## 1.0 INTRODUCTION

This Program User's Guide was written to provide the user a set of instructions for the operation of the TRAP (Transient Analysis Program, HP014A). The guide fulfills a deliverable milestone for Task 705-1. With the exception of Section 2.2, this document is completely self contained.

## 2.0 PROGRAM DESCRIPTION

### 2.1 Program Definition

This program models the transient operation of auxiliary control propulsion systems (ACPS). All components that are normally associated with ACPS have been modeled and include fluid lines, valves, line junctions, regulators, orifices, combustors, manifolds, turbopumps, accumulators, pressure regulators, and tanks. These components can be connected together in an arbitrary manner to simulate a variety of ACPS configurations.

### 2.2 Method of Solution

The theory and mathematical derivation for this program is described in Reference 1.

### 3.0 USER'S INFORMATION

#### 3.1 Input Description

A schematic of an auxiliary propulsion system is shown in Figure 1. This particular system was simulated for the sample case presented in Sections 3.1.11 and 3.2.4.

The first step in preparing the input is to number each type of component from one to the number of the components of its type. The numbering of the components for the sample case is shown in Roman numerals. Each component described by a subroutine must be separated from another component by a fluid line; e.g., a pressure regulator cannot be connected directly to a valve. Generally, if the components are closely coupled in practice, they have been modeled together in one subroutine; for instance, the thrust chamber valve and combustor. A flow direction must be assumed in each line. If the assumption is wrong, the flowrates computed by the program will have a negative sign. Generally, it makes no difference which direction is assumed, except that combustors must always be treated as being at the downstream end of a line.

Data are input to the program on cards via the use of NAMELIST. There is no data tape input to this program. The description of the data used in operating this program is divided into sections to correspond to the different elements of the program. These sections are:

- 3.1.1 General Input and Line Input
- 3.1.2 Accumulator Input
- 3.1.3 Combustor and Turbopump Input
- 3.1.4 Flow Boundary Input
- 3.1.5 Line Junction Input
- 3.1.6 Pressure Boundary Input
- 3.1.7 Friction Pressure Boundary Input
- 3.1.8 Regulator Input
- 3.1.9 Lumped Resistance Input
- 3.1.10 TRWPLT Package

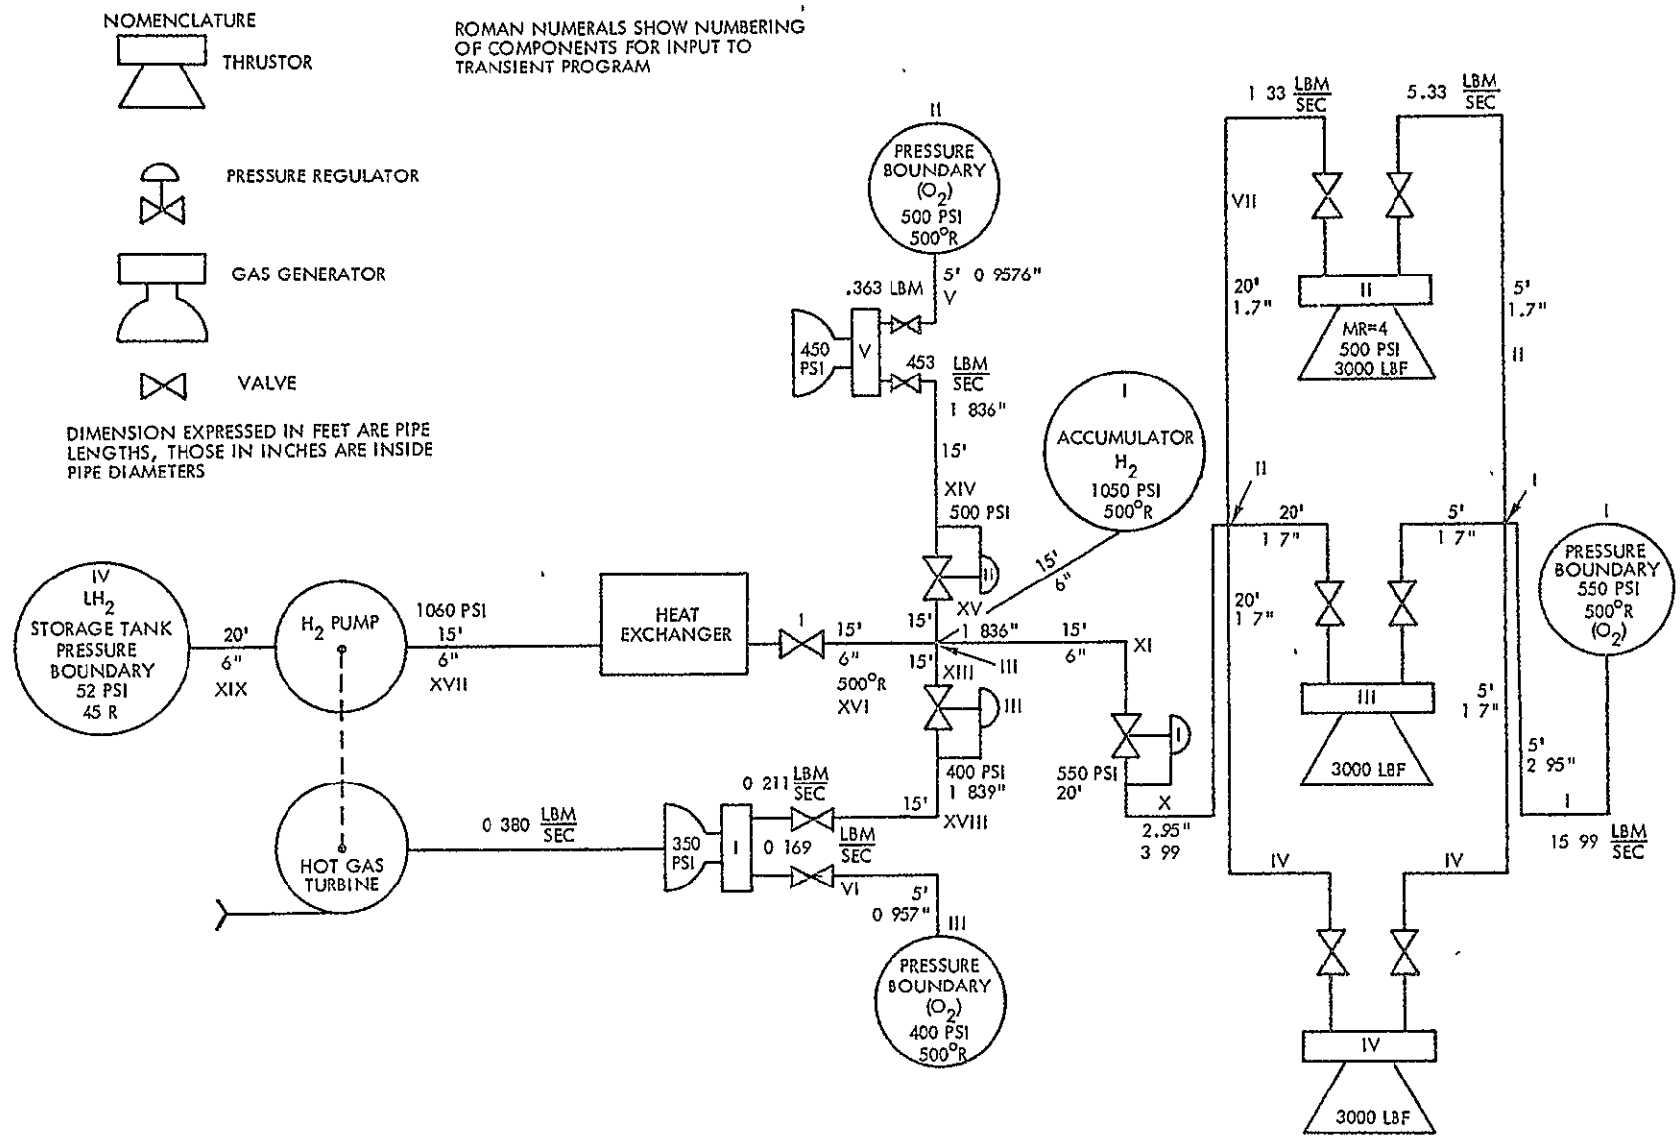

Figure 1. ACPS Transient Program Demonstration Schematic

### 3.1.1 General Input

This section provides a description of the general input used in the program including a description of NAMELIST and its rules.

The first card of the data deck is the NAMELIST name card which contains the characters \$INDATA punched in columns 2-8. Following this card are the NAMELIST data cards. Rules for their use are given below. After the last NAMELIST data card, the NAMELIST end card must appear. This card contains the characters \$END punched in columns 2-5. Following this card, a data deck end card must be present. It is a signal to TRAP to process the NAMELIST data. It contains the character DECKEND in columns 1-7. Certain data has been put into the program using the non-executable sub-program BLOCK DATA. For a list of these values and their applicability, see BLOCK DATA in the listing of the program given in Section 5.0. The values in BLOCK DATA can be overridden using NAMELIST.

#### 3.1.1.1 Rules for Namelist Usage

- 1) Card column 1 may not be used. All variable names may start in card columns 2-77.
- 2) A variable name and its value must be on the same card; no continuations are allowed. If an array cannot be completed on one card, the array and the next location of the array to be used must be specified in the next cards.
- 3) A delimiter (comma or decimal point) must directly follow the numerical value; a blank between the number and delimiter may cause an incorrect interpretation of the number.
- 4) As many variable names and associated values as possible may be put on a single card as long as Rule (2) is not violated.
- 5) A comma is required after every numerical value if more values or variables are to be put on the same card.

### 3.1.1.2 General Input and Line Input

A description of the general input to the program and the input required for operating the line model is included in this section. See Section 3.4.2 of Reference 1 for the assumptions and equations used in modeling the line.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
ALPHA(II)	20	deg.	Angle line II makes with horizontal.
BK(I)*	8	lbf/in <sup>2</sup>	Bulk modulus of elasticity of fluid (required only for liquid lines).
DELT	scalar	sec.	Program time increment.
DIAL(II)	20	in.	Diameter of IIth line.
EL(I)*	8	lbf/in <sup>2</sup>	Young's modulus for lines containing liquid.
FACTØR	scalar	--	1. + the maximum Mach number expected in the line.
FRL(II)	20	--	Friction factor for line II.
G	scalar	ft/sec <sup>2</sup>	Acceleration due to gravity.
KAY(I)	8	--	Ratio of specific heats of ith fluid (required only for gas lines)
LFLAG(I)	8	--	Type of fluid flag for speed of sound calculations. 0 = gas in line 1 = liquid in line
NPIPL	scalar	--	Number of lines in system. Presently limited to 20.
NPIPR(NN)	. 10	--	Integer indicating number of time-steps between printouts of Summary Output during interval NN. For example, if NPIPR(NN)22, the program will print out the summary output at every other time step starting at TIME=ØNIPR(NN) and ending at TIME=ØFFIPR(NN). See Section 3.2.3 for a list of the summary printout.
NPPLT(NN)	10	--	Same as NPIPR, but for plotted output.
NPLINE(II)	20	--	Phase flag for type of fluid in line II.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
ØFFIPR(NN)	10	--	Time to stop printing the summary printout for the NNth summary print interval.
ØNIPR(NN)	10	--	Time to start printing the summary output for the NNth summary print interval.
ØFFPLT(NN)	10	--	Same as ØFFIPR, but for plotted output.
ØNPLT(NN)	10	--	Same as ØNIPR, but for plotted output.
PZOO(II)	20	psi	Initial pressure at upstream point in line.
RHØL(I)	8	lb/ft <sup>3</sup>	Density of fluid.
RGAS(I)*	8	ft-lbf/lbm-°R	Gas constant (not required for liquid lines)
TGAS(I)*	8	°Rankine	Temperature of gas in line (not required for liquid lines).
TH(II)	20	in.	Thickness of IIth line (not required for gas lines)
TIMEND	scalar	sec	End time of program.
XLENGL(II)	20	ft.	Length of line II
ZO(II)	20	ft.	Elevation of upstream end of line II.

\*Up to eight different fluids can be handled by the program. Each line is assigned a fluid by the array NPLINE. If there is a large change in fluid properties across a device, such as across a regulator, then the lines on each side of the device should be treated as having different fluids.

### 3.1.2 Accumulator Input

The variables described in this section define the characteristics of the accumulators in the program. At present the program is limited to two accumulators. See Section 3.4.4.3 of Reference 1 for the assumptions and equations used in modeling the accumulator.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
IACC(I)	2	--	Index of line to which accumulator I is connected.
IACCPR	scalar	--	Debug printout will be generated IACCPRth time through the accumulator subroutine.
IENACC(I)	2	--	End of line IACC(I) to which accumulator is connected. 1 = upstream end 2 = downstream end
NACC	scalar	--	Number of accumulators in network.
NPIA(NN)	10	--	Same as NPIPR, described in Section 3.1.1.2, but for the accumulator printout. See Section 3.1.2 for a list of the accumulator printouts.
ØFFIA(NN)	10	--	Same as ØFFIPR, described in Section 3.1.1.2, but for the accumulator printout.
ØNIA(NN)	10	--	Same as ØNIPR, described in Section 3.1.1.2, but for the accumulator printout.
PACC(I)	2	ft/in <sup>2</sup>	Pressure in accumulator I
VØLACC(I)	2	ft <sup>3</sup>	Volume of accumulator I
XKACC(I)	2	ft <sup>2</sup>	Effective area of accumulator I port.

### 3.1.3 Combustor and Turbopump Input

The following inputs are used in the combustor and turbopump subroutine. See Section 3.4.12 of Reference 1 for the assumptions and equations used in modeling the combustor and Section 3.4.14 of Reference 1 for the turbopumps. The program is limited to a total of six combustors and two turbopumps. A superscript C means combustor input and superscript T means turbopump input. If both appear together, then the variable is used by both.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
AREA(I,J) <sup>CT</sup>	(8,2)	in <sup>2</sup>	Oxidizer and fuel thrust chamber valve effective area.
AREAC(I) <sup>CT</sup>	8	in <sup>2</sup>	Area of combustor throat.
ATDNØZ(K) <sup>T</sup>	2	in <sup>2</sup>	Effective cross-sectional area of turbine duct exit nozzle.
CEFT(K) <sup>T</sup>	2	--	Coefficient in turbine efficiency curve.
CEF2(K) <sup>T</sup>	2	--	Same as above. Note: ETAT(K) = CEF1(K)* U/CVEL + CEF2(K)*(U/CVEL)*
CMAN(I,J) <sup>CT</sup>	(8,2)	in <sup>2</sup>	Oxidizer and fuel injector effective area.

\*Note: In these definitions I is the subscript for combustors and turbopumps. J is the propellant subscript with 1 being oxidizer and 2 being fuel. Turbopumps are entered in the arrays first. If no turbopumps are present, then the combustors are loaded in the first of the array. K is the subscript for variables which are used only in the turbopump portion of the routine.

CP1 <sup>T</sup>	scalar		Specific heat of turbopump fuel.
CP2(L) <sup>T</sup>	6	--	Coefficients of polynomial giving specific heat for turbopump as a function of mixture ratio. Note: CP(I) = CP2(1) + CP2(2) * MR(I) + CP2(3) * MR(I) ** 2 + ...
CS1 <sup>TC</sup>	scalar	ft/sec	Characteristic velocity of pure fue

CS2(L) <sup>TC</sup>	6	--		Coefficients of polynomial giving characteristic velocity of chamber gases as a function of mixture ratio.
DELTF <sup>TC</sup>	scalar	sec		Time increment for combustor and turbopump.
DIAT(K) <sup>T</sup>	2	in		Diameter of turbine rotor.
DTD(K) <sup>T</sup>	2	in		Diameter of turbine exit duct.
GR(K) <sup>T</sup>	2	--		Pump to turbine gear ratio.
ICHAM(I,J) <sup>TC</sup>	(8,2)	--		Index of line oxidizer and fuel lines connected to ith combustor.
ICHAMP <sup>TC</sup>	scalar	--		Combustor debug print flag. Print will occur every ICHAMPth DELTF time point.
IPUMI(K) <sup>T</sup>	2	--		Index of line connected to pump inlet.
IPUMØ(K) <sup>T</sup>	2	--		Index of line connected to pump outlet.
IS1 <sup>TC</sup>	scalar	lbf-sec/lbm		Specific impulse of fuel alone.
IS2(L) <sup>TC</sup>	6	--		Same as CS2 except used for specific impulse.
MR1 <sup>TC</sup>	scalar	--		Mixture ratio below which combustion gas may be treated as fuel alone.
MW1 <sup>TC</sup>	scalar	lbm/lbm-mole		Molecular weight of fuel.
MW2(L) <sup>TC</sup>	6	--		Same as CS2 except used for molecular weight.
NCHAM <sup>C</sup>	scalar	--		Number of thrust chambers. Limited to six.
NCØEF <sup>TC</sup>	scalar	--		Number of coefficients in the following polynomials CS2, IS2, MW2, and TC2. Must be set to the highest number of coefficients present in any one equation. Presently limited to six.
NGGTP <sup>T</sup>	scalar	--		Number of turbopumps. Limited to two.

NPIC(NN)	10		Same as NPIPR described in Section 3.1.1.2, but for the combustor printout and based on the combustor time increment DELTF. See Section 3.2.2.1 for a list of the combustor printout.
NPIT(NN)	10	--	Same as NPIC, but for the turbopump output.
NPVALF(M) <sup>TC</sup>	8	--	Number of points in Mth table of $\emptyset$ PVALF vs TMVALF.
NPVAL $\emptyset$ (M) <sup>TC</sup>	8	--	Same as above except for $\emptyset$ PVAL $\emptyset$ vs TMVAL $\emptyset$ .
$\emptyset$ FFIC(NN)	10	--	Same as $\emptyset$ FFIPR, described in Section 3.1.1.2, but for the combustor printout.
$\emptyset$ FFIT(NN)	10	--	Same as $\emptyset$ FFIC, but for the turbopump output.
$\emptyset$ NIC(NN)	10	--	Same as $\emptyset$ NIPR, described in Section 3.1.1.2, but for the combustor printout.
$\emptyset$ NIT(NN)	10		Same as $\emptyset$ NIC, but for the turbopump output.
$\emptyset$ PVALF(M,N) <sup>TC</sup>	(8,60)	--	Tables of valve injector discharge coefficient versus time for fuel system.
$\emptyset$ PVAL $\emptyset$ (M,N) <sup>T</sup>	(8,6)	--	Same as above except for oxidizer system.
P $\emptyset$ WO(K) <sup>T</sup>	2	--	Coefficients in power vs. flowrate at design speed curve. (P $\emptyset$ WP=P $\emptyset$ W $\emptyset$ (K) + ...+ P $\emptyset$ W3(K)*WP**3)
P $\emptyset$ W1(K) <sup>T</sup>	2	--	Same as above
P $\emptyset$ W2(K) <sup>T</sup>	2	--	Same as above
P $\emptyset$ W3(K) <sup>T</sup>	2	--	Same as above
PWO(K) <sup>T</sup>	2	--	Coefficients in pressure vs. flowrate curve at design speed.
PW1(K) <sup>T</sup>	2	--	Same as above
PW2(K) <sup>T</sup>	2	--	Same as above

RPMPD(K) <sup>T</sup>	2	rpm	Pump design speed
TCI <sup>TC</sup>	scalar	°R	Temperature of pure fuel
TC2(L) <sup>TC</sup>	6	--	Same as CS2 except used for temperature of combustion chamber products.
TMVALF(M,N) <sup>TC</sup>	(8,60)	sec	Table of time for valve discharge coefficient for fuel.
TMVALØ(M,N) <sup>TC</sup>	(8,60)	sec	Same as above except for oxidizer.
VMAN(I,J) <sup>TC</sup>	(8,2)	in <sup>3</sup>	Oxidizer and fuel manifold volume
VØLC(I) <sup>TC</sup>	8	in <sup>3</sup>	Volume of i <sup>th</sup> chamber
XITP(K) <sup>T</sup>	2	lbm-in <sup>2</sup>	Moment of inertia of turbopump rotor.
XLTD(K) <sup>T</sup>	2	ft	Length of turbine exit duct.

### 3.1.4 Flow Boundary Input

The following inputs impose a flowrate boundary at the end of a line. See Section 3.4.4.1 for the assumptions and equations used in modeling a flow boundary. The boundary may be varied as a function of time and at present, there can be ten flow boundaries.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
DFBL(I,J)	(10,50)	lbm/sec	Table of flowrates at boundary I.
IFBL(I)	10	--	Index of line to which flow boundary (DFBL) is attached. If the line is downstream of the boundary, use the negative of the line index value.
NFBL	scalar	--	Number of flow boundaries.
NPFBL(I)	10	--	Number of points in table of DFBL vs. TFBL for flow boundary I.
TFBL(I,J)	(10,50)	sec	Table of times at which flow boundary I occur.

### 3.1.5 Line Junction Input

The variables described in this section provide the information necessary to form a junction of more than one line. See Section 3.4.8 of Reference 1 for the assumptions and equations used in modeling a junction. At present there may be ten junctions in the program, each capable of connecting up to five lines.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
IJUNCL(I,J)	(10,5)	--	Indexes of J lines which form the ith junction. If the line is downstream, input the negative of the line index value.
NJUNCL	scalar	--	Number of junctions.
NLINJU(I)	10	--	Number of lines at the ith junction.

### 3.1.6 Pressure Boundary Input

The pressure boundary inputs allow the program to compute a flowrate at the end of a line provided the pressure is a function of time. See Section 3.4.4.1 of Reference 1 for the assumptions and equations used in modeling a pressure boundary. There are ten possible pressure boundaries in this program.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
IENTD(I)	10	--	End of line I to which pressure boundary is connected. 1=upstream end 2=downstream end
IPB(I)	10	--	Index of line to which pressure boundary I is connected.
NPBL	scalar	--	Number of pressure boundaries.
NPRBL(I)	10	--	Number of points in i <sup>th</sup> table of PPRBL vs. TPRBL.
PPRBL(I,J)	(10,50)	psia	Table of time dependent pressures for pressure boundary I.
TPRBL(I,J)	(10,50)	sec	Table of times at which pressures occur for pressure boundary I.

### 3.1.7 Friction Pressure Boundary

This section describes the inputs used for defining the friction pressure boundaries. The program will calculate a flowrate and pressure immediately downstream of the resistance for a pressure and lumped resistance at the end of a line which are functions of time. See Section 3.4.4.2 of Reference 1 for the assumptions and equations used in modeling a friction pressure boundary. At present there can be ten such resistances.

<u>MNEUMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
IENDF(I)	10	--	End of line at which friction-pressure boundary I is connected. 1=upstream end 2=downstream end
IPBF(I)	10	--	Index of line IENDF(I) at which friction pressure boundary is connected.
NPBLF	scalar	--	Number of friction pressure boundaries.
NKPBLF(I)	10	--	Number of points in i <sup>th</sup> table of XKPBLF vs. TKPBLF.
NPPBLF(I)	10	--	Number of points in i <sup>th</sup> table of PPBLF vs. TPBLF.
PPBLF(I,J)	(10,50)	psia	Table of pressures at friction pressure boundary I.
TKPBLF(I,J)	(10,50)	sec	Table of times at which effective area XKPBLF occurs at friction pressure boundary I.
TPBLF(I,J)	(10,50)	sec	Table of times at which pressures PPBLF occur at friction pressure boundary I.
XKPBLF(I,J)	(10,50)	ft <sup>2</sup>	Table of effective areas at friction pressure boundary I.

### 3.1.8 Regulator Input

This section presents a description of the input variables used for defining the regulator. See Section 3.4.10 of Reference 1 for the assumptions and equations used in modeling a regulator. At present, the program is limited to eight regulators.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
AREGMX(I)	8	in <sup>2</sup>	Maximum flow area of regulator I.
AREGP(I)	8	in <sup>2</sup>	Effective area for pressure balance for regulator I.
FREG(I)	8	lbf	Spring force acting when regulator valve is shut.
IREGPR	scalar	--	Every IREGPR <sup>th</sup> point will be printed when debug print is called for.
LREGDN(I)	8	--	Index of line to which downstream side of regulator is connected.
LREGUP(I)	8	--	Index of line to which upstream side of regulator is attached.
NREG	scalar	--	Number of regulators in system.
NPIR(NN)	10	--	Same as NPIPR, described in Section 3.1.1.2, but for the regulator printout. See Section 3.2.2.3 for the regulator printout.
ØFFIR(NN)	10	--	Same as ØFFIPR, described in Section 3.1.1.2, but for the regulator printout.
ØNIR(NN)	10	--	Same as ØNIPR, described in Section 3.1.1.2, but for the regulator printout.
PREF(I)	8	lbf/in <sup>2</sup>	Regulator reference pressure.
QREG(I)	8	in <sup>2</sup> /in	Constant relating regulator flow area to spring position.
SPREG(I)	8	lbf/in	Regulator spring constant.
TAUREG(I)	8	sec	Regulator time delay.

### 3.1.9 Lumped Resistance Input

This section describes the input which allows the user to form lumped resistances within the feed system. Lumped resistances may be used to describe the losses in valves, orifices, discontinuities in pipe sizes, and bends. See Section 3.4.6 of Reference 1 for the assumptions and equations used in modeling a lumped resistance. At present, the program allows ten lumped resistances to be used.

<u>MNEMONIC</u>	<u>DIMENSION</u>	<u>UNITS</u>	<u>DESCRIPTION</u>
LVDN(I)	10	--	Index of line to which downstream end of resistance is connected.
LVUP(I)	10	--	Index of line to which upstream end of resistance is connected.
NVALL	scalar	--	Number of lumped resistances.
NXKVL(I)	10	--	Number of points in $i^{\text{th}}$ tables of XKVL versus TMVL.
TMVL(I,J)	(10,50)	sec	Independent table of times for $i^{\text{th}}$ resistance.
XKVL(I,J)	(10,50)	ft <sup>2</sup>	Dependent table of lumped resistances effective area for $i^{\text{th}}$ resistance.

### 3.1.10 TRW Plot Package

This section is a condensed version of TRW Report No. 11176-H-594-RO-00, dated August 1970, and is included as a user's guide for operating the plot package which is a part of the ACPS transient program (HP014A). The description of this package is divided into three sections and describes the following: (1) Data tape format, (2) Data deck description, and (3) control card description.

The data tape generated by HP014A for use by the plotting program, (TRWPLT) has three record format types. A Type One record contains time and flowrate pressure data for the first and last node of each line. A Type Two record contains time and combustor turbopump data. A Type Three record contains time and regulator, accumulator, lumped resistance, and friction pressure boundary data. The order of data in each record type is as follows:

#### Type One Record -

Word 1 - record identifier,=1  
Word 2 - number of data words in record,= $4*NPIPL + 1$   
Word 3 - program time  
Word 4 -  $3+4*NPIPL$  - flowrate and pressure data for first and last node in each line.

#### Type Two Record -

Word 1 - record identifier,=2  
Word 2 - number of data words in record,= $1 + 14*(NCHAM+NGGTP) + 8*NGGTP$   
Word 3 - Combustor time  
Word 4 -  $3 + 14*(NCHAM+NGGTP) + 8*NGGTP$  - combustor and turbopump data

#### Type Three Record -

Word 1 - record identifier,=3  
Word 2 - number of data words in record,= $1 + NREG+NACC+2*NPBLF+NVALL$   
Word 3 - Program time  
Word 4 -  $NREG + NACC + 2*NPBLF + NVALL$  - data from regulator, accumulator and lumped resistance and friction pressure boundary data.

The number of data records written on the tape will be  $1 + 3^*$   
(TIMEND/DELT/IPLØT). The user has the option to control the number of  
times plot data is written through the input by variable IPLØT.

## Section II: DATA DECK DESCRIPTION

Four cards are required to generate data for one plot. A description  
of these four cards is listed below followed by a description of various  
options available to the user.

1. PLØT - Specifies the variables to be plotted (must be input  
for each plot).

The variables to be plotted may be specified either by  
BCD symbols or by the location of the variable in the record.  
The BCD symbols used in this program are shown in Table 1.  
The specification by location in the record is not given  
because the relative positions change depending on the con-  
struction of the network.

### A. Specification by BCD symbols:

PLØT = XSYM, IRECX, YSYM<sub>1</sub>, IRECY<sub>1</sub>, YSYM<sub>2</sub>, ..., YSYM<sub>n</sub>,  
IRECY<sub>n</sub>, ENDLST

where

XSYM denotes the BCD symbol of the abscissa variable,  
IRECX denotes the record type in which XSYM will be found,  
YSYM<sub>1</sub> denotes the BCD symbol the the i<sup>th</sup> ordinate variable  
(i = 1, n where max n = 10),  
IRECY denotes the record type in which YSYM<sub>1</sub> will be found,  
ENDLST terminates the list of symbols and record types.

The resultant graph will consist of n traces, XSYM vs.  
YSYM<sub>1</sub>, XSYM vs. YSYM<sub>2</sub>, ..., XSYM vs. YSYM<sub>n</sub>.

### Examples:

PLØT = Time, 1, PIL, 1, P2L, 1, ENDLST

Two traces will be plotted on the graph, PIL vs. Time  
and P2L vs. Time

where the data for Time is in record type 1,

TABLE 1. BCD PLOT SYMBOLS

Record Type One:

<u>BCD</u>	<u>Symbol</u>	<u>Description</u>
TIME		Run time
WiF,	i = 1, 20	Flowrate, line i, first node
WiL,	i = 1, 20	Flowrate, line i, last node
PiF,	i = 1, 20	Pressure, line i, first node
PiL,	i = 1, 20	Pressure, line i, last node

Record Type Two:

TIMEF		Chamber integration time
PCHAM <sub>i</sub> ,	i = 1, 8	Chamber pressure, chamber <sub>i</sub>
WCHAM <sub>i</sub> ,	i = 1, 8	Weight of propellant in chamber, chamber <sub>i</sub>
CSTAR <sub>i</sub> ,	i = 1, 8	Characteristic velocity, chamber <sub>i</sub>
PMAN1 <sub>i</sub> ,	i = 1, 8	Manifold pressure, ox side, chamber <sub>i</sub>
PMAN2 <sub>i</sub> ,	i = 1, 8	Manifold pressure, fuel side, chamber <sub>i</sub>
ISP <sub>i</sub> ,	i = 1, 8	Specific impulse, chamber <sub>i</sub>
MR <sub>i</sub> ,	i = 1, 8	Mixture ratio, chamber <sub>i</sub>
MW <sub>i</sub> ,	i = 1, 8	Molecular weight, chamber <sub>i</sub>
WFUEL <sub>i</sub> ,	i = 1, 8	Weight fuel in chamber, chamber <sub>i</sub>
WØX <sub>i</sub> ,	i = 1, 8	Weight x in chamber, chamber <sub>i</sub>
CV1 <sub>i</sub> ,	i = 1, 8	Ox valve discharge coefficient, chamber <sub>i</sub>
CV2 <sub>i</sub> ,	i = 1, 8	Fuel valve discharge coefficient, chamber <sub>i</sub>
WINJ1 <sub>i</sub> ,	i = 1, 8	Ox injector flowrate, chamber <sub>i</sub>
WINJ2 <sub>i</sub> ,	i = 1, 8	Fuel injector flowrate, chamber <sub>i</sub>
TIMPL <sub>i</sub> ,	i = 1, 6	Total impulse, combustion chamber <sub>i</sub>
PØWP <sub>i</sub> ,	i = 1, 2	Pump input power, turbopump <sub>i</sub>
PØWT <sub>i</sub> ,	i = 1, 2	Turbine power, turbopump <sub>i</sub>
PTØ <sub>i</sub> ,	i = 1, 2	Pressure at turbine outlet, turbopump <sub>i</sub>
RPMI <sub>i</sub> ,	i = 1, 2	Turbine speed, turbopump <sub>i</sub>
TØRP <sub>i</sub> ,	i = 1, 2	Pump torque, turbopump <sub>i</sub>

TØRT <sub>i</sub> ,	i = 1, 2	Turbine torque, turbopump <sub>i</sub>
TTØ <sub>i</sub> ,	i = 1, 2	Turbine outlet temperature, turbopump <sub>i</sub>
WTDNØZ <sub>i</sub>	i = 1, 2	Flowrate through turbine duct exit nozzle, turbopump <sub>i</sub>

Record Type Three:

AREG <sub>i</sub> ,	i = 1, 8	Regulator flow area, regulator <sub>i</sub>
PACC <sub>i</sub> ,	i = 1, 2	Pressure in accumulator <sub>i</sub>
PBNDL <sub>i</sub> ,		Pressure at boundary <sub>i</sub>
XKP <sub>i</sub> ,		Effective flow area at pressure boundary <sub>i</sub> with friction
XK <sub>i</sub> ,		Effective flow area at lumped resistance <sub>i</sub>

where the data for P1L is in record type 1, and

where the data for P2L is in record type 1.

PLØT = TIMEF, 2, CSTAR1, 2, CSTAR2, 2, CSTAR3, 2, ENDLST

Three traces will be plotted on the graph,

CSTAR1 (Record type 2) vs. TIMEF (Record type 2),

CSTAR2 (Record type 2) vs. TIMEF (Record type 2),

CSTAR3 (Record type 2) vs. TIMEF (Record type 2).

2. ENDPLT - This card marks the termination of the inputs for one plot.
3. ENDFIL - The appearance of this card marks the termination of the inputs for one file and causes that file of data to be plotted.
4. ENDRUN - This card marks the termination of all inputs, causes a wrap-up to occur and control to exit the program.

NOTE: The symbols, ENDPLT, ENDFIL, and ENDRUN must appear on a separate card from other inputs. To generate more than one plot per file, cards 1 and 2 would be repeated for as many plots as desired.

The following three cards are used to create labels on the plots. It should be noted that once these inputs are defined by the user they will be used on all subsequent plots until changed or deleted. All cards are 66 characters in length. Each symbol must be followed by = ID = which indicates any combination of characters may follow.

5. TITLE - Graph title; printed at the top of the graph.  
EX: TITLE = ID = USER'S SAMPLE GRAPH TITLE
6. XLABEL - X-axis title; printed below the independent variable axis. EX: XLABEL = ID = USER'S SAMPLE X-AXIS TITLE
7. YLABEL - Y-axis title; printed to the left of the dependent variable axis. EX: YLABEL = ID = USER'S SAMPLE Y-AXIS TITLE

TRWPLT automatically scales the data and optimizes the limits of the plots to insure that all data points are included. However, provision is made for the user to input his own scales instead of using the TRWPLT automatic logic. If the scales are user input they will continue to be utilized for each plot until changes by the addition of the following cards.

8. ISCALX - abscissa scale selector  
= 0 TRWPLT will optimize scaling  
= 1 Input limits will be used

NOTE: If set = 1 in plot A, and set = 0 in plot B, the scales from plot A will be used in plot B also.

9. ISCALY - ordinate scale selector  
= 0 TRWPLT will do scaling  
= 1 Input limits will be used

NOTE: The note concerning ISCALX also applies to ISCALY.

10. XLØ - lower limit for the X-axis

- 11. XHI - upper limit for the X-axis
- 12. YLØ - lower limit for the Y-axis
- 13. YHI - upper limit for the Y-axis

NOTE: If both XLØ and XHI are zero, then the limits will be set equal to the minimum and the maximum of the abscissa data points. If both YLØ and YHI are zero, then the limits will be set equal to the minimum and maximum of the ordinate data points. In conjunction with the note on card 8, the only way to return to automatic scaling is to set both limits, XLØ and XHI, YLØ and YHI to zero.

The next two options are very useful in multi-file and multi-reel plotting.

- 14. REPEAT - The card causes the next file of the data tape (or a new data tape) to be read and processed with the same inputs as in the preceding file.

NOTE: The symbol REPEAT must appear on a separate card from other inputs. No new inputs may be used with this option except for the next card.

- 15. KUNIT - The number of the tape unit on which the input data tape is mounted (initialized to 8). Units 2, 4, 12, and 13 are used for working storage and cannot be used.

Although the description of TRWPLT discussed in this section has not presented all of the options available to the plot program, those described will allow the user a fair degree of sophistication in plotting data from the HP014A Program.

### Section III: DESCRIPTION OF CONTROL CARDS

Because of the possibility of a double execution of HP014A and TRWPLT, control cards for both programs are discussed below:

- 1. Control cards for HP014A

	Card Column	
	1 2 3 4 5 6 7 8 . . .	
A.	V P Δ R U N Δ F1, F2, F3, F4, F5, F6, F7, F8, F9, F10	NAME
B.	V ASG X = ααααα	

61-74

C.	∇	XQT	CUR
D		TRW	X
E.		IN	X
F.		TRW	X
G.	∇Q	XQT	HP014A
H.		HP014A	DATA DECK
I.	∇	EØF	

Description:

A. The fields for card A are as follows:

P - Priority indicator, either A, P, or Z. A priority code must be present.

- a) "A" - Special priority to be used only with approval of the MSC operations monitor or shift supervisor.
- b) "P" - Standard priority to be used for EXPRESS jobs and for those groups that have been authorized priority for specific jobs.
- c) "Z" - To be used for all nominal work.

F1 - Six character badge number

F2 - Division code

F3 - Building, box number

F4 - Project number (1-6 characters)

F5 - Program number (1-6 characters)

F6 - Type run (1 character)

F7 - Estimated time for run (min)

F8 - Estimated hundreds of pages output for run

F9 - Print channel

F10 - Punch channel

Name - Programmer's name

Fields F1 - F6 are always required. Fields F7 - F10 are optional. System will use 3 minutes and 100 pages for F7 and F8, respectively, if not input.

- B. *aaaa* is the tape number of the program tape
- C. Execute the complex utility routine to manipulate tapes.
- D. Rewind tape X to load point
- E. Read program into PCF area

- F. Rewind tape X to load point
- G. Execute the program
- H. Data deck
- I. End of file card

2. Control cards for HP014A and TRWPLT

	Card Column										
	1	2	3	4	5	6	7	8	...	...	61-74
A.	∇	P	R	U	N	F1,	F2,	...	...	F10	NAME
B.	∇				ASG	X =	ααααα				
C.	∇				ASG	Y =	STRWPL				
D.	∇	W			ASG	F =	WØRK1				
E.	∇	S	W		ASG	P =	CCP1				
F.	∇				XQT	CUR					
G.					TRW	X					
H.					IN	X					
I.					TRW	X					
J.	∇	Q			XQT	HP014A					
K.					HP014A	DATA	DECK				
L.	∇				XQT	CUR					
M.					ERS						
N.					TRW	Y					
O.					IN	Y					
P.	∇				XQT	TRWPLT					
Q.					PLØT	DATA	DECK				
R.	∇				EØF						

Description:

- A,B. Discussed in Part 1
- C. Identifier to direct the operator to allow the program to use permanent fastrand file TRWPL
- D. Work tape containing the plot data for TRWPLT
- E. CALCOMP plot tape
- G-L. Discussed in Part 1
- M. Clear the PCF area
- N. Position lead head on Y to selected file
- O. Read TRWPLT into PCF area

- P. Execute TRWPLT
- Q. TRWPLT data deck
- R. Discussed in Part 1

If the user wishes to save the plot data in order to plot it at a later time, the following changes should be made.

- a) Remove card C
- b) Change card D to  
VSW ASG F=SAVE
- c) Remove cards L-Q

### 3. Control cards for TRWPLT

	Card Columns											
	1	2	3	4	5	6	7	8	.	.	.	61-74
A.	V	P		R	U	N		F1,	.	.	.	NAME
B.	V			ASG	Y	=	TRWPL					
C.	V			ASG	F	=	ααααα					
D.	V			XQT	CUR							
E.				TRW	Y							
F.				IN	Y							
G.	VQ			XQT	TRWPLT							
H.				TRWPLT	DATA	DECK						
I.	V			EØF								

All cards necessary to use the TRWPLT subroutines have been explained except C. Card C contains the number of the data tape to be plotted.

### Section IV. LISTING OF SAMPLE CASE PLOT DECK

A listing of the plot deck prepared for the sample case shown in Figure 1 is presented on the following pages.

It should be noted that the user has the ability to use this plot package to cross plot; i.e., to plot variable against variable, in addition to the variable against time. It is also possible to plot variables from one record type against variables from another record type. For examples of plotted output see Figure 39 of Reference 1.

### 3.2 Output Description

Program HPO14A has two output capabilities and several printed output options. It also is capable of generating an output data tape that is compatible with TRWPLT as an input data tape.

The printed output consists of initial print, detailed print, and nominal print. The number of time points printed is controlled by the value of the print flags input by the user. A description of the various output options follows.

#### 3.2.1 Initialization and Line Printout

This block of printout contains both input values and values computed by the main program in setting up the case.

AREAL(II)	Cross-sectional area of pipeline II	ft <sup>2</sup>
BK	Bulk modulus of elasticity of fluid I	lbf/in <sup>2</sup>
CL(II)	Speed of sound in line	ft/sec
DELT	Time increment	sec
DELTF	Combustor time increment	sec
DELXL(II)	Distance between nodes, ith fluid line	ft
DIAL(II)	Diameter of ith line	in.
FRL(II)	Friction factor, line II	
G	Acceleration due to gravity	ft/sec <sup>2</sup>
GC	32.174	lbf-sec <sup>2</sup> /ft lbf
IEND(I)	End of line to which pressure boundary is connected 1 = upstream end 2 = downstream end	
IPB(I)	Line to which pressure boundary I is connected	

LVDN(I)	Line to which downstream end of valve is connected	
LVUP(I)	Line to which upstream end of valve is connected	
NACC	Number of accumulators	
NCHAM	Number of thrust chambers	
NFBL	Number of flow boundaries	
NGGTP	Number of gas generator turbopump combination	
NJUNCL	Number of junctions	
NJUNCL(I,J)	Lines to which junction is connected, if the line is downstream use the negative of the line index value	
NØDEL(II)	Number of nodes, ith fluid line	
NPBL	Number of pressure boundaries	
NPBLF	Number of pressure boundaries with lumped variable friction	
NPIPL	Number of line	
NPLINE(II)	Fluid in line II	
NREG	Number of regulators	
NVALL	Number of valves	
PL(II,JJ)	Pressure at jth node of the ith pipeline	psi
RHØL	Density of fluid I	lb/ft <sup>3</sup>
SINALP(II)	Sine of ALPHA(II)	
THETA(II)	DELT/DELXL(II)	
WDØTL(II,JJ)	Flowrate at jth node of the ith line	lbm/sec
Z(II,JJ)	Elevation of node JJ in Line II	ft.

### 3.2.2 Detailed Printout

#### 3.2.2.1 Manifold and Thrust Chamber

This printout block is comprised of all the variables that are used in the computation of the manifold and thrust chamber parameters.

C	Intermediate Calculations	
C1	Intermediate calculations	
C6	Intermediate calculations	
C7	Intermediate calculations	
C8	Intermediate calculations	
C9	Intermediate calculations	
C11	Intermediate calculations	
CC	Intermediate calculations	
CSTAR(I)	Characteristic exhaust velocity of ith chamber	ft/sec
CV(I,1)	Thrust chamber valve discharge coefficient, oxidizer	
CV(I,2)	Thrust chamber valve discharge coefficient, fuel	
DELP	Intermediate calculations	
DPMAN(I,1)	Derivative of oxidizer manifold pressure with respect to time	lbf/in <sup>2</sup> -sec
DPMAN(I,2)	Derivative of fuel manifold pressure with respect to time	lbf/in <sup>2</sup> -sec
DWFUEL(I)	Derivative of mass of fuel in chamber with respect to time	lbm/sec
DWØX(I)	Derivative of mass of oxidizer in chamber with respect to time	lbm/sec

ISP(I)	Specific impulse of gas in ith chamber	ft/sec
MR(I)	Molecular weight of gas in ith chamber	
MW(I)	Molecular weight of gas in ith chamber	
PCHAM(I)	Chamber pressure	lbf /in <sup>2</sup>
PMAN(I,1)	Oxidizer manifold pressure	lbf/in <sup>2</sup>
PMAN(I,2)	Fuel manifold pressure	lbf/in <sup>2</sup>
PRATI	Intermediate calculation	
PSØN	Intermediate calculation	
PTEMP(II,JJ)	Temporary storage	lbf/in <sup>2</sup>
TC(I)	Temperature of gas in ith chamber	°R
TIMEF	Time of combustor calculation	
WCHAM(I)	Mass of propellant in the ith combustion chamber	lbm
WFUEL(I)	Mass of fuel in the ith combustion chamber	lbm
WINJ(I,1)	Flowrate through oxidizer injector	lbm/sec
WINJ(I,2)	Flowrate through fuel injector	lbm/sec
WNØZ(I)	Flowrate out of combustion chamber	
WØX(I)	Mass of oxidizer in the ith combustion chamber	lbm
WTEMP(II,JJ)	Temporary storage	lbm/sec

### 3.2.2.2 Turbopump

The turbopump section determines the status of calculated parameters. All of the intermediate calculations are included to make system evaluation more comprehensive.

AA3	Intermediate calculation	
AA4	Intermediate calculation	
ATD(I)	Cross sectional area of turbine exit duct	ft <sup>2</sup>
ATDNØZ(I)	Effective cross-sectional area of turbine duct exit nozzle	in <sup>2</sup>
CP(I)	Specific heat at constant pressure of gas in I <sup>th</sup> gas generator	$\frac{\text{BTU}}{\text{lbm}\cdot^{\circ}\text{R}}$
CP1	Specific heat of pure fuel	
CP2(K)	Coefficients of specific heat curve	
CVEL(I)	Isentropic spouting velocity	ft/sec
DIAT(I)	Turbine rotor diameter	in
DTD(I)	Diameter of turbine exit duct	in
DRPMT(I)	Derivative of turbine speed with respect to time	rpm/sec
ETAT(I)	Turbine efficiency	
GAM(I)	Ratio of specific heats of gas in I <sup>th</sup> gas generator	
GR(I)	Pump to turbine gear ratio	
IPUMI(I)	Line connected to pump inlet	
IPUMØ(I)	Line connected to pump outlet	
PØWT(I)	Turbine power	ft-lbf/sec
PTØ(I)	Pressure at turbine outlet	lbf/in <sup>2</sup>
RPMP(I)	Pump speed	rpm
RPMPD(I)	Pump design speed	rpm
RPMT(I)	Turbine speed	rev/min

S	Ratio of pump speed to design speed	
TØRP(I)	Pump torque	ft-lbf
TØRT(I)	Turbine torque	ft-lbf
TTEIS	Isentropic outlet temperature	°R
TTØ(I)	Turbine outlet temperature	°R
WNØZ(I)	Turbine flow rate	lbm/sec
WTDNØZ(I)	Flow rate through turbine duct exit nozzle	lbm/sec
XITP(I)	Moment of inertia of turbopump rotor	lbm-in <sup>2</sup>
XLTD(I)	Length of turbine exit duct	ft
X1	Intermediate calculation	
X2	Intermediate calculation	

### 3.2.2.3 Accumulators and Regulators

As in the above sections, all parameters and intermediate calculations are printed out to facilitate system evaluation.

AREG(I,NT)	Regulator flow area	$\text{in}^2$
C1	Intermediate calculation	
C2	Intermediate calculation	
C3	Intermediate calculation	
C4	Intermediate calculation	
C55	Intermediate calculation	
C66	Intermediate calculation	
DPACC(I)	Change in accumulator pressure with time	$\text{lb}/\text{in}^2\text{-sec}$
PACC	Pressure in accumulator I	$\text{lb}/\text{in}^2$
PØ	Downstream pressure	$\text{lb}/\text{in}^2$
FFPR	Intermediate calculation	
PU	Upstream pressure	$\text{lb}/\text{in}^2$
WW	Regulator flowrate	$\text{lb}/\text{m}/\text{sec}$

### 3.2.3 Summary Printout

The summary print consists of the current time point followed by a printout of the system parameters which include: line index number, pressure and flowrate at each node in the line, and extensive printout covering each component in the system.

A listing of the nominal print variables follows. For those not defined below, see Section 3.2.1.

#### 3.2.3.1 Manifold and Thrust Chamber

CSTAR	PMAN	WINJ.
CV	PCHAM	WNØZ
ISP	TC	
MR	TIMEF	
MW		

#### 3.2.3.2 Turbopump

CP	RPMT
CVEL	TØRP
ETAT	TØRT
GAM	TTØ
MW	U
PØWP	WP
PØWT	
PTØ	

### 3.2.3.3 Regulator and Accumulator

AREG

PACC

### 3.2.3.4 Pressure Boundary With Friction and Valve

<u>Symbol</u>	<u>Definition</u>	<u>Units</u>
PBNDL(I)	Pressure at boundary I	lbf/in <sup>2</sup>
XKP(I)	Effective area of resistance at boundary I	ft <sup>2</sup>
XK(I)	Effective area of valve I	ft <sup>2</sup>

### 3.2.3.5 Line

WDØTL(I,J)	Flow rate in the Ith line at the Jth node	lbm/sec
PL(I,J)	Pressure in the Ith line at the Jth node	lbf/in <sup>2</sup>
TIME	Time from start of transient	sec

#### 3.2.4 Sample Output

Selected printed output for the test case are shown on the following pages. For examples of plotted output see Figure 39 of Reference 1.

3.2.4.1 Initialization and Line Printout

THE FOLLOWING VARIABLES ARE INPUT CONSTANTS

THE PROGRAM DT IS EQUAL TO..... \*10000000-02  
 THE COMBUSTORS INTEGRATION DT IS EQUAL TO..... \*10000000-03  
 THE ACCELERATION DUE TO GRAVITY IS..... \*00000000  
 THE GRAVITATIONAL CONSTANT IS..... \*32174000+02  
 THE NUMBER OF ACCUMULATORS IS..... 1  
 THE NUMBER OF THRUST CHAMBERS IS..... 4  
 THE NUMBER OF FLOW BOUNDARIES IS..... 0  
 THE NUMBER OF TURBOPUMPS IS..... 1  
 THE NUMBER OF LINE JUNCTIONS IS..... 3  
 THE NUMBER OF INTEGRATIONS PER COMBUSTOR IS... 10  
 THE NUMBER OF PRESSURE BOUNDARIES IS..... 4  
 THE NUMBER OF PRESSURE BOUNDARIES/FRICTION IS... 0  
 THE NUMBER OF LINES IN THE SYSTEM IS..... 19  
 THE NUMBER OF REGULATORS IS..... 3  
 THE NUMBER OF LUMPED RESISTANCES IS..... 1

#### 4. FLOWCHARTS FOR HP014A

The flowcharts included in this document are intended to be used as a generalized aid to anyone involved in altering the program or studying its construction. As such, the flowcharts are of a generalized nature, showing the major parts of each routine. All major logic branches and each major section of computation are shown. The flowcharts are not meant to be a line-by-line listing of the program.

The flowcharts included in this document are intended to be used as a generalized aid to anyone involved in altering the program or studying its construction. As such, the flowcharts are of a generalized nature, showing the major parts of each routine. All major logic branches and each major section of computation are shown. The flowcharts are not meant to be a line-by-line listing of the program.
