TENSIONING V-BELTS & MULTI RIBBED BELTS

Correct tensioning is critical for optimum belt life and performance especially so with the higher tension ranges required to satisfy the tough demands on belts for today's vehicles.

For proper tensioning follow the procedure below.

1. When a new belt is installed apply a force of 10 kg at the centre of the span and secure the tension bracket when the belt is deflected the amount indicated in the chart below under new belt.
2. After running the engine for 5 to 10 minutes, re-tension the belt following the procedures in point 1 but use the Re-tensioning column in the chart below for correct amount of deflection.
3. Check the tension periodically and re-tension whenever the deflection is greater than the re-tensioning column with 10 kg of force.

Belt Type	Deflection [amount per 200 mm Span Length	
	New Belt	Re-Tensioning
11A, 13A	6 - 8	8 - 10
15A, 17A	5 - 7	7 - 9
20A	4 - 6	6 - 8
Multi Ribbed		
3 Ribs	6 - 8	8 - 10
4 Ribs	5 - 7	6 - 8
5 Ribs	5 - 6	6 - 7
6 Ribs	4 - 5	5 - 6
7 Ribs	3 - 4	4 - 5

Storage of Automotive Belts

To prevent deterioration, the following should be observed when storing automotive belts:

1. Do not expose belts to direct sunlight during storage. Keep belts at room temperature.
2. Keep belts away from oil, grease and steam.
3. Store belts on shelves or hang them from racks. Avoid placing belts on the floor or ground.
4. Avoid storing belts when sharply bent or piled high on one another.
5. Special care should be taken when storing timing belts so there is no sharp bending or creasing.

Bosch Engine Timing Belt

- Made to Original Equipment Specifications
- High tensile strength, extra heat resistant
- Wear resistant tooth fabric

- Non slip positive drive
- 40,000 km / 24 Months Warranty

Bosch Timing Belts are built to meet the toughest and most exacting Original Equipment requirement of all major engines produced

They are engineered to last longer and are characterised by their positive drive and vibration-free performance

1 Tensile cords

This is the load-carrying part, also the very heart of the belt which provides high tensile strength and extremely high resistance to elongation

2. Teeth.

The teeth are made of shear resistant, moderately hard chloroprene, rubber compound which are integrally moulded to the backing, assuring positive engagement with the mating grooves of the pulley.

3. Nylon Facing.

Tough, wear resistant fabric covers the belt's wearing surface, protecting the tooth surface and keeping frictional losses to a minimum

Installing a new Timing Belt

1 Correct belt tension

Too much belt tension creates belt wear and noise.. Low tension causes belt whip and vibration.

2. Keep pulley misalignment below 1/3°

Excessive misalignment results in unequal tension and extreme edge wear.

3. Do not pry belt over pulley

Tensile cords in belt can be damaged and the pulley could be nicked.

4. Never twist or crimp belt.

Tensile cords could be damaged or weakened

5. Do not expose belt to water or oil

Belt life will be shortened

Note: Consult the manufacturer's manual for the specific and detailed instruction on installation procedures.

Modern drive belts are wear resistant and have a long service life. For this reason, most damage occurs as a consequence of incorrect fitting, poor maintenance or bad driving.

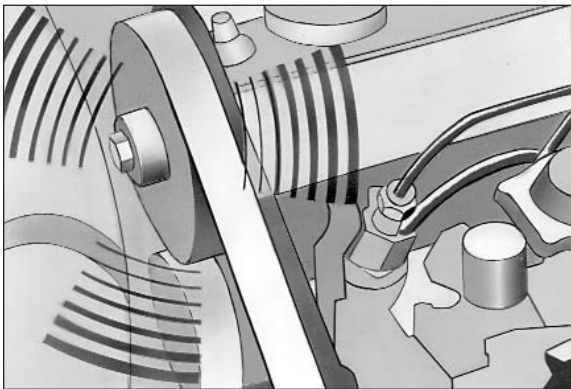

If one heeds the manufacturer's specifications and performs installation and servicing correctly, then damage to the drive belt will be avoided.

Damaged belts are to be replaced immediately by new ones. The costs for rectifying consequential damage

caused by faulty drive belts are far greater than the costs of a new belt.

If a drive belt tears at high speed then from that point in time, the vehicle will be out of control.

For this reason, we have listed the most important kinds of damage below: this makes it easier to detect damage and to rectify the cause.

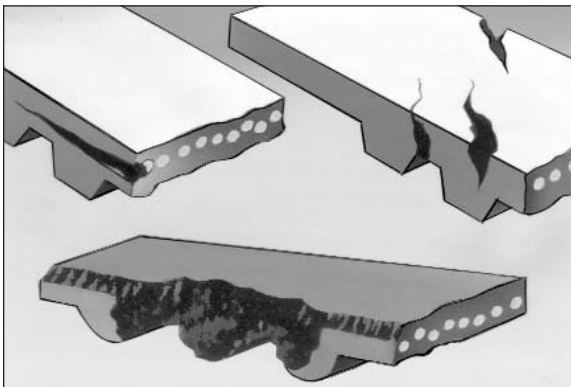

Noise.

On V-belts and ribbed V-belts:

- Insufficient tension, belt slips.

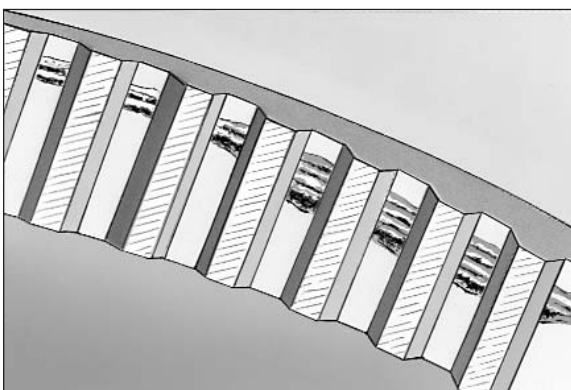

On toothed belts:

- Insufficient tension, timing belt impacts with covering.
- Tension too great, timing belt whines

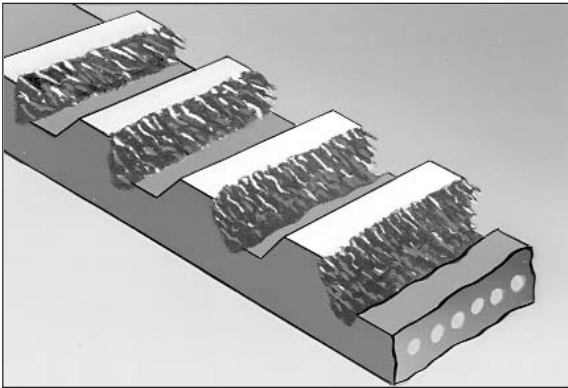

Edge wear.

- Axles not parallel; timing belt runs up against the flange wheel
- Flange wheel has blemishes
- Wheel offset, therefore belt cannot run in true alignment

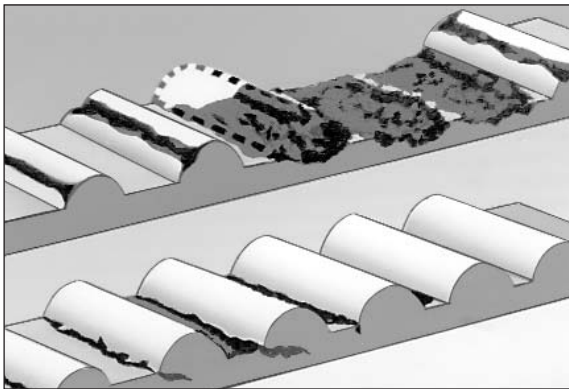

Wear in rib fabric.

- Tension setting too high
- Worn timing belt pulley

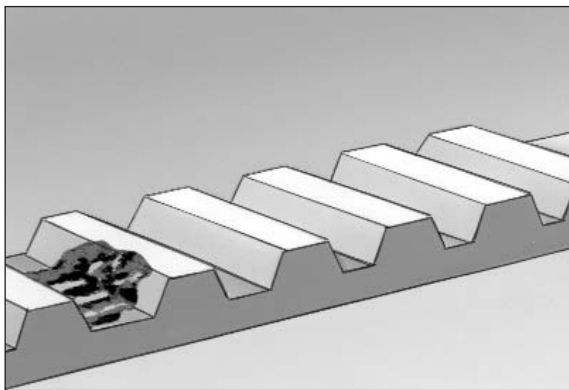

Teeth flank wear

- Tension too great or too small
- Timing belt outside permissible length tolerance
- Influence of foreign media, eg. oil, water
- Sluggish timing belt pulley

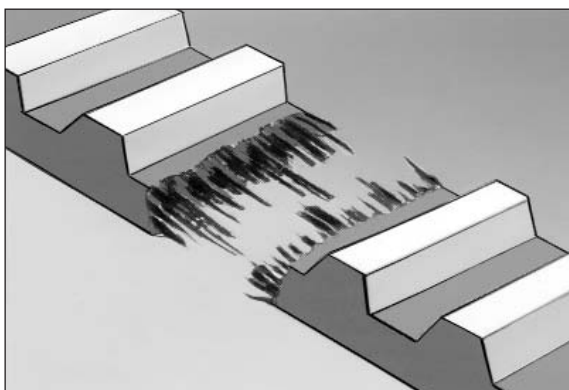

Loose teeth and fabric.

- Pre tension too small or too great

Running marks on tooth side.

- Foreign bodies on timing belt drive
- Faults on toothing of toothed disc through foreign bodies or tools during assembly.

Timing belt tears.

- Foreign bodies in drive timing belt drive
- Influence of oil, grease, water.
- pre-tension too great
- timing belt kinked before or during installation
