1 Release Notes Update History

Revision	Date	Description
16.35.3502	December 31, 2023	Initial release of this Release Notes version, This version introduces Bug Fixes.

2 Overview

Firmware which is added at the time of manufacturing, is used to run user programs on the device and can be thought of as the software that allows hardware to run. Embedded firmware is used to control the functions of various hardware devices and systems, much like a computer's operating system (OS) controls the function of software applications. Firmware may be written into read-only memory (ROM), erasable programmable read-only memory (EPROM) or flash memory.

3.6 PRM Revision Compatibility

This firmware version complies with the following Programmer's Reference Manual:

- Adapters Programmer's Reference Manual (PRM), Rev 0.53 or later, which has Command Interface Revision 0x5. The command interface revision can be retrieved by means of the QUERY_FW command and is indicated by the field cmd_interface_rev.

4 Changes and New Features

4.1 Important Notes

SR-IOV - Virtual Functions (VF) per Port - The maximum Virtual Functions (VF) per port is 127. For further information, see Known Issues.

It is recommended to enable the “above 4G decoding” BIOS setting for features that require large amount of PCIe resources.

Such features are: SR-IOV with numerous VFs, PCIe Emulated Switch, and Large BAR Requests.

Security Hardening Enhancements: This release contains important reliability improvements and security hardening enhancements. NVIDIA recommends upgrading your devices' firmware to this release to improve the devices’ firmware security and reliability.

When upgrading or changing the configuration on multi-host adapter cards, for the changes to take effect, PCIe restart must be simultaneously sent from both hosts (servers).

To do so, perform the following:

1. Shut down the server with the auxiliary card.
2. Shut down the server with the primary card.
3. Bring back the server with the primary card.
4. Bring back the server with the auxiliary card.

UDP	Added support for copy modify header steering action to/from the UDP field.
RoCE: Adaptive Timer	Enabled ADP timer to allow the user to configure RC or DC qp_timeout values lower than 16.
QoS Priority Trust Default State	QoS priority trust default state can now be changed using the new nvconfig below: • QOS_TRUST_STATE_P1 • QOS_TRUST_STATE_P2 The values that can be used to set the default state are: • TRUST_PORT • TRUST_PCP • TRUST_DSCP • TRUST_DSCP_PCP
Bug Fixes	See Bug Fixes section.
16.34.1002	
LLDP Properties Implementation on RDE	Added LLDPEnable, LLDPTransmit and LLDPReceive properties to the RDE Port schema implementation.
Bug Fixes	See Bug Fixes section.
16.33.1048	
NV Configurations via the Relevant Reset Flow	Added `pci_rescan_needed` field to the MFRL access register to indicate whether a PCI rescan is needed based on the NV configurations issued by the software. **Note:** If the Keep Link Up NV configuration is changed, phyless reset will be blocked.

MADs	Added a new MAD of class SMP that has the attributes `hierarchy_Info` as defined in the IB Specification and is used to query the hierarchy information stored on the node and the physical port.
ICM Pages	Added a new register (`vhca_icm_ctrl access_reg`) to enable querying and limiting the ICM pages in use.
XRQ QP Errors Enhancements	Enhanced the XRQ QP error information provided to the user in case QP goes into an error state. In such case, QUERY_QP will provide information on the syndrome type and which side caused the error.
NetworkPort Schema Replacement	Replaced the deprecated NetworkPort schema with Port schema in NIC RDE implementation.
ibstat	Updated the ibstat status reported when the phy link is down. Now `QUERY_VPORT_STATE.max_tx_speed` of UPLINK will not be reported as 0 anymore.
SMPs	Disabled the option to send SMPs from unauthorized hosts.
Firmware Steering	Enabled the option to modify the `ip_ecn` field in the packet header in firmware steering.
SW Steering Cache	Modified the TX or RX cache invalidation behavior. TX or RX cache invalidation now does not occur automatically but only when the software performs the sync operation using the using sync_steering command.
Mega Allocations in Bulk Allocator Mechanism	Modified the maximum bulk size per single allocation from `"log_table_size - log_num_unisizes",` to allocate any range size, to remove limitations that HWS objects such as counters and modify arguments might encounter.
