

# NVIDIA Mellanox NIC's Performance Report with DPDK 20.11

Rev 1.1

## Notice

This document is provided for information purposes only and shall not be regarded as a warranty of a certain functionality, condition, or quality of a product. NVIDIA Corporation ("NVIDIA") makes no representations or warranties, expressed or implied, as to the accuracy or completeness of the information contained in this document and assumes no responsibility for any errors contained herein. NVIDIA shall have no liability for the consequences or use of such information or for any infringement of patents or other rights of third parties that may result from its use. This document is not a commitment to develop, release, or deliver any Material (defined below), code, or functionality.

NVIDIA reserves the right to make corrections, modifications, enhancements, improvements, and any other changes to this document, at any time without notice. Customer should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

NVIDIA products are sold subject to the NVIDIA standard terms and conditions of sale supplied at the time of order acknowledgement, unless otherwise agreed in an individual sales agreement signed by authorized representatives of NVIDIA and customer ("Terms of Sale"). NVIDIA hereby expressly objects to applying any customer general terms and conditions with regards to the purchase of the NVIDIA product referenced in this document. No contractual obligations are formed either directly or indirectly by this document.

NVIDIA products are not designed, authorized, or warranted to be suitable for use in medical, military, aircraft, space, or life support equipment, nor in applications where failure or malfunction of the NVIDIA product can reasonably be expected to result in personal injury, death, or property or environmental damage. NVIDIA accepts no liability for inclusion and/or use of NVIDIA products in such equipment or applications and therefore such inclusion and/or use is at customer's own risk.

NVIDIA makes no representation or warranty that products based on this document will be suitable for any specified use. Testing of all parameters of each product is not necessarily performed by NVIDIA. It is customer's sole responsibility to evaluate and determine the applicability of any information contained in this document, ensure the product is suitable and fit for the application planned by customer, and perform the necessary testing for the application in order to avoid a default of the application or the product. Weaknesses in customer's product designs may affect the quality and reliability of the NVIDIA product and may result in additional or different conditions and/or requirements beyond those contained in this document. NVIDIA accepts no liability related to any default, damage, costs, or problem which may be based on or attributable to: (i) the use of the NVIDIA product in any manner that is contrary to this document or (ii) customer product designs.

No license, either expressed or implied, is granted under any NVIDIA patent right, copyright, or other NVIDIA intellectual property right under this document. Information published by NVIDIA regarding third-party products or services does not constitute a license from NVIDIA to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property rights of the third party, or a license from NVIDIA under the patents or other intellectual property rights of NVIDIA.

Reproduction of information in this document is permissible only if approved in advance by NVIDIA in writing, reproduced without alteration and in full compliance with all applicable export laws and regulations, and accompanied by all associated conditions, limitations, and notices.

## Trademarks

NVIDIA, the NVIDIA logo, and Mellanox are trademarks and/or registered trademarks of NVIDIA Corporation in the U.S. and other countries. Other company and product names may be trademarks of the respective companies with which they are associated.

For the complete and most updated list of Mellanox trademarks, visit <http://www.mellanox.com/page/trademarks>.

1.1	21-Feb-2023	Fix a typo in Test#13 results

# 1 About this Report

The purpose of this report is to provide packet rate performance data for NVIDIA® Mellanox® Network Interface Cards (NICs) and Data Processing Unit (DPU) (ConnectX®-4 Lx, ConnectX®-5, ConnectX®-5 Ex, ConnectX®-6 Lx, ConnectX®-6 Dx and BlueField-2) that has been achieved with the specified Data Plane Development Kit (DPDK) release. The report provides the measured packet rate performance as well as the hardware layout, procedures, and configurations for replicating these tests.

The document does not cover all network speeds available with the ConnectX® or BlueField® family of NICs / DPUs and is intended as a general reference of achievable performance for the specified DPDK release.

## 1.1 Target Audience

This document is intended for engineers implementing applications with DPDK to guide and help achieving optimal performance.

## 1.2 Terms and Conventions

The following terms, abbreviations, and acronyms are used in this document.

Table 2 - Terms, Abbreviations and Acronyms

Term	Description
DPU	Data Processing Unit
DUT	Device Under Test
IXIA	
MPPS	Million Packets Per Seconds
PPS	Packets Per Second
OFED	OpenFabrics Enterprise Distribution; An open-source software for RDMA & kernel bypass. Read more on Mellanox OFED <a href="#">here</a> .
SR-IOV	Single Root IO Virtualization
ZPL	Zero Packet Loss

---

## 2 Test Description

### 2.1 Hardware Components

The following hardware components are used in the test setup:

- ▶ HPE® ProLiant DL380 Gen10 Server
- ▶ Mellanox ConnectX-4 Lx, ConnectX-5, ConnectX-5 Ex, ConnectX-6 Dx Network Interface Cards (NICs) and BlueField-2 Data Processing Unit (DPU)
- ▶ IXIA® XM12 packet generator

### 2.2 Zero Packet Loss Test

Zero Packet Loss tests utilize **I3fwd** ([http://www.dpdk.org/doc/guides/sample\\_app\\_ug/I3\\_forward.html](http://www.dpdk.org/doc/guides/sample_app_ug/I3_forward.html)) as the test application for testing maximum throughput with zero packet loss at various frame sizes based on RFC2544 <https://tools.ietf.org/html/rfc2544>.

The packet generator transmits a specified frame rate towards the Device Under Test (DUT) and counts the received frame rate sent back from the DUT. Throughput is determined with the maximum achievable transmit frame rate and is equal to the received frame rate i.e. zero packet loss.

- ▶ Duration for each test is 60 seconds.
- ▶ Traffic of 8192 IP flows is generated per port.
- ▶ IxNetwork (Version 9.00EA) is used with the IXIA packet generator.

### 2.3 Zero Packet Loss over SR-IOV Test

The test is conducted similarly to the bare-metal zero packet loss test with the distinction of having the DPDK application running in a Guest OS inside a VM utilizing SR-IOV virtual function.

### 2.4 Single Core Performance Test

Single Core performance tests utilize **testpmd** ([http://www.dpdk.org/doc/guides/testpmd\\_app\\_ug](http://www.dpdk.org/doc/guides/testpmd_app_ug)), for testing the max throughput while using a single CPU core. The duration of the test is 60 seconds and the average throughput that is recorded during that time is used as the result of the test.

- ▶ Duration for each test is 60 seconds.
- ▶ Traffic of 8192 UDP flows is generated per port.
- ▶ IxNetwork (Version 9.00EA) is used with the IXIA packet generator.

### 3 Test#1 Mellanox ConnectX-4 Lx 25GbE Throughput at Zero Packet Loss (2x 25GbE)

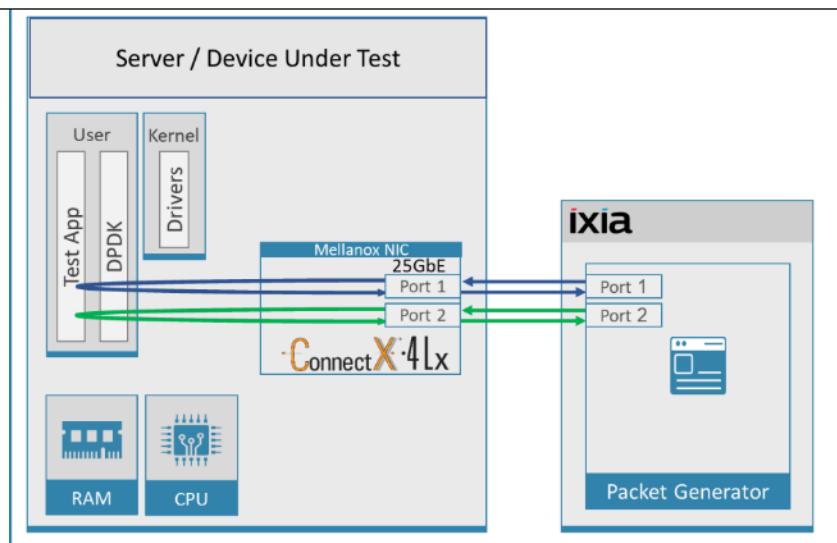

Table 3: Test #1 Setup

Item	Description
Test #1	Mellanox ConnectX-4 Lx 25GbE Dual-Port Throughput at zero packet loss
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX4121A-ACAT - ConnectX-4 Lx network interface card 25GbE dual-port SFP28; PCIe3.0 x8; ROHS R6
Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Kernel Version	3.10.0-1062.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-28) (GCC)
Mellanox NIC firmware version	14.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
DPDK version	20.11
Test Configuration	1 NIC, 2 ports used on the NIC. Each port receives a stream of 8192 IP flows from the IXIA Each port has 4 queues assigned for a total of 8 queues 1 queue assigned per logical core with a total of 8 logical cores

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-4 Lx Dual-Port NIC. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-4 Lx NIC.

The ConnectX-4 Lx data traffic is passed through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the opposing port. IXIA measures throughput and packet loss.

Figure 1: Test #1 Setup – Mellanox ConnectX-4 Lx 25GbE Dual-Port connected to IXIA

### 3.1 Test Settings

Table 4: Test #1 Settings

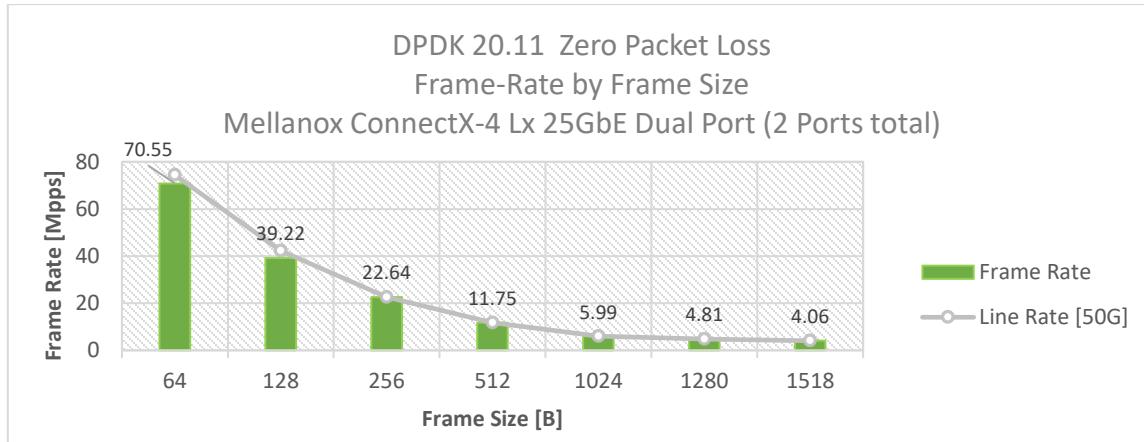

Item	Description
BIOS	1) Workload Profile = “Low Latency”; 2) Jitter Control = Manual, 3400. (Setting turbo boost frequency to 3.4 GHz) See “Configuring and tuning HPE ProLiant Servers for low-latency applications”: <a href="http://hpe.com">hpe.com</a> > Search “DL380 gen10 low latency”
BOOT Settings	isolcpus=24-47 intel_idle.max_cstate=0 processor.max_cstate=0 intel_pstate=disable nohz_full=24-47 rcu_nocbs=24-47 rcu_nocb_poll default_hugepagesz=1G hugepagesz=1G hugepages=64 audit=0 nosoftlockup
DPDK Settings	Compile DPDK using: meson <build> -Dexamples=l3fwd ; ninja -C <build> During testing, l3fwd was given real-time scheduling priority.
L3fwd settings	Updated values /l3fwd/l3fwd.h: <pre>#define RTE_TEST_RX_DESC_DEFAULT 4096 #define RTE_TEST_TX_DESC_DEFAULT 4096 #define MAX_PKT_BURST 64</pre>
Command Line	./build/examples/dpdk-l3fwd -c 0xff0000000000 -n 4 -a d8:00.0,txq_inline=200,txq_mpw_en=1 -a d8:00.1,txq_inline=200,txq_mpw_en=1 --socket-mem=0,8192 -- -p 0x3 -P --config='(0,0,47),(0,1,46),(0,2,45),(0,3,44),(1,0,43),(1,1,42),(1,2,41),(1,3,40)' --eth-dest=0:00:52:11:22:33:10 --eth-dest=1:00:52:11:22:33:20
Other optimizations	a) Flow Control OFF: "ethtool -A \$netdev rx off tx off" b) Memory optimizations: "sysctl -w vm.zone_reclaim_mode=0"; "sysctl -w vm.swappiness=0" c) Move all IRQs to far NUMA node: "IRQBALANCE_BANNED_CPUS=\$LOCAL_NUMA_CPUMAP irqbalance --oneshot" d) Disable irqbalance: "systemctl stop irqbalance" e) Change PCI MaxReadReq to 1024B for each port of each NIC: Run "setpci -s \$PORT_PCI_ADDRESS 68.w", it will return 4 digits ABCD --> Run "setpci -s \$PORT_PCI_ADDRESS 68.w=3BCD" f) Set CQE COMPRESSION to “AGGRESSIVE”: mlxconfig -d \$PORT_PCI_ADDRESS set CQE_COMPRESSION=1 G) Disable Linux realtime throttling: echo -1 > /proc/sys/kernel/sched_rt_runtime_us

### 3.2 Test Results

Table 5: Test #1 Results – Mellanox ConnectX-4 Lx 25GbE Dual-Port Throughput at Zero Packet Loss

Frame Size (Bytes)	Frame Rate (Mpps)	Line Rate [50G] (Mpps)	% Line Rate
64	70.55	74.4	94.83
128	39.22	42.23	92.88
256	22.64	22.64	100

## 4 Test#2 Mellanox ConnectX-5 25GbE Throughput at Zero Packet Loss (2x 25GbE)

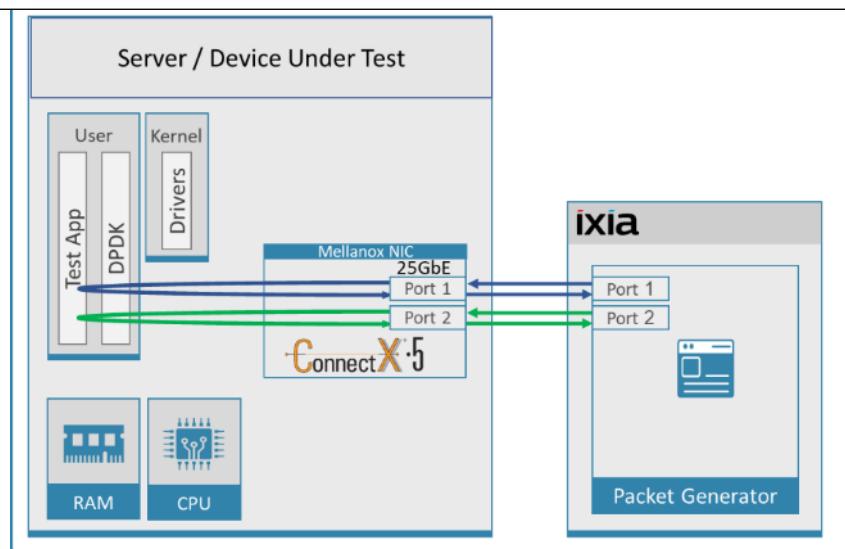

Table 6: Test #2 Setup

Item	Description
Test #2	Mellanox ConnectX-5 25GbE Dual-Port Throughput at zero packet loss
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX512A-ACAT ConnectX-5 EN network interface card; 10/25GbE dual-port SFP28; PCIe3.0 x8; tall bracket; ROHS R6
Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Kernel Version	3.10.0-1062.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-28) (GCC)
Mellanox NIC firmware version	16.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
DPDK version	20.11
Test Configuration	1 NIC, 2 ports; Each port receives a stream of 8192 IP flows from the IXIA Each port has 4 queues assigned for a total of 8 queues 1 queue assigned per logical core with a total of 8 logical cores

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 Dual-Port NIC. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 NIC.

The ConnectX-5 data traffic is passed through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

Figure 3: Test #2 Setup – Mellanox ConnectX-5 25GbE Dual-Port connected to IXIA

## 4.1 Test Settings

Figure 4: Test #2 Results – Mellanox ConnectX-5 25GbE Dual-Port Throughput at Zero Packet Loss

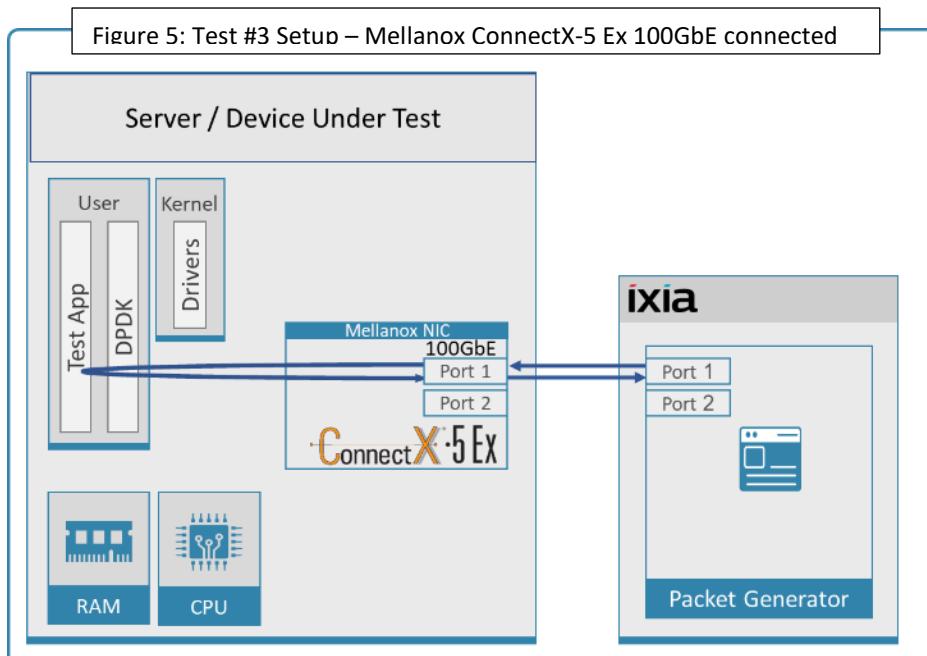

## 5 Test#3 Mellanox ConnectX-5 Ex 100GbE Throughput at Zero Packet Loss (1x 100GbE)

Table 9: Test #3 Setup

Item	Description
Test #3	Mellanox ConnectX-5 Ex 100GbE Throughput at zero packet loss
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX516A-CDAT ConnectX-5 Ex network interface card 100GbE dual-port QSFP28; PCIe3.0/PCIe4 x16; ROHS R6
Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Kernel Version	3.10.0-1062.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-28) (GCC)
Mellanox NIC firmware version	16.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
DPDK version	20.11
Test Configuration	1 NIC, 1 port used on NIC; Port has 12 queues assigned to it, 1 queue per logical core for a total of 12 logical cores. Each port receives a stream of 8192 IP flows from the IXIA

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 Ex Dual-Port NIC (only the first port is used in this test). The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 Ex NIC.

The ConnectX-5 Ex data traffic is passed through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

## 5.1 Test Settings

Table 10: Test #3 Settings

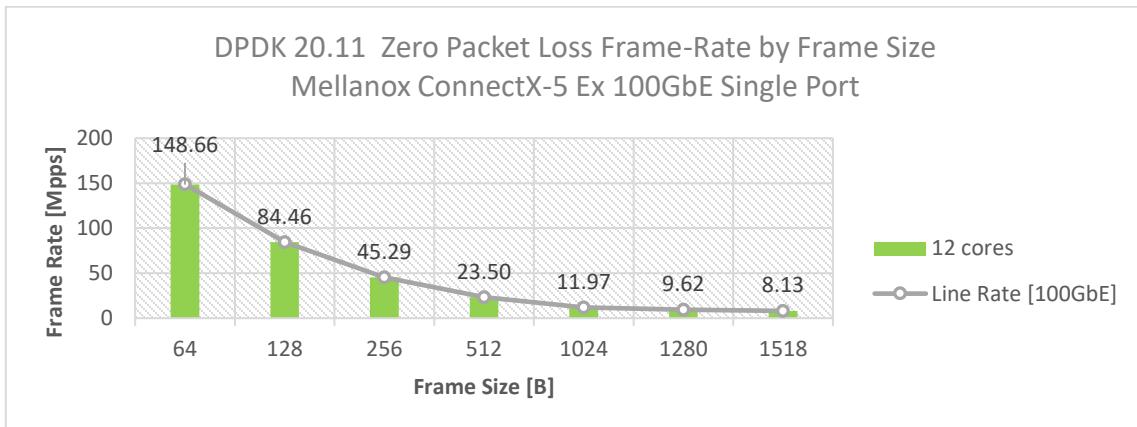

Item	Description
BIOS	1) Workload Profile = "Low Latency"; 2) Jitter Control = Manual, 3400. (Setting turbo boost frequency to 3.4 GHz) See "Configuring and tuning HPE ProLiant Servers for low-latency applications": hpe.com > Search "DL380 gen10 low latency"

Guest Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Guest Kernel Version	3.10.0-1062.el7.x86_64
Guest GCC version	4.8.5 20150623 (Red Hat 4.8.5-28) (GCC)
Guest Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
Mellanox NIC firmware version	16.29.1016
DPDK version	20.11
Test Configuration	1 NIC, 1 port over 1 VF (SR-IOV); VF has 12 queues assigned to it, 1 queue per logical core for a total of 12 logical cores.  Each physical port receives a stream of 8192 IP flows from the IXIA directed to VF assigned to Guest OS.

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 Ex NIC with a dual- port (only first port used in this test) running Red Hat Enterprise Linux Server with qemu-KVM managed via libvirt, Guest OS running DPDK is based on Red Hat Enterprise Linux Server as well. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 Ex NIC. The ConnectX-5 Ex data traffic is passed through a virtual function (VF/SR-IOV) to DPDK running on the Guest OS, to the test application **I3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

Figure 13: Test #7 Setup – Mellanox ConnectX-5 Ex 100GbE connected to IXIA using KVM SR-IOV

## 9.1 Test Settings

## 13 Test#11 Mellanox ConnectX-6 Dx 100GbE PCIe Gen4 Throughput at Zero Packet Loss (2x 100GbE)

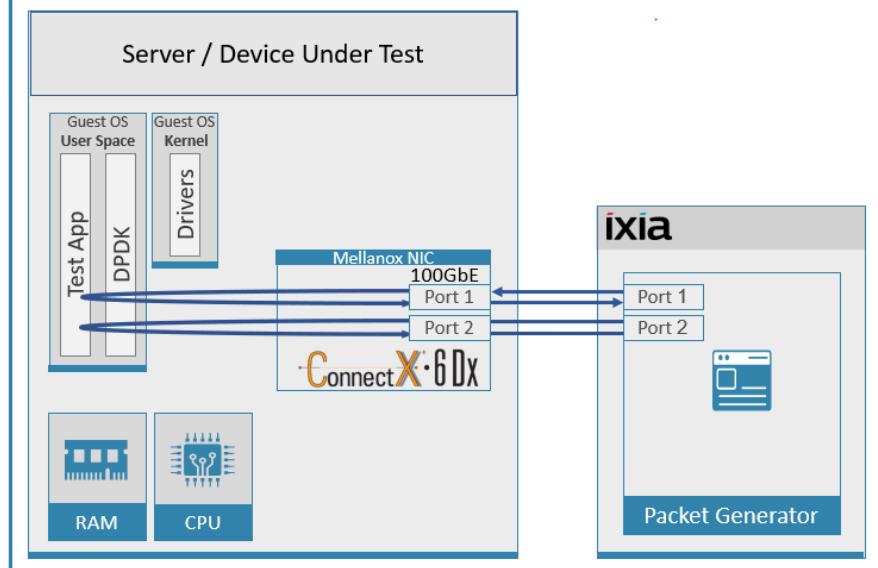

Table 33: Test #11 Setup

Item	Description
Test #11	Mellanox ConnectX-6 Dx 100GbE Dual-Port PCIe Gen 4 Throughput at zero packet loss
Server	Dell PowerEdge R6525
CPU	2x AMD EPYC 7742 64-Core Processor
RAM	512GB: 16 * 32GB DIMMs @ 3200MHz
BIOS	Vendor: Dell Inc. version 1.5.5 (07/27/2020)
NIC	One MCX623106PN-CDAT ConnectX-6 Dx EN adapter card; 100GbE; Dual-port QSFP56; with PPS In/Out; PCIe 4.0 x16
Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Kernel Version	3.10.0-1062.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-39) (GCC)
Mellanox NIC firmware version	22.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
DPDK version	20.11
Test Configuration	1 NIC, 2 port used on NIC; each port has 8 queues assigned to it, 1 queue per logical core for a total of 16 logical cores. Each port receives a stream of 8192 IP flows from the IXIA

The Device Under Test (DUT) is made up of the Dell server and the Mellanox ConnectX-6 Dx Dual-Port NIC (both ports are used in this test). The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-6 Dx NIC ports.

The ConnectX-6 Dx data traffic is passed via PCIe Gen 4 bus through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

## 14 Test#12 Mellanox ConnectX-6 Dx 100GbE Throughput at Zero Packet Loss (1x 100GbE) using SR-IOV over KVM Hypervisor

Table 36 - Test #12 Setup

Item	Description
Test #12	Mellanox ConnectX-6 Dx 100GbE Throughput at zero packet loss using SR-IOV over KVM Hypervisor
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX623106AN-CDAT ConnectX-6 Dx EN adapter card; 100GbE; Dual-port QSFP56; PCIe 4.0/3.0 x16;
Hypervisor	Red Hat Enterprise Linux Server release 7.7 (Maipo) QEMU emulator version 1.5.3 (qemu-kvm-1.5.3-156.el7)
Hypervisor Kernel Version	3.10.0-1062.el7.x86_64
Hypervisor Mellanox Driver	MLNX_OFED_LINUX-5.2-1.0.4.0
Guest Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Guest Kernel Version	3.10.0-1062.el7.x86_64
Guest GCC version	4.8.5 20150623 (Red Hat 4.8.5-28) (GCC)
Guest Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
Mellanox NIC firmware version	22.29.1016
DPDK version	20.11
Test Configuration	1 NIC, 1 port over 1 VF (SR-IOV); VF has 12 queues assigned to it, 1 queue per logical core for a total of 12 logical cores.  Each physical port receives a stream of 8192 IP flows from the IXIA directed to VF assigned to Guest OS.

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-6 Dx NIC with a dual- port (only first port used in this test) running Red Hat Enterprise Linux Server with qemu-KVM managed via libvirt, Guest OS running DPDK is based on Red Hat Enterprise Linux Server as well. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-6 Dx NIC. The ConnectX-6 Dx data traffic is passed through a virtual function (VF/SR-IOV) to DPDK running on the Guest OS, to the test application **I3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

## 15 Test#13 Mellanox ConnectX-6 Dx 200GbE PCIe Gen4 Throughput at Zero Packet Loss (1x 200GbE)

Table 39 - Test #13 Setup

Item	Description
Test #13	Mellanox ConnectX-6 Dx 200GbE single-port PCIe Gen4 throughput at zero packet loss
Server	Dell PowerEdge R6525
CPU	2x AMD EPYC 7742 64-Core Processor
RAM	512GB: 16 * 32GB DIMMs @ 3200MHz
BIOS	Vendor: Dell Inc. version 1.5.5 (07/27/2020)
NIC	One MCX623105AN-VDAT ConnectX-6 Dx EN adapter card, 200GbE, Single-port QSFP56, PCIe 4.0 x16, No Crypto
Operating System	Red Hat Enterprise Linux Server release 7.7 (Maipo)
Kernel Version	3.10.0-1062.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-39) (GCC)
Mellanox NIC firmware version	22.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
DPDK version	20.11
Test Configuration	1 NIC, 1 port used on NIC; Port has 16 queues assigned to it, 1 queue per logical core for a total of 16 logical cores. Each port receives a stream of 8192 IP flows from the IXIA

The Device Under Test (DUT) is made up of the Dell server and the Mellanox ConnectX-6 Dx Single-Port NIC . The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-6 Dx NIC port. The ConnectX-6 Dx data traffic is passed via PCIe Gen 4 bus through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

## 16 Test#14 BlueField-2 25GbE Throughput at Zero Packet Loss (2x 25GbE)

Table 42 - Test #14 Setup

Item	Description
Test #14	BlueField-2 25GbE Dual-Port Throughput at zero packet loss
Server	HPE ProLiant DL380 Gen10
Data Processing Unit (DPU)	One MBF2H332A-AEEOT_A1 BlueField-2 P-Series SmartNIC; 25GbE; Dual-port SFP56; PCIe Gen3/4 x8
DPU hosted CPUs	BlueField-2 A1 A72 @2.5GHz , 8 Cores-Processor
DPU RAM	DDR On-board Memory 16GB
DPU BIOS	U30 rev. 1.36 (02/15/2018)
Operating System	BlueField-2, CentOS7.6-5.4.60-mlnx.51.ge913ebd-MLNX_OFED-5.2-1.0.4.0-1-aarch64
DPU Kernel Version	5.4.31-mlnx.23.g403b967
DPU GCC version	(GCC) 4.8.5 20150623 (Red Hat 4.8.5-36)
Mellanox NIC/DPU firmware version	24.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4
DPDK version	20.11
Test Configuration	1 NIC/DPU, 2 ports; Each port receives a stream of 7500 UDP flows from the IXIA 1 queue assigned per logical core with a total of 2,4 and 8 logical cores

The Device Under Test (DUT) is made up of the HPE server and one BlueField-2 25GbE DPU utilizing two ports. It is connected to the IXIA packet generator which generates traffic towards both ports of the BlueField-2 25GbE DPU. BlueField-2 25GbE data traffic is passed through DPDK to the test application **testpmd** that is running on the ARM cores (**embedded in the DPU**) and is redirected to the opposite direction using the second port. IXIA measures throughput and packet loss. The test measured the results while using 1,2,4,6 or 7 ARM cores.

Kernel Version	3.10.0-1062.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-28) (GCC)
Mellanox NIC firmware version	22.29.1016
Mellanox OFED driver version	MLNX_OFED_LINUX-5.2-1.0.4.0
DPDK version	20.11
Test Configuration	1 NIC, 2 ports; Each port receives a stream of 8192 IP flows from the IXIA Each port has 4 queues assigned for a total of 8 queues 1 queue assigned per logical core with a total of 8 logical cores

The Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-6 Lx Dual-Port NIC. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-6 Lx NIC.

The ConnectX-6 Lx data traffic is passed through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

Figure 29 - Test #15 Setup – Mellanox ConnectX-6 Lx 25GbE Dual-Port connected to IXIA

## 17.1 Test Settings

Table 46 - Test #15 Settings

Item	Description
BIOS	1) Workload Profile = "Low Latency"; 2) Jitter Control = Manual, 3400. (Setting turbo boost frequency to 3.4 GHz) See "Configuring and tuning HPE ProLiant Servers for low-latency applications": <a href="http://hpe.com">hpe.com</a> > Search "DL380 gen10 low latency"
BOOT Settings	isolcpus=0-23 intel_idle.max_cstate=0 processor.max_cstate=0 intel_pstate=disable nohz_full=0-23 rcu_nocbs=0-23 rcu_nocb_poll default_hugepagesz=1G hugepagesz=1G hugepages=64 audit=0 nosoftlockup idle=poll
DPDK Settings	Compile DPDK using: meson <build> -Dexamples=l3fwd ; ninja -C <build> During testing, l3fwd was given real-time scheduling priority.
L3fwd settings	Updated values /l3fwd/l3fwd.h: <pre>#define RTE_TEST_RX_DESC_DEFAULT 4096 #define RTE_TEST_TX_DESC_DEFAULT 4096 #define MAX_PKT_BURST 64</pre>
Command Line	./build/examples/dpdk-l3fwd -c 0xff0000 -n 4 -a 12:00.0,mprq_en=1,rxqs_min_mprq=1 -a 12:00.1,mprq_en=1,rxqs_min_mprq=1 --socket-mem=8192 --p 0x3 -P -- config='(0,0,23),(0,1,22),(0,2,21),(0,3,20),(1,0,19),(1,1,18),(1,2,17),(1,3,16)' --eth- dest=0,00:52:11:22:33:10 --eth-dest=1,00:52:11:22:33:20
Other optimizations	a) Flow Control OFF: "ethtool -A \$netdev rx off tx off" b) Memory optimizations: "sysctl -w vm.zone_reclaim_mode=0"; "sysctl -w vm.swappiness=0" c) Move all IRQs to far NUMA node: "IRQBALANCE_BANNED_CPUS=\$LOCAL_NUMA_CPUMAP irqbalance --oneshot" d) Disable irqbalance: "systemctl stop irqbalance" e) Change PCI MaxReadReq to 1024B for each port of each NIC: Run "setpci -s \$PORT_PCI_ADDRESS 68.w", it will return 4 digits ABCD --> Run "setpci -s \$PORT_PCI_ADDRESS 68.w=3936" f) Set CQE COMPRESSION to "AGGRESSIVE": mlxconfig -d \$PORT_PCI_ADDRESS set CQE_COMPRESSION=1 g) Disable Linux realtime throttling: echo -1 > /proc/sys/kernel/sched_rt_runtime_us

## 17.2 Test Results

Table 47 - Test #15 Results – Mellanox ConnectX-6 Lx 25GbE Dual-Port Throughput at Zero Packet Loss

Frame Size (Bytes)	Frame Rate (Mpps)	Line Rate [50G] (Mpps)	% Line Rate
64	74.25	74.40	99.80
128	42.18	42.23	99.90
256	22.62	22.64	99.90
