1.0 INTRODUCTION

This document constitutes Volume 2 to D2-118387-1A, "Users Guide for Guidance and Control Launch and Abort Simulation for Spacecraft (LASS) Volume I." Volume I, D2-118387-1A, provides descriptions of engineering math models used in the development of LASS. Volume II contains flow charts, symbol dictionaries, and computer program listings that supplement the discussions contained in Volume I. The supplement information is divided into Appendix A, which contains flow charts and symbol dictionaries, and Appendix B, which contains computer program listings currently used in LASS.

1.1 LASS PROGRAM INPUT

Data is input to LASS by two means. The first is by four input data cards that are read by the FUN master program. The second is by changes in data arrays housed in INITIA subroutine and additional data array located in some of the other subroutines. However, those parameters that control an abort are input via the data cards. The first data card contains a field of 50 columns in width. These first 50 columns are used to input titles that are put at the top of each of the output plots. The title is common to all output plots in any particular run. The second card contains five F format fields each are 14 columns wide. The variables contained on this card are in order:

ABTT	Time of abort in GET
TTD1	Time delay desired between abort initiation and start of closed loop abort guidance
TLAT1	Latitude of launch PAD in degrees
TLONG1	Longitude of launch PAD in degrees
AALIM	Thrust limit of orbiter in gees

The third card contains four integer format fields each three columns wide and four F format fields each 14 columns wide. The variables contained on this card are in order:

KAUT	If KAUT = 1 the Ideal autopilot is used during powered flight. If KAUT = 0 the conventional autopilot is used during powered flight.
KLPDR	If KLPDR = 1 the orbiter returns to the launch site after abort. If KLPDR = 0 the orbiter continues downrange for landing after abort.

1.1 LASS PROGRAM INPUT (Continued)

KACØTC Not presently used

IRERUN Not presently used

SINCI Orbit plane inclination angle in degrees

SLAZI Lanuch azimuth in degrees

THBØ Abort target altitude in feet

TPPCØ Time in seconds that the orbiter pitch profile is used. This variable is used for PAD aborts.

The fourth card contains two F format fields each 10 columns wide. The variables contained on this card are in order:

GTDM Limiting rate at which the orbiter is allowed to rotate when using conventional autopilot

THELIM Limiting rate at which the desired inertial pitch angle is allowed to change when the orbiter is maneuvering during an abort.

1.2 LASS PROGRAM OUTPUT

All output from LASS is provided by the INITIA and READO subroutines. The INITIA subroutine outputs constant data that is used to identify the run and provide some of the more pertinent constants that are used in LASS. The READO subroutine loads data into either or both output data arrays or output plot arrays every other second of ground elapsed time from launch to LASS program termination.

1.2.1 Data Run Title Block

The data run title block is shown in Table I - VOL. 2. This data provides the identification of the abort run and is written by the INITIA subroutine. Specific data format is shown in the listings of Appendix B. Symbols are defined in the symbol definitions for INITIA subroutine provided in Appendix A.

1.2.2 Tabular Data Output

An example of the tabular data output array is shown in Table II - VOL. 2. This represents 16 seconds of data taken every other second. Data from each variable is put in the array by the READO subroutine and held in the array until it is full. When

1.2.2 Tabular Data Output (Continued)

the array is full all data contained is written out. If the run terminates prior to completion of a full data array, the remaining part of the unfilled array is filled with zeros and written out. Lists of data variables that are output are shown in the description of READO subroutine provided in Appendix A.

1.2.3 Plotted Data Output

An example of LASS output plots are shown in reference 18. Values of selected variables to be plotted are loaded in data arrays every other second. These plot arrays are being filled and held in memory until the run reaches terminal end conditions. At this terminal point, the plots are made with ground elapsed time being the independent variable. A list of variables to be plotted, as time histories, are shown in the description of READO subroutine provided in Appendix A.

If LASS should terminate its run prior to attainment of simulation terminal conditions, provisions are made to plot that data which is contained in the plot data arrays. Two machine language subroutines are provided for this purpose. The RECOV subroutine is called up by the master FUN subroutine. It in turn uses the QZKILL subroutine to cause a program restart to be entered in the READO subroutine. Consequently, when a LASS run terminates before normal terminal conditions are reached, all data left in the plot arrays are plotted. The recovery subroutines are shown in Appendix B.

The plotting provisions use the standard MSC plot routines. The specific call statements and arguments are shown in the program listings for READO provided in Appendix B.

APPENDIX A

Appendix A contains flow charts of the more complicated subroutines used in LASS. The charts are detailed using coded symbol notation. Along with each flow chart is a symbol definition table. The symbol definitions are provided showing engineering symbols as defined in the respective discussions located in section 5 of Vol. I. The symbol dictionary is detailed from the coded listings in alphabetical order. The symbols that are provided in the common blocks of each subroutine are also included. This provides a focal point which defines input and output from the subroutine and provides a correspondence for use of the listing provided in Appendix B. The flag codes, used in the symbol dictionary, are:

- 1 Internally used parameter
- 2 Input parameter from another subroutine
- 3 Output parameter or available for output
- 4 Output print parameter
- 5 Contained in common block but not used in subroutine
- 6 Parameter not presently in use
- 7 Parameter initialized to zero
- 8 Parameter initialized to a value other than zero
- 9 Card input parameters

An attempt was made to code symbols such that they have identity to major subroutines. As noted in section 5.0 of Vol. I, the prefix letters are in general:
