

ERRATA

The following corrections should be made to NASA CR-61260, "An Empirical Analysis of the 10-15 km Maximum Winds to Determine Apollo and AAP Launch Opportunities, Cape Kennedy, Florida," by Harold L. Crutcher and Nathaniel B. Guttman:

- (1) On the cover sheet and the title page the authors should be Harold L. Crutcher and Jimmy A. Almazan.
- (2) On the title page the Government Order should be H-76789.
- (3) Tables 2.9.a and 2.10.a are reversed.
- (4) On page 21 the page numbers for Tables 12.12.a, 12.12.b, 12.13.a, and 12.13.b should be 278, 279, 280, and 281, respectively.
- (5) On pages 283-293, the page numbers for the tables should be numbered consecutively from 295-554.
- (6) The section on "Statistics" was omitted and should be added on page 3 as Section B of "II: Analysis of Data." It should read as follows:

B. Statistics

Maximum wind speeds observed in the 10-15 km layer are observed quantities of a random or stochastic variable. The following discussion in this paragraph is based on Hald [2]. It is convenient here to interpret a set of observations of the maximum wind speeds in the 10-15 km layer as a random sample drawn from a population of all conceivable observations that may have been made under the same conditions. The probability of an event then may be spoken of as the frequency of the event in the population. When the theory of probability is applied here, it is assumed that eventually an event will occur with a relative frequency which is practically equal to its probability. To the extent then that the data sample of eight years of serially complete record of the maximum wind speeds of the 10-15 km layer over Cape Kennedy Florida, is representative of the population, relative frequencies are computed and used as probabilities.

Correction (6) continued:

Previous work (Crutcher and Quinlan [2]) with the maximum wind in the 10-15 km layer at Cape Kennedy, Florida indicates that a normal distribution may be used to approximate the upper wind maxima distribution. However, there does exist some correlation in time so the serial data are not completely independent. Work with the statistical parameters is reserved for the future. This study presents only the empirical probabilities in terms of the wind speeds less than and equal to, or greater than specified speeds occurring in specified time intervals. The correlation or dependence of data, though of interest, is a part of the ensemble and need not be extracted. The data are treated then in the fashion described below.

- (7) Sections B and C of "II: Analysis of Data" should now be numbered Sections C and D, respectively.

## SUMMARY

The first of this two-part study gives the launch opportunity empirical probabilities at Cape Kennedy, Florida. A launch opportunity is defined as an opportunity to launch a vehicle through the wind field of the 10-15 km region when certain specified prior conditions have been given for launching. Wind observations are available at 12-hour intervals. There may be one launch opportunity in each 12-hour period. The probabilities are presented for the number of opportunities for monthly reference periods. The periods range from one 12-hour interval to forty 12-hour intervals or twenty days. The probabilities are presented for both consecutive and non-consecutive opportunities. The second part of this study presents the empirical probabilities for no opportunity to launch a vehicle. Again, the consecutive and non-consecutive features are given for each month. The empirical probabilities are based on records available for the overall period from January 1956 through December 1963 for the Cape Kennedy area.

This study represents one of the few analyses of twice daily maximum 10-15 km layer winds in the Cape Kennedy area. The eight-year serially complete data sample used in the analysis is unique. It has been obtained through a thorough examination of all official upper air records in the Cape Kennedy area.

## I. INTRODUCTION

### A. Statement of Problem

Winds aloft play an important role in several aspects of the aerospace mission - first, in design studies; next, in mission planning; and finally, in launch operations. Because the maximum wind speed and the maximum vehicle dynamic pressure both usually occur in the altitudes between 10 and 15 km, that layer is usually of particular concern. This study, directed primarily to the mission planning problems, investigates the empirical probabilities of critical and non-critical wind speeds occurring in the maximum (10-15 km altitude) wind layer. A previous study by Lifsey [3] treats the problem of exposure of vehicles to surface winds for varying periods of time. Although the problem considered here is somewhat different, since the vehicle is exposed to winds aloft for very short time periods, the counting technique is similar. Because of the extremely short exposure time, the concept of "launch opportunity" was introduced. A launch opportunity is defined simply as an opportunity to launch a vehicle through the maximum wind (10-15 km) layer under specified prior wind speed constraints.

Since winds-aloft observations are made at 12-hour intervals, the terms of reference in this study are based on 12-hour periods; i.e., a launch opportunity covers 12 hours. For specified winds-aloft constraints, probability statements were developed for  $i$  consecutive opportunities and for  $i$  opportunities in  $j$  periods, where  $i$  ranges from 1 to 20 and  $j$  from 1 to 40. This was accomplished for two cases: first, for wind speeds equal to or greater than the specified wind speed; second, for wind speeds less than the specified wind speed. Some of the questions answered are as follows: (1) What is the probability of one launch opportunity in one 12-hour period, in two 12-hour periods, etc., to forty 12-hour periods? (2) What is the probability of two consecutive launch opportunities in two 12-hour periods, in three 12-hour periods, ..., in forty 12-hour periods? (3) What is the probability of two, three, four, ..., twenty launch opportunities in 2, 3, 4, ..., forty 12-hour periods where the opportunities need not be consecutive? (4) What is the probability that a launch opportunity will not exist for the same time periods described above? This important event, although not exactly a launch opportunity, is included under that title and identified in the tables as  $W \cong W^*$ .

## B. Data Sample

Weather observing stations make routine periodic observations of existing surface and upper air weather. The upper air observations are summarized and recorded on standard forms [5]. Data are processed either manually or by means of a standard electronic data computer, and the records are sent by each station to the National Weather Records Center (NWRC) at Asheville, North Carolina, for final deposition and storage.

The National Aeronautics and Space Administration, George C. Marshall Space Flight Center, Huntsville, Alabama, maintains a continuing program for such information at the Environmental Science Services Administration, Environmental Data Service National Weather Records Center, Asheville, N. C., funded under Government Orders H-41949, H-66040, and H-76789 dated October 9, 1962, November 19, 1963, and December 4, 1964, respectively.

One task of the program is the serial completion of upper air winds for Cape Kennedy, Florida, at one-kilometer intervals from the surface to twenty-seven kilometers.<sup>1</sup> Serially complete records are available now for the period of January 1956 through December 1963. The techniques used to complete the records serially are given by Canfield et al. [1]. In brief, the available observed and recorded data are plotted on time cross sections. Where only one or two data points are missing, experienced meteorologists determine the most likely data for completing the record. Where larger gaps occur in the records, the meteorologists insert, at the appropriate locations, data from prepared wind tabulations computed for constant pressures and constant altitudes. Visual scans and electronic data computer program scans then are used to detect wind values which may exhibit unlikely vertical shears and changes with respect to time. These are examined and changed, if necessary, by experienced meteorologists.

From each observation of 8 years (Jan. 1, 1956 - Dec. 31, 1963) of twice-daily serially complete, Cape Kennedy, Florida, upper air observations, the maximum wind speed in the 10-15 km layer was extracted. These wind speeds plus the first thirty-nine observations from January 1964 (to compute the last forty 12-hour lag) comprise the data sample for this study.

---

<sup>1</sup>This serial completion and certain computations have been made under Government Orders H-41949, H-66040, and H-76789 under supervision of the Terrestrial Environment Branch, Aerospace Environment Division, Aero-Astrodynamics Laboratory, NASA - George C. Marshall Space Flight Center, Huntsville, Alabama.

## II. ANALYSIS OF DATA

### A. Arrangement of Data

The data are separated into months for computation of the launch opportunities on a monthly basis. Speed groups (intervals) are selected as 5 meters per second (m/sec). However, the lower boundary for some months is different; i.e., the lowest wind speed for which values are computed for January is 25 m/sec while for May it is 10 m/sec. These wind speeds were selected by examining the extreme wind values for each reference period.

### B. Launch Opportunity Probability

The "launch opportunity" is computed from

$$P(A) = N_j(A)/N_j$$

where  $P(A)$  is the empirical probability of occurrence of an event A during a "launch" period of duration  $j$ , and  $N_j(A)$  is the number of launch opportunities of duration  $j$  in which event A has occurred. Therefore,

$$N_j = N - j + 1,$$

the total number of launch periods of duration  $j$  in a sequence of  $N$  consecutive values; i.e., the number of possible outcomes.

The relationships of  $N_j$  to  $N$  and  $j$  are as follows:

In period  $j$ , there is at least one possible outcome.

In period  $j + j$ , there are at least two possible outcomes.

In period  $j + 2j$ , there are at least three possible outcomes.

Therefore, in period  $j + kj$ , where  $k = 1, 2, 3, \dots$ , there are at least  $kj + 1$  possible outcomes.

### C. Procedure

For examples of the method used to compute the empirical probabilities, consider the hypothetical wind speed observations, Set A and Set B, of Table A. These are consecutive observations taken every 12 hours. Although these computations will apply to Set A, Set B will be used as required to complete any series begun in Set A.

TABLE A

Set A		Set B	
Observation No.	Wind Speed ( $W_s$ ) (m/sec)	Observation No.	Wind Speed ( $W_s$ ) (m/sec)
1	38	1	43
2	45	2	40
3	40	3	41
4	35	4	50
5	50	5	42

Assume  $W_s \geq 45$  m/sec to be a launch constraint. Those observations, or periods, showing  $W_s < 45$  m/sec, may then be designated as launch opportunities.

Now, we want the probability of 1, 2, 3, ..., i, consecutive launch opportunities ( $W_s < 45$ ) in 1, 2, 3, ..., j, consecutive periods. Table B shows the favorable occurrences for  $i = 1, 2, 3$ , and  $j = 1, 2, 3, 4, 5$ . For the case 1 opportunity in 1 period, it is only necessary to count the Set A wind speeds  $< 45$  m/sec. The three occurrences are entered under column 1, row 1, of Table B. Next, for example, count the occurrences of two consecutive launch opportunities in three periods. Consider the observations in series of 3 always starting in Set A; i.e.,

Set A 1, 2, 3;    Set A 2, 3, 4;    Set A 3, 4, 5;

Set A 4, 5, Set B 1;    Set A 5, Set B 1, 2.

TABLE B

j periods	i consecutive launch opportunities		
	1	2	3
1	3		
2	5	1	
3	5	3	
4	5	5	1
5	5	5	2

Of the five combinations of observations (periods), three contain two consecutive wind speeds less than 45 m/sec. Consequently, "3" is entered under column 2, row 3 of Table B.

Suppose now we want the probability of encountering 1, 2, 3, ..., i launch problems (wind speed  $\geq 45$  m/sec) in 1, 2, 3, ..., j periods, and that the launch problems need not be consecutive. Applying this statement to Set A as extended by Set B gives the results shown in Table C.

TABLE C

j periods	i launch problems		
	1	2	3
1	2		
2	4	0	
3	5	0	0
4	5	1	0
5	5	3	0

Again, a few examples may prove helpful. First, determine the number of times one launch problem in two periods occurs. Of the five combinations obtained by considering the observations two at a time -- Set A 1, 2; Set A 2, 3; Set A 3, 4; Set A 4, 5; Set A 5, Set B 1 -- four contain a launch problem ( $W_s \geq 45$  m/sec). Consequently, "4" is entered under column 1, row 2. Second, what is the probability of encountering two launch problems in four periods. Take the observations in series of four (Set A 1, 2, 3, 4; Set A 2, 3, 4, 5; Set A 3, 4, 5, Set B 1; Set A 4, 5, Set B 1, 2; Set A 5, Set B 1, 2, 3). Count those series that contain two wind speeds  $\geq 45$  m/sec. In this example, only one combination (Set A 2, 3, 4, 5) meets the requirement -- "1" then appears under column 2, row 4 of Table c.

The number of possible outcomes for  $j = 1$  is

$$N_k = N - j + 1 = 5;$$

for  $j = 2$ ,

$$N_k = 6 - 2 + 1 = 5,$$

and so on. The number of possible outcomes in all cases for Set A is 5. For any set of data, the number of possible outcomes is merely the number of elements in the set, provided the data are not truncated.

### III. RESULTS

The results of this study are presented in the Appendix, which is described and used as follows:

Tables 1.1.a through 12.13.b, Part I, show the empirical probabilities of wind speeds less than a specified speed group for (a)  $i$  consecutive launch opportunities in  $j$  periods where  $1 \leq i \leq 20$  and  $1 \leq j \leq 40$  12-hour periods, and (b)  $i$  launch opportunities in  $j$  periods. Part II lists the empirical probabilities of wind speeds equal to or greater than a specified speed group for the same (a) and (b) as in Part I.

Using Part I, Table 1.1.a as an example, the top row denotes  $i$ , the number of launch opportunities, and the first column denotes  $j$ , the number of 12-hour periods. Therefore, the probability of two consecutive launch opportunities in eight 12-hour periods (4 days) in January is equal to

0.054 for wind speeds less than 25 m/sec (48.6 knots). This low probability indicates that the maximum winds in the 10-15 km layer are stronger, in general, than 25 m/sec in January at Cape Kennedy, Florida. If the period is extended to 14 days, the probability is 0.167. Furthermore, if the events need not be consecutive, Table 1.1.b shows a probability of 0.214 for two launch opportunities in 14 days.

If a higher value for wind speed is chosen, say, 60 m/sec (116.5 knots), then Table 1.8.a shows an empirical probability of 0.891 that the winds will be less than 60 m/sec for two consecutive launch opportunities in a sequence of eight 12-hour periods (4 days). Furthermore, if the launch opportunities are not necessarily consecutive, then by Table 1.8.b, the empirical probability is 0.915 for two opportunities in four days and 1.00 for two opportunities in fourteen days.

The total number of observations in the sample is given in each table. For example, January has 496 observations for eight years of records with two observations per day.

Part II of the Appendix contains the empirical probabilities for wind speeds equal to or greater than a specified wind speed for the same groups as in Part I. The tables are read in the same manner as in Part I.

#### IV. CONCLUSION

Historical weather records provide information about twice daily maximum winds in the 10-15 km layer over Cape Kennedy, Florida. The information extracted is presented in percentage probabilities (relative frequencies). Empirical in nature (i.e., based solely on past observation), the results of this study indicate the pattern which these maximum winds of the troposphere over Cape Kennedy may be expected to follow in the future. For the design and operation of aerospace vehicles, this information can be applied to a variety of problems in which tropospheric maximum winds in the 10-15 km layer are a factor influencing the final decision.
