, imports from those countries totalled \$5.9 billion against \$2.5 billion exported to them. That

situation doubtless reflects the rapid industrialization of countries such as Hong Kong, the Republic of Korea and Singapore which have become significant exporters of manufactured goods.

#### Intra-African trade

104. Data for 1985 indicate that intra-African trade is not growing: its share in the total external trade of African developing countries was still around 4 per cent. In absolute terms, that spelled a decline compared with 1984: an estimated \$2,563 million and a fall of 6.2 per cent. Table III.7 shows the commodity structure of the trade. Compared with 1980, such trade was nearly 13 per cent less. It must not be forgotten that there is a large amount of unrecorded trade between African countries, particularly the traditional trade between coastal countries and their neighbours in the interior of the continent. Nevertheless, the data give cause for concern. They do show that intra-African trade is not increasing and they do provide a further indication of the disappointing performance of the economy of the region.

TABLE III.7. STRUCTURE OF INTRA-AFRICAN TRADE, 1984

	Millions of dollars	Percentage of total

<sup>a</sup> Including commodities not shown.

105. Though intra-African trade is not increasing, Governments are committed to promoting it. As already reported in the last Survey, the Conference of African Ministers of Trade, at its eighth session, held at Brazzaville on 28-31 October 1985, agreed on a set of measures to promote such trade. The meeting at Addis Ababa, Ethiopia, on 3-4 December 1986 by the Heads of State and Government of the countries belonging to the Preferential Trade Area for Eastern and Southern African States (PTA) was a further indication of the commitment to further mutual trade, which is seen as a cornerstone of action for mutual co-operation and development. However, the difficulties are not to be underestimated. The above meeting decided to postpone measures to reduce tariffs, for instance, because of the possible revenue losses which member States might suffer.

106. An examination of flows makes it evident that intra-African trade was heavily "subregionalized", i.e. took place largely within rather than between subregions. Even in the subregion where trade is most diversified, North Africa, intra-African trade was virtually limited to that subregion. In East and southern Africa, trade with other countries of the subregion has averaged more than 10 per cent of total trade during 1984-1985, compared with the regional average of 4 per cent mentioned above.

107. An analysis of intra-African trade by commodity classes shows that primary products represented more than 74.3 per cent in 1984 (see table III.7), a proportion which changed little compared to 1983. However, mineral fuels and related products accounted for 38 per cent against 31.1 per cent in 1983. Agricultural trade between African countries may have increased during the drought, as some countries with surpluses supplied food grains to others, but that trade must have grown much less than food imports from developed countries. In 1984, cereals of regional origin represented only 1.1 per cent of total imports by all African developing countries.

108. It is to be supposed that intra-African trade did not increase in 1986 against the background of the general contraction of trade flows in the region and poor commodity prices.

#### E. THE BALANCE OF PAYMENTS

109. The current account balance of the region deteriorated seriously in 1986, from a deficit of \$7.1 billion in 1985 (which had itself been an improvement) to one of \$21.5 billion. The change is more than explained by the steep fall in merchandise exports. Table III.8 shows the main components of the balance, in so far as they are traceable. It will be seen that official (inward) transfers were marginally worse and known capital inflows clearly better than in 1985. Nevertheless, reserves appear to have increased by \$1 billion, compared to an increase of \$3.2 billion in 1985. That result stems from the relatively large movements in the balancing item described as "errors and omissions", which does not facilitate either the task of explaining the past or forecasting the future. A decrease in the reserves would certainly have obtained save for the building up of debt arrears by a number of countries.

TABLE III.8. BALANCE OF PAYMENTS OF DEVELOPING AFRICA, 1985-1987  
(Billions of dollars)

	1985	1986 <sup>a</sup>	1987 <sup>b</sup>

<sup>a</sup> Preliminary.

<sup>b</sup> Forecast.

110. In 1987, a further worsening of the position is expected unless oil prices strengthen substantially. On current account, some widening of the current-account deficit appears inevitable, perhaps to around \$20.3 billion.

111. Nigeria's balance of payments improved in 1985, but in 1986 the external accounts were in a state of permanent crisis. The fall in oil revenues enlarged the financial gap that would probably have existed anyway. Protracted negotiations with creditors were necessary, which reached a conclusion only in late December.

However, despite the agreements then reached projections for 1987 indicate that problems may still lie ahead. The Government cut imports severely, first through direct controls and then through the "second-tier foreign exchange market",<sup>9</sup> which raised the cost of buying foreign exchange. Those policies at least prevented a drastic depletion of the country's reserves.

112. Another country whose balance of payments came under great strain was Egypt. For many years past it benefited not only from significant oil revenues but also from transfers made by its expatriate workers in the Gulf countries, tourism receipts, the revenues provided by the Suez Canal and sizable inflows of foreign aid. All those revenue sources were jeopardized during 1985-1986, not least the oil revenues. While the current-account deficit was estimated at \$1.5 billion in 1984/1985, it was forecast to grow to \$2.3 billion in 1985/1986 and to \$3.2 billion in 1986/1987. Remittances by emigrants declined partly because of exchange rate movements, partly because of lower activity in the Gulf countries. Tourism was hit by the general climate of unrest in the Middle East. Even Suez Canal dues failed to expand as fast as expected. To compound the problems, Egypt faces heavy servicing charges on a debt estimated at more than \$38 billion at the end of 1986.

#### F. EXCHANGE RATES

113. Internationally, 1986 was marked by the depreciation of the United States dollar against the major industrial countries' currencies, mainly the yen and the deutsche mark. The fall had started early in 1985 but it gathered momentum after the September 1985 meeting of the finance ministers of the Group of Five. The meeting declared that the dollar was overvalued and that an adjustment of its value was necessary for balance in the world economy, particularly for correcting the trade imbalances between the United States on the one hand and Japan and the Federal Republic of Germany on the other hand. The yen, which had been traded in 1985 at an average level to the dollar of 238.54, was trading at the end of 1986 around 159. The corresponding rates to the dollar of the deutsche mark were an average of 2.32 in 1985 and 1.94 by the end of 1986. In trade-weighted terms, the dollar depreciated by 13.6 per cent during 1986 (*The Economist*, 3-9 January 1987).

114. The CFA franc, which is held at a fixed parity to the French franc and was exchanged on the average at 449.3 to the dollar in 1985, accordingly reached 334 to the dollar by December 1986, an appreciation of 34.5 per cent. The average exchange rate in 1986 was CFAF 347.6 to the dollar, 29.2 per cent up on 1985.

115. For other African currencies 1986 was marked by a substantial number of devaluations and other monetary adjustments. Six countries, namely, Burundi, the Gambia, Ghana, Sierra Leone, Tunisia and the United Republic of Tanzania, formally devalued their currencies, while Nigeria, Somalia and Zambia introduced foreign currency auction systems which resulted in considerable *de facto* devaluations.

116. The Government of Tunisia, confronted by a severe economic crisis, devalued the dinar by 10 per cent relative to competing exporters in the framework of a stand-by agreement with IMF, which also provided for a flexible exchange-rate policy. By the third quarter of 1986 the dinar had fallen 7.8 per cent compared to the second quarter.

117. The Gambia also embarked on a structural adjustment programme supported by IMF when decreeing a large devaluation, the value of its currency falling in the third quarter of 1986 by 47.1 per cent compared to the 1985 average.

118. In Sierra Leone, where the rate of inflation had risen to around 100 per cent by the middle of 1986, the leone was floated in the framework of the Economic Recovery Programme on June 27, 1986 and the devaluation reached an average of 77.1 per cent by the third quarter of the year.

119. The Government of Ghana made several adjustments to the value of the cedi following those made in 1985. By the end of the third quarter of 1986 the cedi had been devalued by 40 per cent compared to the 1985 average level.

120. The decision taken by the authorities in the United Republic of Tanzania to devalue the currency was a momentous one, given their long-standing opposition to devaluation. In the framework of the package of reforms agreed upon with IMF, the exchange rate was changed to 40 Tanzanian shillings to the dollar in June 1986, a 56 per cent devaluation relative to the average 1985 value. The rate to the dollar subsequently drifted down to an average of TSh 43.7 in December 1986.

121. The Libyan Arab Jamahiriya had for long pegged its currency, the dinar, to the dollar at the fixed rate of \$3 377. Early in 1986 the Government pegged it instead to the Special Drawing Right (SDR), a move which resulted in a 7 per cent depreciation relative to the dollar.

122. In Uganda, the new Government established at the conclusion of the civil war up-valued the currency in May 1986, despite considerable depreciation on the free market. At the same time, it abolished the two-tier market system. It set the rate at 1,400 Uganda shillings to the dollar although the non-priority rate had been USh 5,000 to the dollar in May 1986.

123. As stated in chapter II, section C, the introduction by Nigeria of the structural adjustment programme in July 1986 was followed by that of the second-tier foreign exchange market on October 1, 1986. The latter move led to a rapid decline in the value of the naira, which by the year-end was quoted against the dollar at N 3.477 compared to the 1985 average of N 0.892, a fall of 74 per cent.

124. The same auction route had been taken in October 1985 by Zambia and resulted in a considerable devaluation of the kwacha: that currency was quoted against the dollar at the year-end at nearly 15 compared to 5.01 when the auction system began.

125. The Government of Ghana announced in September 1986 its intention to experiment with an auction system, which would in fact mean opening a second "window". The second rate was in the range 120-140 cedis to the dollar. In the parallel market, however, trading was reported to be taking place at c210 to the dollar.

126. In another development, the countries of southern Africa whose currencies are linked to the rand were affected by its loss in value in relation to the major world currencies. One country, Swaziland, ended the status of the rand as legal tender in February 1986.

127. Overall, weighting exchange rates by African exports to the United States in 1980, there was a slight appreciation (1.4 per cent) of the currencies of African

developing currencies against the dollar in 1986. In 1987 a depreciation of 6 per cent is expected.

#### G. EXTERNAL RESOURCE FLOWS

128. According to information published by OECD,<sup>10</sup> net resource flows to developing countries declined in 1985, both in current and in real terms, to an estimated \$80.1 billion compared to \$83 billion in 1984. The peak value of \$138.6 billion was reached in 1981. The fall was 4.5 per cent in real terms and was the third since 1982. It was due mainly to the contraction of export credits and private flows: export credits are estimated to have been only \$3 billion in 1985 compared to a peak of \$18 billion in 1981 and private flows \$29 billion compared to a peak (also in 1981) of \$74.3 billion. That adverse trend was no doubt linked to the debt crisis of developing countries and to the reduction in investment by oil-exporting countries with the decline in oil prices. Bank credit was particularly affected. It has fallen by 75 per cent since 1975. In contrast, official development finance, particularly official development assistance (ODA), continued to grow, albeit only when expressed in current prices. In 1985, ODA flows increased by 2 per cent and came to account for 44.1 per cent of total flows compared to 25.4 per cent in 1980.

129. Member countries of OECD remained the main source of resource flows to developing countries. In 1985 they provided 62.6 per cent of bilateral ODA flows compared to 60.2 per cent in 1980. The share of DAC members would be even greater if multilateral flows were apportioned according to the national sources of funding of the multilateral institutions.

130. Information now available unfortunately does not segregate data according to the criteria used by ECA and it is impossible at this stage to give a picture of net resource flows to the African region as a whole. However, data exist for sub-Saharan Africa, which is the part most dependent on external assistance. Table III.9 shows that, after falling in 1984 to a low of nearly \$12 billion, resource flows to sub-Saharan Africa (North Africa excluded) increased by a substantial 15 per cent in 1985. In real terms the increase can be estimated at nearly 14 per cent, in sharp contrast to the evolution in other

Source: OECD, *Financial and External Debt of Developing Countries: 1985 Survey* (Paris, 1986).

developing regions. In fact, the share of sub-Saharan Africa in total net resource flows has been increasing and now stands at 17.1 per cent compared to 11.8 per cent in 1980 and 12.7 per cent in the period 1975-1976. The situation for official and officially-supported finance is even more remarkable: sub-Saharan Africa with 11 per cent of world population was receiving in 1984 more than Asia with 70 per cent. The conditions of finance were also more favourable for sub-Saharan Africa than for most other regions: the grant element of official development finance in 1984 was 91 per cent compared to 77 per cent for Asia, 86 per cent for the Middle East and North Africa and 86 per cent for the Western hemisphere (Latin America and the Caribbean).

131. However, the evolution of the pattern of aid to sub-Saharan Africa shows a growing preponderance of official flows. That has arisen partly because export credits have practically vanished and private flows have been reduced to a fraction of their 1980 level. An effective programme of aid requires a well-balanced mixture of official and private-sector efforts, since each party has a distinctive contribution to make.

132. The OECD secretariat considered that prospects were good for an increase of resource flows generally in 1986, believing that the declining trend in evidence since 1981 had been reversed and that a more stable pattern was emerging. OECD forecast that net resource flows would increase in 1986 by 20 per cent in current terms and by 6.7 per cent in real terms, with flows to sub-Saharan Africa gaining 7.3 per cent in real terms.

133. There is no clear evidence to date as to whether the OECD forecast for sub-Saharan Africa proved accurate. There have been conflicting trends, in that some donors reduced their aid commitments, especially once it was evident that the drought emergency had passed. However, some developments at the multilateral level and in some donor countries and institutions are worthy of note.

134. The World Bank set up a Special Facility for Sub-Saharan Africa in July 1985, through which it expected to mobilize resources amounting to \$1.2 billion.

The intention is that the Facility would provide funds for countries eligible to receive assistance from IDA, in the context of appropriate medium-term policy reforms. Access to the funds is therefore conditional, in effect, on recipient countries adopting policy reforms approved by the World Bank. It is encouraging to note that \$782 million dollars was pledged by donors to the Facility in its fiscal year 1986, 45 per cent for the purpose of structural adjustment credits.

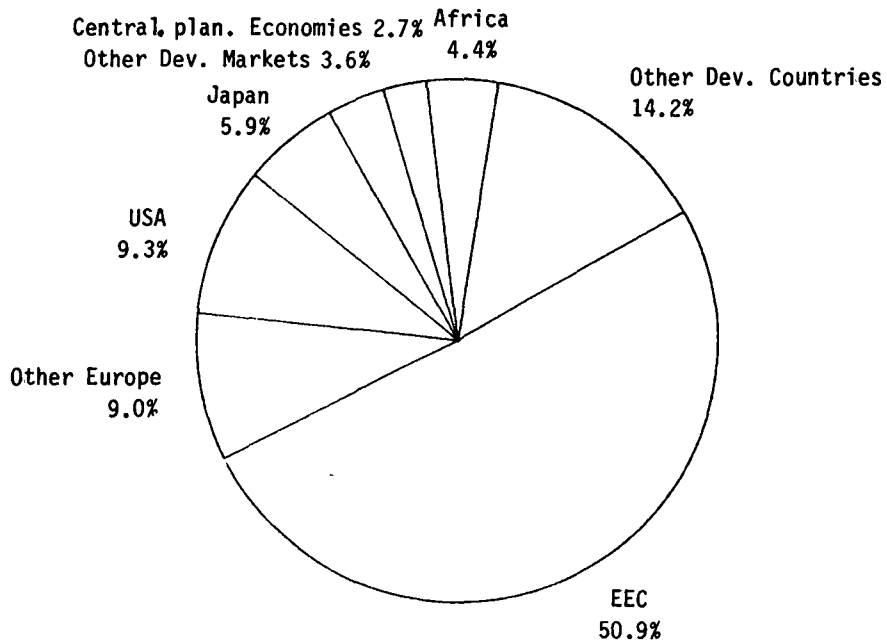

135. For its part, IMF had created a Structural Adjustment Facility in March 1986 to assist low-income countries. Resources were to be drawn from repayments into the IMF Trust Fund, which are expected to amount to SDR 2.7 billion in 1985-1991. Access to the Facility is dependent on recipient countries undertaking a three-year structural adjustment programme within a policy framework developed jointly with the staffs of the World Bank and IMF. The first country to gain access was Burundi, which will be able to borrow SDR 20 million from the Facility, as well as a stand-by loan of SDR 21 million. Burundi has duly set up a three-year structural adjustment programme. The richer countries of North Africa and relatively rich oil-exporters like Nigeria are the only African developing countries excluded from access to the Facility.

136. The French Government, which is a major donor of aid to Africa, announced important policy changes in September 1986. While its development assistance has recently been less concentrated on Africa, it was announced that priority would be given henceforth to the francophone African countries because of the difficulties facing the region and the traditional ties with those countries. In 1986, ODA by France represented 0.52 per cent of GNP and the objective for 1987 was announced as 0.54 per cent. While ODA by France has increased since 1981, there have been reductions in the share of grants relative to loans and in the percentage of ODA that consisted of bilateral aid and of allocations to the Assistance and Co-operation Fund. That tendency would be reversed, the Minister for Co-operation announced, with an increase in bilateral aid, in the share of grants, in allocations to the Fund and in structural adjustment loans.

DEVELOPING AFRICA  
Direction of Trade 1985 IMPORTS

## IV. FISCAL, MONETARY AND PRICE DEVELOPMENTS

137. During the period 1985-1986, many African countries continued to undertake far-reaching adjustments and policy reforms. Subsequent to the adoption of APPER, Governments have shown determination to take concrete steps towards economic reforms including fiscal and monetary policy packages to deal with domestic imbalances. Some of those policies, which are discussed in the sections below, were taken at great political risk. The fact that they were taken at all illustrates the determination of Governments to achieve economic stability.

### A. FISCAL DEVELOPMENTS

#### 1. Revenue

138. Most African countries witnessed an appreciable increase in nominal terms in their recurrent revenues.<sup>11</sup> A similar trend was observable in 1986, although the rates of increase were generally lower than in 1985. Furthermore, a majority of countries reported budget out-turns in 1985 and 1986 that showed revenues higher than had been anticipated in the preceding budget forecasts. However, in interpreting the increase in nominal revenues attention must be paid to two important factors. First, the increase was less in many countries than the rate of inflation, so that in real terms recurrent revenues did not increase significantly for the region as a whole. Secondly, some countries, such as Ghana, Uganda and Zambia, registered increases that were far below the rate of depreciation of their currencies.

139. The main factors that accounted for the increase in revenues in nominal terms, especially in 1985, include:

(a) a continued trend towards more effective tax collection and administration, with a recovery rate reaching nearly 100 per cent in some countries;

(b) a better performance of the national economies in terms of income growth, relative to the preceding years;

(c) depreciation of many African currencies against major currencies with a resultant boom in nominal revenues from international trade and other domestic indirect taxes; and

(d) a general increase in the most important tax rates, especially those for indirect taxes.

140. Efforts to widen the tax base came up against the increasing importance of economic activities not officially recognized. Many Governments, concerned by the decline in real income, were not inclined to raise direct taxation rates. The general weakness of export commodity prices, coupled with the fall in the volume of imports, also affected revenues, since taxes on international trade represent such a high proportion of government revenues.

141. Among economic groupings of countries, the most important trend during 1985 and 1986 was the poor revenue performance of the oil-producing countries.

During 1986, in particular, all those countries registered either a decline or an appreciable deceleration in the growth of government revenues, a direct result of a drastic fall in oil revenues. In Nigeria, the initial revenue estimates for 1986 were rather optimistic and were made obsolete by the fall in exports from \$11.2 billion in 1985 to only \$6.8 billion in 1986, causing revenue estimates for 1987 to be set 27.3 per cent below those for 1986 (when expressed in dollars). In Algeria, where revenues from hydrocarbons fell 8.4 per cent in 1985, the first estimates for 1986 were 7.7 per cent lower than those of 1985; later revisions showed a drastic 44.2 per cent fall against 1985. In Tunisia the original 1986 budget estimates of expenditure had to be revised downwards. Spending on investment and financial operations in particular were reduced by 7.2 per cent. The reduction in oil revenues was estimated to account for one third of the deficit in the 1986 budget. The Congo, Egypt and the Libyan Arab Jamahiriya also suffered similar fates as regards oil revenue. The overall effect of the poor revenue performance of the oil-producing countries is that for the region as a whole the ratio of revenues to GDP declined from 25.4 per cent in 1985 to 24.9 per cent in 1986. For the oil-exporting countries combined, the ratio declined from 29.2 per cent in 1985 to 27.1 per cent in 1986—a rather modest fall which may understate the true position because the figures for 1986 are the budget estimates, not the actual revenues.

142. The prospects for significantly increasing government revenues in 1987 seem to be relatively remote. That is indeed evidenced by the widespread caution apparent in most of the African budgets for fiscal 1986. The trend is, again, most pronounced for the oil-producing countries. Algeria, the Congo, Egypt and Gabon have all based their estimates on a cautious view of the evolution of the world oil market in the near future. The non-oil producing countries show signs of a continued reluctance to increase direct taxes in the face of the decline in real income. Indeed some budgets (e.g., those of Swaziland, Zambia and Zimbabwe) have promulgated explicit tax relief packages, with allowances and/or rebates.

143. The structure of revenue continued its historical trend during 1985 and 1986: indirect taxes and those on international trade accounted for 40 per cent or more of the total and around 26 per cent of the total, respectively, in each of the two years. Indirect taxes exclude oil royalties: if they were added in, the share of indirect taxes in total revenue would be substantially larger. The upward trend was, of course, accentuated by (a) the decline in revenues from oil royalties; (b) the reluctance of Governments to accelerate the increase in direct taxes; and (c) the devaluation of many currencies, resulting in higher absolute tax receipts in local currencies from *ad valorem* duties on imported goods and export commodities.

144. Table IV.1 shows major fiscal indicators in the form of percentage ratios for the region as a whole.

TABLE IV.1. MAJOR FISCAL INDICATORS IN DEVELOPING AFRICA, 1984-1986 (Percentage)

	1985	1986	1987

## 2. Expenditure

145. Despite the widespread and genuine efforts of African developing countries to curtail the growth of government expenditures, the 1985 and 1986 fiscal exercises witnessed, on the average, increases that were greater than those in revenues. As table IV.2 indicates, the increase in total expenditures was faster in 1985, with as many as 28 out of a sample of 39 countries recording increases of over 10 per cent. Only 17 countries in the sample had an increase in total revenue of over 10 per cent in that year. In 1986, the rate of increase in government expenditures showed signs of slowing down, mainly as a result of the necessity, especially in the oil-producing countries, to cut down their budgets drastically. For the region as a whole, the weighted average ratio of total government expenditures to GDP at current prices increased from 33 per cent in 1984 to 33.5 per cent in 1985, then jumped to 35.2 per cent in 1986.

146. Continuing the trend that has prevailed since the beginning of the 1980s, the increases were generally due to the expansion of recurrent expenditures. However, with the rate of growth of the latter slower than that of total expenditures in Algeria, Côte d'Ivoire, Egypt, Kenya, the Libyan Arab Jamahiriya and Nigeria, the contribution of recurrent expenditures to the overall

increase in total expenditures was less in 1985 and 1986 than in the preceding years, taking the region as a whole. In point of fact, more countries registered rates of increase in recurrent expenditures that were less than their rates of domestic inflation in both 1985 and 1986 than in the immediately preceding period.

147. Overall, government capital expenditures do not seem to have increased faster in 1985 and 1986 than in 1983 and 1984. It must be emphasized that for quite some time such expenditures had either been stagnant or declining, with the result that the share of capital formation by government in national fixed capital formation had slipped appreciably. By 1984, the weighted ratio of government capital expenditures to GDP for the region as a whole had declined to only 13.1 per cent from 14.9 per cent in 1982. It is clear that the adjustment programmes have led to a reduction of investment expenditures because cutting into recurrent expenditures involved socially sensitive issues. In 1985 and 1986, the regional ratio of government capital expenditure to GDP fell to 12.7 per cent and 12.4 per cent, respectively. In the available estimates for 1987, the proportion is down to 12.2 per cent. It must be pointed out, however, that few countries recorded surpluses on their recurrent budgets. Capital budgets, therefore, tended to depend largely on domestic and external borrowing. The share of each type of finance in financing the deficit tended to be around 40 per cent for external financing and 60 per cent for external financing in recent years with no clear change in 1985 and 1986.

148. Broadly, the major factors that serve to explain the only limited success of African developing countries in controlling recurrent over-runs of expenditure seem to have been the structural rigidity of most of the expenditures and the social sensitivities that are associated with some specific expenditure items. First, recurrent expenditures in most African countries are characterized by the large proportion related to personnel. In most cases such expenditures tend to be difficult to adjust downwards. Thus Governments were faced with very limited possibilities of achieving substantial reductions in salaries, wages and other personnel allowances, especially in the face of persistent inflation. Secondly, a significant part of recurrent expenditure was for vital services such as education and health. They are as a consequence, not easily reducible without serious consequences for the social well-being of the population. Indeed, in some countries concern began to be expressed about the adverse effects of austerity measures on supplies in critical areas of the economy and in the society as

TABLE IV.2. FREQUENCY DISTRIBUTION OF SELECTED COUNTRIES ACCORDING TO GROWTH RATES OF GOVERNMENT EXPENDITURES, 1985-1986

Growth percentage	Total expenditures		Recurrent expenditures		Capital expenditures

Source: ECA secretariat.

a whole. Thirdly, some countries faced serious problems and/or difficulties in trying to reduce certain types of subsidies, especially those on food. Such a course of action is bound to be politically sensitive.

149. In addition to such mainly structural problems, many Governments had to deal with three other factors that diminished their capacity quickly and durably to re-establish financial equilibrium, namely: (a) the mounting burden of debt service; (b) the depreciation in value of their national currencies during the period; and the continuing inflationary pressures that tended to push costs beyond estimated levels. It must be emphasized that until a satisfactory solution is found to the debt problems of African developing countries, it will indeed become increasingly harder to limit the expansion of government recurrent expenditures. The "Front-line States" had to face during the period under review the peculiar problem of incurring extraordinary expenditures resulting from the many difficulties of the situation in southern Africa.

150. Despite the structural rigidities and sensitivities, however, all African Governments consistently endeavoured to control expenditures. To achieve that objective a number of innovative and sometimes radical policy measures were attempted during 1985 and 1986. One such policy that received particular attention was the reform of public enterprises. Many countries recognized the importance of reducing government transfers or subventions to para-statal bodies. Some countries embarked on a reassessment of the public sector with a view to identifying those enterprises that could be retained without creating financial burdens and those which should be totally or partially privatized or even liquidated. Some countries, such as Nigeria, have already proposed the gradual divestiture of government holdings in the specific areas of agricultural production, hotels, food, beverages, breweries and distilleries. Another policy measure that seems to have been prevalent in spite of the obstacles is the reduction of subsidies. A number of countries announced the elimination of or reduction in subsidies on petroleum and food items such as rice and maize meal.

### 3. Budget deficits

151. While the budgets of most Governments remained in deficit in 1985 and 1986, there was a perceptible deceleration in the rate of increase of those deficits, especially during 1985. More countries were able to report a decline in the deficit relative to either the 1984 level or the 1985 budgeted estimate. The factors behind that healthy trend were mainly increased revenue and some measure of austerity and financial discipline in expenditure. The slower expansion of budget deficits was not uniformly observable, however, in all countries: the oil-producing ones suffered from the repercussions of depressed oil prices on their revenue. Most indicators show that fiscal 1986 might see higher deficits, with the regional ratio of deficits to GDP rising sharply.

152. The financing of the budget deficits in 1985 and 1986 continued to depend largely on borrowing from the domestic banking system and on external grants and loans. Many countries reported meeting difficulties in raising domestic resources from outside the banking system. Among the commonly cited problems was the already high level of expenditure in servicing the domestic public debt and the low level of domestic sav-

ings. The trend of persistent borrowing from the banking system had to be reversed because of its adverse effects, particularly on the rate of domestic inflation. In the face of increasing debt-servicing burdens, there was a noticeable decline in the level of external borrowing to finance the capital programmes of the Governments.

### B. MONETARY DEVELOPMENTS

153. In 1985 the growth of the major monetary aggregates accelerated. On the basis of a sample of more than 30 African developing countries for which details of monetary indicators were available, money supply narrowly defined (M1: currency outside banks plus demand deposits), as well as the total volume of money (M2: money supply plus quasi-money, i.e., savings and time deposits), increased faster in 1985 than in 1984. As shown in table IV.3, M1 for the sample group increased by 17.1 per cent (at 1980 exchange rates) compared to 15.6 per cent in 1984; and the total volume of money including quasi-money increased 18.5 per cent in 1985 compared to 16.4 per cent in 1984.

TABLE IV.3. WEIGHTED AVERAGE GROWTH RATES OF MONETARY INDICATORS IN SELECTED AFRICAN COUNTRIES, 1984-1985\*

	At current exchange rates		At 1980 exchange rates	
	1984	1985	1984	1985

Source: Calculated and compiled from data in *International Financial Statistics*, vol. XXXIX, No. 11 (November 1986).

\* Weighted by GDP.

154. It is to be noted in the table, however, that at current exchange rates, there was on the contrary a deceleration in the growth of money supply in 1985. In fact, M1 declined slightly by 0.6 per cent, while M2 increased by 0.3 per cent only. The main explanation is that many national currencies depreciated more in 1985 than in 1984.

155. Table IV.4 provides a frequency distribution for a sample of countries according to the growth rate of money supply (M1) experienced. An analysis of the table shows that the expansion of money supply was less evenly distributed among countries in 1985 than in 1984. In 1985, there were more countries that registered an actual contraction but also far more countries that recorded a very rapid increase. Money supply contracted in 1985 in Togo (-8.8 per cent), Benin (-2.7 per cent), Kenya (-1.4 per cent) and Madagascar (-0.6 per cent). The countries where M1 expanded by more than 30 per cent in 1985 were Sierra Leone (85 per cent), Uganda (83.8 per cent), Somalia (83.2 per cent), the Gambia (62.8 per cent), Ghana (42.7 per cent), Zambia (41.6 per cent) and Zaire (31.3 per cent).

156. The major factor that accounted for the faster growth in M1 in 1985 in most of the countries concerned was the rapid expansion in domestic credit. As table IV.3 shows, domestic credit increased by 19.3 per cent at

1980 exchange rates compared to 21.9 per cent in 1984; at current exchange rates, the increase in 1985 was 3.9 per cent compared to 11.8 per cent in 1984. Both the public and the private sector participated in the expansion of credit: at 1980 exchange rates the increases were 27.1 per cent and 12.2 per cent, respectively. The depreciation of national currencies was clearly associated with those increases in credit. In certain countries, such as Zambia, which devalued their currencies appreciably there was a concomitant dramatic rise in the operating costs of private and public enterprises which, in turn, necessitated a massive resort to domestic borrowing. At the same time, the financing of many government budget deficits in 1985 relied heavily on borrowing from the banking system. (There were a few countries, such as Botswana, where the Government had an overall surplus in its transactions with the banking system.)

157. The level of foreign assets played a less direct role in the expansion of money supply in 1985, since there was a widespread decline in those assets in most countries. Only a handful of countries, such as Botswana, Burundi, Cameroon and Ethiopia, had an increase in foreign assets that was significant enough to influence the level of money supply. However, to the extent that a decrease in foreign assets resulted in an increase in indebtedness and a concomitant increase in government borrowing, there was an indirect influence on the money supply.

### C. PRICE DEVELOPMENTS

158. Developing Africa witnessed a slower increase in prices in 1985 than in 1984. The percentage change in the consumer price index for the region as a whole was 11.7 per cent in 1985 compared with 24 per cent in 1984. While the 1985 increase was undoubtedly high, it is noteworthy that (as shown in table IV.5) it was considerably lower than the world average of 19.5 per cent and little more than a fifth of the average for developing countries as a whole. As shown by table IV.6, there was undoubtedly a downward shift of the distribution of countries according to the rate of inflation. The number of countries having a rate of less than 5 per cent went up to 8 compared to 5 in 1984, the median falling in the 5 to 10 per cent range while it was in the 10 to 15 per cent range in 1984.

159. Price movements showed a generally declining trend throughout 1985. After growing by 2.8 per cent in the first quarter and by 3.2 per cent in the second, con-

sumer prices settled down to a rate of growth of less than 1 per cent in the remainder of the year. In 1986, however, results for the first two quarters indicate an acceleration of inflation, which could reach 14.7 per cent for the year as a whole. This figure may not be significant however because of the limited size of the sample of countries concerned.

160. However, some African countries diverged from the regional trend just described. Uganda, for example, recorded a very large increase: the consumer price index rose by 133 per cent in 1985 compared to 38.3 per cent in 1984. Sierra Leone, Somalia, the Sudan and Zimbabwe also registered rates of increase of over 30 per cent. Table IV.6 shows the frequency distribution of a sample of countries according to the severity of price increases.

161. The moderation of inflation in 1985 is one of the positive results of the various stabilization measures taken by African governments. The contraction in domestic demand resulting from those measures was, perhaps, the most important contributing factor in the slower rate of inflation. But the recovery of agriculture in 1985 and the resulting improved food supply also played an important role. Equally important was the lower rate of increase in the cost of imports, because of the much-reduced inflation in industrialized countries. The incidence of the agricultural recovery is quite clear in Ethiopia, where consumer prices, which had increased rapidly in 1984 and in the first nine months of 1985, fell 8.6 per cent in the fourth quarter of that year when harvesting began. That decline was equivalent to a fall of 30.2 per cent in annual terms. The market price of cereals, which had risen by 56.2 per cent in the capital city, Addis Ababa, decreased by 30.8 per cent in 1986.<sup>12</sup>

162. The force making for increased inflation during 1985-1986 in countries such as Ghana, Sierra Leone and Uganda was mainly excess domestic demand, particularly budget deficits, which were still too high and resulted in central bank borrowing. In Uganda, for example, the projected deficit on the 1986/1987 budget is

three times that of 1985/1986 and is to be financed mainly by bank borrowing. In addition to those factors, foreign exchange shortages affected the supply of imported goods and contributed to inflation in those countries. Devaluation also tended to fuel inflation, at least in its first stage. Zambia is an example of that situation.

**Part Two**  
**PRODUCTION OF GOODS**

## V. DEVELOPMENTS IN AGRICULTURE, FISHING AND FORESTRY

### A. AGRICULTURE

#### 1. Overall output of agriculture

163. According to data provided by FAO, the output of agriculture (including fishing and forestry) in developing Africa increased by 3 per cent in 1986 compared to a compound average annual rate of 2.31 per cent in the period 1980-1986.

164. The best results were obtained in East and southern Africa, where the primary sector grew by 5.18 per cent in 1986. In that subregion, above-average harvests were reported in Kenya, Malawi, Somalia, Swaziland, Zambia and Zimbabwe. In North Africa, agricultural output is reported to have grown by 2.95 per cent in 1986. That satisfactory performance was due in no small measure to the remarkable output of cereals in Algeria and Morocco. The performance of agriculture in the subregions of Central and West Africa and in the Great Lakes area was likewise satisfactory; the percentage growth in output is reported to have been 2.43, 2.65 and 1.05, respectively (see table V.1).

TABLE V.1. GROWTH RATES OF AGRICULTURAL PRODUCTION, BY SUBREGION\*

	1984	1985	1986	1980-1986

\*Calculated from production index numbers, base 1979-1981 = 100.

#### 2. Food production and crops in 1985-1986

165. Food production improved remarkably in 1985 in a number of African countries, largely owing to the favourable weather conditions which prevailed in the region. By the end of 1985 12 countries had had a good cereal harvest, of which seven had already jointly accumulated an exportable surplus of 2.5 million tons. That outcome improved on that of the previous year by 36 per cent and was above the long-term average. The recovery was especially pronounced in the Sahelian countries, except for Cape Verde, which was still suffering from prolonged drought.

166. Table V.2 shows for the region as a whole the production of the principal cereal crops, cassava and pulses. Total cereal production rose by 5.9 per cent from 73.2 million tonnes in 1985 to 77.5 million tonnes in 1986. Over the same period cassava and pulses each grew by 5.6 per cent.

167. In 1985 output of cereals in West Africa was estimated at a record 23 million tons. Eight countries (Benin, Burkina Faso, Chad, Côte d'Ivoire, Mali, the

Niger, Senegal and Togo) produced above-average quantities of coarse grains. The combined production of cereals in the 11 countries of East Africa (Burundi, Comoros, Djibouti, Ethiopia, Kenya, Rwanda, Seychelles, Somalia, the Sudan, the United Republic of Tanzania and Uganda) was estimated at 19.1 million tons, some 50 per cent more than the 1984/1985 cereal harvest. In southern Africa harvests were also generally good except in Angola and Mozambique, where civil strife still hampered production, and in Botswana, where drought conditions prevailed for the fifth consecutive year. In North Africa output of cereals was higher than in 1984, due mainly to better harvests in Egypt, Morocco and Tunisia. The combined cereal output in the seven countries of Central Africa (Cameroon, the Central African Republic, the Congo, Equatorial Guinea, Gabon, Sao Tome and Principe and Zaire) was estimated at 2.4 million tons, some 17 per cent above the average for the previous five years. Production of roots and tubers in 1985 increased by about 4 per cent in the Great Lakes countries. Taking the region as a whole, food grain production increased at an annual rate of 2.8 per cent during 1981-1985.

168. Despite the overall improvement in 1985, many African countries continued to rely on commercial food imports and food aid to meet their structural deficits. That was particularly true of the six drought-prone countries: Angola, Botswana, Cape Verde, Ethiopia, Mozambique and the Sudan.

169. In 1984/1985, the region as a whole imported 32.5 million tons of cereals. The largest importers were North African countries (Algeria, Egypt, the Libyan Arab Jamahiriya and Morocco). In 1985/1986, sub-

Saharan countries required 3.2 million tons of cereals as food aid on top of commercial imports of about 8.1 million tons.

170. Turning to 1986, the FAO Global Information and Early Warning System reported that the harvest was favourable in most parts of the continent. In North Africa, the output of cereals in Morocco and Algeria was estimated at 7.2 million tons and 3 million tons, respectively. In contrast unfavourable weather in Tunisia was estimated to have brought the crop down to less than 30 per cent of the record harvest of 1985.

171. In the coastal countries of West Africa crop conditions were generally good and above-average harvests are expected to have been gathered in Ghana and Guinea. Dry conditions adversely affected maize production in Togo, however, and in Nigeria cereal production results were mixed. Crop conditions are reported to have been generally good in Burkina Faso, Chad, the Gambia, Guinea-Bissau and Mali but unfavourable in Cape Verde and Mauritania. Irrecoverable losses and poor crop conditions were reported in the Niger and the northern and central parts of Senegal, where damage from locusts and grasshoppers also posed a serious threat.

172. In East Africa, above-average harvests were obtained or expected. In the Sudan, the area sown to sorghum and millet is estimated to have been 6.7 million hectares — well above the average for the past five years. In Ethiopia the harvest is reported to have been good. However, in both the Sudan and Ethiopia, crops were threatened by locust infestation. Moreover, in southern Sudan there is still a risk of widespread starvation unless steps are taken to accelerate the delivery of relief supplies. Main-season harvests of coarse grains were good in Burundi, Rwanda, the United Republic of Tanzania and Uganda, while above-average output was expected in Kenya and Somalia.

173. In southern Africa, above-average harvests were reported in Malawi, Swaziland, Zambia and Zimbabwe. Due to poor weather conditions and/or internal strife, cereal harvests were reported to be below average in Angola, Botswana, Lesotho and Mozambique. The loss of crops in Botswana after the long drought was an acutely serious blow. Botswana also faced the worst brown locust infestation of any African country.

174. While the advent of good rains mitigated the severe effects of the drought years, it created ideal conditions for the breeding of grasshoppers and four different locust species: the African migratory locust (*locusta migratoria migratorioides*), the red locust (*nomadacris septemfasciata*), the brown locust (*locusta paradalina*) and the desert locust (*Schistocerca gregaria*). To overcome the threat of locusts to food crops, ground control operations and/or aerial spraying campaigns have been organized. In some instances, however, the ground operations were handicapped by shortages of pesticides, vehicles, ancillary equipment and trained personnel. The external assistance pledged in cash and kind for current control campaigns is estimated at about \$35 million, of which approximately \$23 million was donated to countries in West Africa and \$12 million for Central, East and southern Africa.

175. Despite more encouraging food production in the immediate past the long-term perspectives continue to be a matter of grave concern. In most countries the basis for sustained and self-reliant development is still

fragile and many of the underlying factors that contribute to the adverse production conditions have still to be effectively tackled. In many countries disparities between urban and rural incomes are widening; policy shifts in favour of agricultural development are still inadequate or only tentative; agricultural terms of trade continue to deteriorate; and marketing facilities are inadequate. Broadly speaking, the long-term technological and economic foundations for increasing agricultural productivity at well above the rate of population growth remain lamentably lacking.

### 3. Production of industrial crops

176. The production of industrial crops in developing Africa is being seriously handicapped by (a) the low producer prices which farmers receive; (b) heavy taxation of agricultural exports; (c) heavy protection of fledgling industries; and (d) the inefficiency of many marketing agencies and of parastatal bodies in general which are concerned with the agricultural sector. The paragraphs which follow contain more specific information on individual commodities.

#### (a) Cocoa

<sup>b</sup> Forecast.

178. Production of cocoa beans in developing Africa is estimated to have remained stagnant at around 1.1 million tons in 1984/1985 and 1985/1986 and is forecast to decline to 1 million tons in 1986/1987. In Nigeria, where the 1985/1986 out-turn was 120,000 tons, production is provisionally forecast to decline in the next crop year to a mere 80,000 tons. That is indeed a dismal prospect and would represent the lowest level for nearly 40 years of the commodity, which constitutes the major non-petroleum export. The latest information reveals that further losses are being sustained owing to the spread of black pod disease, against which little or no spraying is taking place. Purchases of cocoa by the marketing board, in 1985/1986 were equivalent to only 70 per cent of those in 1978/1979. Considerable aging of the existing cocoa plantations and the diminishing profitability of growing cocoa beans compared to occupations in the urban sector account for part of the poor performance. The greatest concern at present centres on the question of quality. With the demise of the Nigerian Cocoa Board on 30th June 1986, responsibility for purchases has been left to the private sector and the co-

operatives. However, cocoa expertise in the private sector is thinly spread and there has been a tendency to accumulate stocks without due regard to quality. As a result, the cocoa is often sold before it has been adequately dried or properly fermented.

179. In Ghana production is estimated to have reached 215,000 tons in 1985/1986 compared to 175,000 tons in 1984/1985. That result owes much to the thorough overhaul of the transport infrastructure and the provision to farmers of materials for spraying against fungal diseases. However, a much more fundamental factor has been the policy of combining increases in producer prices with the devaluation of the currency, the cedi. Those measures have immensely contributed to strengthening the incentives of a large number of farmers.

180. In Cameroon cocoa production is estimated to have reached 118,000 tons in 1985/1986 and is forecast to reach 125,000 tons in 1986/1987. The government bonus scheme for cocoa farmers which was introduced in 1985 continued in 1986. Among its most significant advantages is that it provides a certain amount of income to growers outside the main harvest season.

181. In Côte d'Ivoire—the world's largest cocoa producer—the final out-turn of the 1985/1986 crop is estimated to have been 570,000 tons. However, following the protracted dry period in the 1986/1987 growing season, production is forecast to decline to 515,000 tons in the following crop year.

182. Meanwhile a new International Cocoa Agreement was adopted on 25 July 1986, marking the successful conclusion of more than two years of negotiations held under the auspices of UNCTAD. According to the UNCTAD secretariat buffer stocking constitutes the main mechanism of price stabilization provided under the Agreement. The overall size of the buffer stock remains unchanged at 250,000 tons, with a possibility of an additional 100,000 tons should the Agreement be extended for a period of more than one year. The Agreement provides for a price review whenever the buffer stock has bought or sold 75,000 tons of cocoa during any six-month period after it enters into force. It is stipulated that the price of cocoa beans shall be determined by reference to a daily price and an indicator price, both expressed in SDR.

183. No country had ratified the Agreement up to the end of September 1986. The major exporting coun-

tries (those in Africa and Brazil), however, gave notice that they would apply the Agreement provisionally. (Among the signatories are a number of consumer countries, including members of the EEC.)

#### (b) Cotton

184. Production of seed cotton in developing Africa is forecast to reach 6.4 million bales in 1986/1987, only slightly above the preceding season's crop (6.3 million bales). Within that total, Egypt is expected to produce 2.1 million bales (compared to 1.98 million bales), while in Zimbabwe the anticipated gain in productivity would take output to some 503,000 bales, but in the United Republic of Tanzania and Nigeria production is expected to remain close to the 1985/1986 levels. Significant production gains are expected in Burkina Faso, the Central African Republic, Chad and Senegal but the decline from the 1984/1985 level of around 900,000 bales could continue in the Sudan, where yields of long staple cotton at 3.1 kantars (950 lb) per acre are the lowest since the disastrous 1981/1982 season and the acreage planted is the lowest in 20 years. The fall in yields has been largely due to drought and the high incidence of wilt leaf disease—particularly in the Gezira scheme, the world's largest irrigated farm, which covers over 2 million acres. Recently, depressed world cotton prices and weak marketing policies have left the Sudan with substantial quantities of unsold cotton, estimated to be worth over \$600 million. In Zambia, cotton production is forecast at 115,000 bales in 1986/1987 compared to 96,000 in the previous year. Here, cotton cultivation is aided by guaranteed support prices, credit facilities, maintenance of low prices for inputs, payment of farmers within a month of delivery of cotton and a policy shift to growing cotton in valleys where low rainfall favours production. In Malawi, the area under cotton cultivation fell appreciably to some 130,000 acres, owing to the escalation of prices for pesticides. Table V.4 shows the trends in production, export and consumption in recent crop years.

185. Consumption of cotton in developing Africa is expected to show only a small increase from the 1985/1986 level of 3.29 million bales. In Egypt, textile capacity has been expanded to an estimated 2,869,500 spindles at the end of 1985 compared to 2,707,670 spindles in 1984. Output of cotton yarn in 1986/1987 is estimated at 318,000 tons, about 10 per cent above that of the previous season. The Cotton Marketing Board in

Source: Cotton World Statistics, Bulletin of the International Cotton Advisory Committee, vol. 39, No. 4 (part II), (Washington, D.C., April 1986).

\* Preliminary estimates for 1986/1987.

Zimbabwe anticipated no increase in consumption in 1986/1987 owing to slackness in textile off-take. In Nigeria, consumption is expected to fall short of the 1985/1986 level of 243,000 bales. Because of unfavourable producer prices in that country, consistently below the average export price at the official exchange rate, there has been a steady decline in purchases of cotton by the marketing board to only 38 per cent of those recorded in 1978/1979. Consequently, Nigeria has become a net importer of cotton for the domestic textile industry.

186. The decline in world cotton prices was halted towards the end of 1985 and there was a recovery during January/February 1986. For instance, prices per pound rose to 62 1/2 cents in February 1986 compared to 61 cents in December 1985, and were quoted at over 63 cents by November 1986.

#### (c) Coffee

187. Coffee production in developing Africa stood at 1.35 million tons in 1985 and was estimated to have increased to 1.41 million tons in 1986 (see table V.5). In Kenya, production declined substantially in 1985 as a result of the weather in the previous year. From a peak of 119,000 tons in 1984, it fell in 1985 by 18.5 per cent to 97,000 tons. The 1985/1986 crop was estimated at 110,000 tons and with the sharp rise in world prices and the suspension of export quotas, Kenya seemed poised to earn an estimated \$500 million in 1986 compared to \$280 million in 1985. Improved crop husbandry combined with intensification of farming among small-scale growers is yielding favourable results. In Cameroon, coffee production in 1985/1986 fell by 27.4 per cent to 83,131 tons against the 114,519 tons in 1984/1985. The poor performance is attributable to bad weather conditions and the absence of fertilizers. Cote d'Ivoire's crop in 1986 was expected to have been as good as the previous season's 280,000 tons. The Government aims to raise output to between 330,000 tons and 360,000 tons annually. To that end it plans to expand the area under coffee, currently 1.3 million hectares, and to replace old bushes and prune branches to improve productivity. Ivorian peasants receive CFA 60,000 for each hectare pruned as aid to cover part of the loss sustained while waiting for the orchard to start producing again.

<sup>a</sup> Preliminary estimates.

188. Meanwhile, the Brazilian Government claims to have lost 50 per cent of its production in 1986. During February 1986 ICO suspended quotas on exports by producing member countries, the composite indicator price established by the Organization having remained above \$1.50075 a pound for 45 consecutive days. That indicator averaged \$1.95 for the whole of February and \$2.04 for March. However, the prospects for survival of the International Coffee Agreement brightened in early April with news that the United States, the world's largest consumer, had decided not to withdraw.

#### (d) Sugar

189. For developing Africa as a whole, sugar production is estimated to have grown from 5,323,000 tons in 1985 to 5,463,000 tons in 1986. In Egypt, the largest producer, output is estimated to have reached 775,000 tons in 1986. The growth was due essentially to higher yields, which reached 1.5 tons per acre as a result of the provision of irrigation water and agricultural mechanization. In 1986 sugar cane covered 198,000 acres as against 192,000 acres in 1985/1986. In Swaziland, the area harvested in 1985/1986 increased by 4.1 per cent to 34,938 hectares. Nevertheless, production declined by 6.8 per cent to 374,580 tons on account of weather damage, pests and disease. A production of 409,835 tons is forecast for 1986/1987. The volume of exports decreased by 5.3 per cent, from 381,103 tons in the previous year to 360,925 tons in 1985/1986. In 1986, EEC took 34.9 per cent of the country's total sales, which was 5,000 tons more than the quota of 121,000 tons. Swaziland's quota for sales to the United States was reduced further in 1985/1986 to 24,065 tons from 35,850 tons in the previous crop year. Deraillments on the rail link to Maputo continued to disrupt shipping programmes and to pose problems for storage of the harvest. In Mauritius, sugar production is estimated to have reached 675,000 tons in 1986 compared to 646,000 tons in 1985. The bulk of Mauritian sugar is sold at guaranteed prices, currently three to five times world prices. From 1985 onward 505,000 tons a year were due to be sold to EEC and 37,000 tons a year to the United States under such arrangements. The sugar industry is beset by high production costs and several mills have been in serious financial difficulty owing to shortage of investible funds. In April 1985, a Sugar Action Plan was introduced by the Government to restructure the industry at a cost of 1.1 billion Mauritius rupees, in order to restore viability and assure competitiveness and efficiency. In the Sudan, the Kenan sugar complex came fully on stream with production of 270,000 tons in 1983/1984 and is forecast to reach the design capacity of 330,000 tons per year in 1986/1987.

190. On the world market—i.e. the smaller part of international trade not governed by quotas and guaranteed prices—sugar prices per ton remained depressed: they fell from 150 pounds sterling in June 1984 to a mere £61 in July 1985, the lowest level in 15 years. By April 1986, prices had recovered to £152, only to fall back to £85 in July 1986.

#### (e) Tea

191. Production of tea in developing Africa is estimated to have declined from 261,000 tons in 1985 to 253,000 tons in 1986. In Kenya, the largest producer, output rose to 147,000 tons in 1985 compared to 116,000 tons in 1984. In 1986, production declined to 140,000 tons. A striking feature of the small-holder tea industry

is the sharp rise in yields per hectare from 838 kg in 1983/1984 to 1,114 kg in 1984/1985. In Malawi, tea production rose marginally to 35,000 tons in 1986 compared to 34,000 tons in 1985. Sales on the Limbe auction floors in 1984 stood at 10.4 million kg and fetched an average price of 343.90 tambala per kg. Sales in 1985 expanded to 11.5 million kg but the average auction price slumped to 179.75 tambala per kg. (There are 100 tambala to the Malawi kwacha.)

192. Prices per kg on the London floor fell from 279.69 pence in January 1985 to 113.50 pence in July 1985, had only slightly recovered to 131.31 pence in February 1986 and reached 138 pence in September 1986. The level of production in India played a pivotal role in determining world tea prices in 1986, because there was a phenomenal increase in output in North India between January and April 1985 (brought about by exceptionally good weather and changes in the pruning cycles). The Indian crop was estimated to have reached a total of 680 million kg in 1986, which put further pressure on prices.

193. In the long term, the possibility of favourable changes in demand and supply resulting from complementarity and substitution effects cannot be underestimated. The low price of sugar, which is strong a complement to tea consumption, may add impetus to the propensity to consume. Furthermore, the recent dramatic rise in coffee prices may well stimulate consumption of tea as a substitute.

#### (f) *Tobacco*

194. Production of tobacco leaf in developing Africa is estimated to have stagnated at 306,000 tons in 1985 and 1986. In Malawi production stood at 77,000 tons in both 1985 and 1986. The market for Malawi burley, dark-fired and air-cured tobacco remained poor throughout 1985. In addition to few buyers, the market was plagued with problems of poor quality. Mid-year prices per pound for Malawi flue-cured tobacco stood at 66 United States cents, whilst the top price received for the United States product was 190 cents. Malawi burley fetched a mid-year price of 38 cents. In Zimbabwe, tobacco sales to the Agricultural Marketing Authority increased from 254.5 million Zimbabwean dollars in 1984 to \$Z 295 million in 1985.

195. The world market for tobacco continued to be influenced in 1985 by declining consumption. The tobacco industry world-wide is beset by high taxation on tobacco products, pressure from anti-smoking lobbies and high unemployment, resulting in a steady decline in consumption. Large carry-over stocks of burley and flue-cured tobacco from 1984 in major producing countries such as Brazil and the United States helped to make 1985 a buyers' market. Tobacco prices generally are estimated, however, to have improved on average in 1986. In a much longer-term perspective, the market is disturbed by the threat that China, which produces more tobacco than any other country but as yet has exported none, may emerge as a major exporter.

#### 4. *Livestock, meat and dairy products*

196. The livestock population (cattle, buffaloes, sheep, goats, camels, pigs, horses and chickens) of developing Africa was estimated at some 221.5 million head in 1985 or 116 per cent of the 1975 population, giving an average annual growth rate of 1.3 per cent over the decade. There were considerable variations,

however, from year to year, among animal categories and among the subregions.

197. The distribution among animal categories was skewed in favour of cattle and small ruminants during the decade. For instance, in 1985 about 74 per cent of the population was bovine, 7 per cent consisted of sheep, 6.6 per cent of goats and 6.5 per cent of camels. Geographically, a large part of the livestock population was concentrated in the East and southern Africa subregion.

198. With the return of near-normal rains over most of Africa since 1985 after three years of drought, one would expect the supplies of forage to be more than sufficient for the reduced livestock population. In addition, planting conditions in 1986 in most of the region should also have been ideal to obtain increased quantities of agricultural and agro-industrial by-products for feeding animals, provided that the recent efforts to control grasshoppers and locusts succeeded. All in all, animal feeding conditions in the region were better in 1985/1986 than during the previous three years.

199. The normal strategy of producers, especially pastoralists, after a drought is to expand herds, thus utilizing excess acreage, and to build up stocks of forage in order to cope with the consequences of future calamities such as drought and killer diseases. However, for a number of reasons — the short cycle of the drought, the widespread existence of rinderpest, the overall poor animal health and marketing services, poor water development and management policies, inadequate land tenure policies — livestock numbers, especially those of cattle, may do no more than stabilize at pre-drought levels.

200. Total indigenous meat production in developing Africa was estimated at 6 million tons in 1985 and was growing at an average annual rate of 3 per cent over the period 1975-1985. The rate of growth for many individual products was well above that of human population in many subregions. The share of beef, mutton and pork in total meat production decreased from 69 per cent to 66 per cent over the decade, all subregions except Central Africa sharing in the decline. In replacement of red meat, the production of poultry meat rose by about 88 per cent during the same period.

201. As shown in previous ECA studies, the productivity of livestock, especially cattle, improves significantly in terms of increased weight gain, better health, shorter calving intervals and lower mortality, after a major disaster such as the recent drought. In particular, animals can be slaughtered at younger ages than normal and at near-record slaughter weights. However, competition between suppliers of meat for the domestic market and exporters becomes keener, since the majority of animals are of export types. In most instances, countries which traditionally export live animals experienced a shortage of meat for domestic consumption since, at the official retail prices, sellers of meat could not even recover their livestock purchase prices. Governments, in the past, resorted to a policy of banning exports of live animals instead of adjusting retail prices of meat, combined perhaps with the introduction of quotas. Such a policy did more harm than good, owing to the existence of large uncontrolled borders between exporting and importing African countries, which induced major importers to diversify their sources of supply to include those outside the continent. Overall, meat production should continue to rise during the years ahead.

202. At the same time as overall trade deficits of African countries declined substantially during 1982-1984, livestock trade deficits steadily worsened. Livestock imports by some 45 countries<sup>13</sup> reached \$2,188 million in 1984 against \$633 million in 1975, while exports fell from \$161 million in 1975 to \$112 million in 1984. The livestock trade deficit therefore increased from \$472 million in 1975 to \$2,076 million in 1984. Over the same period the region changed from a net exporter of meat (in value terms) to a net importer. Related to that change, the share of dairy products in total imports of livestock products was estimated at 81 per cent in 1975 against 63 per cent in 1984, the comparable percentages for exports being 7 and 4, respectively.

203. Dairy products were thus the major contributor to the deteriorating balance of trade in livestock products (i.e. meat and dairy products) over the period 1975 to 1984. If the current trends in that trade deficit — 16 per cent average annual growth rate over the last decade — were to have continued, the same 45 countries would have run up a deficit of \$2,794 million in 1986, despite the existence of great production potentials throughout the region.

204. The livestock sector can develop from its inner strengths and has a great favourable potential for integration. What is required is a drastic change in current approaches to the development of the sector. Specifically, policies and actions need to be harmonized and co-ordinated in order to secure optimal exploitation of the potential for the supply of and the demand for major livestock products, by-products and inputs within each subregion and among subregions. Furthermore, efforts should be directed towards identifying and implementing joint investment programmes between private sector and/or public organizations for production and trade in specific major products, by-products, inputs and services, so as to speed up the achievement of collective self-sufficiency in animal food production at national and regional levels.

## B. FISHING

205. Fish production in developing Africa was 3.4 million tons in 1984 and output is estimated to have shown a decline in 1985. Inland fisheries, mainly in countries adjacent to large bodies of water such as Lake Chad and Lake Victoria and in countries located along major rivers, accounted for 43.8 per cent of the 1984 total. The catch increased by 1.4 per cent per annum between 1981 and 1984.

206. According to FAO, the estimated potential is 10 million tons of fish a year, about three times the present production. In Gabon, for example, out of an estimated potential of 370,000 tons a year of pelagic and demersal fish, about 15 per cent is reported to be exploited. In Guinea, the corresponding figures are 200,000 to 300,000 tons and 10 per cent. World-wide, only 4.2 per cent of fish production of 82.8 million tons in 1984 came from developing Africa.

207. Although fishing contributes to foreign exchange earnings, animal protein consumption and employment, it is therefore clear that the region's inland water and marine fishing potential has not been effectively harnessed. There are exceptions: typically, exports of fish products by Senegal accounted for a quarter of that country's merchandise exports; in Malawi fish con-

tributed about 70 per cent of animal protein consumption and the industry employed directly or indirectly some 200,000 people; in Guinea-Bissau and Cape Verde fish exports accounted for 38 per cent and 70 per cent of merchandise exports, respectively; and in Morocco the sector employed 75,000 persons directly or indirectly and accounted for 9.4 per cent of total export earnings in 1984.

208. Reasons advanced for the low level of activity in African developing countries include the absence of proper handling, preserving and marketing facilities, the lack of personnel trained in fishing technology, the small size of fishing fleets, lack of port and harbour facilities, lack of capital and the high cost of energy. It has been reported in Nigeria, for example, that production was hampered by shortage of nets and boats and the cancellation of industrial fishing licences. In Ghana the industry has been badly hit by fuel shortages and inadequate storage facilities. In the United Republic of Tanzania fishing is handicapped by the lack of technology and foreign exchange to buy modern equipment and the use of primitive methods by artisanal fishermen.

209. In spite of the above handicaps, however, foreign trade in fishery products continues to be of considerable importance to the region. Imports in 1984, were valued at \$422 million (constituting 2.5 per cent of world imports) against exports valued at \$720 million (accounting for 4.5 per cent of world exports). The trade balance therefore continued to be positive, reflecting the high quality of exported fish.

210. Of late, a number of countries have launched development projects whose objective is to exploit more efficiently their fish wealth. In Senegal measures to expand production in the traditional sector included greater assistance in providing motors and nets for canoes used by small-scale fishermen, more credit, technical assistance and infrastructure. In the Gambia investment in the sector was stepped up, indigenous participation in most industrial fishing increased — all in a period of declining and unpredictable groundnut production. In Seychelles, the National Development Plan included expansion of the catch of demersal varieties by the home-based fleet to 5,500 tons a year and reorganization of marketing under the aegis of the Seychelles Marketing Board. The 1982-1985 Development Plan of Cape Verde postulated an investment outlay of 1,020 million Cape Verdean escudos to foster the development of fish processing. In addition, the Plan stressed the urgent need to lessen dependence on agriculture and exposure to the dangers of drought by tapping off-shore fish resources. In Morocco, special financial concessions were given in 1984 to improve the export potential of the fishing industry. In the United Republic of Tanzania efforts were intensified to develop fishing resources on a commercial basis, to organize training programmes, to promote joint ventures with foreign partners and to improve surveillance. In Côte d'Ivoire, a Centre was established in 1986 for collecting information on the demand for, and supply of, fish products. The Congo, Côte d'Ivoire and Senegal collaborate with the Office for Scientific and Technical Research Overseas of France, mainly in fisheries research. Egypt intends to improve its fishing capabilities by strengthening the marine science infrastructure and increasing the quality of its research institutions. The other objective was to conserve the marine environment, by protecting endangered species and ensuring the

biological productivity and chemical equilibrium of the Red Sea. The Intergovernmental Meeting of Experts on Aspects of the Exploration and Exploitation of Sea-bed Resources, held at Addis Ababa, Ethiopia, 11-14 November 1985, in the context of the United Nations Convention on the Law of the Sea, stressed the urgent need for co-operation among African States at the sub-regional and regional level for the more efficient exploitation of their fish wealth. In addition, the Meeting emphasized that countries in the African region should explore arrangements to cooperate with countries in other regions.

### C. FORESTRY

211. Forest depletion continued in Africa in 1985-1986. The estimated rate of disappearance of closed humid forest was 1.3 million hectares a year and of depletion of open forest was 2.4 million hectares a year. The rate of forest destruction is alarmingly high in Côte d'Ivoire, Ethiopia and Nigeria. A recent World Bank report apparently highlighted the alarming disappearance of Ethiopia's forests, which have shrunk from an estimated 40 per cent of the land area in 1900 to less than 3 per cent today. In some developing African countries deforestation rates exceed planting rates by a factor of 30:1. The main causes are uncontrolled logging, the search for fuelwood, over-grazing and bush fires. FAO has calculated that some 25 million additional hectares need to be planted by the year 2000 in order to avoid drifting into a fuelwood deficit. That would be a huge undertaking and it is estimated that it would cost \$2 billion, some of which would be in foreign exchange. In view of competing claims of their scarce resources, many African developing countries would not feel they were in a position to afford the expenditure involved. A far better approach is to attack the causes of deforestation by drawing up measures to reduce the damage.

212. Afforestation is by no means a negligible activity in the region, however. The sub-Saharan plantations grew in 1984 at a rate of 100,000 hectares a year and although that is equivalent to only 2.6 per cent of the area deforested it is higher than the target set in the Lagos Plan of Action drawn up in 1980.<sup>14</sup> Among the most important species planted were eucalyptus, teak, gmalina and other tropical hardwoods.

213. The production of roundwood was 404 million cu m in 1984 and was estimated at 413 million cu m for 1985. Since it has been estimated that about 90 per cent of roundwood is utilized as fuelwood and charcoal, the roundwood transformed into energy could be in the neighbourhood of 367 million cu m.

214. Production of sawnwood and sleepers in 1985 was estimated at 7.9 million cu m, of which exports are believed to have been about 800,000 cu m. Those estimates were based on data available in 1984 and the rising trend in consumption in the major European markets. According to recent information, a significant proportion of output was directed to local markets in Africa. In Cameroon, for instance, domestic policies required that at least 60 per cent of the wood cuttings should be processed locally for internal use. Other countries such as Côte d'Ivoire, Ghana and Nigeria, took measures to promote local roundwood processing in the light of the LPA objective to reduce the export of logs. Nevertheless, the region remained a net importer of sawnwood: the gap between production and consump-

tion was estimated at 2 million cu m, Algeria and Egypt being the main importers.

215. It is heartening to note that a fair number of countries are making increased efforts to conserve and develop forestry resources—for the most part with a view to alleviating energy problems and protecting the eco-system. Though their efforts are commendable, the gap between requirements and what the countries have achieved remains very wide.

216. A recent FAO study—African Agriculture: The Next 25 Years (Rome, 1986)—identified the major areas for priority attention as including the following:

(a) Creating village and individual fuelwood lots, with local communities advising on the selection of the site and tree species but receiving advice on planting and maintenance techniques and on the production of seedlings;

(b) Improving the management of natural forests;

(c) Planting shelter belts and wind breaks, drawing on lessons learned from projects such as the system of anti-erosion wind breaks in the Maja Valley, the Niger, and the Senegalese project (assisted by FAO) where border tree planting with *acacia albida* increased millet and sorghum yields by at least 50 kg/ha;

(d) Integrating trees in farming systems, through a programme of village or farmer-led demonstrations, and support for seedling production;

(e) Upgrading bush fallows through managed regeneration, using *acacia Senegal* and similar species;

(f) Launching extension-service campaigns to improve traditional charcoal production and to reduce fuelwood consumption by the use of more efficient wood stoves;

(g) Establishing industrial plantations to provide for urban fuel needs; and

(h) Introducing fuelwood price policies that are compatible with national energy policies and promote substitution between fuelwood and other fuels (in either direction) as indicated by domestic resource costs.

### D. EXTERNAL TRADE

217. Export trade in agricultural products is seriously handicapped by the low producer prices which farmers receive, heavy taxation of exports, over-valued currencies, heavy protection of fledgling industries and poorly managed parastatal and other agencies. No less important has been the poor infrastructure, lack of dependable market intelligence services and low international prices.

218. Of the reasons underlying the disappointing growth in food and industrial crops, the setting of official producer prices in a number of cases at unremunerative levels is perhaps the most serious. In many countries where producer prices were raised, their effect was undone by over-valuation of the currency. In Nigeria, for example, a doubling of the official maize price in 1984 had no significant impact since the over-valued exchange rate caused local maize delivered at Lagos to be more than three times as expensive as imported maize.

219. Furthermore, there was substantial smuggling across national frontiers in response to the availability of consumer goods and significant price differentials, typically in the cocoa and coffee trades. Cocoa moved

from Ghana into Côte d'Ivoire and coffee from Uganda to Kenya because of large price differentials. Coffee, cocoa, palm kernels and rice were smuggled out of Sierra Leone through neighbouring Liberia.

220. Many African developing countries tax export crops at very high rates. The farm price for coffee was a third of the border price in Togo. Cotton and groundnut farmers received half the border prices in Mali and less than half for cocoa in Cameroon and Ghana. The World Bank has commented that marketing boards which were originally expected to use "the bulk of their funds for the benefit of the farming community have become *de facto* taxation agencies for extracting resources from export agriculture in support of the post-independence drive to industrialization".<sup>15</sup> Those high rates of taxation range between 50 per cent and 75 per cent.

221. There seems to have been little or no improvement in intraregional or interregional trade. The little trade within the region, which hardly involved 4.5 per cent in 1985, was barter-based, mainly involved cereals such as maize and was partly financed by donor countries in the form of food aid through triangular transactions which the world Food Programme arranged. In recognition of that state of affairs participants at the World Food Council meeting in June 1986 placed a special accent on regional complementarities in food production and trade within the region.

222. A major hurdle obstructing the expansion of agricultural trade has been the region's inability to ensure a regular flow of supplies to meet export demand, due to fluctuations in production levels. Apart from that, the inadequacy of infrastructural facilities such as transport and storage structures remained a crucial impediment, leading in some countries to substantial losses. In Kenya, for instance, the dearth of well-constructed stores occasioned difficulties in the export of horticultural products. In Malawi and Zimbabwe, where cereals and in particular maize were in surplus, storage facilities fell drastically short of needs.

223. Another equally vital factor behind the disappointing level of agricultural trade was the fluctuating and often low level of prices on world markets. International prices for the region's four principal export crops (coffee, cocoa, sugar and tea) declined during the period 1984/1985-1985/1986. The trend is likely to persist in 1986/1987 except for coffee, the price of which is expected to pick up owing to a poor harvest in Brazil.

224. Since the general decline in prices of agricultural export commodities was on the whole not compensated by increased sales volume, regional export earnings fell and the capacity to finance development programmes and agricultural imports suffered. Including exports derived from fishing and forestry resources, earnings in 1984 amounted to \$10.6 billion and either stagnated or even fell to a lower level in 1985-1986. They are likely to improve in 1986/1987 owing to expected higher prices for coffee and sugar.

225. Regional import trade in agricultural products was largely dominated by food imports, an important component of which were cereals, principally wheat, rice and coarse grains, for which table V.6 shows details.

226. In 1984, the region imported food and other agricultural commodities valued at \$15.6 billion, which exceeded its export earnings from such commodities by \$5 billion. Cereal imports were \$5.6 billion, mainly wheat, a major import crop. The secular trend in im-

<sup>a</sup> Estimate.

<sup>b</sup> Forecast.

ports of agricultural products seems to have been downward (implying the region's progressively declining capacity to finance any increase). A further slight decrease in the period 1985-1987 may be expected, in the form of lower imports of coarse grains and a decline in world cereal prices.

#### E. AGRICULTURAL POLICIES

227. During the period under review the majority of African developing countries endeavoured to introduce policy reforms designed to facilitate the attainment of self-sufficiency in food supplies within the framework of the LPA. Such action was reflected in their development strategies and in the decisions taken at various international forums such as the Thirteenth Special Session of the General Assembly in May 1986, the World Food Council meeting in June 1986 and the twenty-first session of the OAU Assembly of Heads of States and Government in July 1986 (to all of which reference has already been made). The meetings convened by the Southern Africa Development Co-ordinating Conference (SADCC) in January 1986 and the Economic Community of West African States (ECOWAS) in May 1986 gave indications of the policy objectives pursued by the countries in the subregions concerned.

228. As part of government efforts to promote agriculture, producer prices were significantly raised in Botswana in 1986. In 1985 the Government had introduced the "Accelerated Rain-fed Arable Programme", under which farmers were encouraged by payment of grants to destump up to 10 hectares (at the rate of 50 pula per hectare) and to hire draught power for ploughing (P 50/ha), for row-planting (P 10/ha) and for weeding (P 5/ha). In Ghana the producer prices per ton for cocoa were increased from 56,000 cedis to C 85,000 (or, per headload of 30 kg, from C 1,700 to C 2,550. In addition, a production bonus of C 500 per ton was to be paid to farmers if at the end of the season the crop exceeded an agreed production target. Producer prices per ton for coffee and sheanuts were increased to C 94,095 and C 28,000, respectively. In Sierra Leone, cash crop producer prices were set at levels commensurate with world prices in 1986 following the devaluation to adjust for a period of severe inflation (see chapter III, section F). In Zambia, apart from raising the producer prices of all commodities, the Government abolished the state marketing monopoly for maize and fertilizers. Under its Economic Recovery Programme (1986/1987-1988/1989) the United Republic of Tanzania took measures to raise producer prices, particularly those of export crops to around 60-70 per cent of world prices—an increase of 5 per cent in real terms. In the Gambia, the task force which drew up an Economic Recovery Programme in June 1985 recommended substantial increases in producer prices.

229. Other policy measures were concerned with the provision of incentives, the banning of imports of rice and maize and the restriction of food aid in order not to depress the price of locally grown crops. In the United Republic of Tanzania, for example, bonus payments were introduced for exceeding given production targets. In Nigeria imports of rice and maize were banned with effect from October 1985 and of vegetable oils from January 1986. In Sierra Leone the Government progressively reduced the level of rice imports.

230. In some countries, the measures taken for revitalizing the farming sector were far more fundamental and all-embracing. In the Sudan, for example, the reforms required the Government to abolish export taxes from the Gezira scheme, lower the nominal exchange rate applied to cotton exports, announce producer prices ahead of harvesting time and pay farmers promptly for their cotton. Consequently, cotton production doubled between 1980/1981 and 1983/1984.

231. Some para-statal corporations for export marketing were reformed. In Somalia the monopoly in maize, sorghum and imported goods was discontinued in 1985. With the demise of the Marketing Boards on 30 June 1986, the Government of Nigeria passed responsibility for purchasing to the private sector, including the co-operatives.

232. Policy reforms introduced in the areas of land reform, resettlement and rehabilitation were also noteworthy. The First National Development Plan of Zimbabwe (1986-1990) emphasized land reform and the effective utilization of land as a major development objective. Land reform would involve, *inter alia*, equitable distribution of land in order to establish viable resettlement schemes and increase agricultural productivity. During the plan period, 15,000 families with about 100,000 dependants were to be settled each year. In Ghana, success was achieved in integrating the population in the rural development programmes. In Swaziland, the prominent place of agriculture in the economy reflects a long-standing concern for a sector so crucial in terms of employment opportunities and income generation. That concern is now reinforced by *Ekhaya*, the back-to-the-land programme. In Nigeria, the Government decided when it abolished the petroleum subsidy in 1986 to devote about half the savings (some 450 million naira) to a fund for rehabilitating various categories of roads in the country and in particular for developing a national network of rural and feeder roads in support of its massive drive to achieve food and agricultural self-sufficiency in the shortest possible time. The programme envisaged that the rehabilitation of some 60,000 km of rural feeder roads would be undertaken in 1986.

233. An equally important policy area which influenced the performance of the agricultural sector was investment. In Malawi the Government launched a three-year public sector investment programme for the period 1985/1986-1987/1988 under which 18.6 per cent of the total planned expenditure was allocated to agriculture. In Mozambique, a \$258 million cashew nut project financed by the World Bank commenced in 1986. In Rwanda, arrangements were approaching finality in 1986 to launch a five-year programme to expand rice production at an estimated cost of 35 million francs. Phase II of the ambitious "man-made river" project in the Libyan Arab Jamahiriya went ahead in 1986 at an estimated cost of \$1.5 billion. In Egypt, investment levels were

substantially raised and efforts made to modernize the agricultural sector through more extensive use of machinery in the production process, research, soil conservation, extension services and the reclamation of more tracts of the desert. In Sierra Leone, the Government embarked upon a Green Revolution Programme in 1986 which envisaged a gross investment of \$112 million. The objective was to increase rice production to match the level of domestic consumption and eliminate imports. The first National Development Plan of Zimbabwe (1986-1991), the Fourth Development Plan of Lesotho (1986/1987 to 1990/1991), the Sixth National Development Plan of Botswana (1985-1991), the Sixth Development Plan of Cameroon (1986/1987-1990/1991) and the Economic Recovery Programme of the United Republic of Tanzania (1986/1987-1988/1989) all implied an increase in the share of agriculture in total investment outlays. Ethiopia's Ten-Year Perspective Programme (1984-1994) laid heavy stress on peasant agriculture; it postulated an average annual growth of 4.5 per cent throughout the plan period and allocated about 22.5 per cent of the country's total gross investment to agriculture.

234. In the areas of research and extension services there are policy measures to report at national and regional levels. In March 1986 OAU experts on tropical forestry participating in a seminar at Abidjan, Côte d'Ivoire, recommended the establishment of a centre for research into the degradation of tropical forests and desertification. The workshop on exchange of experience between African and Asian food policy-makers which was held in May 1986 underlined the vital importance of agricultural research oriented towards small farmers as a basis for expanding food and agricultural production. The ECA/FAO project on the establishment of a maize research network in the subregion of the Lusaka-based MULPOC started to become operational, arrangements being under way to set up a research centre.

235. The various policy measures taken by governments during the period under review were not without shortcomings and problems were experienced in the areas of formulation, implementation and management. First, the skilled manpower for their execution was often lacking. Secondly, the resources allocated generally proved inadequate and the level of domestic official investment in the agricultural sector remained far below the 20-25 per cent of total such expenditure recommended in APPER—and the flow of external resources to the sector was also insufficient. Thirdly, despite official policy pronouncements, incentive mechanisms in the sector left much to be desired. There was a wide difference between declared policies and practical achievement in many countries. Fourthly, the data for formulating agricultural policies remained inadequate and misleading in some countries, with the result that policies were developed on the basis of premises that proved wrong, instead of factual information.

236. The standard of policy-making in the region will improve if measures are taken to tackle the foregoing problem areas within the broad framework of the LPA and the APPER. The latter seeks to reinvigorate the more dynamic, internally generated forces for growth and development. As regards agriculture, its primary focus in the short term is on combating food emergencies through the establishment of national food security arrangements, effective early warning systems

and flexible and efficient regional networks of crop protection agencies. In the medium term, its main objective is to give a new impetus to agricultural development by measures for increasing both productivity and production (which would require substantial additional investment in agriculture). Arable land would be protected and developed to render it more productive. Fertilizers, seeds and pesticides would be made available, together with credits for research and extension services. Storage, distribution and marketing systems would be improved and/or expanded. The other major areas to which the APPER devotes resources include: the provision of remunerative producer prices; the development of livestock through improved management and attention to animal diseases; establishment of reforestation, drought and desertification control programmes; and assistance programmes for small farmers, especially women food producers and rural youth. The investment required for the implementation of the programmes described above is estimated at \$57.4 billion, which is 44.8 per cent of the estimated total cost of APPER. In September 1986 the FAO Regional Conference for

Africa, which met at Yamoussoukro, Cote d'Ivoire, came up with guidelines for application in the agricultural sector which the participants considered to be a pre-condition for attaining the goal of food self-sufficiency. They also, more specifically, adopted a plan for food self-sufficiency and defined a consistent development programme for agriculture during the next 25 years.

237. At the subregional level, good plans and strategies for economic co-operation among countries to achieve food self-sufficiency have been drawn up. The principal elements of the strategy devised by SADCC for achieving its food security objectives were reinforcement of national food production capacity; improvement of food storage facilities; marketing and distribution systems; development of skilled manpower; development of intra-regional trade; establishment of systems for the prevention of food crisis; establishment of programmes for the control of major pests and diseases; development of national food policies; and development of institutions and mechanisms for the exchange of information on all those issues.<sup>16</sup>

## VI. DEVELOPMENTS IN THE MANUFACTURING INDUSTRY

### A. INTRODUCTION

238. Following the proclamation of the LPA in 1980<sup>17</sup> and the declaration by the General Assembly of the Industrial Development Decade for Africa 1980-1990 (IDDA), setting policy objectives and specific targets for manufacturing industry in developing Africa, the countries concerned have given greater consideration to the various aspects of industrial development. However, the region as a whole is still unable to point to the achievement of a growth rate of the industrial sector that would bring its share to the LPA target. During the period 1980-1985, the share of manufacturing in the region's GDP was appreciably lower than the comparable average for all other developing countries, while agricultural performance declined seriously, comparing unfavourably with that achieved in the previous decade and with performance in other developing regions. Given the close link between agriculture and industry, poor performance in the agricultural sector has reacted negatively upon manufacturing.

### B. GROWTH OF THE MANUFACTURING INDUSTRY, 1980-1986

239. For developing Africa as a whole, the value added by the manufacturing sector grew from \$26,035 million in 1980 to \$30,823 million at 1980 factor cost in 1985, an annual growth rate of 3.4 per cent (see table VI.1), as compared to 0.3 per cent for real GDP. Thus, growth has slowed down considerably since 1980 compared with past decades — 8.8 per cent per annum in the 1960s and 10.1 per cent in the 1970s. Although the manufacturing sector is growing faster than GDP, the rate was far from adequate in terms of the development goals implied by the LPA and Lima targets. The preliminary estimates for 1986 suggest that manufacturing industry will have grown by 3.9 per cent, which is lower

than in 1985 (5.9 per cent). In 1984 there was a decline of 0.57 per cent.

240. Over the period 1980-1985, the table shows that the Central Africa subregion recorded the highest average annual growth rate, 9.8 per cent per annum, followed by North Africa (6.2 per cent) and East and southern Africa (1.2 per cent). West Africa recorded a negative growth rate of 0.04 per cent over the same period, owing to the sharp decline in 1984 (12.9 per cent) as a result of the effect of drought on agro-industries, the shortage of foreign exchange for the import of spare parts and the shortage of water for hydro-electric power generation, which often caused cuts in supply. That subregion's growth is estimated to have improved substantially in 1985 as a result of the recovery in Nigeria's manufacturing output, but in 1986 it declined again by 2.4 per cent.

241. The LDCs recorded poor growth — only about 1.6 per cent per annum — during 1980-1985, against 4.3 per cent for major oil-exporters and 3.4 per cent for other countries. The latter two economic groupings recorded better performance in 1985 than in 1984. The improvement is expected to discontinue in 1986, with an estimated 1.8 per cent for major oil-exporters and 2.3 per cent for the "other countries" grouping.

242. The manufacturing sector grew somewhat faster (measured at constant factor cost) than GDP in no fewer than 33 of the 50 African developing countries under study (see, table VI.2). Ten countries recorded a negative growth rate in both GDP and manufacturing. Only in three countries did the growth in value added by the manufacturing exceed the 9.8 per cent per annum required to meet the LPA target. In North Africa, Algeria, the Libyan Arab Jamahiriya and Egypt achieved a growth rate of over 8 per cent per annum, whereas the Sudan suffered negative growth owing to the crisis which

it is currently undergoing. In only one country in West Africa (the Gambia) did the manufacturing growth rate exceed 10 per cent per annum, while negative growth rates were registered in Côte d'Ivoire, Ghana, Guinea-Bissau, Liberia, Mauritania, Sierra Leone and Togo. The largest industrial power of this subregion, Nigeria, recorded no significant increase (0.6 per cent per annum). In Central Africa, Cameroon had the highest growth rate of the region (21.8 per cent per annum) while industrial stagnation persisted in Zaire. In East and southern Africa annual growth nowhere exceeded 7 per cent except in Uganda.

243. There are several reasons why the manufacturing growth target of 9.8 per cent set in the LPA has still not been achieved by 47 out of 50 African countries, five years after its adoption. In general, structural factors, such as limited domestic markets, shortage of personnel with high-level skills and industrial experience, and the weakness of linkages between the manufacturing sector and the rest of the economy, have constrained development. A further cause of failure to meet the target has been the dependence of manufacturing industry in developing Africa on imports of know-how (foreign technology), skills and raw materials, which exposes it to a severe foreign exchange constraint. Some efforts have been made to deal with those general problems, particularly since the proclamation of the LPA, but, evidently, with limited success.

244. Apart from natural calamities (drought and desertification in the West Africa and East and southern Africa subregions), there are other socio-economic factors which contributed to poor growth performance in the manufacturing output of several African countries. In North Africa the sector was adversely affected by declining oil revenues in Algeria, Egypt, the Libyan Arab Jamahiriya and Tunisia. In West Africa, as mentioned above, Nigeria's set-back derived mainly from low overall utilization of industrial capacity (estimated to have been no more than 60 per cent in 1985), brought about by foreign exchange constraints on imported inputs. In Côte d'Ivoire, the decline in manufacturing output occurred in the context of the economic depression experienced since 1980 and was attributable to falling domestic demand, whereas in Ghana increasingly high costs of production reinforced shortages of imported inputs to make domestically manufactured products uncompetitive with imports. The growth of manufacturing industry in Central Africa was adversely affected by falling oil revenues in Gabon and the Congo, as well as by low absorptive capacity, high domestic costs of production, low productivity and financial difficulties in Zaire and

other countries. The performance of the manufacturing sector in East and southern Africa was influenced by the impact of drought on agro-industries (Ethiopia and the United Republic of Tanzania). It was also affected to a certain extent by the actions of South Africa.

245. There has been hardly any change in the structure of manufacturing industry in developing Africa since the early 1960s. In several countries manufacturing output remains very small both in absolute terms and in relation to GDP and to the world total. There is heavy concentration on import-substitution consumer-goods industries rather than intermediate- and capital-goods industries.

#### C. SECTORAL SHARE IN GROSS DOMESTIC PRODUCT

246. The share of manufacturing output in GDP (measured at 1980 factor cost) has not changed significantly in the last five or six years, increasing from 8 per cent in 1980 to 9.4 per cent in 1986. (It was 7.6 per cent in 1960). In other words, the yearly growth rate of the manufacturing sector has not been *substantially* higher than that of GDP in most African countries. Table VI.3 shows the picture for subregions and economic groupings.

247. In all subregions except West Africa the share of manufacturing in GDP increased between 1980 and 1986. The concentration of industrial output in North Africa is most noticeable: in 1985-1986 that subregion produced 48 per cent of the manufacturing output of developing Africa, while West Africa and East and southern Africa produced about 26 per cent and 19 per cent of the regional total, respectively; in Central Africa manufacturing industry is still small (7 per cent of the total), although growing very fast. The share of manufacturing output in GDP for the "other countries" grouping reached 15.2 per cent in 1986 as against 12.5 per cent in 1980 and 1985. For LDCs and OPEC members the contribution of the manufacturing sector to GDP was 7.9 per cent and 6.4 per cent, respectively, in 1986. The manufacturing output of the "other countries" grouping accounted for 56 per cent of the regional total, while that of OPEC members and LDCs represented 33 per cent and 11 per cent, respectively. (All the above percentages are calculated by reference to gross manufacturing output.)

248. As far as individual countries are concerned, the leading 10 manufacturing countries in 1985 produced 76.1 per cent of the value added by manufacturing in developing Africa (see table VI.4). Those countries

were Egypt, Algeria, Morocco, Tunisia and the Libyan Arab Jamahiriya in North Africa; Nigeria, Ghana and the Côte d'Ivoire in West Africa; Cameroon in Central Africa; and Zimbabwe in East and southern Africa. Manufacturing industry in developing Africa has been dominated by a relatively small number of countries throughout the past two decades. Thus, adverse fluctuations in those countries (as was the case of Nigeria in 1984) inevitably affected to a great extent the regional output of the sector. It can be noted from table VI.4 that most of the leading industrial producers in 1965 were still the leaders in 1985, although their relative positions had altered considerably and some (such as Zaire, Ethiopia and Mozambique) had lost their leading position in favour of newly emerging industrial countries such as Côte d'Ivoire, and the Libyan Arab Jamahiriya.

249. In per capita terms, North Africa still leads over the other subregions, with value added by manufacturing per capita increasing from \$100 in 1980 to \$118 in 1985, followed by West Africa. In terms of economic groupings, the rich major oil-exporting countries naturally had higher values than the LDCs. It is estimated that in 1986 North Africa will still have led the other subregions, with a per capita value of \$122 compared with \$48, \$35 and \$36 in West Africa, Central Africa and East and southern Africa, respectively.

#### D. INDUSTRIAL BRANCH STRUCTURE

##### 1. The International Standard Industrial Classification

250. Data on the branch structure of manufacturing industry in individual countries are not always comparable in developing Africa. The 25 countries for which detailed information is available are included in tables VI.5 and VI.6, which present, for consumer-goods industries and for capital- and intermediate-goods industries, respectively, estimates of value added in 1985 according to the International Standard Industrial Classification (ISIC).<sup>18</sup> Table VI.7 summarizes the estimates in tables VI.5 and VI.6 and compares them with estimates of gross output. It appears that the food, beverages and tobacco and the textile and clothing divisions in ISIC remained the most important branches of manufacturing in 1985, accounting for more than half of gross output and of value added in manufacturing industry. Next in importance were the industries producing chemicals and related products and those producing fabricated metal products, machinery and equipment, which together contributed 26.8 per cent of the value of gross output and 26.6 per cent of the value added in manufacturing. The ISIC divisions covering wood products and furniture; paper and paper products; printing and publishing;

non-metallic mineral products not based on petroleum or coal; and basic metal industries – those divisions contributed less significantly to gross output and to value added in manufacturing.

## 2. Consumer-goods industries

251. The light, consumer-goods industries, which comprise the ISIC divisions 31 to 34 shown in table VI.5, accounted for about three fifths of both the gross output and the value added by the manufacturing sector. The share of those industries in total manufacturing value added in 1985 was 68.4 per cent in Nigeria, 62.8 per cent in Cameroon, 79.4 per cent in Ethiopia, 41.4 per cent in Kenya, 66.0 per cent in Zambia and 53.4 per cent in Zimbabwe. In the last-named country food-processing based

on locally grown food items accounted for 25 per cent of the industrial sector's output; and textiles which utilize locally grown cotton contributed 10 per cent in 1985-1986. In the Gambia the processing of groundnuts and fish accounted for 75 per cent of manufacturing value added. On a subregional basis, it appears that the level of concentration on consumer-goods industries was highest in West Africa (65.2 per cent) and Central Africa (67.9 per cent). In particular, the wood products, furniture, paper and paper products industries were much more important in West and Central Africa, especially as generators of employment. In East and southern Africa there seems to have been less emphasis on the textile, wearing apparel and leather industries than in the other subregions, while in North Africa the industries based on wood products, furniture, paper and paper products were relatively unimportant.

252. It is worth noting, however, that the pre-eminence of the consumer-goods industries in developing Africa reflects the situation which prevailed in the early years of independence (the 1960s). All African developing countries, except Algeria, the Congo, Côte d'Ivoire, Egypt, Kenya, Morocco, Senegal, Tunisia, Zaire and Zimbabwe, began their economic development following independence with a poor industrial structure. When the need for industrialization was recognized, import-substitution industries appeared to be the simplest, most natural and least risky ones to develop and their establishment was facilitated by knowledge of the existing domestic demand structure. In more recent times there has been a tendency to broaden the scope of import substitution to include the production of intermediate goods and capital equipment.

## 3. Capital- and intermediate-goods industries

253. The value added by the intermediate- and capital-goods industries, comprising ISIC divisions 35 to 39 is shown in table VI.6 and estimated at 40 per cent of the manufacturing total in 1985. For most individual countries, the share of the most important of those industries

(ISIC divisions 37 and 38) was below 20 per cent of the total, with the notable exceptions of Algeria (49.5 per cent), Cameroon (23.0 per cent), Kenya (42.8 per cent) and Zimbabwe (29.2 per cent). The heavy, capital-goods industries, as traditionally understood (ISIC division 38), are still in the very early stages of formation. They consist mainly of the manufacture of machinery, equipment and instruments; and the assembly and manufacture of fabricated metal products. The result is an imbalance between output, demand and consumption of engineering products. The few countries nurturing a nascent capital goods subsector are characterized by the predominance of scattered enterprises without much inter-linkage or complementarity in the processing chain. Another crucial problem is that the existing intermediate-goods industries are not geared to supply the needs of the capital-goods industries.<sup>19</sup>

254. The intermediate goods are exemplified by the iron and steel and the non-ferrous metals industries — in particular, those concerned with copper, lead, zinc, aluminium and ferro-alloys (ISIC divisions 36 and 37). Chemical intermediates considered critically important for African developing economies include fertilizers, pesticides and pharmaceutical active ingredients, as well as basic chemicals such as sulphuric acid, soda ash and mineral products for the chemical industry (ISIC division 35).

255. A rudimentary iron and steel industry exists in some 26 of the 50 ECA member States. The traditional kind of iron and steel industry has been established in Algeria, Egypt, Nigeria, Tunisia and Zimbabwe. Integrated industries are in the process of being established in the Libyan Arab Jamahiriya (Misurata project) and Morocco (Nador project). New projects in the following countries have been either abandoned or deferred: Angola, Kenya, Mozambique and Tunisia; while expansion projects in Algeria (Bellara), Egypt (Dekhela) and Tunisia have been delayed. The production of iron and steel in developing Africa is primarily accounted for by Algeria, Egypt, Nigeria, Tunisia, and Zimbabwe, with a

combined output of 1.86 million tons in 1984 compared with 1.67 million tons in 1980, an increase of 2.7 per cent per annum. As a share of world steel production, that represented 0.26 per cent in 1984 against 0.23 per cent in 1980. Compared to the developing regions of Asia and the Pacific and of Latin America and the Caribbean, the region's share of crude steel production is dismally low. Notwithstanding this fact the trend in apparent consumption per capita of steel in developing Africa indicates an annual increase of 20 kg during the period 1980-1983.<sup>20</sup>

256. There has been a steady growth in the fertilizer and other chemical industries in the region. Increasing priority is accorded to the use of raw materials and energy resources available on the continent by the fertilizer industry. Such resources are abundant, particularly phosphate rock, potash and hydrocarbons. Future requirements of sulphur, which is not available in the region, may be met by reduction, using other acids (nitric and hydrochloric acids) or by recovery from fuels and feedstocks of petroleum refineries. The use of electric furnaces in the production of phosphoric acid may replace the wet process, which is an older technology. The existing fertilizer plants in Africa are confronted, however, with the problem of low capacity utilization.

#### E. INVESTMENT

257. During the five years following the adoption of the LPA, several African countries paid increasing attention to investment in manufacturing industries. The high cost of investment arises from the ordering of unnecessarily elaborate equipment, the high costs of transport and installation, the need to hold large inventories (which ties up working capital) and unduly elaborate building structures. Table VI.8 shows the size and share in total national investment of actual and projected industrial investment in selected African countries for which recent data are available. In most cases, the share of actual and planned investment in total investment is well above 10 per cent, except for LDCs such as

<sup>a</sup> Share of manufacturing in total national investment.

Botswana, Guinea and the Niger. Gabon also recorded low investment in manufacturing for the simple reason that most of its oil revenues are invested in mining, agriculture and the infrastructure.

258. The light, consumer-goods industries have overtaken the heavy industries in the region as a whole and continue to record a rapid expansion in investment. While heavy industries generally lag behind, increasing attention is being given to them in the recent investment policies of a few African countries. For instance, Ethiopia has given high priority to the exploitation of the potash deposits of the Danakil Depression. Uganda has commissioned a study to appraise the viability of the Lake Katwe salt project. The Zaire authorities are considering the possibility of relaunching operations at the \$1.3 billion aluminium smelter at Moasida-Banana, using electricity supplies from the Inga power station. Nigeria has rescheduled the full integration of the Ajaokuta steel company for 1988 instead of 1986. Elsewhere in West Africa, investments in resource-based manufacturing industries were directed more to the exploitation of mineral deposits than to the transformation and processing of mineral raw materials into industrial finished products.

259. In North Africa, Tunisia is establishing a scrap-based mini-mill at a cost of \$85 million for the annual production of about 200,000 tons of reinforcing bars. A plant producing 50,000 tons a year of steel sections will also be built. In the chemical sector, Tunisia carried out pre-engineering studies for the exploitation of dry salt lakes with the aim of producing a range of chemicals, including sodium and potassium chlorides as well as magnesium, potassium and sodium sulphates. The Libyan Arab Jamahiriya continues to examine the \$20 billion project for an aluminium complex at Zewara with an installed capacity of 120,000 tons a year. Algeria is to construct a second steelworks at Bellara near Jijil, with a capacity of 2.2 million tons a year at an estimated cost of \$2-3 billion. In the chemical sector, Egypt is expanding raw sodium carbonate production from 80,000 tons a year to 200,000 tons a year at an estimated cost of \$120 million. This is in addition to constructing another soda ash plant, with a proposed capacity of 200,000 tons a year, for which bids were being evaluated last year. The Egyptian authorities propose to expand oil refining and petrochemicals capacity to meet domestic demand.

#### F. EMPLOYMENT

260. The trends in industrial employment over the past five years or so have varied significantly among countries, industries and locations. In every country the creation of net direct employment has been only moderate in relation to the postulated level of investment or the scale of expansion in manufacturing output. In general, the contribution of the manufacturing sector to total employment has rarely exceeded 20 per cent. The exceptions include Cameroon (27.2 per cent in 1981), Mauritius (24.2 per cent in 1984), Senegal (26.4 per cent in 1982), Tunisia (22.3 per cent in 1982) and Zimbabwe (20.1 per cent in 1985). In the Congo the sector accounts for less than 10 per cent of the national wage and salary bill. In the Gambia, the sector employs less than 2 per cent of the labour force. The proportion of the labour force engaged in industry in developing Africa as a whole increased from 8 per cent in 1960 to around 13 per cent in 1980.

261. It has proved extremely difficult to obtain employment statistics for recent years. Nevertheless, it is likely that the decline in the growth of industrial output, the growing number of enterprises operating much below their installed capacity and the closure of several enterprises have resulted in a substantial decrease in the number of people employed in the manufacturing sector. The limited capacity of manufacturing industry in the region to create employment has two main causes: (a) in most countries investment in the sector has been modest both absolutely and in comparison to total investment efforts; and (b) many industries have been operating with highly capital-intensive technology. For instance, petro-chemical plants, aluminium smelters and engineering industries created by several African countries have in general required very large amounts of capital but did not create much direct employment.

#### G. EXTERNAL TRADE

262. Data on the external trade in manufactured goods of African developing countries reveal two major structural features: the dependence on the outside world (particularly Europe) as destination of exports and source of imports and the small absolute size of intra-African trade in those products.

263. In absolute terms, such exports by African developing countries declined from \$6.2 billion in 1981 to \$5.6 billion in 1985. They consisted mainly of textiles, articles of apparel and clothing, and "other manufacturing". In contrast, the total imports of manufactures by those countries were valued f.o.b. at \$45.1 billion in 1985 against \$57.4 billion in 1981. They included mainly chemicals (12.9 per cent in 1985), machinery and transport equipment (46.6 per cent) and other engineering products, metals and fertilizers (40.5 per cent). Imports of engineering manufactures by African developing countries increased from \$4.4 billion in 1970 to \$24.1 billion in 1984; they represented 4.9 per cent of world trade in such products in 1970, 4.8 per cent in 1983 and 4.1 per cent in 1984.<sup>21</sup> Consequently, the deficit in the trade in manufactures, which showed a slight improvement in 1985 compared with 1981 (see table VI.9) resulted more from the decline of imports than from the expansion of exports. That decline, in turn, is to be explained by shortages of foreign exchange.

#### H. INDUSTRIAL POLICIES

264. In the framework of the LPA, the Industrial Development Decade for Africa (IDDA) aimed at ensuring the expansion of industries which are necessary to develop the economy of the region and to exploit and upgrade its energy, agricultural and mineral resources. As measures to implement the long-term industrial development strategy, African developing countries set at Lagos a series of quantitative targets which included the following for the region's share of world industrial production, in conformity with the Lima target for all developing countries: 2 per cent was to be achieved by the year 2000; the short-term objective was to achieve 1 per cent by the year 1985; and the medium-term objective was to achieve 1.4 per cent by the year 1990, while ensuring self-sufficiency in food, building materials, clothing and energy.

265. The period under review, 1985-1986, comprised the first two years of the implementation phase (1985-1990) of the IDDA Programme. If Africa is to

Source: ECA secretariat.

achieve its regional target for the year 2000 and thus meet its declared contribution to the 25 per cent target set at Lima for all developing countries, it would need to maintain its share in the developing world's industrial production at a minimum of 8 per cent. That share has been declining, however — from 9.4 per cent in 1970 to 8.1 per cent in 1985. As mentioned above, real industrial growth in the region during the period 1980-1985, about 3.4 per cent per annum (ECA estimate), must be judged inadequate in relation to the development goals implied by the LPA and Lima targets.

266. The region's manufacturing industries need therefore to be rehabilitated and revitalized in order to contribute efficiently to the recovery of African economies. In this regard, the United Nations Programme of Action for African Economic Recovery and Development 1986-1990 (UNPAAERD), adopted by the General Assembly at its Thirteenth Special Session, spelled out areas for industrial rehabilitation and development including, *inter alia*:

- (a) production of agricultural tools and equipment;
- (b) production of small-scale irrigation equipment;
- (c) processing of raw materials and intermediate inputs;
- (d) production of spare parts for the overhaul, repair and maintenance of vehicles, machinery and transport equipment;
- (e) development of capacity for utilization of renewable sources of energy, especially bio-mass and solar energy;
- (f) establishment of engineering capacity for the production of spare parts and components.

In addition, UNPAAERD put great emphasis on the rehabilitation of existing plants, because most of them serve to process agricultural products and play an essential part in alleviating the food crisis or in increasing foreign exchange earnings. UNPAAERD also stressed the need to improve training of industrial, technical and managerial manpower.

267. There is a need to strengthen the industrial base of the region by developing basic industries, namely, metallurgical, chemical and engineering industries. Existing national capacity for petroleum refining or processing of scrap, even if limited in scope, should be revitalized so as to meet domestic consumption needs and to reduce foreign exchange expenditure. Since only a few countries are in a position to develop competitive basic industries with capacity limited to meeting only national demand, it is of paramount importance for the

region to embark on concrete subregional or at least multinational joint ventures as the only practical way to establish integrated industrial units with large economies of scale. Such action is necessary both to achieve an appropriate market size and to hold down investment costs. It is also essential for the speedy implementation of UNPAAERD. In present circumstances the production of fertilizers, pesticides, agricultural tools and equipment, spare parts for transport equipment—to quote a few examples of products indispensable to the recovery and further development of the agricultural sector—can be economically undertaken only within multinational and subregional frameworks. As a first step, the projects already identified for chemicals, iron and steel, and engineering products should be urgently brought to the bankable stage.

#### I. PROSPECTS FOR 1987

268. The present recovery in the agricultural sector resulting from the good rainy seasons of the last two years should make it possible for most agro-industries to be provided with the raw materials they require and hence to operate at adequate capacity in 1987. At the same time, the improvement in agricultural export earnings should make it possible to import the necessary spare parts for the rehabilitation of existing plants. Hence the prospects for an acceleration in the growth of the manufacturing sector are potentially rather encouraging. Some countries recorded a relatively good performance in 1986, mainly because of the recovery of their agro-industries. However, for the region as a whole, growth in 1986 was poorer than in 1985 for the reasons stated above.

269. The prospects for 1987 remain disappointing compared with the regional target, although there is expected to be slight improvement compared to the year 1986. Preliminary UNIDO forecasts of growth for sub-Saharan Africa show a 2.6 per cent annual increase in real terms compared with 1.8 per cent in 1986. Prospects for the immediate future will vary from country to country: most of the small countries (mainly, the LDCs) with inadequate natural resource bases would be seen to suffer more than others; and certain oil exporters, such as Nigeria and Gabon, are expected to experience negative growth in 1987 if average oil prices decline. In general, however, the prospects for most African developing countries in the near future will continue to depend on the environment outside the region—the level of economic activity in OECD countries, the terms of trade, the balance of payments situation, etc.

## VII. ENERGY AND MINING DEVELOPMENTS

### A. INTRODUCTION

270. Energy resources on the planet Earth and in its interior and surrounding atmosphere are what make life and human activities possible. Their discovery and exploitation have required knowledge and the development of technical skills, often of great complexity, and capital investment on an increasingly large scale. Energy takes many forms and man often transforms it from the form in which it is first acquired – for example, by combustion of a fuel source – before putting it to final use. The production of energy non-commercially by cutting and burning roundwood is, in fact, a major component of developing Africa's production, the final use being for the most part in the form of the heat so created. Combustion of other mineral fuels is generally followed by transformation of the energy into other forms (for example, the kinetic energy of a vehicle). Commercial generation of electricity is the other major form in which energy is first produced, to be later transformed into heat, light and power.

271. The purpose of mining is essentially to extract from earth the materials that, after further processing, become either fuel sources of energy or inputs for manufacturing industry. This survey follows the practice of ISIC, in that the term mining is used in the broadest way for the extraction and first stages of processing of all minerals occurring naturally, whether as solids, liquids or gases. In particular, therefore, it includes the production of crude petroleum.

### B. ENERGY EXPLORATION AND CONSUMPTION TRENDS

#### 1. Exploration

272. The developments in the oil market, particularly those of 1979-1980, prompted both oil producers and other countries in Africa to make serious efforts to diversify their sources of energy. First, a major exploration drive was set in motion in both categories of countries – the oil producers to consolidate their position or to substitute for the fall in the output of known oil fields, the other countries in an endeavour to overcome their payments difficulties. Secondly, the costly energy régime has encouraged renewed efforts to develop and intensify the use of new and renewable sources of energy such as solar radiation, biomass and wind power, for which there is considerable scope. The oil exporters, in particular, have started to examine the atomic energy option. Egypt and the Libyan Arab Jamahiriya are two countries where that option is under serious consideration.

273. The persistent decline in oil prices since 1981, however, affected the oil exploration drive, albeit in an uneven manner. Table VII.1 gives a profile of oil and gas exploration activities in developing Africa during 1982-1984. As is clear from the table, drilling took place mainly in the oil-exporting countries and was more successful there than elsewhere. Nevertheless, non-oil pro-

ducers made considerable efforts, even if the results were mixed. Invariably, however, there was a noticeable tendency for exploration activity everywhere to slow down. During 1985-1986 and particularly after the drastic fall in oil prices during 1986, exploratory drilling was largely confined to the completion of outstanding contracts with foreign companies, mainly because of the squeeze on the resources of oil producers and the reluctance of financing institutions to extend new lines of credit, the future economic returns on investment in oil exploration and exploitation having been called in question.

#### 2. Consumption

274. In view of the transformations to which energy is subjected, it is customary when reviewing consumption in the economy as a whole to relate electricity consumption, for instance, back to the fuel or other input used for electricity generation. That is the principle on which table VII.2 is constructed.

TABLE VII.2. ENERGY CONSUMPTION IN DEVELOPING AFRICA, 1981 AND 1984 (Millions of tons of oil equivalent)

	1981	1984
Petroleum .....	51	74
Natural gas .....	14	16
Coal .....	5	5
Renewable sources .....	93	98
TOTAL	163	193

Source: A/41/383/E/1986/101, table 7.

275. Renewable sources of energy, notably biomass and material such as charcoal and fuelwood, constitute about 50 per cent of total energy consumption in developing Africa but up to 90 per cent in parts of sub-

Saharan Africa. Over the period 1981-1984 energy consumption from those sources grew by a mere 5.4 per cent, which was far below the rise of 45.1 per cent in oil-based energy consumption. The rise in consumption based on petroleum is closely associated with the evolution of industrial production techniques.

276. The use of new and renewable sources of energy has been advocated as an effective solution to energy problems in the region. Unfortunately, in some cases its credibility has suffered from premature and excessive promotion of the technologies involved. It is true that mature technologies already exist, but their diffusion to potential users, particularly in the rural areas where they are expected to generate the greatest impact, poses a problem. Their comparative advantage would be greatly enhanced by the removal of the high level of hidden subsidies currently enjoyed by petroleum products and electricity in many African countries.

#### C. ELECTRICITY GENERATION

277. Major oil producers, as well as mineral exporters, and the more industrialized countries in the region, continued to experience relatively higher annual growth in the generation of electricity in 1984-1985 (see table VII.3).

278. Major new electricity generating projects have been rather few. In Egypt, the 945 MW thermal power station at Shoubra al Kheima has started operations. At the same time the two hydroelectric power plants at the Aswan High Dam and the Aswan Dam, which supply most of the country's electric power requirements, are undergoing repair and working below capacity. The Egyptian Government still plans to achieve a significant switch to nuclear power during the 1990s, although some questions have lately been raised regarding the safety and desirability of that option. In Morocco the conversion of power stations to coal-firing continued; the 300 MW section of the 1,300 MW station at Mohammedia has already been converted and a 4x300 MW coal-fired station for Jorf Lasfar is planned to be built in two

phases, starting in 1987. Kenya is making growing use of the high potential of its geothermal resources. The additional capacity installed in 1985 increased the electricity generated from such sources by about 44 per cent to 336 gigawatt-hours.

279. Greater emphasis has also been placed in many countries in the region on integrated electric energy development and on rural electrification.

#### D. MINING IN THE CONTEXT OF DEVELOPING AFRICA

280. It is evident from the introduction to this chapter that mining is a crucial part of the foundations of modern, industrial economies. In the case of the countries of developing Africa, it is also an important foreign exchange earner in several cases, namely: Botswana, the Central African Republic, Liberia, Morocco, Sierra Leone, Tunisia, Zaire and Zambia. In other countries, even though less important to the economy, it makes a significant contribution to export earnings. Developments in the international market for minerals are therefore of great interest to developing Africa.

281. Although it is among the oldest activities in the region, mining continues to be generally underdeveloped, remaining almost wholly an export-oriented industry, dependent on demand conditions in the developed countries.

282. With the world's mining industries still suffering from over-production, as well as considerable overcapacity and low demand throughout the mineral processing chain—from extraction to refining—mineral prices remained depressed during 1985-1986, in consequence of which the pace of new investment and follow-up exploration in the region have declined considerably since the late 1970s. The growing competition from developed countries and other third world countries has been a major limitation on mineral exports by the region; indeed, the mining sector in developing Africa is among the most vulnerable in the world.

TABLE VII.3. ELECTRICITY PRODUCTION IN SELECTED AFRICAN COUNTRIES, 1981-1985 (Gigawatt-hours)

Sources: *Monthly Bulletin of Statistics*, vol. XL, No. 10 (October 1986); and ECA secretariat.

283. Only a few new projects, therefore, were undertaken in 1985-1986, notably in gold mining. Rehabilitation of existing mines assumed a higher priority, particularly in Zaire and Zambia, where the processing and maintenance facilities in the copper-cobalt mining industry were reported to have been in poor condition. Likewise, in Zimbabwe, the iron and steel production company adopted a rehabilitation programme. Those programmes were designed essentially to improve the utilization of existing facilities and make it possible to increase output. The shortage of foreign exchange continued to prevent similar moves in many other countries. The increase in production and rehabilitation costs put further constraints on the development of the sector.

284. Nevertheless, the expansion and upgrading of smelting and refining capacity has been successfully carried out in recent years. Smelting capacity expanded from 92 per cent of mine production in 1980 to about 95 per cent in 1985 in the case of copper, from 54 per cent to 81 per cent for lead and from 50 per cent to 74 per cent for zinc. In addition, 68 per cent of copper mined in the region is currently refined domestically but the refining of precious metals continues to be done largely abroad.

#### E. THE MINING SCENE IN 1985-1986

285. As always, economic conditions in the OECD countries governed the working of the markets for minerals. Hence, in 1985-1986 there was a general downward trend in demand for and prices of the region's minerals. Two forces were at play: first, slow growth in the OECD countries, which limited the demand for both fuels and industrial raw materials; and, secondly, technological change in the form of improvements in production processes and the development of substitutes, which greatly affects the intensity of metal usage by industry generally. Cases in point are the slow but steady invasion of the steel-based industries by plastics and the growing importance of the recycling of metals such as copper, aluminium, zinc, lead, silver, tungsten and some minor minerals.

### 1. Production of mineral fuels

#### (a) Oil

286. Table VII.4 shows oil production during 1982-1986 in developing Africa. It supplements the information on main market trends outlined above. Production in the region increased by 11.7 per cent over the previous year to reach 240.6 million tons in 1985. It is estimated to have fallen back in 1986 to its 1984 level of 228.9 million tons, representing 78 per cent of the peak level attained in 1980 of 294.1 million tons. Developments in the African countries belonging to OPEC broadly followed the general trend. Their production rose in 1985 by 3.5 per cent in comparison with 1984 to 161.2 million tons, falling again to 155.9 million tons in 1986. Production by African members of OPEC in 1986 was only 63.8 per cent of its level in 1980. The decline is essentially due to the fall in production in Algeria—which follows a conservation policy—and in the Libyan Arab Jamahiriya. Nigeria and, to a lesser extent, Gabon continued to increase their production.

287. Oil production by other African developing countries, on the other hand, continued to rise: it reached a peak of 79.6 million tons in 1985, mostly owing to increased production in Egypt, the third largest "other" producer and Angola. In 1986, however, the combined production of that group fell by 8.5 per cent to 72.8 million tons. It is to be noted that the share of the non-OPEC members in total regional oil production almost doubled to 32 per cent between 1980 and 1986.

288. While production of crude petroleum is currently on a plateau, some countries, such as Nigeria and Egypt, are increasing their refining capacity in order to reduce imports of refined products and, if possible, to increase exports of refined products, which are not subject to quota restrictions.

#### (b) Coal

289. Developments in the coal market followed those for oil. Regional production continued to decline, especially among the major producers. Between 1983

<sup>a</sup> Preliminary estimate based on extrapolation of January-April production figures.

and 1985 output fell by 3.7 per cent in Zimbabwe, by 9.8 per cent in Morocco and by 13.2 per cent in Mozambique; only Zambia was able steadily to increase its output.

290. Overall, developing Africa produced about 170.5 million tons of coal in 1985 and exported about 40 million tons, mostly steam coal.

(c) *Uranium*

291. Regional production of uranium fell for the fourth successive year. Between 1981 and 1985 the decline was about 17.5 per cent, to 7,715 tons U308 (t U) in 1985. That fall was almost wholly accounted for by the continuous decline in production in the Niger, the leading regional exporter. In 1985, for instance, the combined production of the two mines in that country decreased by about 2.8 per cent to 3,180 t U. Production in Gabon rose by 3.7 per cent to 935 t U, while that of Namibia remained more or less at the 1984 level of 3,600 t U.

292. The mine production statistics shown in table VII.5 underscore the uncertainty which prevails in the sector. Among all the commodities reported in the table, only bauxite, iron ore and diamonds show continued production growth in recent years. The rest had mixed fortunes. Copper production fell by 3.8 per cent in 1985, phosphate by 4.6 per cent, zinc by 6.3 per cent and silver by 2.5 per cent. Aluminium, however, after suffering substantial declines in production of 34.0 per cent in 1983 and 5.6 per cent in 1984, recovered strongly in 1985 with an increase of 18.7 per cent. Cobalt production increased by 10.9 per cent in 1985 but still remained 20 per cent below its 1982 level. Production of diamonds continued to be particularly buoyant, rising by 12.6 per cent, 26 per cent and 3.4 per cent in 1983, 1984 and 1985, respectively.

293. An index of mining production which takes into account the above divergent trends indicates that regional mineral production other than oil and natural gas fell by 2 per cent in 1985, compared with a rise of 5.3 per cent in 1984, essentially because of lower output of copper, phosphate and zinc in countries such as

Morocco, Tunisia, Zaire, Zambia and Zimbabwe. In Zambia, production of copper, which accounts for the major part of exports, fell in 1985 by about 10 per cent to 85 per cent of the 1983 level. That fall was accounted for mainly by the foreign exchange shortages which constrained maintenance, rehabilitation and mine development activities. Plans are under way to rehabilitate the industry, however, with financial assistance from the African Development Bank and the EEC. Likewise, in Sierra Leone the mining sector experienced considerable difficulties in 1985. Mining costs continued to rise and shortages of fuel and mining equipment to hamper the industry. In Zaire, mining production fell by 1.4 per cent in the first half of 1985 because of the difficulties encountered by GECAMINES in copper production.

2. *Prices of mineral fuels*

(a) *Oil*

294. By far the most important development internationally was the collapse of oil prices. A series of actions by members of OPEC—notably by its main producer, Saudi Arabia—at a time of weak demand quickly created a situation of over-supply and over-stocking. Demand for OPEC oil fell continuously from 31 million b/d in 1979 to 15.5 million b/d in 1985, the OPEC share of the oil market dwindling from 49.1 per cent in 1981 to 29.1 per cent in 1985.

295. The pressure had begun to build up as early as January 1985, when OPEC members agreed to a two-tier pricing structure in preference to the "fixed" pricing system pursued previously. Largely to maintain market shares in a situation where the production of non-OPEC members was growing rapidly, OPEC members started to make a series of price cuts, to embark on payments concessions and to exceed their production quotas. As a result, prices took a dramatic turn early in 1986 and by the middle of the year, at around \$10 a barrel, were in real terms barely above their pre-1973 level of \$2.60 a barrel. In current dollars, prices were only 28 per cent of their peak 1982 level of \$35 barrel and only 36 per cent of their end-1985 level of \$28 a barrel.

\* th: thousands of tons; t: tons; t U: tons U308; th ct: thousands of carats.

<sup>a</sup> Smelter production.

296. Market stability was not encouraged by the actions of major producers such as Saudi Arabia, which stepped up the pressure on high-cost producers in a bid to impose a new pricing pattern, raising its production from around 4.4 million b/d in the first quarter of 1986 to some 7 million b/d in the last two weeks of August 1986, when prices were at their lowest. It has been estimated that the latter level of production, combined with actions of a similar nature by other OPEC members, would have enabled the oil companies to amass oil stocks at the rate of over 3 million b/d in the third quarter of 1985, compared with only 100,000 b/d in the corresponding quarter of 1985, which would have caused further falls in price by the new year.

297. Those developments prompted the members of OPEC to try once again to arrest the slide in oil prices and, with a return to the fixed price system, to guarantee to generate a price of at least \$18 a barrel, some \$3-4 a barrel above the August 1986 level. Meeting in September/October 1986, the Organization agreed on a production ceiling averaging 15 million b/d by its members in November and December 1986, excluding production by Iraq estimated at roughly 2 million b/d. That agreement expired at the end of the year and was replaced by a new one to cut output by members by about 1 million b/d in 1987 to around 16 million b/d.

(b) *Coal*

298. Developments in the coal market closely followed those for oil. In the wake of the second surge in

oil prices in 1979-1980 spot prices for steam coal attained record levels and were forecast to reach \$90 a ton by 1986, in the event that coal grade traded at one third of such a price or even less. Those earlier, over-optimistic forecasts had led to the launching of numerous programmes to expand coal mining and resulted in oversupply. An aggressive selling policy by the new market entrants and lower shipping costs were additional major factors behind the decline in prices.

(c) *Uranium*

299. Uranium prices continued to decline. Since the metal accounts for over 80 per cent of export receipts and covers some 40 per cent of government expenditure in the Niger, the fall in prices and demand severely affected investment activity in that country and repeatedly delayed the implementation of its five-year development plan.

300. Table VII.6 shows the evolution of prices of mineral fuels since 1982.

3. *Prices of non-fuel minerals*

301. Mineral ore and metal prices continued to show a declining trend (see table VII.7). During 1985, in particular, the prices of nearly all major commodities fell or at best remained stable. The price of tin rose by 7.4 per cent in 1985, only to slump by 35.7 per cent on average during the first half of 1986. Preliminary data for 1986 confirm the downward trend. Aluminium prices, for example, fell by 6.7 per cent, those of zinc by 20 per cent,

<sup>c</sup> Yearly average.

iron ore by 5.6 per cent, lead by 5.3 per cent and silver by 7.2 per cent. The few minerals which rose in price were bauxite (2.5 per cent), phosphate (2.6 per cent), diamonds (7 per cent) and gold (8.1 per cent). The prices of nickel and copper have remained more or less stable during the past few years. Overall, non-fuel mineral prices in 1986 were 34 per cent lower than in 1980.

#### F. REVIEW OF SELECTED NON-FUEL MINERALS

##### 1. *Diamonds*

302. Diamond production increased by about 3.4 per cent in 1985, although prices fell by 12 per cent from their 1984 levels. The sustained growth in production in Zaire and Botswana, the region's most important producers, was the principal cause, Zairian production in particular increasing by 5.9 per cent. Diamonds are now that country's largest export earner after copper, cobalt and oil. The 1985 exports of Botswana accounted for 70 per cent of that country's foreign exchange earnings. Other producers, in decreasing order of importance, were Angola, Ghana, the Central African Republic, Liberia, Sierra Leone and the United Republic of Tanzania. In all those countries programmes are under way to increase production, in response to the relatively high demand for natural diamonds in recent years.

##### 2. *Gold*

303. At 1,213 tons in 1985, world production of gold, excluding that of centrally planned economies, was at its highest level for 14 years. In developing Africa production reached 28 tons in 1985, 33.9 per cent higher than in 1981. Prices, however, fell for the second year in succession to a low of \$317.35 an ounce in 1985. In 1986 an upward trend developed and prices averaged \$359.17 an ounce.

304. Ghana increased production by 3.8 per cent to 9.3 tons in 1985. Zaire, once among the main producers together with Ghana and Zimbabwe, continued to suffer from illicit digging and smuggling. Consequently, reported production by Zairian mines fell by 56.6 per cent to 1.1 tons.

305. With gold showing substantial promise, all the major exporters of the metal in the region are taking measures to increase the efficiency and scope of their operations. In Guinea, for instance, the Government issued a decree banning small-scale local mining throughout the country in a bid to monitor production and prevent smuggling, particularly to Mali. In Ghana, residual gold in tailings estimated to total some 40-45 tons, is to be extracted by heap leaching, with financial assistance from the World Bank, while the Ashanti mine is due to be expanded and the Tarkwa mine renovated. In sum, those measures are expected to restore Ghana to its former leading position among the gold producers of developing Africa.

##### 3. *Silver*

306. Demand for silver continued to be sluggish. Production fell for the second year running, from 333 tons in 1983 to 329.2 tons and 321.6 tons in 1984 and 1985, respectively. Likewise, prices fell from their peak 1983 level of \$11.44 an ounce to \$6.14 an ounce in 1985 and are estimated to have fallen by a further 7.2 per cent in 1986.

##### 4. *Copper*

307. The period since the early 1970s has been one of sluggish growth and increasing uncertainty in the world copper market. Indeed, world demand has almost completely stagnated and prices have fallen for most of that period irregularly, on account of the considerable over-supply situation and the considerable idle capacity among OECD members. Regional copper production fell by 1.6 per cent in 1984 and again by 3.9 per cent in 1985.

308. Hampered by poor external demand and by domestic production difficulties, the copper industry experienced difficult times; major producers such as Zaire and Zambia were forced to cut down production, the latter to 463,000 tons in 1985—only 77 per cent of the 1980 level. In part, however, the decline in Zambia was the result of a new strategy of improving profitability by abandoning high-cost operations and by up-grading relatively low-cost mines and plants that were operating below acceptable levels in terms of maintenance work and efficiency. Furthermore, emphasis is being placed on the programme for leaching tailings. The target for annual production of copper under that programme is 80,000 tons, which would add 60 per cent to the current volume of production from tailings; even so, it is far below the potential scale of activity. The Zambian copper belt is believed to contain more than 7 million tons of copper tailings and waste dumps, the heritage of over 50 years of mining. The existence of similar potential is anticipated in Zaire.

##### 5. *Iron ore*

309. The iron ore supply situation has deteriorated somewhat compared to the early 1980s. Local production difficulties and inefficiency were the main factors at work. In Liberia, the National Iron Ore Co. was closed down in March 1985, while the remaining two mining companies had to carry out measures to increase efficiency. In Sierra Leone the Marampa Iron Ore Co. ceased operations owing to financial difficulties.

310. Little has been done to develop the known but unexploited ore bodies in Cameroon, Côte d'Ivoire, Guinea and Senegal. Their development is likely to be deferred indefinitely, owing to the world over-supply situation and idle production capacity in many areas.

311. The collapse of iron ore prices accelerated the decline. Prices fell by 8.6 per cent in 1983, 3.6 per cent in 1984, 1.9 per cent in 1985 and were expected to fall for the fifth consecutive year by 8.6 per cent during 1986.

##### 6. *Manganese ore*

312. The steel industry consumes about 95 per cent of the production of manganese ore, to make steel alloys. Hardly any substitute for it exists and the relationship between production of the two commodities therefore remained fairly stable. Production of manganese ore in developing Africa continued to expand despite the weakening of ore prices from their 1982 level of \$164.12 a ton to \$140.27 a ton in early 1986. As table VII.7 shows, however, the mineral has traded at relatively stable prices over the past three years.

313. The chemical (non-metallurgical) grade of manganese ore, which is found mainly in Ghana and Gabon, generally fetched prices three times those of the metallurgical grade.

314. So long as regional production remains low compared to 1979 and 1980, there is little hope that any new deposit, such as Tambao in Burkina Faso, will be exploited. The reopening of the Kisenge mine on the border between Zaire and Angola could greatly expand production if the Benguela railway line became operational again. Gabon is likely to increase its export capacity with the replacement of the existing ropeway, which brings ore to the port, by a rail link. Ghana is approaching the complete exhaustion of its high-grade deposits but possesses ample resources of lower-grade ore.

#### 7. *Bauxite and aluminium*

315. Guinea is a major producer of bauxite, accounting for over 90 per cent of regional output and some 20 per cent of world production. In 1985 production remained at its 1984 level, which was 13.5 per cent higher than in 1983. Production in Sierra Leone, another important African producer, continued to rise steadily. Prices, however, remained rather unstable.

316. Aluminium production recovered in 1985 after having declined for three years in succession, recording an increase of 19.7 per cent. Prices, after improving during 1982-1984, started to edge down in 1986.

#### 8. *Cobalt*

317. After falling to a low of 7,409 tons in 1983, cobalt production in the region recovered considerably in the subsequent two years—by 78.5 per cent in 1984 and by a further 5.4 per cent in 1985. Production by Zaire and Zambia, the two major world producers, was markedly higher in 1984 than in 1983, totalling 12,273 tons against 7,091 tons. That was still considerably lower than the record high for the two countries of 18,850 tons achieved in 1980. Prices, however, continued to fluctuate. Although cobalt marketing shifted in 1984 from spot pricing to a producer-price system on the initiative of Zaire, followed by Zambia, prices were largely influenced by the buying policy adopted by the General Services Administration of the United States of America. At the beginning of 1986 both countries reverted to free market pricing. The average for that year was \$6 a pound.

#### 9. *Lead and zinc*

318. Lead production fell by about one third of its 1983 level during the period 1984-1985. The decline was largely accounted for by the progressive exhaustion of the Kabwe deposit in Zambia, which was scheduled to close down during the course of 1986, and by shortages of spare parts and lubricants, leading to the frequent breakdown of equipment. Morocco, the leading producer, maintained its position, with a share of about 62 per cent of the regional output.

319. Lead prices continued to weaken, falling by 26.9 per cent in 1985 and by a further 5.3 per cent in 1986. The trends in the zinc market were similar: prices fell by 18.4 per cent and 20 per cent in 1985 and 1986, respectively, following rises of 5.1 per cent in 1983 and 19.5 per cent in 1984.

320. No new mines came into production during 1984-1985. Despite efforts by Nigeria to open up lead mines, its production was relatively modest. In the field of exploration, however, intensive efforts were made to develop the large poly-metallic sulphide deposits at

Perkoa, Burkina Faso, which contain high percentages of lead, zinc and silver. In the event of a successful outcome, Burkina Faso could develop a large mine with production of sulphur as a bonus. The manufacture of sulphuric acid from domestic supplies of sulphur would hold tremendous promise for the establishment of partially acidulated phosphate industries in the Sahel region, a development which might be of interest not only to Burkina Faso but also to the Niger, where phosphate deposits exist.

#### 10. *Tin*

321. Conditions in the tin market have somewhat stabilized after the collapse of the London market in June 1985, although the supply and stock situation continues to cause concern. Regional production stagnated in 1985 at around 6,500 tons; a decrease that year in Nigeria's output was offset by an increase in Zaire.

#### 11. *Phosphate rock*

322. Regional production of phosphate declined by 4.6 per cent in 1985, following substantial rises of 11.9 per cent in 1983 and 7.9 per cent in 1984. A major factor was the fall in production by Morocco, the leading world producer, of about 1.9 per cent. The decline was accentuated by the fall in production by Tunisia (5.3 per cent) and Togo (9.1 per cent).

323. This notwithstanding, a large number of African phosphate producers carried out large-scale development or exploration activities. In Morocco emphasis was placed on expanding capacity for the processing of rock into downstream chemicals and on exploring the large potential of untapped markets in third world countries and the Union of Soviet Socialist Republics. For its part, the United Republic of Tanzania embarked on the Minjingue phosphate mine project with the aim of producing raw materials for a fertilizer plant.

324. Demand remained weak, however, largely because the demand for phosphate fertilizer in a number of key markets in the world, especially the United States and Western Europe, failed to improve. World demand fell by about 2.6 per cent in 1985, causing a reduction of about 11.3 per cent in prices. The data available for 1986, however, show that prices rose by about 2.6 per cent in the first quarter of the year.

#### 12. *Other industrial minerals*

325. The remaining industrial minerals produced in developing Africa include asbestos, barytes, fluorspar, selenium, lithium, mica, salt, sodium carbonate, sodium sulphate and beryllium. Although those materials account for only 6.5 per cent of regional exports of non-fuel minerals, they are believed to have considerable potential, in that some of them are expected to fetch high prices in view of the growing number of industrial uses that have been developed. Moreover, sizeable deposits are known to exist, though for the most part they have yet to be exploited. Sodium carbonate and sodium sulphate, for instance, are presently exploited in only three African countries: Chad, Egypt and Kenya but deposits of economic interest are known to exist in Ethiopia and the United Republic of Tanzania. Beryllium is another minor metal of growing interest world-wide. Mica and graphite are potential foreign exchange earners for the region; their production is fairly small and is carried out in only five countries:

Madagascar, Mozambique, the Sudan, the United Republic of Tanzania and Zimbabwe.

#### G. PROSPECTS FOR 1987 AND BEYOND

326. Future prospects in the field of energy and for the mining sector depend inevitably on what the trend will be in GDP growth, granted their key role in any economy. However, since so much of the mining activity in developing Africa is export-oriented, prospects will depend above all on the future levels of activity in the OECD countries and on the changes in the intensity with which energy and various industrial materials are used, as technologies evolve and new technologies are discovered.

327. As regards energy resources, even with falling oil prices worldwide exploration for petroleum continued in 1985 and 1986, although the discoveries made only marginal additions to reserves. The viability of new exploration activities has been affected by those price developments; exploration budgets were cut significantly in 1986 and efforts were concentrated mainly on areas of clear economic promise. Thus, in West Africa, where prospects were rated highly, activities initiated in the early 1980s continued. The efforts of the African members of OPEC are constrained by their revenue problems and they are confining exploration largely to national companies. However, the larger producers outside OPEC, such as Egypt and Angola, are attracting increasing attention.

328. At the present stage of development in many African countries the pattern of energy consumption cannot be expected to change rapidly. Continued use will have to be made of biomass material. Neither petroleum products nor electricity can substitute easily or quickly for fuelwood or charcoal. Consumption of the latter materials is therefore expected to increase in

both rural and urban areas. Since annual fuelwood needs amount to 1-1.9 cubic metres per person, an acute regional scarcity of fuelwood in the not very distant future is a strong possibility.

329. In rationalizing their energy policies all countries, including OPEC members, are becoming cost-conscious. There are many examples of prices being raised to reflect costs and in order to dictate priorities in energy use. Governments also increasingly use the media to enhance awareness of energy issues and to discourage wasteful use of energy resources. Such efforts are generally accompanied by measures to diversify the pattern of investment in the various sources of energy. Those policies are likely to continue in the future.

330. Internationally, the oil market remains uncertain. OPEC members have decided to cut further their production quotas, the objective for the immediate term being to raise prices to \$18 a barrel and to maintain them at that level. The coal and uranium markets will be strongly influenced by what happens to oil.

331. The generation of electricity, however, will continue to depend on GDP growth within the region.

332. As regards non-fuel minerals, prices and the volume of imports by OECD countries are expected to remain around 1984-1985 levels. The price trend will be affected particularly by the current substantial stockpiles of raw materials, semi-finished and finished products. There is, of course, the on-going adverse impact of the substitution of natural raw materials by synthetics based on petrochemicals, etc.

333. However, at the domestic African level, the rehabilitation of mines, the adoption of less capital-intensive techniques and the recovery of minerals from tailings are all expected to proceed steadily, thereby enhancing the capacity of the mining sector to respond with speed and flexibility to external demand factors.

**Part III**

**OTHER ACTIVITIES**

## VIII. TRANSPORT AND COMMUNICATIONS

### A. INTRODUCTION

334. Historically, the African transport network was built upon the colonial penetration routes connecting the ports with the inland town, which, in turn, were connected by integration arteries and feeder or supply routes. The state of development of the various components of that network reflected the fact that much of Africa's commercial production was to be shipped overseas. The small size of domestic markets and the low level of intra-African trade restricted the development and improvement of the axes of integration and the feeder routes within and between countries. The newly independent African States placed emphasis mainly on the development of their national networks.

335. During the period under review, 1985-1986, there were still vast areas without regular transport services of any kind. Few areas of the continent, if any, can be characterized as being adequately served. The progressive development of all-weather roads has been hindered by the cost of road maintenance, which constitutes a heavy burden on the budgets of national administrations. Despite recent improvement in road networks, road transport of freight remains costly and time-consuming. Where railways exist they continue to be the principal means of moving international freight to the ports for shipment by sea. The Union of African Railways (UAR) has sought to improve links between neighbouring railway systems to facilitate economic integration among African countries but that calls for investment on a scale beyond the capacity of most African developing countries; furthermore, it is hampered by the existence of several track gauges.

336. Approximately 95 per cent of the region's international trade is seaborne. Port congestion has been significantly reduced in recent years and the security of shipment by sea improved since the mid-1970s by the introduction of containers. However, some 97.5 per cent of exports and imports is still carried in foreign ships. The air transport system has expanded at a rate well above the world average—over 10 per cent annually in the 1970s. It is confronted, however, with several problems: higher than average costs, a great lack of suitable facilities, acute shortage of skilled personnel and the need to operate in the face of unfavourable regulatory and policy restrictions.

337. The communications sector covers three basic kinds of activity: (a) telecommunications, which include telephone, telex and their derivatives; (b) broadcasting of radio and television; and (c) postal services. Telecommunications, in particular, have been the subject of considerable technological change in recent decades. The Pan-African Telecommunications Network (PANAFTEL) is an ambitious programme which aims to bring the advantages of modern technology to developing Africa, for the benefit of communication between countries of the region and with other parts of the world. Work on PANAFTEL projects continued in the period under review. Terms of reference are under

consideration for a study on the establishment of a Regional African Satellite Communications System. The development of low-cost sound broadcasting for rural communities and the strengthening of regional postal services are under investigation.

338. African countries have, since 1980, related their development strategy to those parts of the LPA which emphasized the need to strengthen the role of regional economic communities and foster integration in the field of transport and communications. For that purpose, new institutions have been created and existing ones strengthened. Within the framework of the United Nations Transport and Communications Decade in Africa, 1978-1988 (UNTACDA), governments have striven to obtain the advantages which such integration and co-operation can bring. They have recognized the need for the complementary development of all transport modes to ensure timely and cost-efficient means of transport and communications and the desirability of establishing over the years an integrated African transport network. However, in the period 1984-1986, the economic crisis that affected Africa and the world at large slowed down the implementation of the projects contained in the phase II programme of UNTACDA.

339. The contribution of transport and communications services to GDP in terms of value added was \$16,739 million in 1985, measured at 1980 factor cost, compared with \$16,159 million in 1980, for the region as a whole. Table VIII.1 gives details by subregion and economic grouping. The average annual rate of growth of that value added between 1980 and 1985 was 0.7 per cent, compared to 0.3 per cent for the growth of GDP;<sup>22</sup> consequently, the share of transport and communications in GDP rose from 5 per cent in 1980 to 5.1 per cent in 1985. The negligible rate of growth of the transport and communications sector reflects the general trend in the economies of the region, which were hard hit by considerable disparities among the subregions. While in North Africa the value added grew annually on the average by 4.1 per cent, in Central Africa by 2.6 per cent and in East and southern Africa by 1.7 per cent, West Africa recorded a negative average growth rate of 5.1 per cent.

340. Preliminary estimates for 1986 show that the value added in the region will probably have increased by 2.8 per cent to reach \$17,200 million in consequence of the increase in investment and in passenger and freight traffic in the various means of transport.

### B. TRANSPORT TRAFFIC FLOWS

341. An assessment of the development of the various modes of transport in developing Africa is handicapped by lack of accurate and comparable data and indices of ton-kilometres and passenger-kilometres. It is possible to present only rough estimates of the indicators of traffic together with an analysis in the broadest of

terms of the problems and policy issues that exist in each specific mode of transport.

### 1. Road transport

342. Road transport continues to play a dominant role among the various modes of transport, carrying 80-90 per cent of inland goods and passenger surface traffic, in so far as the patchy data allow estimates to be made. The observed differences in classification of the various types of road make comparison of road lengths in different countries very difficult.<sup>23</sup> Moreover, the published information on the road networks generally does not extend beyond 1977.<sup>24</sup>

343. Table VIII.2 shows road lengths in countries for which data are available. At the end of 1985, the total length of usable roads in those countries was estimated at 474,485 km, of which 87,020 km or 18.3 per cent was permanently surfaced with bitumen. National totals ranged from 145,000 km in Zaire to 8,186 km in Sierra

Leone. The network in km per sq km for roads of all types combined ranged from 0.20 in Malawi to 0.01 in Mali. The generally low density in Africa reflects the fact that few new roads have been constructed. To make matters worse, the maintenance and rehabilitation of existing roads is generally less than adequate.

344. There was a steady growth in the use of road motor vehicles during the period 1980-1985 and the regional total in 1985 is estimated at 5,615,600 compared with 4,029,500 in 1980 (see table VIII.3). Those estimates relate to private and commercial vehicles but exclude tractors, trailers and two-wheeled vehicles. The number of vehicles per thousand inhabitants in 1985 varied between 6.5 in West Africa and 20 in North Africa, while the average for the region was 13.2 and an average of 300 is common in Europe. There were, on average, 6 vehicles per kilometre of main and secondary road in 1985 compared with 50 vehicles in Europe. The number of vehicles in the region per kilometre of main

road alone was of the order of 18.2. When it is considered that most vehicles in Africa operate much of the time in urban areas only, it must be concluded that the road usage outside the urban areas is extremely low.

## 2. Maritime transport

345. Maritime transport is extremely important to African countries because of the openness of their economies and the very high proportion of total trade conducted with overseas countries by that transport mode. Crude petroleum, refined petroleum products, iron ore and other mineral and agricultural products are the most important export commodities. Machinery and transport equipment, fuel and raw materials, consumer goods, chemicals and pharmaceutical products are the most important imports. Table VIII.4 shows the volume of goods loaded and unloaded in external trade at the ports of selected countries, virtually all of which recorded an increase in cargo unloaded between 1980 and 1985. Madagascar and Tunisia were the exceptions. In 1985, world-wide, the volume of international sea-borne

trade amounted to 3.33 billion tons, a decrease of 1 per cent compared with 1984. The share of all developing countries in that trade was 47.7 per cent for goods loaded and 25.8 per cent for goods unloaded; within that share developing Africa accounted for 8.7 per cent and 5.8 per cent, respectively.

346. The African coastline contains more than 105 seaports, of which some 70 are major international ports.<sup>25</sup> Although there were management problems at most of those ports, in general activity was maintained at a fairly high level during 1980-1985. Signs of congestion were indeed noticed in some ports in the subregions other than North Africa. The large increase in cargo movements led to further investment in harbour facilities. New berths were planned or are under construction. In some countries, large-scale port improvements took place and ports were modified to handle bulky cargoes, e.g. crude oil at Cap Lopez (Gabon), phosphates at Kpeme (Togo) and Dakar (Senegal), iron ore at Monrovia (Liberia), manganese ore at Pointe Noire (Congo), and copper at Matadi (Zaire). In other

<sup>b</sup> Estimates.

countries, steps towards greater mechanization of handling operations were taken with a view to cutting costs and increasing efficiency. That objective is achieved by the use of techniques which unify cargo—containerization, palletization + lighter-and-ship (LASH), Roll on/Roll off (Ro/Ro) + LASH, which make it possible to transport relatively sophisticated goods in sealed units that protect them from pilferage and the usual hazards of sea transport. Containers can also be stored on aprons at ports, thereby reducing the need for warehouses. The volume of containers handled at selected African ports in 1985, measured in 20 ft equivalent units, was as follows:

Egypt	185 572
Nigeria	187 771
Côte d'Ivoire	151 252
Kenya	92 462
Morocco	88 234
Cameroon	65 224
Togo	36 305
Zaire	35 887
Tanzania	33 000
Ghana	30 052

Source: UNCTAD, "Review of Maritime Transport 1985" (TD/B/C.4/299).

347. About one million containers were moved through African ports annually. Although a good number of them still remained within the vicinity of the ports, many began to be moved inland both within coastal States and to land-locked countries. There are, however, extremely few indigenous multimodal transport operators in developing Africa and the vast majority of multimodal transport documents are issued by foreign ones. Consequently, the full gains expected from containerization have yet to be obtained, in spite of the heavy investments in container terminals made by many port authorities in the region.

348. Other factors, however, have also limited the rapid expansion of containerization in the region. In addition to capital investment the technique calls for improved port facilities and labour redundancy—which, in most cases, is politically unacceptable. A further problem is the shortage of outward-bound cargo, which means that containers return empty. Given those constraints, other techniques have generally been adopted in Africa. The LASH system was mentioned above, according to which goods are stored on lighters and carried thus abroad. At the port of arrival, the lighter can be quickly unloaded from the ship and then tugged to various points which a big vessel cannot reach because of draught limitations. However, the system involves capital expenditure on which the financial charges are often far in excess of the net revenue obtainable from the freight traffic on offer. Moreover, most African ports are not deep enough close to shore to facilitate the navigational operations it requires. Another technique introduced in some African countries is palletization, which requires only minimal capital investment and causes little labour redundancy, since it merely involves storing cargo on wooden pallets, which are moved on fork-lift trucks. Palletization is extensively used in African ports and some lines have adapted their ship holds and cover to the system. Palletization is not, however, a fully mechanized operation and cannot be utilized without warehouse facilities.

349. All coastal States have two main and related interests in maritime shipping. First since freight rates form part of the final demand price of exports and part of the final supply price of imports, they have a strong interest in ensuring that freight rates on African routes are as low and as competitive as possible. Secondly, shipping can provide an important source of invisible income and thus help to improve the balance of payments. African developing countries have begun to establish their own shipping companies but as yet they account for a very small proportion of world shipping (about 1.2 per cent).

### 3. Inland water transport

350. The African continent has a vast potential for the development of inland water transport. Its rivers and lakes include some of the largest in the world and could be used to good effect for large-scale transport of goods and passengers. Some of the natural water routes already play an important role in the economies of the countries in which they are situated: River Nile for Egypt and the Sudan; River Congo for the Central African Republic, the Congo and Zaire; River Niger for Mali, the Niger, Nigeria and Guinea; Lake Victoria for Uganda and Kenya; and Lake Tanganyika for Burundi and the United Republic of Tanzania.

351. Inland waterways could be of particular importance to land-locked countries by opening up additional access routes to the coastal States. Some land-locked countries, therefore, have fostered the development of their inland water transport—the Central African Republic is a case in point. It should be noted, however, that many other African countries continue to display a lack of interest in the development of that mode of transport. Currently, only Egypt and, to some extent, the Sudan have more or less well developed inland water transport systems. There have recently been moves to establish commissions for the Nile River basin and the Congo-Zaire River basin.

### 4. Railway transport

352. The level of activity on railways in developing Africa is summarized in table VIII.5. All except 11 African countries<sup>26</sup> possess railways systems. Most of them were designed to serve particular enclave activities, some to supplement the existing surface transport system. The total length of railway routes in the region is estimated at 50,000 km.<sup>27</sup> That is relatively small compared to systems in other developing and developed countries of the world. Nevertheless railways remain the major carriers of bulky goods over long distances. The volume of railway freight traffic is estimated to have grown from 51,751 million ton-km in 1980 to 63,205 million ton-km in 1985. In central Africa railways have very low levels of traffic, but North Africa and West Africa have heavy traffic. The data, which are summarized in the table, show considerable fluctuations on some routes since the various countries gained their independence. While during 1960-1970 railway goods traffic grew by 16.7 per cent, the growth was 66.1 per cent during 1970-1980 and 22.1 per cent during 1980-1985.

353. Recently, however, the railways have faced serious competition from road transport, which has expanded relatively faster. The problems facing the railways are to a large extent due to the existence of different gauges, to gradients and curvatures which limit

<sup>a</sup> Estimates.

speed and to the low tariffs under which railways in many African countries are obliged to operate, in order to stimulate agricultural production. The result has been to divert highly rated traffic to motor roads, which are faster than the railways, confining the latter to the transport of low-rated bulk cargo. Difficulties in management and control have also been widely reported but, in spite of the constraints, railways retain a competitive advantage over road transport where medium- and long-distance haulage are concerned.

354. The various railway systems of the region have been the subject of modernization schemes and programmes in recent years in order to expand capacity and lower costs by: (a) improving the permanent way; (b) the construction of new marshalling yards and repair shops; (c) strengthening signalling and control systems; and (d) purchasing diesel and diesel-electric locomotives. A small number of new lines were or are being built or planned. The UAR prepared a plan for the construction of more than 26,000 km of line by the various railways of developing Africa which would mean an increase of about 50 per cent in the length of operating lines.

#### 5. Air transport

355. A number of countries operate their own national (and sometimes international) air transport services. International airports have been constructed or re-equipped to take the larger modern aircraft. There are 70 international air carriers based in the region and they employ about 92,000 people (1983 data). Forty-eight of them operate scheduled services and the remaining 22 operate non-scheduled services, 19 of them being all-cargo carriers. In addition, the region is served by 48 non-African scheduled airlines: 27 from Europe; 10 from the Middle East; 6 from Asia and the Pacific; 3 from Latin America and the Caribbean; and 2 from North America. A number of the non-scheduled carriers, based mainly in Europe, operate charter flights, particularly to North and East Africa. The commercial transport fleet of the region's international carriers increased from 363 aircraft in 1978 to 525 in 1983, a rise of 45 per cent. Evidence of growing modernization is provided by the 72 per cent increase in the number of jet aircraft from 201 to 346 (including 37 wide-bodied) and the fact that jet-engined aircraft now account for two thirds of the fleet.

356. Between 1977 and 1984, the region's route network expanded slightly, both within Africa and between Africa and other regions, but improvements were uneven. Regional bodies such as the African Civil Aviation Commission and the African Airline Association have actively promoted measures to improve intra-African services through consolidation of traffic flows into a proposed "grid" network. Two factors that have

hindered the improvement of long-haul services are the low volume of traffic and the inability of airlines to obtain "fifth freedom" traffic.<sup>28</sup> Nevertheless, there have been some encouraging developments in recent years, including the establishment of joint airline operation on one of the transcontinental routes crucial to the overall network. A survey of manpower and training needs throughout developing Africa by ICAO/UNDP Aviation Organization (ICAO) and the United Nations Development Programme (UNDP) was published in 1975 and provided a basis for setting up and expanding a number of regional training institutions. As is the case in many other high-technology industries, low standards of recruitment and high wastage rates leave both operators and governments short of the requisite skilled manpower. Investment in training programmes at all levels is a high priority in most countries. Another problem centres on the exchange controls imposed in a number of African countries. Such controls adversely affect the cash flows of airlines and their impact on currency remittances is particularly acute in the region because intra-African services constitute the major proportion of the operations resulted.

357. The number of passengers carried on international scheduled services to, from and within the region increased annually by an average of 7.5 per cent between 1977 and 1985 to reach a total of 28.3 million, of which intra-African traffic amounted to 4.9 million. Of the remaining 23.4 million passengers approximately three quarters were on flights between Africa and Europe, one fifth between Africa and the Middle East and only about one twentieth on flights connecting Africa with the Americas, Asia and the Pacific. Approximately 45 per cent of the extra-regional traffic was carried by African-based airlines. Those airlines are estimated to have flown close to 30,000 million scheduled passenger-km in international services in 1985, representing about 6 per cent of the world total. Passenger traffic grew between 1982 and 1985 at an average annual rate of 12.6 per cent compared to 9.2 per cent in the world as a whole, while the load factor improved significantly during the 1980s to reach 61 per cent in 1985 (hardly below the world average of 62 per cent). Domestic scheduled traffic represented about 25 per cent of the total traffic of carriers based in developing Africa and has been increasing at the same rate as international traffic over the past decade.<sup>29</sup>

#### 6. Pipeline transport

358. Several countries, mainly those exporting oil, use pipelines to transport crude petroleum, petroleum products and natural gas. The length of pipelines in the region increased from roughly 10,000 km in 1966 to 25,000 km in 1984, of which 15,570 km for crude

petroleum, 4,500 km for petroleum products, 1,015 km for gasolines and 3,735 for feeder pipelines (ECA estimates). Pipelines are a very specialized form of transport which generally constitutes the most economical means of inland transportation for liquid or gaseous commodities. Few African countries, however, use them to transport very large volumes of liquids over long land distances. Table VIII.6 shows the throughput in recent years.

### C. COMMUNICATIONS SERVICES

#### 1. Telephone, telex and their derivatives

359. The total number of telephones in use in developing Africa in 1985 is estimated at 5.16 million. Table VIII.7 shows the development by subregion since 1979. The regional total represents a very small proportion of the world total. Telephone density in the region per 100 inhabitants increased from 0.6 to 1.1 over the period 1979-1985, compared with an increase from 0.6 to 3.5 in Asia and the Pacific, 3.1 to 5.2 in Latin America and the Caribbean and 5.7 to 10.8 in the world (average). The sub-regional distribution of telephones shown in the table may be considered generally promising but it is very uneven. The density increased more slowly in Central Africa and in East and southern Africa than in North Africa and West Africa. The highest density is found in North Africa, where it reached 1.92 in 1985; however, the current world average is 14.7.

360. The slow growth of the national telephone networks is attributable to the fact that practically all equipment must be imported and there is an acute shortage of foreign exchange in nearly all countries. Poor management and the lack of well defined policies for telecommunications development as a whole are contributing factors.

361. However, there have been significant improvements in the telegraphic services of a number of countries, reflecting the importance attached to those services by large organizations such as banks, businesses with nation-wide interests and airlines. Traditional high-frequency (HF) links are being replaced in many countries by systems that use super high, ultra and very high frequency links. Continuous efforts have been made during the past decade to implement PANAFTTEL, which encompasses the most important intraregional and international telecommunications projects in Africa. PANAFTTEL is creating a new structure, comprising both terrestrial and satellite links extending over some 29,700 kilometres, in at least 33 African countries. The network will require 36 international telephone switching centres, 49 earth stations for satellite communications and 44 international telex switching centres. However, the current utilization of the network is

<sup>a</sup> Estimates.

very low. Telecommunications traffic which could pass over those links is still being routed through transit centres outside Africa. The PANAFTTEL circuits are often out of order or otherwise unreliable in their operation, owing to the lack of spare parts or adequate maintenance or of agreement on tariff and transit arrangements. The more attractive transit tariffs offered by centres outside Africa, inadequate facilities within the region for international exchanges, insufficient multiplex terminals for transit traffic and poor co-ordination of signalling systems are additional reasons for that state of affairs.

#### 2. Radio and television broadcasting

362. UNTACDA recognized the need to integrate broadcasting with other modes of communication as part of a country's infrastructure. Educational broadcasting, especially to rural communities, has been given due emphasis. The goal is the creation of an informed, motivated and educated public and a greater supply of productive manpower. As can be noted from table VIII.8, there has been a marked increase in recent years in the number of radio broadcasting and television transmitters operating in developing Africa: 1,037 and 342, respectively, in 1985. The number of television sets in use reached some 924,400 in 1985. Usage per 100 inhabitants is estimated to have risen to 8 radio sets and 0.8 TV sets, compared with the UNTACDA targets of 20 and 50, respectively. The level attained is nevertheless of considerable significance, since it offers scope for mass education through the medium of broadcasting.

#### 3. Postal services

363. Postal communications play a vital role in promoting economic and social development because they are an important instrument for securing co-operation in the fields of trade, commerce, industry, transport, etc. However, the great distances within and between African countries and the lack of transport links com-

bine to hamper the development of postal services. Where surface transport is used for mail it is invariably inadequate and often irregular, slow and costly in handling the bulk of domestic traffic. Air transport has the potential to play an extremely important role in transporting mail but at present only a limited number of air connections are used for that purpose and only between neighbouring countries. As a result, the dispatch via European countries of mail posted in one African country for delivery in another African country is all too common and must be deplored.

#### D. TRANSPORT PROBLEMS

364. The transport sector in developing Africa is still plagued with numerous problems, some of which have been mentioned above: the inadequacy of equipment and the need to rehabilitate the existing infrastructure; lack of trained personnel at all levels; and inefficient management and operations. A distinction must however be drawn between specific problems related to particular modes of transport and those with a spatial dimension.

##### 1. Problems of modal dimensions

365. With regard to roads and road transport, the most significant problems, apart from the obsolete and underdeveloped infrastructure and service, are: the lack of reliable information and data on the condition and development of the system in general; policy developments; vehicle fleet age and capacity; and the fuel efficiency of the fleets which operate in the region. Other major problems are the low priority and insufficient attention accorded to human resources development, especially the lack of training policy and programmes for the sub-professional categories, and the lack of effective measures to prevent motor vehicle accidents. In this context, efforts have been or are being made by governments to remove the human resources constraints by, *inter alia*, imparting and upgrading the knowledge and skills of personnel through seminars and on-the-job training.

366. At African ports the following problems largely persist, despite serious efforts to resolve them: shortage of skilled manpower; obsolescence and inadequacy of cargo-handling equipment, cumbersome and inappropriate managerial and organizational structures; inadequate infrastructures; lack of unification in procedures, statistics and documentation; and lack of appropriate linkages with other transport modes and among ports. Those problems result in low productivity: for instance, one gang of dockers handles an average of 5-7 tons of general cargo per hour compared with 20-25 tons at European ports. Maritime transport by na-

tional operators is relatively small-scale: generally some five vessels at most are involved. Coupled with limited financial resources, adverse conference-line practices and lack of technical expertise and management skills in shipping, that situation causes most operators to incur losses and forces them to depend on national subsidies to remain in business.

367. With the exception of the East and southern subregion and the Maghreb countries in North Africa, the railways in the region are characterized by the lack of connections between national systems, differing gauges and technical incompatibilities. There are nine gauges in all but only three are in widespread use: the normal European gauge of 1.435 m (11,743 km or 14.5 per cent of the regional network); the standard UAR gauge of 1.067 m (49,473 km or 61.3 per cent); and the metre gauge (15,473 km or 19.2 per cent). The European gauge is used in North Africa (Morocco and Egypt), the UAR gauge is used in Ghana, Nigeria, the Sudan, the United Republic of Tanzania, Zaire and Zambia and the metre gauge in most West African railways (Burkina Faso, Cameroon, Côte d'Ivoire, Guinea, Mali, Senegal), as well as in the three countries of the former East African Railways (Kenya, Uganda and the United Republic of Tanzania). The difficulties in interconnecting different railway systems in such circumstances may be understood. Presumably, the adoption of the median UAR gauge for the inter-African network could facilitate interconnection. It is already widely used also in southern Africa and it is technically feasible to connect it with the railways to the east in Malawi, Mozambique, Swaziland, Zambia and Zimbabwe. At the least, a common gauge could with advantage be adopted in each subregion to facilitate subregional interconnections and trade.

368. The main problem with the air transport mode is its small size and the use of obsolete equipment. The schedules and other operational activities are largely unco-ordinated with the result that advantage cannot be taken of economies of scale and cost-sharing arrangements which might reduce operating costs and improve profitability. Another serious problem is that air control and safety are still underdeveloped. There remain large blind areas in which aircraft are out of range from control bases. Very few subregions have any search and rescue services.

369. Weaknesses in planning the development of containerization caused many African countries to be totally unprepared for multimodal transport, which is therefore handled internationally only by operators from developed countries. The situation has been aggravated by a parallel lack of regulations in developing Africa in regard to multimodal transport and a very

poor level of information. Another obstacle is the incompatibility of insurance systems in the various countries through which containers may transit. This again calls for co-ordination among the countries involved, such as some integration groupings in Africa now pursued, e.g. the Preferential Trade Area of Eastern and Southern States (PTA) and the Economic Community of West African States (ECOWAS).

## 2. *Problems of spatial dimensions*

370. The major difficulty posed in African transit transport is the lack of adequate facilities. Inter-country road transport arrangements governing vehicle dimensions, axle load specifications, as well as other legal and administrative regulations related to licences and insurance, may simply be non-existent or their enforcement and surveillance may be weak and ineffective. Storage for transit cargo raises a number of difficult problems between land-locked and transit countries, particularly with regard to the capacity and predictability of the means of inland transport and the length of time required for cargo documentation. The state of the communication links with various ports and commercial centres in land-locked countries continues to be yet another major handicap to the speedy movement of transit cargo and causes enormous delays in getting cargo in and out of ports. Some land-locked countries are known to suffer from the non-availability of "warehouse-to-warehouse" or all-risk cover for highly perishable goods. Complex formalities, procedures and paperwork often constitute a very significant cost factor and hence a serious impediment to the expansion of international trade.

371. The problems of island countries are mainly those of communication with the outside world, particularly sea and air communications. Maritime links with most island countries of the region have been inadequate. Sometimes, as in the case of Sao Tome and Principe, the main harbour is not a deep-water port and large freighters must be loaded and unloaded from their anchorages by barge. Since the use of aircraft for cargo services tends to be expensive, particularly where commodities of low unit value account for most of the trade, expanded use of air-freighting services along present lines may not be a viable solution. It appears that efforts to make regional or subregional cargo-pooling arrangements with continental African countries have so far been unsuccessful.

372. Another problem of spatial dimension relates to the development initiated by ECA of trans-African highways to interconnect major parts of the continent. The existing five major highways comprise some 31,519 km of primary and 43,066 km of secondary network and are of interest to 41 countries. Four additional major highways are planned to complete a primary network covering the entire region. One problem in implementing the project is that only 44 per cent of the total length of the 84 inter-State links (45,600 km out of an estimated 104,300 km) is paved. A further 16 per cent (16,900 km) is gravel and the remaining 40 per cent (41,800 km) consists of partially improved and unimproved earth tracks and trails. Insufficient financial resources and the limited availability of qualified technicians experienced in road construction are among the barriers to the completion of those major highway interconnections.

## E. THE UNITED NATIONS TRANSPORT AND COMMUNICATIONS DECADE IN AFRICA, 1978-1988

373. UNTACDA aims at ensuring independence, selfreliance and co-operation among African developing countries in all fields and modes of transport and communication.<sup>30</sup>

### 1. *Design and implementation of phase II of the UNTACDA programme*

374. The implementation of the UNTACDA programme was planned to take place in two phases, covering the periods 1979-1983 and 1984-1988 of 1979-1988, respectively. The outstanding result of the phase I programme was that less than 50 per cent of the finance required for the programme as originally conceived (\$7 billion out of \$15 billion) was obtained. Consequently only 476 of the original 1,091 projects (or 44 per cent) received total or even partial financing. In those circumstances, emphasis was placed on national rather than regional and subregional projects, so that the latter accounted for only 10 per cent of the available financing, compared with the 26 per cent allocated to them in the original planning. Experience proved that it was much more difficult to obtain financing for such projects than for national ones, despite the importance attached to them by UNTACDA.

375. Accordingly, the projects originally formulated for the phase II programme were redesigned with a keener appreciation of the nature of the problems which they would be expected to address. The priorities established were in the following order: maintenance and rehabilitation; training and technical assistance; inter-State links; regional and subregional problems; and other national projects.

376. The progress of the Decade was reviewed by the Conference of African Ministers of Transport, Communications and Planning at its fifth meeting, held at Cairo, Egypt in March 1986. While it was conceded the some progress had been made towards achieving the basic UNTACDA objectives, the Ministers noted that the region was still far from possessing an integrated transport and communications system. They recognized that the adoption of APPER provided further support for the improvement of transport and communications, as activities which furnished essential ancillary services for food and agricultural development, the centre-piece of the recovery programme. The status of phase II implementation at the end of July 1986 is shown in table VIII.9.

377. As can be seen from the table, 54 of the 578 projects in the transport sector (9 per cent) had been completed and 145 (25 per cent) were under implementation. Twenty of the 472 projects in the communications sector (4 per cent) had been completed and a further 66 (14 per cent) were under implementation. On the financial side, \$4.29 billion had been raised at that date, representing 23 per cent of the revised programme cost of \$18.255 billion. Of that sum, 42 per cent or \$1.814 billion had been obtained from external sources. National projects continued to attract more financing than regional and subregional ones — and the implementation reflects that bias.

## 2. Factors that impeded the implementation of the original phase II programme

378. Several factors combined to prevent the full implementation of UNTACDA in the time scheduled. While the tremendous efforts made by African developing countries to mobilize resources for the programme planned for phase I had resulted in their raising domestically three quarters of the total sum obtained, the economic crisis which hit most African economies during the first two years of phase II severely affected the mobilization of domestic resources at a time when external resources were also hard to come by. That proved to be a major obstacle to implementation. Judging that the maximum amount of resources which could be mobilized from all sources was of the order of \$15 billion, compared to an originally planned \$24 billion.

the list of projects was pruned with the aid of the priority rankings shown above (paragraph 375), which the Cairo Conference endorsed. Furthermore, the major donor Governments preferred to finance transport and communication projects on a bilateral basis, favouring mainly national rather than subregional and regional projects, which formed the core of the original phase II programme. In addition, there were other, purely technical factors which slowed down the rate of implementation: lack of skilled expertise, the lengthy period required for feasibility studies, the non-availability of transport and communications equipment and raw materials, etc.

379. Although the Decade ends within two years, development efforts in transport and communications are likely to be essential beyond 1988 and the momentum will need to be maintained.

## IX. THE SOCIAL SECTOR: SELECTED ISSUES

### A. INTRODUCTION

380. Human resources, health and the environment are the three main issues in the social sector addressed in this chapter. The extent to which a nation's human resources are developed and productively engaged is one of the measures of progress in national socio-economic conditions. The structure and quality and the degree of their participation in the economy therefore are parameters of development. Consequently, they need to be constantly reviewed with the aim of highlighting associated issues of concern to policy-makers. In the last few years efforts to integrate human resources planning and programming in overall national socio-economic planning have begun to take on a larger dimension, particularly in North Africa and East and southern Africa. By 1985, full ministries responsible for human resources planning and programming had been established in a number of countries, including Lesotho, the United Republic of Tanzania and Zimbabwe. Many other countries embarked upon strengthening human resources planning in ministries responsible for economic planning or for labour affairs. Specific programmes of staff development and other policy measures were initiated in 1985 to strengthen central and sectoral institutions for human resources planning and programming. For example, Botswana, Lesotho, Malawi, Swaziland, Uganda and Zimbabwe collaborated in joint workshops aimed at improving the planning of human resources and undertook research activities to make higher education more relevant to the needs of African economies. Ghana carried out a study on the relevance of non-formal education to the needs of society. Measures to strengthen guidance and counselling programmes were evaluated in Chad, the Central African Republic, Ethiopia and the United Republic of and Tanzania. Training workshops for manpower and employment planners were held in Kenya and Liberia with the objective of strengthening the institutional base and staff capabilities for human resources management. Nevertheless, a continuing problem faced by member States is the poor statistical base for human resources planning and programming.

381. Health services, which in the broadest sense include sanitation and supplies of safe drinking water, are an indispensable adjunct to policies for the development of human resources. The latent talents of the population cannot be fully harnessed to the tasks of raising living standards and the quality of life so long as disease and malnutrition are rife. For that reason they were listed among the priority areas of concern in the LPA. The health situation in developing Africa is one of the poorest in the world and there can be no illusions about the difficulty of bringing about a significant improvement.

382. Environmental projection and management, as a public policy issue, is a challenge for all African Governments since, in recent years, ecological degrada-

tion has greatly reduced the carrying capacity of the land for food and agricultural production, causing famine; disease and death in many cases and thus deepening the prevailing economic crisis. It was this realization that led the Heads of State and Government to include environmental questions in the LPA. They listed specifically: (a) drought and desertifications; (b) deforestation and soil degradation; (c) environmental aspects of human settlements; (d) marine pollution and conservation of marine resources; (e) the rehabilitation of mined-out sites; (f) education and training, legislation and information relating to environmental questions; and (g) air pollution control. Many of their concerns were re-echoed in APPER and the UNPAAERD.

### B. DEVELOPMENT OF HUMAN RESOURCES

#### 1. Population

##### (a) Demographic trends

383. We begin with a brief survey of the demography of Africa. Most African countries have yet to reach the phase of "demographic transition" through which most developed countries, in particular, have passed. In that phase a régime of high mortality and fertility gives way to declining rates followed by stabilization at much lower levels. As table IX.1 shows, birth rates and, to a lesser extent, death rates are still high and population continued to grow at relatively fast rates. In 1980-1985 the annual population growth rate of a selected number of African countries with populations of 10 million and above, constituting three-quarters of the population of developing Africa in 1985, was 2 per cent or more. Indeed, one of the highest annual rates of growth of population in the world has been that of Kenya, which averaged 4 per cent during the past decade.

TABLE IX.1. MAJOR DEMOGRAPHIC INDICATORS, BY SUBREGION, 1980-1985

Subregion	Crude birth rate <sup>a</sup>	Crude death rate <sup>a</sup>	Percentage annual population growth
North Africa .....	39.3	12.3	2.7
West Africa .....	49.2	18.3	3.1
Central Africa .....	44.7	17.7	2.7
East and southern Africa .....	44.5	16.3	2.8

Source: ECA secretariat.

<sup>a</sup> Per 1,000 population.

384. The maintenance of fertility at a high plateau in the face of moderate declines in mortality is the main cause of rapid population growth in Africa. Recent estimates suggest, however, that mortality levels are still high, with life expectancy at birth of 50 years compared to around 40 years in the 1950s. At the same time, given the nature of African society, the influences of cultural

patterns, early and almost universal marriages, the relatively large cohort in the child-bearing ages which a young population produces and the slow progress of family planning activities, fertility has been maintained at a persistently high level.

(b) *Population growth and development*

385. Food scarcity and overly large labour forces are the two most significant contemporary consequences of rapid population growth. Whereas food production increased at about the same pace as population growth during the 1960s, i.e. 2.3 per cent per annum, the position changed markedly in the 1970s. While food production continued to grow at about 2.3 per cent per annum, population growth rose to 2.7 per cent per annum. That led a large number of African countries to depend on food imports to fill the gap between demand and domestic production. It would appear that increasing population put excessive pressure on the land and therefore on food supplies in countries where farming systems are based on shifting cultivation. Fallow periods were shortened, thereby adversely affecting the recuperative capacity of the soil.

386. The age distribution of African population, in which at least 40 per cent of the population is below age 15 and a correspondingly small proportion is of old age, ensures that a sizable cohort enters the labour force each year. The consequences of the large labour forces which result are indeed already being felt in a number of African countries in the form of high and growing unemployment, especially among young persons, excessive rural-urban migration and the proliferation of low-productivity employment in the urban areas. The steady expansion to be expected in the labour force of the majority of African countries means that increasing resources will have to be devoted to training and equipping the new entrants and that a considerable organizational effort will be required to mobilize and effectively utilize the increased labour force. The opportunity costs involved, in terms of capital expenditure and savings which have to be forgone in other areas of development, may be considerable.

(c) *Population policies*

387. For a long time, the popular view among African governments seemed to be that the continent was under-populated and that population growth would spur economic development. Rapid population growth was hardly seen as jeopardizing economic growth. All that is changing, according to a survey conducted in 1982 by the Population Division at United Nations Headquarters. Governments were invited to state their perception of the natural increase in population on development, its acceptability and the desirability of intervention to change rates of population growth. The survey found that 19 out of 51 African countries (i.e. 37 per cent) considered their population growth rates to be too high, as against only 6 countries (11 per cent) which considered theirs to be too low. The 19 countries indicated their intention to achieve a lower rate of natural growth of population and 12 had already launched comprehensive intervention policies with emphasis on mortality and fertility changes. A similar survey in 1983 showed that substantially more African countries reported that their population growth was too high. The changing perception of the problems of population growth is perhaps even more evident in the Kilimanjaro Programme of Action for African Population and Self-

reliant Development, adopted at Arusha, United Republic of Tanzania, in January 1984.

388. Among the countries that now see their population growth rates as too high is Cameroon, which has started plans for improving women's employment and shows interest in family planning. Burkina Faso is another country that is facing up to its population problems. A National Population Council was established in 1982 and in 1985 a policy was adopted of integrating family planning into the health services. A few years ago Algeria regarded its population growth rate as satisfactory but currently it considers the rate too high. At its second regular session, held in 1979, the Central Committee of the National Liberation Front of that country adopted a resolution which stated that activities aimed at health information, education and maternal child protection as well as the institution of a population policy based on individual adherence and general consonance with the country's socio-cultural condition should be taken up, developed and facilitated.

389. There is little doubt that considerable work needs still to be done in Africa to relate activities such as those reviewed above to the socio-economic reality of the countries. The necessity for such an approach perhaps is best illustrated by the case of Kenya, which has one of the oldest family planning organizations in Africa and yet has the highest population growth rate in the continent.

2. *Employment*

(a) *Size of the labour force*

390. The labour force in developing Africa grew from an estimated 152 million people in 1975 to a little over 200 million in 1985, averaging a growth of 2.3 per cent per annum. Except in southern Africa, the growth was steady and at an increasing rate. The most rapid annual rate of growth occurred in North Africa, estimated at an average of 2.75 per cent, the slowest in Central Africa (around 1.82 per cent). Over the next five years the labour force could rise by at least 20 per cent in many African countries, even if concrete measures are introduced to reduce present population growth rates, in view of the large number of young people of school age who are due to enter the labour force. The task of absorbing those new entrants in the labour market will impose further strain on the economy of the region, leaving aside the question of employment for those currently seeking work. At a time when economic growth in most of the economies is unimpressive, and the need to provide a basic social infrastructure for the growing dependent population is intensifying, the seriousness of that prospect can hardly be exaggerated.

391. In Northern and Southern Africa, the female labour force is growing much faster than the male—about 60 per cent faster in the former case (see table IX.2). Policies and practices to integrate women in the process of development have contributed to the tremendous growth of the female labour force in those two subregions. The high rate of emigration of males in search of job opportunities in South Africa and elsewhere has increased the supply of and demand for women in the labour markets of Southern African countries.

392. The "crude activity rate", or ratio of the labour force to the total population, is a measure not only of the degree to which the economy can be stimulated, but

also of the viability of the economy in utilizing the nation's human resources. Table IX.2 provides estimates of the rate at which the labour force has been growing. Table IX.3 shows the estimated size of the economically active population and the crude activity rate, by subregion in 1985.

<sup>a</sup> The crude activity rate, defined as the percentage ratio of the economically active population to the total population.

393. Nearly 40 per cent of the African population was economically active during 1985 (see table IX.3). Males accounted for 65 per cent of the total. For the North Africa subregion, where the crude activity rate was 28 per cent, the proportion of economically active males was as high as 86 per cent. For the whole region the crude activity rate fell slightly from 40.4 per cent in 1960 to 38.8 per cent in 1985. With the exception of East and southern Africa, where the rate increased from 41 to nearly 45 per cent, that decline was felt in all the subregions.

394. The sectoral distribution of the labour force among agriculture, services and industry changed con-

siderably between 1960 and 1980, not at all between 1980 and 1985, as the following percentages show.

	Agriculture	Services	Industry
1960 .....	79	13	8
1980 .....	69	19	12
1985 .....	69	19	12

That distribution was far from identical, however, as between one subregion and another, as table IX.4 shows.

TABLE IX.4. LABOUR FORCE DISTRIBUTION, BY SECTOR AND SUBREGION, 1960-1985 (Percentage)

	North Africa	West Africa	Central Africa	East and southern Africa	Developing Africa
<b>Agriculture</b>					
1960 .....	66	79	85	88	79
1980 .....	50	71	78	82	69
1985 .....	45	68	76	79	69
<b>Services</b>					
1960 .....	23	13	8	7	13
1980 .....	27	19	11	11	19
1985 .....	32	20	15	14	19
<b>Industry</b>

1980 .....	23	10	10	7	12
1985 .....	23	12	9	7	12

Source: ECA secretariat

395. The share of agriculture, while declining everywhere, is still the preponderant one. In North Africa, however, it had already sunk to 50 per cent by 1980. West Africa looks likely to be the first subregion to follow suit, though not in the near future.

396. The service sector, which collected more than half of the share lost by agriculture, held a more prominent position in North Africa than in any other subregion even in 1960. At that time it was one third as important as agriculture in North Africa; the proportion has subsequently climbed to three quarters. Elsewhere, the gains made by the service sector compared with their position in 1960 may perhaps appear more impressive but the comparison is with a really small base except in the case of West Africa — which is precisely where the advance of the services faltered after 1980.

397. The industrial sector made good gains between 1960 and 1980 but experienced hardly any change almost everywhere except in West Africa in the next five years. Industry is still far from challenging the services for second place, however, in any subregion.

398. An associated issue of immediate concern is the conjunction of two conflicting trends: a declining crude activity rate and a substantial rate of growth of the total population. Between 1960 and 1985, the former declined by about 4 percentage points, while the population almost doubled in absolute numbers. As a result, the labour force expanded by roughly 80 per cent. If those trends were allowed to persist, the situation could explode into a social crisis within the next decade. Corrective measures need to be taken, which should include: the expansion and diversification of investments; the creation of more job opportunities; rational and effective utilization of existing and potential manpower; and the restructuring of education and training systems and practices.

### (b) *Employment trends*

399. Employment statistics for the majority of African States are poor and make it difficult to assess structural changes in labour markets, sectoral demand for and supply of labour and the extent of unemployment and under-employment. However an examination of available data and information reveals that, on the whole, there has been no significant increase in the level of productive employment since 1979. In fact, some countries experienced an absolute decline over the years in the number of persons employed (see table IX.5).

400. The two major problem areas in African labour markets are first, the deteriorating absorptive capacity of the two largest employing sectors; and, secondly, the rising level of open unemployment. Over the years agriculture has continued to be the largest employer, followed by the public sector. However, their absorptive capacity, particularly that of the latter, has diminished during the last two years, due principally to drought and the growing fiscal deficits of Governments, a development which boosted the expansion of the informal sector. There is already a significant proportion of the economically active population in that sector and it may well offer even more employment opportunities in the years to come despite its low productivity and the marginal income earned. African Governments need urgently to pay greater attention to the development and transformation of the informal sector, in rural and urban areas of their countries, as a viable strategy for minimizing unemployment and under-utilization of labour.

401. A rapidly growing labour force, low national productivity and inappropriate human resources development programmes have combined to create various problems in nearly all African States. One such problem is the disparity between the growth in the level of employment and the much faster growth in the number of job-seekers, giving rise to high levels of unemployment. Manpower underutilization has become a visible and wide-spread reality as shown by the large number of people, particularly in urban cities, looking for work or engaged in relatively unproductive activities. By 1985, it was estimated that roughly 22 million Africans were unemployed, made up to a disproportionate extent of educated youths and school drop-outs.

402. At the same time, certain types of labour and skilled manpower continue to be sought after by employers with little or no success. In many countries

rising general unemployment co-exists with rising vacancy rates for managers and research workers in manufacturing and agriculture. Among the explanations for that state of affairs are the poor organization and dissemination of labour market information, the constant shortage of critical skills necessary to fill the vacancies and the flight of human capital from Africa.

403. Effective employment-creation and exchange programmes will have to be devised and put into effect within the framework of a set of policies in the areas of investment, development and utilization of human resources. Decaying industrial and agricultural establishments in most African countries will have to be revamped, particularly in terms of their production capacities and labour use. Tax measures aimed at promoting employment will have to be instituted in countries where capital has unintentionally been made cheaper to use than labour. Finally, human resources planning and management programmes will have to be designed scientifically with the objective of bringing into equilibrium the supply of and demand for skills, the possession of knowledge and work attitudes.

### 3. *Education*

#### (a) *Enrolment levels*

404. School enrolment continued to grow at all levels of the formal education system in response to a rapidly growing population, progressive educational policies and increased social awareness. At the first level, where more than three quarters of the school population were to be found (see table IX.6), enrolments nearly trebled between 1970 and 1986, in which year more than 90 million pupils were enrolled. The expansion at the secondary or second level was even more impressive, from 4.9 million pupils in 1970 to 14.7 million in 1980, 17.5 million in 1982 and an estimated 25.1 million in 1986. Between 1982 and 1986 there was a 44 per cent increase. Enrolment for third-level education saw a four-fold expansion from 0.5 million in 1970 to 1.3 million in 1980, to reach 1.5 million in 1982 and 2 million in 1986.

405. The percentage of pupils enrolled at each of the three educational levels has not varied significantly in recent years (see table IX.6). The percentage enrolment of the first level has declined, but since 1980 at a slow rate, more or less matched by the changes in the opposite direction at the second level. The percentage enrolled at the third level was always below 2 but after a jump between 1970 and 1975 has remained virtually constant over the years. One significant feature of the enrolment

structure (which the table does not show) is the low school survival rate throughout the education system, with its undesirable socio-economic implications for the labour force.

(b) *Educational programmes and activities*

406. Among the issues arising from the impressive growth in school enrolment and the skewness of the distribution of pupils at the three levels of education, is the imperative necessity to expand educational programmes at the second and third levels. That cannot be achieved without expanding school facilities and teaching staff. Despite the recent slackening of economic growth, Governments are increasingly committed to undertaking a series of education programmes under such heads as free basic education, universal primary education, adult literacy education, the indigenization of school activities and teacher training.

407. Ethiopia, Ghana, Kenya and the United Republic of Tanzania have all embarked upon strong programmes of adult education to redress illiteracy. The literacy rate was estimated in 1985 at 45 per cent of the total African population, ranging between 36 per cent in West Africa and 59 per cent in East and southern Africa. Algeria, Morocco and Tunisia instituted a campaign in 1985 for the "Arabization" of school life, which also aimed to relate education more closely to the activities of local life and emphasized the provision of better opportunities for girls. Benin and the United Republic of Tanzania took the lead in instituting institutional reforms to make schools more production-oriented by blending learning and doing. In higher education, science and technology have featured more prominently in research work during the last two years.

408. However, such efforts are far from ensuring that the quantity and quality of outputs from the school system are as well matched as possible to the limited job opportunities and the type of labour demanded by African labour markets. Attempts to reduce the pupil/teacher ratio which, on the average, is a high as 50 to 1 in the first and second levels, have been undermined

by high turn-over rates of qualified, trained teachers and the shortage of school facilities in the rural areas. The cost of education is continuously rising, not only because of increased school enrolment, but also as a result of rising prices for school materials and other inputs.

409. The rapid expansion in the education system has placed greater demands on its administration and management. In most African countries a greater emphasis on cost-effectiveness has become an urgent necessity. The growing concern about making educational opportunities available equitably and relating education to work should underline the importance of planning and research in this field.

(c) *Expenditure on education*

410. From what has been said above, it is no surprise to learn that public expenditure on education for the region as a whole was about 4.7 per cent and 4.6 per cent of regional GNP in 1970 and 1980, respectively, but reached 6.3 per cent in 1985. The expenditure per head rose from \$6 in 1965 to \$41 in 1980, falling to \$28 in 1985 under pressure from a rising population and a shrinking economy (see table IX.7). As a percentage of current expenditure by governments, the range is 10-40, with most member States averaging between 20 and 30. The difficulty of financing education in developing Africa is not likely to diminish in the next few years, notwithstanding the financial assistance that is increasingly available for the education sector from such multilateral agencies as the World Bank, IDA and the African Development Bank. There is therefore a pressing need for every country to ensure the effective and judicious management and distribution of the resources available to its education sector.

411. The public expenditure figures understate the total sums spent, since they ignore the substantial expenditures on education incurred by parents and the contributions by local and non-local donors towards the development of the private education sector which, in most countries, is also expanding rapidly.

(d) *Policies and problems*

412. In their vigorous efforts to initiate plans and policies for the development of education, most African countries have been caught between expanding enrolment to meet increasing demand for education and the desire to change the character of education to make it more responsive to the socio-economic needs of society.

413. Most education planning in Africa emphasizes a common concern for (a) social equity, through the attainment of universal basic education; (b) development of science and mathematics teaching to ensure a basis for technology transfer and development; (c) re-orientation of course content, teaching methods and curricula to ensure a greater impact on economic and social development; and (c) creation of a national capacity for management and research activities to ensure an effective

tive development and operation of the education system. The extent to which those policy goals have been achieved naturally differs from country to country. In general, however, most African countries have suffered from a mismatch between the quantitative and qualitative demands on the education system and the limited availability of physical resources such as buildings, teachers and teaching materials. That situation, the result mainly of the internal and external inefficiencies which exist within African education systems, is made even more serious by the deteriorating quality of education in the region and particularly in rural areas, where those inputs that are crucial to raising quality are far less adequate than in urban areas.

#### 4. Health

##### (a) *The perilous situation in developing Africa*

414. The health situation in developing Africa is characterized by unacceptably high maternal and infant mortality rates. It was aggravated by the drought and famine of the years of 1983-1985, although it is important to recognize that it was generally unsatisfactory even before that crisis erupted. As UNICEF has noted, there was already a prevailing "silent emergency" in Africa since, even in normal times, nearly four million African children died each year from malnutrition or ill-health, a worse situation than in Latin America. The proportion of the population enjoying access to safe water supplies was 31 per cent, compared to almost 100 per cent in the developed countries, and per capita health expenditure per annum was \$1.7 compared to an average of \$244 in the developed countries. Assessments of the coverage of rural water supply and sanitation have produced figures ranging from 3 per cent in Madagascar and 4 per cent in Mauritania to 100 per cent in Zambia and the Gambia. In 1985, it was estimated that only about 25 per cent of the total population of the region had access to adequate supplies of drinking water. The rate was much lower for rural areas where, in addition, sanitation was for the most part neglected. Recent studies in Botswana, Kenya, Liberia, Nigeria and Sierra Leone have made clear the high rates of pregnancy-related morbidity and mortality among young people which are associated with economic conditions of poverty, ignorance and lack of access to such necessary services. Other studies have shown that alcohol and drug abuse is on the increase among adults in many urban centres in Africa.<sup>31</sup>

415. Other fundamental factors which mould and perpetuate the poor health situation in Africa include certain socio-cultural attitudes and practices, maintenance in most countries of the urban and elitist orientation of health care inherited from colonial times, the socially inappropriate and irrelevant health curricula of most higher institutions and universities and the minimal, abysmally low budgetary allocations made by Governments to the health sector. The existing urban-oriented, hospital-based health system in African countries is not only rather ineffective in solving the huge health problems of the region, but also costly to Governments, which in general can ill afford wasteful expenditure at a time of grave economic crisis and financial retrenchment. It is significant that to achieve the goal set by the World Health Organization—Health for All Africans by the Year 2000 (HFA AFRO/2000)—the additional annual expenditure per capita is estimated at

\$16.20 if a conventional approach is adopted, but only \$2.60 on the basis of a participatory, primary health care (PHC) approach.

##### (b) *Towards a better health balance sheet*

416. It is crucial to develop and maintain an intersectoral approach to health and social development. The vertically structured, isolated strategies for promoting health, basic education, literacy, nutrition, women in development, water supply and sanitation have each on its own proved costly, often ineffective and the source of duplicated efforts. That approach has an impact on the already skewed health and related budgets which finance personnel and capital costs that are mainly urban-based. In Senegal 57 per cent of the health budget in 1981 went to pay salaries. In Ghana, 90 per cent of the rural population in 1980 were allocated only 15 per cent of the health budget. The pooling of the resources of health and various other social services is therefore necessary, in order to redirect the limited available facilities and resources towards meeting the needs of the people.

417. In the broadening of the social foundations of health and related socio-economic development, certain basic needs of the population, especially in rural areas, must be given priority and satisfaction. Those needs include literacy, particularly for women; health and family life education; the health needs of female adolescents, pregnant and lactating women; adequate food supplies and nutrition; housing, water and sanitation. Unless such needs are met in a systematic fashion and urgently, a good deal of the gains of future economic development could be nullified—where, indeed, their achievement is not rendered impossible.

418. It is vitally important to ensure that in the present financial and economic crisis the stabilization and structural adjustment policies adopted by Governments do not jeopardize the basic social needs of the population. An assessment should be made of the social impact of such policies prior to their implementation. Social and health components, skilfully designed, should be incorporated in the structural adjustment packages. That will call for urgent co-operation among donors and between them and recipient countries.

419. Despite the daunting magnitude of the problems, many African Governments have made significant strides in implementing programmes in areas such as immunization, PHC, adult literacy and women in development. Health development policies and programmes have increasingly taken into account other social considerations, but a lot remains to be done. A fundamental adjustment in thinking is required to permit the health and social pyramid to be built upon the base where the vast majority of the disadvantaged and afflicted are to be found. Social justice must be made the key to HFA/2000 and the principal channel for conveying it must be effective community participation. Properly utilized, social mobilization and community participation can be effective means of supplementing the government resources made available for the development of health. PHC and HFA AFRO/2000 can be stepped up by focusing on the direct and local levels, using individuals, families and communities as the focal points.

420. Finally, if a holistic approach is adopted to health, as opposed to disease control, and the social

target of health for all Africans by the year 2000 is maintained, appropriate disaggregated socio-economic indicators must be developed and used to monitor progress and to guide adjustments in programmes within the demographic and economic realities of Africa. For example, given the present sharp social inequities and income disparities between urban and rural populations, the ratio of doctors per thousand inhabitants or of population per hospital bed cannot be employed or regarded as satisfactory indices of progress in health status. Health and other social and economic planners are therefore presented with a real challenge to map out a course of genuine integrated development on the continent.

### C. PROTECTION AND MANAGEMENT OF THE ENVIRONMENT

#### 1. Drought and desertification

421. Drought and desertification have been Africa's greatest environmental problems, afflicting more than two thirds of the continent for more than two decades and severely damaging not only the physical environment but also social and economic conditions. However it was with the gruelling drought in the Sahel in 1968-1973 which ravaged 15 countries, spread from Mauritania to Somalia, that the world became alerted to African drought problems. But the Sahelian drought did not really come to an end: in spite of brief respites of near-normal rainfall in places in 1974-1976, 1979-1982 and 1985, it continued well into 1986.

422. The severest spell of drought was in the period 1982-1985, when as many as 24 African countries, ranging from the sub-humid Sudano-Guinean zone in West Africa to the dry savanna of East and southern Africa, were so badly affected that they required emergency food aid at one time or another. The countries seriously affected were: Angola, Botswana, Lesotho, Mozambique, Zambia and Zimbabwe in southern Africa; Ethiopia, Kenya, Somalia, Uganda and the United Republic of Tanzania in East Africa; Burkina Faso, Cape Verde, Chad, Mali, Mauritania, the Niger, Senegal and the Sudan in the Sudano-Sahelian region, and Burundi and Rwanda, located on the equatorial plateau in Central Africa. Of the 200 million people living in those drought-prone countries, 30-35 million were seriously affected. As many as 10 million became displaced persons because they had to abandon their homes in search of food, water and pasture for their livestock. Famine, malnutrition, disease and, in many cases, death were the lot of those people. That lamentable situation brought the cost of the emergency needs of 21 drought-stricken African countries in terms of food and water, essential medicines and survival items, as well as logistical support, to \$3,342 million in 1984/1985, of which food-aid requirements alone, including overland transport and handling costs, amounted to \$2,395 million.<sup>22</sup> With the return of the

rains from the end of 1985 to the beginning of 1986, only five countries (Angola, Botswana, Ethiopia, Mozambique and the Sudan) continued to receive emergency food aid, whilst another four countries (Kenya, Malawi, Senegal and Zimbabwe) had a surplus in food production.

423. As a follow-up to the first devastating Sahelian drought mentioned above and to aid countries already under the stress of desertification, the United Nations Conference on Desertification, held in 1977, had adopted a Plan of Action to combat desertification in which an inter-agency, interdisciplinary approach was developed. Subsequently, on the recommendation of a Scientific Round Table on the Climatic Situation and Drought in Africa, held in February 1984, ECA adopted at its nineteenth session, held at Addis Ababa, Ethiopia, in May 1984, the Regional Plan of Action to Combat the Impact of Drought in Africa. Thereafter, the United Nations Environment Programme, in collaboration with ECA and OAU, convened the African Environment Conference held at Cairo, Egypt, 16-18 December 1985, in which ministers responsible for questions of the environment participated. That conference adopted the Cairo Programme for African Co-operation on Environment and Eco-Development. Finally, measures to control drought and desertification in Africa at the national, subregional and regional levels were included in APPER and subsequently endorsed in UNPAAERD.

424. The policy initiatives and actions at regional and subregional levels notwithstanding, there is very little concrete evidence to suggest that in the majority of African countries environmental management has become the major issue of public policy which it should be. However, there are encouraging indications that many Governments are taking steps to build institutions capable of ensuring co-ordination among countries of the region on questions of the environment. The data available indicate that, by 1986, 48 of the 50 ECA member States had established machinery for such co-ordination under one of the following administrative arrangements: (a) a Ministry of the Environment (10 countries); (b) a Department of the Environment within a Ministry (10 countries); (c) a separate Council Commission/Academy for the Environment (6 countries); or (d) a caretaker department within a Ministry, the name of which does not make reference to the environment (22 countries).

425. To implement effectively any national plans of action in this field member States must develop, strengthen and/or rehabilitate an infrastructure for the collection, analysis and dissemination of relevant data. That would enhance the value of information exchanges, particularly those at intergovernmental level such as the meetings of the Joint Intergovernmental Regional Committee on Human Settlements and environment, which take place biennially under ECA auspices for the purpose of adopting policy measures on problems of environmental assessment and management in the region.

## INTRODUCTION

The Statistical Annex is intended to provide a cross section of data required for describing the economic and social conditions in Africa up to the year 1985 with special focus on changes which have taken place in the region between 1981 and 1985. Thus, it provides the background information for some of the estimates given in the text relating to the performance of the African economy in the period 1985 to 1986. The data is limited to the 50 member States of the United Nations Economic Commission for Africa since the report is essentially meant for these countries.

Different data sources have been used in compiling the Annex. Usually these are data published by member States, the United Nations and its specialised agencies, the International Bank for Reconstruction and Development (World Bank) and the International Monetary Fund (IMF). These are normally provided to ECA in the form of publications, printouts, magnetic tapes and microfiche. These data are supplemented if possible by the ECA Statistics Division estimates made by the Statistics Division.

ECA as the main UN agency advising national statistical offices in the region on the collections, processing and dissemination of statistical data recommended to these organizations the use of uniform concepts, definitions and classifications in keeping with standards approved by the United Nations Statistical Commission. This has been done through working groups, seminars and workshops organised by ECA for professional staff of national statistical offices. In addition, while checking data for inclusion in the Annex, the ECA Statistics Division has undertaken further standardisation to the extent possible. However, it cannot guarantee that in all cases data are directly comparable.

The tables in the Annex are grouped as follows: basic indicators which present a summary picture, demographic and social indicators, national accounts, agriculture, transport and communications, finance and banking and the external sector which includes international trade data. An important omission from the tables has been the industry sector. This is mainly due to the fact that most of the information available on that sector on production, number of persons employed and index number of production are both scanty and out of date. As a matter of fact, data available at the ECA Secretariat so far refer to about twenty countries and it appears that important indicators such as industrial output by product, capital formation by type of capital goods, man-days worked by operatives, raw materials consumed by type and origin, changes in stocks by major components and index number of countries industrial production are not compiled by a large number of countries in the region. Moreover, the time-lag between the inquiry period and the publication of the results vary generally from two to four years. The latest year for which information is available at ECA is 1983. Efforts will be made in the coming years by the ECA Secretariat to address this problem

in the region and it is hoped to include a section on the industrial sector in future issues of the Survey.

The division of Africa into sub-regions is based mainly on the grouping of countries under the ECA Multinational Programming and Operational Centres (MULPOC's). There are five MULPOCs - one for North Africa with headquarters at Tangiers (Morocco), a second for West Africa with headquarters at Niamey (Niger), a third for Central Africa with headquarters at Yaounde (Cameroon), a fourth for the Great Lakes area with headquarters at Gisenyi (Rwanda) and the fifth for East and Southern Africa with headquarters at Lusaka (Zambia). For the presentation of tables in the annex, however, the Yaounde and Gisenyi MULPOCs have been combined into one subregion - Central Africa.

Two sections of the annex need further explanation. These are national accounts (Tables 8 - 18) and international trade (Tables 28 - 32).

National accounts data are obtained from country publications, or by ECA staff members on special advisory missions to national statistical offices. However, most of the 1985 estimates are computed by ECA staff members.

The estimation procedures adopted distinguish the following three cases:

1. Countries which have both current and constant price estimates of GDP; For these countries, the official country data will be used. Where necessary minor adjustments have been made to smooth out differences in data coverage in the historical series. Where the official constant series refer to a base year other than 1980, adjustments to the country data would be made to shift them to the 1980 base. To obtain estimates of GDP in constant 1980 U.S. dollars, weighted average exchange rates for converting total value of trade from national currency into the U.S. dollar as published by the UN are being used. However, adjustments to these exchange rates have been made for certain years for Angola, Cape Verde, Ghana, Equatorial Guinea, Guinea-Bissau, Sao Tome and Principe, Mozambique and Uganda. This is thought to give more realistic picture of exchange rates than the UN official rates.

2. Countries for which official estimates in current or constant prices only are available: The procedure adopted in this case involved in the ascertaining of sectoral deflators in respect of production sectors as well as expenditure categories. When official estimates are available in current prices only, constant price estimates would result from the application of these assessed sectoral deflators. On the other hand, if official GDP estimates are available in constant prices only, the application of sectoral deflators would result in obtaining GDP estimates in current prices. The conversion of national currencies into U.S. dollars follows the same procedures as in (1) above.

3. Countries for which official estimates of GDP in neither current nor constant prices are available for recent years; (this is the case for most countries of the African region): The procedures adopted are as follows:

- (a) Ascertaining of sectoral growth rates in terms of volume from 1980;
- (b) Obtaining of sectoral price deflators, for both the production sectors and the expenditure categories;
- (c) The multiplication of sectoral growth rates by their respective sectoral price deflators (or inflators) and then by GDP figures for the base year to arrive at sectoral GDP estimates at current factor (or approximate factor) incomes;
- (d) Estimation of indirect taxes net of subsidies by making use of either data from government accounts, or past trends in indirect taxes expressed as a percentage of GDP at factor cost;
- (e) Obtaining estimates of GDP at current market prices (or purchasers' values) by using the formula, GDP at factor cost + indirect taxes (net) = GDP at market prices;
- (f) Estimating the components of GDP by type of expenditure such as exports and imports of goods and services, capital formation, government consumption expenditure etc., in current prices through the use of relevant indicators and then deriving estimates of private consumption expenditure as a residual item by deducting from the GDP at current purchasers' values as obtained in (e) above, the other expenditure components of GDP.

Conversion of values from national currencies into U.S dollars is based on monthly conversion factors for visible imports and exports provided regularly by the United Nations Statistical Office in computer printouts and in the Yearbook of International Trade Statistics. This conversion is explained in greater detail in the last paragraph of the Introduction. Weighted average currency rates (R) are then derived as follows:

$$R = \frac{\frac{r_i v_i}{v_i} + \frac{r_e v_e}{v_e}}{\frac{v_i}{v_i} + \frac{v_e}{v_e}}$$

where "r" denotes "rate", "v" value and the subscript, "i" and "e" refer to imports and exports respectively. The concepts and definitions used by most countries are in accordance with the United Nations System of National Accounts Series E, No. 24, Rev. 3.

The international trade data, except terms of trade indices, are largely from magnetic tapes issued by the International Trade Section United Nations Office at Geneva. They are supplemented

by data from national and UN publications, and by ECA estimates whenever possible. The estimation procedure has mainly been based on the interpolation of available developed market partner countries' data.

All 1981 figures were provided directly by the countries concerned except for Angola, Guinea and Gambia (imports) where they were estimated by ECA. The 1985 figures are ECA estimates except for total trade for Burundi (exports), Egypt, Libya (exports) Malawi, Mauritius, Seychelles and Tunisia. The international trade statistics are reported under one of the following systems: general trade system which includes goods kept in customs bond houses and exported without being cleared for domestic consumption and special trade system which excludes them. The statistics of the following countries are based on the general trade system: Comoros, Cote d'Ivoire, Ethiopia, Gambia, Ghana, Guinea, Libya, Kenya, Lesotho, Malawi, Mauritius, Niger, Nigeria, Uganda, Rwanda, Seychelles, Sierra Leone, Sudan, Swaziland, Tanzania, Tunisia and Zimbabwe. The following countries report their trade statistics under the special trade system: Algeria, Angola, Benin, Burkina Faso, Botswana, Burundi, Cameroon, Cape Verde, Chad, Congo, Djibouti, Egypt, Central African Republic, Gabon, Guinea Bissau, Liberia, Madagascar, Mali, Morocco, Madagascar, Mali, Morocco, Mauritania, Mozambique, Reunion, Sao Tome and Principe, Senegal, Somalia, Togo, Zaire and Zambia.

The statistics include merchandise, that is goods which add to or subtract from the stock of material resources in a country as a result of their movement into or out of the reporting country. All goods in transit are generally excluded from the statistics. Exports are generally valued free on board (f.o.b.) and imports at cost, insurance and freight (c.i.f.).

As explained in the Yearbook of International Trade Statistics, published by the UN Statistical Office, "Conversion of values from national currencies into U.S. dollars is done by means of currency conversion factors based on official exchange rates (mainly par values). Values in currencies subject to fluctuation are converted into U.S. dollars using weighted average exchange rates especially calculated for this purpose. The weighted average exchange rate for a given currency for a given year is the component monthly factors mostly furnished by the International Monetary Fund, weighted by the value of the relevant trade in each month. A monthly factor is the exchange rate (or the simple average rate) in effect during that month. These factors are applicable to total imports and exports respectively, but not necessarily to trade in individual commodities or with individual countries."

1/ Total net resource flows excludes other resource flows for Libya

## TECHNICAL NOTES

### Table\_1: Basic Indicators

**Population:** The estimates of population for mid-1985 are based mainly on data from the UN Population Division. In certain cases these have been adjusted using the results of recent population census. Note that long-term refugees in a given country are considered to be part of the population of that country.

**Area:** The area of any country is as recorded in the UN Demographic Yearbook.

**Life expectancy at birth** is defined as the average number of years to be lived by a birth cohort if mortality at each age remains constant in the future.

**GDP per capita:** This is calculated by dividing the total GDP at market prices for a country by the population of that country. The average annual growth rates are the arithmetic average for the 1981-1985 period of the real growth rate per annum and are given in percent. The same method is applied for the regional level.

The average annual growth rates of GDP deflator in percent are calculated using the geometric average for the period 1981-1985. GDP deflator is calculated by dividing, for each year of the period, the value of GDP in current market prices by the value of GDP in constant market prices both in national currency. The regional average growth rate are weighted by GDP in 1980.

The average annual growth rates of consumer price index in percent are obtained by using the geometric formula. The regional average growth rates are weighted by the 1980 final private consumption expenditures expressed in U.S. dollars.

### Table\_2: Selected Demographic Indicators

Data shown in this table are mainly derived from the UN Population Division report: World population prospects, estimates and projections as assessed in 1984, with some adjustments by the ECA Population Division which take into account the results of recent population censuses.

The crude birth and death rates indicate the number of births and deaths in a year per thousand mid-year population respectively.

The infant mortality rate is the annual number of deaths of infants under one year of age per thousand live births.

The total fertility rate represents the number of children that would be born per woman, if she were to live to the end of her child-bearing years and bear children during those years in accordance with prevailing age-specific fertility rates.

The gross reproduction rate is a measure of the reproduction of a population expressed as an average number of daughters to born to a cohort of women during their reproductive age, assuming no mortality and a fixed schedule of age-specific fertility rates. More specifically it is the total fertility rate for the period for which it is measured multiplied by the proportion of the total births that were female births.

These demographic indicators are also expressed in terms of index numbers with 1980 = 100.

### Table 3: Growth of Total and Urban Population

Sources of data on total population, urban population as a percentage of total population, annual growth rates of total and urban population are the same as in tables 1 and 2.

The annual rates of growth are calculated by using the geometric formula and are given as percent per annum.

Since the estimates of urban population in this table are based on different national definitions of "urban", inter-country comparisons should be treated with caution. Examples of definitions of "urban" used in some African countries are:

(i) Algeria: All communes having as chef-lieu a city, a rural-town or an urban agglomeration;

(ii) Ghana: Localities of 5000 or more inhabitants

(iii) Central Africa Republic: 20 principal centres

(iv) Senegal: Agglomerations of 10,000 or more inhabitants

### Table 4: Economically Active Population, Crude and Refined Activity rate

The data shown in this table are derived mainly from the ILO publications: Economically active population, 1950-2025 and Yearbook of Labour Statistics. The estimates of the numbers economically active have been adjusted by the ECA Statistics Division to reflect recent changes in the estimates of the total population as explained in tables 1 and 2. For Djibouti, Sao Tome and Principe and Seychelles, all estimates were made by the ECA Statistics Division.

The economically active population refers to employed and unemployed as defined by the International Conference of Labour Statisticians.

The crude activity rate is the ratio of total economically active population to the total population and the refined activity rate is defined as persons economically active aged 10 years and over to the population aged 10 years and over.

**Table 5: Economically Active Population: Sectoral Distribution**

Table 3 of the ILO publication Economically active population 1950-2025 Volume II provides data for numbers and proportions of economically active population in agriculture, industry and services by sex for 1950, 1960, 1970 and 1980. ECA Statistics Division has estimated the percentages for 1985 based on data from various sources including the results of recent censuses. These data will be updated in subsequent issues as soon as official ILO estimates become available. The data for 1981 were obtained by interpolation.

The definitions of agriculture, industry and services are as given in Table 11.

**Table 6: Students Enrolled at First Level of Education**

The data on number enrolled at first level of education refer to estimates of total and female enrolment of students of all ages in primary school. It should be noted that a gross enrolment ratio for the first level of education could be calculated by dividing the total enrolment by the population of the age group which according to national regulations, should be enrolled at the first level (in general for the age-group 6 to 11).

Data shown are mainly derived from the UNESCO Statistical Yearbook and national publications. ECA Statistics Division made estimates for the following countries: Comoros, Djibouti, Mauritania, Sao Tome and Principe and Seychelles.

**Table 7: Literacy rate**

The literacy rate is defined as the percentage of persons aged 15 years and over who can read and write in any language. The data are derived from the UNESCO Statistical Yearbook, supplemented by Statistics Division estimates.

**Table 8: GDP and GDP per Capita at current factor cost**

Gross domestic product (GDP) at market prices measures the gross final output of goods and services of resident producers of an economy. It is calculated without allowance for depreciation.

GDP at factor cost differs from GDP at market prices (purchasers' values) by the inclusion in the latter of indirect taxes net of subsidies.

**Table\_\_9:** Gross domestic product by kind of economic activity at current factor cost

The classification shown in this table refers to the major divisions of the International Standard Industrial Classification of all Economic Activity (ISIC) except for:

i) Commerce which includes trade, restaurants and hotels (Division 6) and financing, insurance, real estate and business services (Division 8);

ii) Public administration and defence and related public sector activities;

iii) Other services which comprises the remaining activities under the major division 9: community, social and personal services.

**Table\_\_10:** Gross domestic product by kind of economic activity at constant 1980 factor cost

See Introduction.

**Table\_11:** Structure of GDP by main Sectors, percent at current factor cost

The structure (shares) of GDP was calculated from current price series. The agricultural sector comprises agriculture, forestry, hunting and fishing. The industrial sector comprises mining, manufacturing, construction and electricity, water and gas. All other branches of economic activity are categorized as services.

**Table\_\_12\_and\_13:** Growth of GDP, GDP per capita and GDP by main sectors at constant 1980 factor cost.

Growth rates for 1981-1985 were obtained by taking the arithmetic averages for the period.

**Table\_14:** Expenditure on gross domestic product, at current market prices

Public consumption consists of all current expenditures made by general government for the purchase of goods and services (including wages and salaries of government employees) less sales of goods and services. Included are the capital outlays of government services on durable goods for national defence and security.

Private consumption is the final consumption of households and private non-profit institutions serving households.

Gross capital formation consists of the outlays of industries, producers of private non-profit services to households, on additions of new durable goods (commodities) to their stocks of fixed assets less their net sales of similar secondhand or scrapped goods. The aggregate includes increase in stocks and excludes the outlays of government services on durable goods for national defence and security.

Nonfactor services refer to transport, communication, insurance, etc.

**Table\_\_15:** Structure of demand, percent at current market prices.

See notes on Table 14 above.

**Table\_\_16:** Average annual growth rate of consumption, investment and export of goods and nonfactor services.

See notes on Tables 12, 13 and 14 above.

**Table\_17\_and\_18:** Resources and uses at current market prices and 1980 constant market prices

These two tables are derived from the tables on National Accounts above.

**Table\_19:** Agricultural indicators.

**Arable land:** The definition followed is that of the Food and Agriculture Organization of the UN. It refers to land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens (including cultivation under grass), and land temporary fallow or lying idle.

**Value added in agriculture:** This is the gross value of output of the sector less the value of the input into it.

**Table\_20:** Food supply by principal items

The source of data in this table is FAO.

Other food comprises sugar, honey, pulses, nuts, oilseed, vegetables, fruit, meat and offals, eggs, fish and other seafood, oils and fats.

**Table\_21:** Livestock and fisheries

The source of data is mainly FAO.

**Table\_\_22:** Production, trade and consumption of certain energy commodities.

Electricity production refers to the total gross production generated by public utilities (i.e. publicly or privately owned enterprises) and by individual establishments generating for their own use or for sale. Production includes station use and transmission losses.

Data for crude petroleum production include shale oil and field or lease concentrate but excludes natural gas liquids and oils obtained from the distillation of solid fuels.

**Table\_23:** Transport and Communication indicators.

The basic data were obtained from country publications.

**Table\_24:** Freight by type of transport

The data were obtained from country publications. The growth rate is the arithmetic average for the period.

**Table\_25:** Central Government current Revenue

The data were obtained from country publications as well as the Government Finance Statistics Yearbook (IMF).

The data relate to all units that are agencies or instruments of a country's central authority and whose jurisdiction extends to all parts of the State.

**Table\_26:** Central Government Expenditures

Central government expenditure comprises all expenditure by government offices and other agencies or instruments of the central government. Both current and capital expenditures are included.

The overall surplus or deficit (S/D) is obtained from the equation:  $S/D = \text{current revenue} + \text{capital revenue} + \text{grants received} - \text{total expenditure} - (\text{lending} - \text{repayments})$ .

Data sources are country publications, IMF Government Finance Statistics Yearbook and IMF data files.

**Table\_27:** Monetary Indicators

Data on monetary aggregates shown in this table are derived from the IMF publication: International Financial Statistics (IFS). They are expressed in U.S. dollars using the end-of-period official market exchange rates.

Net Foreign Assets is defined as foreign assets held by the monetary authorities less the sum of their respective foreign liabilities excluding long-term foreign liabilities.

Domestic Credit represents claims on other financial institutions and non-financial resident sectors of the economy. All financial transactions between monetary institutions are excluded through the process of consolidation.

Net Claims on Government equals the sum of claims on government held by the monetary authorities and the deposit money banks less the sum of government deposits with those institution plus, where applicable, the counterpart entries of banking activities of the central government (private sector demand deposits with the postal checking system and the treasury).

Money equals the sum of currency outside banks and private sector demand deposits with the deposit money banks plus, where applicable, private sector demand deposits with the postal checking system and the treasury.

Quasi-money comprises the time, savings and foreign currency deposits of residents with the monetary authorities and deposit money banks.

**Table 28: Merchandise Trade: Value, Average Growth rate, and Terms of Trade**

The annual average growth rates of merchandise exports and imports are computed by the least squares method applied to the exponential trend function  $Y_t = a \exp(bt)$ . Where "t" is time (in years) and "yt" is total export or import (in years). The annual average growth rate "r" is thus obtained as  $\exp(b^*) - 1$  where "b\*" is the least squares estimates of "b" in the exponential trend function.

The terms of trade indices are the net barter terms of trade, and are computed as the ratio of the unit value index of export to the unit value of import. They, therefore, show the average price of a country's aggregate exports in relation to the average price of its imports.

**Table 29: Structure of Merchandise Exports**

The data are classified, whenever possible, according to the Standard International Trade Classification (SITC, Revision 2) as follows:

	SITC
Primary commodities	Section 0 through 4
Food, Beverages, Tobacco	Section 0 and 1
Raw material, excluding fuels	Sections 2 and 4
Manufactured goods	Section 5 through 8
Textile, articles of apparel and clothing	Divisions 65 and 84
Other manufactures	Section 5 to 8 less Divisions 65 and 84.

**Tables 30 and 32: Destination of Merchandise Exports and Origin of Merchandise Imports**

The official total trade figures for Direction of trade, tables 30 and 32, generally differ from total trade imports and exports figures in Table 28 due mainly to delay in updating details in direction of trade data by the countries themselves.

Countries are classified as follows:

**Developed Market Economies:** Australia, Austria, Belgium, Canada, Denmark, Finland, France and Monaco, Federal Republic of Germany, Greece, Iceland, Ireland, Israel, Italy and San Marino, Japan, Luxembourg, Netherlands, New Zealand, Norway and Svalbard and Jan Mayen Islands, Portugal, Spain, South Africa, Sweden, Switzerland and Liechtenstein, United Kingdom and United States.

**Centrally Planned Economies:** Albania, Bulgaria, China, Czechoslovakia, Democratic Republic of Germany, Hungary, Democratic Republic of Korea, Mongolia, Poland, Romania, Union of Soviet Socialist Republics (USSR)

**Developing Market Economies:** All other countries which are not included in the above two groupings.

**Miscellaneous:** Areas not elsewhere specified, ship stores and bunkers.

The designation "developed" and "developing" is intended for statistical convenience and does not necessarily express a judgment about the stage reached by a country or area in the development process. The grouping EEC excludes Portugal and Spain.

**Table 31: Structure of Merchandise Imports**

The SITC codes used for Beverages and Tobacco and fuels are the same as those in Table 29: Food (section C), Chemicals (section 5) and Machinery and Transport Equipment (section 7). The other commodities are classified as in Table 29.

**Table 33: Balance of Payments and Reserves**

The source of the data is the balance of payments statistics (IMF). Conversion rates used were U.S. dollars per SDR.

Information on balance of trade is available in Table 28.

**Table 34: External Debt and Debt Service Ratio**

External public debt represents the amount of public and private loans disbursed and outstanding at the end of each year, including IMF repurchases, private non-guaranteed loans and arrears.

Debt service is the sum of interest payments and repayments of principal on public and publicly guaranteed and private non-guaranteed long term debt.

All data shown were supplied mainly by the World Bank.

**Table\_35: Terms of Public Borrowing.**

Commitments refer to public and publicly guaranteed loans for which contracts were signed in the year specified. Interest is the major charge levied on a loan and is usually computed on the amount of principal drawn and outstanding. The maturity of a loan is the interval period between the date of the agreement and the date of final repayment of principal. The grace period is the interval period between the agreement date and the date of the first repayment of principal.

Figures for interest rates, maturities and grace periods are averages weighted by the amounts of loans.

Data shown in this table are derived mainly from the world Bank publication: 1986 World Debt Tables.

**Table\_36: Net Resource Flows**

The net resource flows represent the sum of the net Official Development Assistance (ODA) flows and the net others flows. The ODA flows consist of grants and loans net disbursement made at concessional financial terms, from bilateral and multilateral sources.

ODA flows are calculated as: Loans + Grants - Interest - Amortization.

The net others flows are calculated as: Loans + Direct Investment - Interest - Amortization.

All data shown are supplied by member States, OECD or the World Bank.
