Operating Instructions

CPU-95 Enhanced VariSpark Digital Ignition System with Enhanced Display

Form CPU-95EVS OI 7-13

altronic
HOERBIGER Engine Solutions

1.0 OVERVIEW

1.1 The Altronic CPU-95EVS Digital Ignition system with enhanced display has been designed for application on natural gas fueled engines. This system is field-programmable and offers a variety of advanced control, emissions reduction, primary and spark diagnostics, self diagnostics, serial communications and engine protection features. The system consists of three main parts: an engine mounted Ignition Module (791963-8/16A), DC to DC power supply (791911-1), and a user interface Display Module (791909-1).

1.2 This document provides instructions and descriptions to be used in the operation of the ignition system, and does not cover physical installation. Reference the installation instructions, form CPU-95EVS II, for instructions regarding installation and mounting.

2.0 IGNITION MODULE OUTPUT SWITCHES, LED INDICATORS AND CONTROL INPUT

2.1 Three output switches in the Ignition Module provide a means of communicating the current ignition status to other systems. These switches have isolated outputs and share one common return path which is not referenced to engine or power ground. They will be in the open condition when the unit is unpowered. A typical application would be as a relay or solenoid coil driver.

FIRE-CONFIRM OUT switch: closed when the ignition is firing or trying to fire. Could be used as a signal to the control system to turn fuel on.

FAULT OUT switch: closed to signal that the ignition has no diagnostic faults which would result in a self-shutdown. Upon detecting a fault that would result in a self-shutdown of the ignition, this switch will open. Could be used as a signal to the control system to turn fuel off.

ALARM OUT switch: closed to signal that no unacknowledged faults or warnings are present. Upon detection of a diagnostic fault or warning, this switch will open. This output is designed to control an alarm indicator or sounding device.

2.2 Four red LED indicators are provided inside the ignition unit for troubleshooting purposes:

POWER LED: on to indicate that the unit has power and the microprocessor is running. The Power LED flashes to indicate that the unit has power but is not operating correctly. The Power LED is off to indicate that the unit has no power.

TX LED: flashes to indicate that the ignition unit is transmitting on the RS-485 serial link.

RX LED: flashes to indicate that the ignition unit is receiving on the RS-485 serial link.

ALARM LED: turns on to indicate that a warning or fault is present. The ALARM LED flashes when an acknowledged warning is present.

2.3 One RS-485 serial communications port is provided within the Ignition Module. This port is normally used for communication to the optional Display Module. A PC (personal computer) or a PLC (programmable logic controller) can be connected to the RS-485 port to perform remote monitoring or control functions. The Ignition Module can be operated in a stand-alone mode, but diagnostic and control features would not be accessible. This port is also used to configure the ignition system for its application using a PC and the CPU-95EVS PC terminal software.

2.4 One digital input is provided inside the ignition system (MISC. INPUT). This logic

WARNING: DEVIATION FROM THESE INSTRUCTIONS MAY LEAD TO IMPROPER ENGINE OPERATION WHICH COULD CAUSE PERSONAL INJURY TO OPERATORS OR OTHER NEARBY PERSONNEL.

THE IGNITION SYSTEM MUST BE CONFIGURED PRIOR TO USE ON AN ENGINE. REFER TO SECTION 4.9 TO VIEW THE CURRENT CONFIGURATION. REFERENCE FORM CPU-95EVS PI FOR INSTRUCTIONS DESCRIBING HOW TO CONFIGURE THE IGNITION SYSTEM. VERIFY EEPROM PROGRAMMING PRIOR TO STARTING ENGINE.

NOTE: These instructions pertain to CPU-95EVS systems equipped with logic firmware dated 03/09/13. The firmware dates can be displayed from the home screen by pressing "DIAG" and then "ENTER". The date of the installed firmware is viewed:
- *Top line (LOGIC) applies to the output module firmware date.*
- *Lower line (DISPLAY) applies to the display module firmware date.*

NOTE: If possible, keep the original shipping container. If future transportation or storage is necessary, this container will provide the optimum protection.

level input is active when shorted to ground, and is used to control any combination of the following features: one-step retard, spark energy level or multi-strike option. These features are enabled based on the special features configuration settings as described in the programming instructions, form CPU-95EVS PI.

3.0 DISPLAY MODULE USER INTERFACE AND INPUTS

3.1 Display Module: serves as the user interface for the CPU-95EVS ignition system. An RS-485 two wire serial communications format is used to connect the Display Module to the Ignition Module. This link communicates between the modules using a proprietary protocol.

3.2 **LCD DISPLAY:** A graphical, back-lit LCD display is used to provide output to the user. A sealed membrane keypad is used to accept user input. The LCD display and the keypad function together to provide an interactive user interface which prompts the user as different functions are selected.

3.3 All actions and adjustments are immediate and are performed on an incremental basis using up and down arrow keys. All keypad adjustments, except individual offset timing adjustments are performed directly in non-volatile EEPROM memory. This EEPROM memory retains previous settings even after an engine shutdown or an ignition power down.

3.4 Capital letters are used on the LCD display screen to designate an active selection while lower case letters are used to indicate other possible options.

3.5 The display module includes an isolated current loop input which can be configured to control spark timing. Reference the programming instructions, form CPU-95EVS PI.

3.6 One logic level digital input (MISC. INPUT) is available at the Display Module which can be used in the same fashion as the input of the Ignition Module. If either input is shorted to ground, then the MISC. INPUT functions are active.

3.7 The display module incorporates a half duplex RS-485 port which is Modbus RTU slave compliant. The protocol used follows the Modicon Modbus RTU standard. For a complete list of the Modbus register addresses, **SEE SECTION 15.0**. The CPU-95EVS terminal program CD contains a PC-based Modbus compatible monitoring program which can be used to access the ignition data remotely.

3.8 One USB peripheral port. The USB port can be configured to allow programming of the attached ignition module when used with CPU-95EVS Terminal program V1.0 and above. The USB port can also be configured as another Modbus RTU interface.

4.0 UNDERSTANDING THE HOME SCREEN

4.1 A series of home screens are used to describe the current status of the ignition system. The LCD display always reverts back to one of the home screens after a keypad operation is completed or times out. The home screen is designed to display the most critical operating parameters on one screen.

4.2 The **READY** message is displayed when the ignition is ready for the engine to crank for starting.

```
     CPU-95 IGNITION
 READY        0rpm
E1 SS
   4.0mA    10.0° Btdc

     P2A360.FS1   #001
```
4.3 Once the engine begins turning, the **SYNCING** message is displayed while the ignition system verifies signals from the engine pickups.

```
     CPU-95 IGNITION
 SYNCING    100rpm
E1 SS
   4.0mA    10.0° Btdc

     P2A360.FS1   #001
```
4.4 The **FIRING** message is displayed when the ignition begins firing. Additional data is provided on this screen to describe the selected mode of operation for the ignition. The bit stream selection (E1,E2,E3) and the single-strike/multi-strike type (SS or MS) are described in the middle of the upper line in small characters.

```
     CPU-95 IGNITION
 FIRING    1000rpm
E1 SS
   4.0mA    10.0° Btdc

     P2A360.FS1   #001
```
4.5 The **STALLED** message is displayed when a loss of rotation is detected after the ignition is firing and neither a **SHUTDOWN** or **FAULT** has occurred. This signifies that the engine has stopped without any detected cause from the ignition system.

```
  CPU-95 IGNITION
STALLED      0rpm
E1 SS
  4.0mA   10.0° Btdc

   P2A360.FS1  #001
```
4.6 The **WARNING** message will supersede all of the above home screens if a diagnostic warning condition is present. When a diagnostic warning exists, a ** **Press DIAG** ** message will appear on the display. The Ignition Module will continue to operate under a warning condition while alerting the operator of a potential problem in several ways: by turning on the Alarm LED in the Ignition Module and by changing the state of the Alarm Out switch (switch opens). The Display Module will display the Warning message. The various types of diagnostic warnings are described in **SECTION 10.0**.

```
  CPU-95 IGNITION
WARNING  1000rpm
E1 SS
  4.0mA   10.0° Btdc

   ** Press DIAG **
```

4.7 The **FAULT** message will supersede all of the above home screens if a diagnostic fault condition is present. When a diagnostic fault exists, a ** **Press DIAG** ** message will appear on the display. The ignition system will stop operating under a fault condition and will alert the operator to the problem in several ways: by changing the state of the Fire Confirm Out switch (switch opens), by turning on the alarm LED inside the Ignition Module, by changing the state of the Alarm Out switch (switch opens), by changing the state of the Fault Out switch (switch opens), and by displaying the Fault message. The various types of diagnostic faults are described in **SECTION 10.0**.

```
  CPU-95 IGNITION
FAULT        0rpm
E1 SS
  4.0mA   10.0° Btdc

   ** Press DIAG **
```
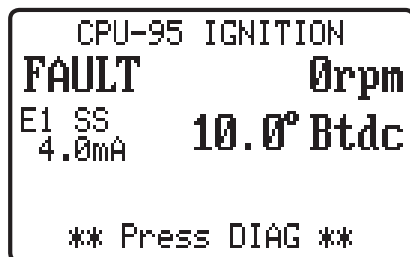

4.8 The **SHUTDOWN** screen will supersede all other home displays if the logic level shutdown input of the Ignition Module or the G-Lead of the output primary connector is grounded or was previously grounded and the engine has not stopped rotating. This screen indicates that the ignition is not firing because a shutdown input was triggered to shutdown the engine. If a diagnostic fault or warning exists while the ignition is in shutdown, a **PRESS DIAG** message will appear on the display. The Fire Confirm Out switch will change state (switch opens) and the other outputs will function as described above based on the existence of faults or warnings.
```
    CPU-95 IGNITION
 SHUTDOWN      0rpm
 E1 SS
   4.0mA    10.0° Btdc

     P2A360.FS1   #001
```

4.9 From the **HOME SCREEN**, pressing the NEXT key allows you to cycle through the configuration comments which describe the configuration of the ignition system.

AT

```

　　　　　064 = FORCE MULTI-STRIKE WHEN RPM IS LESS THAN 250
　　　　　032 = FORCE MAX ENERGY WHEN RPM IS LESS THAN 250
　　　　　016 = USE 1 STEP RETARD WHEN RPM IS LESS THAN 250
　　　　　004 = FORCE MULTI-STRIKE WHEN MISC INPUT IS GROUNDED
　　　　　002 = FORCE MAX ENERGY WHEN MISC INPUT IS GROUNDED
　　　　　001 = USE 1 STEP RETARD WHEN MISC INPUT IS GROUNDED

5.O ADJUSTING GLOBAL RETARD

5.1 Global retard is an adjustment affecting the timing of all cylinders equally. This adjustment can be equated to the manual timing switch of the Altronic CPU-90 system. Adjustments made as described below will be in effect until another adjustment is made.

5.2 To adjust global retard:

FROM

```
   CPU-95 IGNITION
FIRING    1000rpm
E1 SS
  4.0mA    10.0° Btdc

   P2A360.FS1  #001
```

PRESS [TIMING]

THEN AT

```
   CPU-95 IGNITION
READY        0rpm
E1 SS
  4.0mA    10.0° Btdc
        timing
  ↑ = GLOBAL (ENGINE)
  ↓ = CYLINDER (INDV)
```

PRESS [↑]

THEN AT

```
   CPU-95 IGNITION
READY        0rpm
E1 SS
  4.0mA    10.0° Btdc
        global
  ↑ = ADJUST RETARD
  ↓ = SELECT MODE
```

PRESS [↑]

THEN AT

```
   CPU-95 IGNITION
READY        0rpm
E1 SS
  4.0mA    10.0° Btdc
        global
     MANUAL RETARD
     Esc ↓↑  5.8°
```

NOTE: RESULTANT TIMING SHOWN ON BOTTOM LINE.

PRESS TO INCREASE RETARD [↑] **PRESS TO DECREASE RETARD** [↓] **PRESS TO EXIT** [ESC]

5.3 The increment of timing change is dependent on the number of holes or teeth being sensed. The minimum timing change is defined as follows.

If N < 270, then Increment = "45/N" degrees

If N ≥ 270, then timing increment is "90/N" degrees, where N = no. of holes or teeth.

5.4 Global spark timing is determined based on the sum of several spark retard components which include manual retard, current loop retard, rpm retard, and one step retard. The range of total retard is limited to 255 X timing increment. When the sum of all retard components reaches 255 X timing increment, the actual timing will be at the retard limit.

6.0 SELECTION OF GLOBAL TIMING MODES

6.1 Several options exist with regard to global timing modes. Once the global timing mode menu is entered, as described below, the status of each option can be viewed and changed.

FROM

```
   CPU-95 IGNITION
FIRING     1000rpm
E1 SS
  4.0mA    10.0° Btdc

   P2A360.FS1   #001
```

PRESS [TIMING]

THEN AT

```
   CPU-95 IGNITION
READY        0rpm
E1 SS
  4.0mA    10.0° Btdc
        ──timing──
  ↑ = GLOBAL (ENGINE)
  ↓ = CYLINDER (INDV)
```

PRESS [↑]

THEN AT

```
   CPU-95 IGNITION
READY        0rpm
E1 SS
  4.0mA    10.0° Btdc
        ──global──
  ↑ = ADJUST RETARD
  ↓ = SELECT MODE
```

PRESS [↓]

6.2 The first mode selection can enable or disable the pre-configured retard curve controlled by the 4-20 mA current loop input. The choices are ON or OFF, with the active selection displayed in capital letters. A PC is required to configure the 4-20 mA curve; reference the programming instructions, form CPU-95EVS PI. When the current loop is on, the current loop value is displayed (xx.x mA) with the "A" capitalized. When the current loop is off, the value is displayed (xx.x ma) with the lower case "a".

AT

```
    CPU-95 IGNITION
READY           0rpm
E1 SS
  4.0mA   10.0° Btdc
       -global-
  CURRENT LOOP RETARD
   ↓off/ON↑ Next Esc
```
NOTE: DISPLAY SHOWS CURRENT LOOP ON.

TO TURN ON	TO TURN OFF	FOR NEXT OPTION	TO EXIT
↑	↓	NEXT	ESC

6.3 The next mode selection can enable or disable the pre-configured retard curve controlled internally by engine RPM. To configure the RPM retard curve, reference form CPU-95EVS PI.

AT THE NEXT OPTION SCREEN

```
    CPU-95 IGNITION
READY           0rpm
E1 SS
  4.0mA   10.0° Btdc
       -global-
    RPM RETARD MAP
   ↓OFF/on↑ Next Esc
```
NOTE: DISPLAY SHOWS RPM MAP OFF.

TO TURN ON	TO TURN OFF	FOR NEXT OPTION	TO EXIT
↑	↓	NEXT	ESC

6.4 The next mode selection can increase or decrease the one-step retard value. The first screen below is displayed when one-step retard is both configured and is active. The second screen below is displayed when the one-step retard is configured but not active. The default configuration selects one-step retard to be controlled by the Misc. Input terminal. The additional retard would be implemented when the input is grounded. The third screen below is displayed when the one-step retard feature is not configured. The actual engine timing is displayed on this screen so the effect of 1 step retard can be seen during adjustments (if the Misc Input terminal is grounded).

AT THE NEXT OPTION SCREEN

```
     CPU-95 IGNITION
READY          0rpm
E1 SS
  4.0mA    10.0° Btdc
        global

```

TO TURN ON MULTI [↑]   TO TURN off MULTI [↓]   FOR NEXT option [NEXT]   TO EXIT [ESC]
9.3 The next setup screen permits the operator to select one of three ignition spark profile levels (E1,E2,E3) for the previously selected Single Strike or Multi Strike mode.

Note 1: A special feature can be selected during configuration to use the maximum energy level below 250 rpm, or when the Misc Input is grounded. This feature is not active in a standard configuration.

Note 2: The use of higher spark energy may tend to accelerate spark plug electrode erosion.

Note 3: The energy levels are used to select preprogrammed spark profiles. Six total, E1,E2,E3SS and E1,E2,E3MS. See Fig. 2 for spark profile details.

AT

```

```
NOTE: Spark Profile E1 is displayed.

| TO INCREASE ↑ | TO DECREASE ↓ | FOR NEXT OPTION NEXT | TO EXIT ESC |

9.4 The next setup screen is used to adjust the engine overspeed setpoint. The setpoint can be adjusted in increments of 10 rpm to a maximum of 2550 rpm.

AT

```
    CPU-95 IGNITION
 READY           0rpm
 E1 SS
   4.0mA    10.0° Btdc
       ─setup─
   ADJUST OVERSPEED
   Next Esc ↓↑ 900rpm
```
| TO INCREASE ↑ | TO DECREASE ↓ | FOR NEXT OPTION NEXT | TO EXIT ESC |

9.5 The next setup screen is used to specify the exact position of the reset pin. Both the reset position and the engine timing are displayed. Adjustments are made here to make the displayed timing match the actual spark timing as verified with a timing light. This adjustment effects the displayed timing but does NOT change the actual timing of the firings.

NOTE: Adjustment of this parameter should be done while individual cylinder offsets are all at zero.
NOTE: To set up, or adjust the actual reset position, and engine timing, see form CPU-95EVS II, section 8.0.

AT

```
      CPU-95 IGNITION

9.6 The next setup screen is used to enable or disable **VALUE PROTECTION** of all user values in the EEPROM memory. When protection is on, none of the EEPROM settings under the Setup or Timing menus can be changed. This feature can be used to provide limited protection from random changes by inexperienced operators.

AT

```
      CPU-95 IGNITION
READY            0rpm
E1 SS
  4.0mA     10.0° Btdc
        ‐setup‐
   VALUE PROTECTION
   ↓OFF/on↑ Next Esc
```

TO TURN ON PRO-TECTION ↑   TO TURN OFF PRO-TECTION ↓   FOR NEXT OPTION NEXT   TO EXIT ESC
The **VALUE PROTECTION** can be password protected. The password **PROTECTION LOCK** is enabled when programming options from the PC terminal program. See the Programming Instructions, form CPU-95EVS PI for details. When password protection is enabled the following menu appears instead of the **VALUE PROTECTION** menu.

```
 ┌─────────────────────────────┐
 │     CPU-95 IGNITION          │
 │  READY            0rpm       │
 │  E1 SS                       │
 │    4.0mA    10.0° Btdc       │
 │  ────────setup──────         │
 │    PROTECTION LOCK           │
 │    _____    Next Esc         │
 └─────────────────────────────┘
```

To enter the password press, use the function keys F1, F2, F3, F4 where F1=1, F2=2, F3=3, F4=4 where the number entered is equal to the user assigned five digit password. After the last digit of the proper password is entered, the **VALUE PROTECTION** menu shown above will appear. If the password is not known, press the ESC key to exit or the NEXT key to go on to the next setup menu.

9.7 The last setup screen permits the operator to enter an ignition test mode. This test mode can fire all outputs cyclically, or individual outputs at a slow rate. This feature can be used to troubleshoot primary wiring and Output Module operation. Test mode will terminate if rotation of the engine is sensed. Diagnostic features do not function while in test mode.

```

PRESS TO MODIFY THE VALUE [↑] [↓]

PRESS TO ADVANCE TO THE NEXT SELECTION [ENTER]   PRESS TO GO TO THE NEXT MENU [NEXT]   PRESS TO EXIT [ESC]

Node ID can be set anywhere from 1 to 254. The auxiliary RS-485 (Modbus RTU) port can have the following baud rates 9600, 19200, 38400, 57600, 115200. Always no parity, 8 data bits, and 1 stop bit (N81). The USB port has the following modes: **TERMINAL**, **MODBUS RTU**, and **DEBUG**. The **TERMINAL** mode allows the display to act as a go between for programming the CPU-95EVS ignition directly. This will work for CPU-95EVS Terminal Program version 1.0 and above. Baud rate selection in the **TERMINAL** mode is unnecessary as the terminal program accesses the USB port natively. The **MODBUS RTU** mode follows the node ID, and the USB baud rate. This mode uses the virtual com port driver that is a part of the USB driver on the CDROM. The USB port virtual com port baud rate can be set to the following: 9600, 19200, 38400, 57600, 115200. The **DEBUG** mode is used by the factory for testing purposes.

9.9 The **CLOCK SETUP** menu is used to set the desired calendar date and time used by the datalog feature of the display module.

9.10 The Display Module supports data logging of the information that it normally has available for viewing. The unit retains 255 datalogs which are stored in a FIFO (first in, first out) manner. When 255 logs are stored, the oldest log is purged and the newest added. The oldest data is stored as log no. 255 and the newest as no. 1; there is also a copy of the current values available as datalog 0. The datalogs can be accessed by the special PC terminal program supplied with the unit or by a special Modbus command sent by the user-supplied PLC or computer system. More detailed information is provided on the terminal CD.

The **DATALOG SETUP** menu appears after the **COMMUNICATION SETUP** menu. If datalogs are not being used, press the NEXT key to proceed to the **CYLINDER LABELS** menu.

AT

```
     CPU-95 IGNITION

10.0 CPU-95EVS DIAGNOSTICS

10.1   A diagnostic fault represents the most severe classification of problems. The presence of a diagnostic fault will inhibit the ignition from firing. When a fault is detected several things will occur:

Ignition will stop firing.

Fire Confirm Out switch will open.

Fault Out switch will open.

Alarm Out switch will open.

Alarm LED in the ignition unit will turn on.

Home status will read FAULT, and the bottom line will read PRESS DIAG.

```
 ┌─────────────────────────┐
 │     CPU-95 IGNITION      │
 │  FAULT          0rpm     │
 │  E1 SS                   │
 │    4.0mA     10.0° Btdc  │
 │                          │
 │     ** Press DIAG **     │
 └─────────────────────────┘
```
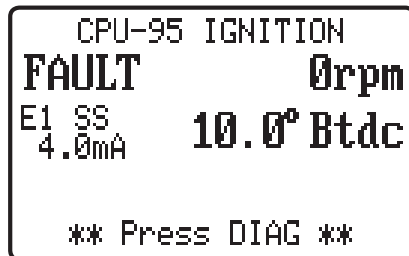

10.2   A diagnostic warning represents the least severe classification of problems. The ignition will continue to fire in the presence of a diagnostic warning. When a warning is detected, several things will occur:

Alarm Out switch will open.

Alarm LED in the ignition unit will turn on.

Home status will read WARNING, and the bottom line will read PRESS DIAG.

```
 ┌─────────────────────────┐
 │     CPU-95 IGNITION      │
 │  WARNING     1000rpm     │

```
10.7   After all of the diagnostics have been read, the user can reset the warnings and faults by pressing the reset key as pictured below.

```
 CPU-95 IGNITION

   PERFORMING
     RESET
```

PRESS TO EXIT [ESC]   PRESS [RESET]
Pressing the reset key performs all of the following actions:

- **Clears all diagnostic warnings from memory.**
- **Clears all diagnostic faults from memory.**
- **Clears a latched shutdown condition when the input is no longer grounded.**
- **Causes temporary cylinder timing offsets to be overwritten from EEPROM memory.**

11.O UNDERSTANDING AND USING THE SECONDARY SPARK DIAGNOSTICS

11.1. The spark reference number is a unitless number which correlates with voltage demand at the spark plug and is calculated for every firing of each cylinder. As the voltage increases, the reference number also increases. The number is non-linear and will increase faster at higher voltages (above 20kV). The usefulness of the number lies not in its absolute value, but rather in how the number changes over time as the spark plugs erode. With a little experience, the engine operator will be able to tell when spark plugs require changing. Abnormal conditions in the ignition system, such as open or short circuits in the primary and secondary wiring, can also be detected.

11.2 The reference "cylinder spark data" number can be viewed separately for each ignition output (cylinder) in two ways, and compared to the average of the entire engine:

Instantaneous value: shown in ( )

Cylinder average value: cavg

FROM THE HOME SCREEN

PRESS TO VIEW BASE DISPLAY F1

11.4 The spark reference number is used in conjunction with comparative thresholds to set diagnostic codes for several different ignition system and spark plug conditions. When a threshold is violated twice in a row, the corresponding diagnostic flag is set for the appropriate cylinder. The diagnostic flags are latching and will exist until the unit is restarted or until a reset or power-down occurs.

Open Primary	CAVG < 1
Shorted Primary	CAVG < 50
Low Spark Voltage	CAVG < user programmable threshold (typ. 100)
High Spark Voltage	CAVG > user programmable threshold (typ. 180)
No Secondary Spark	CAVG > user programmable threshold (typ. 250)
Low From Engine	(EAVG - CAVG) > user programmable threshold (typ. 20)
High From Engine	(CAVG - EAVG) > user programmable threshold (typ. 20)

11.5 The above user programmable thresholds need to be adjusted based on the type of coil being used and on the operating characteristics (specifically, voltage demand) of the engine. There are known differences between various types of Altronic coils, and slight variations are normal between coils of the same type. In order to maximize the usefulness of the cylinder spark reference number, it is recommended that all coils be of the same type and vintage (production date). This will aid greatly in detecting variations in one cylinder vs. the general trend in the engine. The typical ranges to be expected in normal operation with new spark plugs are:

Older 501061 (blue) coils:	**105-130**
Current 501061 (blue) coils:	**120-150**

11.6 The indicated thresholds were designed to be adjustable so that the user can customize these diagnostics to fit the specific needs of each engine. It will take some testing and adjustment to obtain thresholds that optimize the use of these features. For maximum benefit, the spark reference number for each cylinder should be recorded at normal operating load with new spark plugs installed and then monitored over a period of time for changes. The **HI SPARK VOLTAGE** alarm level should be set (typically) at 180 initially and can be adjusted as experience dictates. A gradual increase in the spark reference number is expected over time as the spark plug electrodes erode.

11.7 In addition to the diagnostic flags, the reference numbers can also be used for predictive purposes:

A. As the numbers increase toward the preset **HI SPARK VOLTAGE** threshold **(SEE SECTION 12.3)**, the operator knows that a change of spark plugs should be scheduled. With this information, this function can be determined on an actual need basis rather than a predetermined schedule. Also, unexpected engine misfiring or shutdowns can be avoided by tracking the reference numbers on a routine basis.

B. The reference numbers can provide an early warning of a difference in operation in a given cylinder(s). A reading higher (or lower) than the other cylinders, when such a difference is not normally present, tells the operator of a potential problem; this allows further troubleshooting and evaluation to take place before an unexpected operational problem develops. **(SEE SECTION 12.5, 12.6.)**

11.8 Other Information regarding the spark reference number:

A. The spark energy setting has only a small effect on the reference number if the spark plug fires correctly. Therefore, the high and low voltage thresholds should hold across the spark profile settings if the spark plugs continue to fire correctly. On the other hand, a worn plug may not fire consistently on spark profile setting E1 but will on spark profile setting E2.

B. The spark reference number is designed to work with one coil per output. Where two coils are connected to the same primary lead, the number will tend to be an average of the conditions at the two spark plugs. While some of the benefits of the spark reference number can still be realized, the usefulness of the number in detecting deviations between cylinders (alarm levels) will be reduced.

12.0 THRESHOLD ADJUSTMENT SCREENS

12.1   Ten threshold adjustment screens enable the operator to calibrate thresholds used to diagnose potential ignition problems and control ignition energy based on the spark reference numbers. All of the threshold screens have the same button functions as described with the first threshold screen. All thresholds are accessed under the F2 key.

FROM

```
     CPU-95 IGNITION
  FIRING      1000rpm
 E1 SS
   4.0mA    10.0° Btdc

     P2A360.FS1   #001
```
PRESS TO VIEW FIRST THRESHOLD SCREEN   **F2**

Note: Coils of the same type that contain production dates of great variance could have spark reference numbers that do not display in the same range as each other.

12.2   If the CAVG reference number of a cylinder is below the **LO SPARK VOLTAGE** threshold, a diagnostic warning for that cylinder will occur. This test will identify a low voltage demand condition which may result from a shorted coil, secondary lead or spark plug. To disable diagnostic, set value to zero.

14.2 Programming the CPU-95EVS EEPROM

It is possible to program the CPU-95EVS system through the enhanced display, P/N 791909-1, via USB, from a computer without a RS485 card. Refer to programming instructions CPU-95EVS PI 4-08. The user must first confirm the program option.

```
CPU-95 IGNITION

┌─eeprom program─┐
│ PROGRAM STORED │

15.0 CPU-95EVS MODBUS REGISTER LIST

The CPU-95EVS is compliant with the Modicon Modbus RTU standard. The CPU-95EVS Terminal program CD contains a PC-based Modbus-compatible monitoring program. Maximum number of registers that can be read at one time is limited to 32. Maximum number of booleans that can be read at one time is limited to 256. The default configuration is 19200 baud, 8 Data bits, No Parity, 1 Stop bit (19200 8N1). The MODBUS address list is on the following pages.

The 10xxx registers are read-only binary and support Modbus standard function 1. These registers are read in multiples of 8 (1 byte) addressed at each 8 bit boundary (10001-10008, etc.). A single Boolean read from registers 10001 to 10064 can be made which will return all 64 values as a group of 8 bytes. These registers also support an Altronic custom function 101 which will return a descriptive label for each specific register. The custom label function can be used to reduce the need for the Modbus master to maintain a current listing of all of the register labels for each unit.

FIGURE 1: MOUNTING SPECIFICATIONS

POWER: 24VDC @ 150mA NOMINAL, 32VDC @ 250mA MAX.
ENCLOSURE: WEATHERPROOF, POWDER COATED ALUMINUM
FIELD CONNECTIONS: PLUG-IN TERMINAL STRIPS ON BACK
CONTROL INPUTS:
1. RS-485 SERIAL COMMUNICATIONS PORT
2. MISCELLANEOUS INPUT – ONE STEP RETARD (DEFAULT), ALSO MULTI-STRIKE, MAX. ENERGY LEVEL (CONFIGURED THROUGH P.C.)
3. 4–20mA CURRENT LOOP INPUT
4. AUXILIARY RS-485 MODBUS RTU PORT
5. USB

NOTE: To meet ingress protection ratings the display should be mounted inside of an enclosure that meets the desired ip rating.
FIGURE 2: CPU-95EVS DIRECTED ENERGY SPARK PROFILES

**E1 SS:** Emulates SS mode of standard CPU-95.

**E1 MS:** Emulates MS mode of standard CPU-95.
E2 SS: A medium current single spark event.

E2 MS: Tri-spark event with one high current and two medium current sparks.

E3 SS: A high current single spark event.

E3 MS: Quad spark event with two high current and two medium current sparks.
