INTRODUCTION

Proposed V/STOL aircraft require propulsion systems that operate efficiently over wide ranges of free-stream velocity, incidence angle and inlet throat Mach number (mass flow rate). A major component determining the efficiency of operation at these flow conditions is the inlet. An important tool in the design of an efficient inlet is the capability to theoretically analyze the inlet flow.

Many of the proposed V/STOL inlets are three-dimensional (fig. 1). Since the capability for a full three-dimensional inlet analysis does not exist at this time, simpler but approximate methods for modeling these inlets were developed. The flow about some of these inlet shapes (e.g., fig. 1(a)) can be approximated by calculating the flow about a group of axi-symmetric geometries having shroud profiles corresponding to several circumferential angles. Methods for analyzing axisymmetric geometries exist (ref. 1) and are in use at the Lewis Research Center. However, inlets such as shown in figures 1(b) and (c) are not adequately approximated axi-symmetrically. These inlets are better approximated by two-dimensional geometries. Therefore, a procedure for calculating two-dimensional potential flows was developed. Figure 2 shows the two-dimensional approximations made for analyzing the three-dimensional inlets shown in figures 1(b) and (c).

The procedure developed utilizes three computer programs and is similar to the procedure for calculating axisymmetric flows (ref. 1). The chief program is the Douglas two-dimensional potential flow program (ref. 2) called 23Y at Lewis, which calculates the incompressible potential flow about arbitrary two-dimensional bodies. The other two programs, original with Lewis are called SCIRCL (ref. 1) and COMBIN-2D. Program SCIRCL generates input for 23Y from various specified analytical shapes or sets of coordinate points for the inlet components. Program COMBIN-2D takes the basic solutions output by 23Y and combines them into solutions of interest, and if desired applies a compressibility correction. Figure 3 is a schematic representation of these solution steps.

E-9671

This paper consists of a statement of the problem to be solved, a description of each of the programs, sample results and sufficient documentation, including a test case, to enable the user to run the programs.

SYMBOLS

A, B, C, D	combination coefficients
M	Mach number
V	velocity
$\dot{W}$	inlet mass flow
α	inlet incidence angle

Subscripts:

c	control station
i	incompressible
S1	passage between lower shroud and centerbody
S2	passage between upper shroud and centerbody
∞	free stream value

PROBLEM AND SOLUTION DESCRIPTION

Statement of the Problem

The basic problem to be solved is to calculate either the compressible or incompressible potential flow in and about an arbitrary two-dimensional inlet at any combination of operating conditions of free stream velocity V_∞, inlet incidence angle α, and inlet mass flow rates $\dot{W}_c$, $\dot{W}_{S1}$, or $\dot{W}_{S2}$. Figure 4 shows four possible combinations of inlet geometries and weight flow specifications to be analyzed. Figure 4(a) shows the single inlet passage where the free stream conditions V_∞, α, and inlet weight flow rate,

$\dot{W}_c$ are specified. Figure 4(b) shows a single inlet with dual passages where V_∞, α, and the two passage weight flow rates $\dot{W}_{S1}$ and $\dot{W}_{S2}$ are specified. Figure 4(c) shows the same inlet and free stream flow conditions, V_∞, α, as figure 4(b). However, in this case the total inlet and one passage weight flow rate, $\dot{W}_c$ and $\dot{W}_{S1}$ are specified. Figure 4(d) shows a dual inlet configuration where V_∞, α, $\dot{W}_{S1}$, and $\dot{W}_{S2}$ are specified. The two dimensional flow problem is solved in several steps (programs).

1. Geometric representation (Program SCIRCL)
2. Incompressible potential flow basic solutions (Program 23Y)
3. Combined solutions with compressibility correction (Program COMBIN-2D).

Each step and its corresponding program is described in the following section.

Description of Solution Steps and Programs

Geometric representation - Program SCIRCL. - The inlet is assumed to be two-dimensional. The body profiles are broken into segments at convenient tangential points (fig. 5). Each segment may be defined by an analytic expression or by a set of points. The inlet duct walls and outer surfaces must be extended far downstream (fig. 5) to facilitate obtaining accurate potential flow solutions in the inlet in the region of interest. The geometry program SCIRCL prepares coordinate-point input for efficient use of the potential flow program and also prints out information such as curvature, wall angles, etc., which is useful in preliminary screening of proposed inlet shapes.

In addition to the surface points, sets of points perpendicular to the inlet axis, called rakes, are needed at axial locations where velocity profiles or streamlines are desired. At least one set of rake points is required, corresponding to the axial location where the inlet weight flow is specified, as discussed with regard to figure 4. Such rakes are called control stations.

Program SCIRCL generates the coordinates of the rake points for 23Y. Program SCIRCL will also produce a Calcomp plot of the inlet geometry and rake points.

Incompressible potential flow basic solutions - Program 23Y. - Program 23Y is the Douglas incompressible potential flow computer program for single or multiple two-dimensional bodies. Briefly, the program utilizes a distribution of sources and sinks of initially unknown strength to represent the inlet profile. The continuous distribution is approximated by representing the inlet as a finite number of discrete flat elements having constant source strength and characterized by the mid point of the element (called the control point). This approximation results in a set of linear algebraic equations for source strength at the control points that are solved by matrix methods. Velocities at the control points and at specified off-body points (rake points) are then calculated from the source/sink distribution.

In the two passage case, the program is used to obtain five basic solutions which are used in linear combination in order to satisfy the prescribed operating conditions (fig. 4). The first basic solution is axial flow, the second is a 90^{o} cross flow, the third, fourth, and fifth solutions are vorticity solutions about the lower shroud, centerbody, and upper shroud, respectively. In the single passage case, only four solutions are generated. The first two are the same as the two-passage case while the third and fourth are vorticity solutions about the lower and upper shrouds respectively.

Combined solution - Program COMBIN-2D. - This program combines the basic solutions $\overline{V}_j$, j=1,2,3,4,5 from 23Y into any number of solutions of interest. A solution of interest is one having specific values of free stream velocity, V_∞, angle of attack of inlet, α, and weight flow, $\dot{W}$, through the control stations described previously. Optional inputs for $\dot{W}$ are average axial velocity at the control stations (V_c, V_{S1}, or V_{S2}) or average Mach numbers (M_c, M_{S1} or M_{S2}). If either $\dot{W}$ or M_c are specified, they are converted to velocities for use in the combination solutions. Temperature and pressure must also be specified if other than standard conditions are used.

The method of combination of the basic solutions is shown in figure 6. A compressibility correction, if desired, is then applied to the velocities. The compressibility correction used is that of Lieblein-Stockman (ref. 3).

$$V_{com} = V_{inc}\left(\frac{\rho_t}{\rho_s}\right)^{V_{inc}/\overline{V}_{inc}}$$

where the terms on the right hand side are obtained from the incompressible solution. This correction requires no alteration of the inlet geometry and can handle locally sonic or supersonic flows. Flow properties (Mach number, pressure ratio, etc.) are calculated for either the compressible or incompressible cases depending on the version desired. The compressibility correction is actuated by setting ICOMP1 to 0. The incompressible version is generated by setting ICOMP1 to 1. If two passages are specified, two of the rakes mentioned under SCIRCL are used as control stations by COMBIN-2D. A control station is the rake where the average inlet axial velocity of the combined solution is specified. The possible choices of control stations for two passage cases are shown in figures 4(b) to (d). If only one passage is specified (fig. 4(a)), then any rake can be used as a control station. However, it should be noted that the compressible solution is most accurate in the vicinity of the control station since the compressibility correction does not exactly satisfy continuity.

When the velocity on the inlet surface becomes locally supersonic, the agreement between theory and experiment is generally not as good as when the flow remains subsonic. To improve the agreement, an optional supersonic correction has been incorporated into the program. The supersonic correction is actuated by specifying NX as 1 on input.

Sample Results

To illustrate the results of the present calculation procedure, the graphic output for the Test Case is presented next.

The graphic output of SCIRCL is illustrated in figure 7 and consists of a plot of the inlet geometry and the computational point spacing, and the location of the rakes and their point spacing. In addition to its reference value the plot is useful for troubleshooting for mistakes in the geometry input and for validating the satisfactory distribution of body points and rake points.

The graphic output of COMBIN-2D is illustrated in figures 8 to 10. Figure 8 shows the pressure distribution on both the internal and external surfaces of the upper shroud. Similar plots can be obtained for the lower shroud and for the centerbody when there is one.

Figure 9 shows the surface Mach number distribution. The comments made above for the pressure plots apply also to Mach number plots.

Figure 10 shows a plot of the flow field vectors. Whenever rake points are specified (see fig. 7) velocity vectors are calculated and can be plotted. Note that velocity vectors can be obtained outside the inlet as well as inside.

INPUT AND OUTPUT FORMAT

SCIRCL Input

Card no.	Format	Col. no.	FORTRAN name	Description
	9A6	1-54	ARE	= title for area plots. "CROSS-SECTIONAL AREA, SQ. IN."
	9A6	1-54	EX	= title for x-axis. "AXIAL POSITION, IN."
	9A6	1-54	CURVO	= title for curvature plots. "CURVATURE ON SHROUD"
	9A6	1-54	SURFAC	= title for x-axis with surface distance plots. "DISTANCE ALONG SURFACE FROM DOWN-STREAM END OF SHROUD, IN."

These first four cards above will be unchanged for all runs and can be made a part of the execution setup deck, or replaced with data statements.

Card	Format	Column	FORTRAN name	Description
1	9A6	1-54	TITLE	Description of Case

FOR CALCOMP PLOTTING OF INLET PICTURES

Card	Format	Column	FORTRAN name	Description
2	6F10.2	1-10	XX	Length, in plot-inches, of X-axis required.
		11-20	XMIN	Value, in data-inches, of far left X-point.
		21-30	EXEP	Data-inch per plot-inch along X-axis.
		31-40	YY	Length, in plot-inches, of Y-axis required.
		41-50	YMIN	Value, in data-inches, of bottom Y-point.
		51-60	ORD	Data-inch per plot-inch along Y-axis (usually equal to EXEP).

FOR INFORMATION USED BY SCIRCL

Card	Format	Column	FORTRAN name	Description
3	-	-	-	Blank
4	2A6,I4, 2I1,2I2, 10X,I1,	1-6	IDENT	Six-character tag for case I.D.
	9X,3I1, 2I2	7-12	PROG	23Y
		13-16	NO6	0
	(Flag 'A')	17	LPNCHO	1, Do not save output for 23Y on Unit 17.

Card	Format	Column	FORTRAN	Description
	Flag B	18	IPLOTA	Plot inlet area against X-position (used only for axisymmetric case).
	Flag C	19-20	IPLOTC	-1, Plot curvature versus X +1, Plot curvature versus S (Used only for axisymmetric case)
	Flag D	21-22	IREAD	0 (Obsolete)
<u>ALL FLAGS</u> are 'on' when =1, unless otherwise noted. (Either E or J or neither can be on but not both).				
	Flag J	33	IAB	Redo geometry from point (XAA, YAA) to (XBB, YBB).
	Flag E	43	IREDON(1)	Redo entire geometry via direct interpolation
	Flag F	44	IREDON(2)	LPNCHO for any redo
	Flag G	45	IREDON(3)	IPLOTA for any redo
	Flag H	46-47	IREDON(4)	IPLOTC for any redo
	Flag I	48-49	IREDON(5)	IREAD for any redo
Skip card 5 if J=0				
5	4F12.5	1-12	XAA	X position of starting point for partial redo.
		13-24	YAA	Y position of starting point for partial redo.
		25-36	XBB	X position of ending point for partial redo.
		37-48	YBB	Y position of ending point for partial redo.

Card	Format	Column	FORTRAN	Description
6	4F10.2	1-10	ANBDYS	Number of bodies
		11-20	DELS	Spacing between points in region of interest.
		21-30	DELSMX	Maximum spacing far from region of interest.
		31-40	XRI	Axial distance at which surface distance equals zero.
7	I4	1-4	NRAKE	Number of axial locations at which data across the passage is desired. (Cannot be greater than 25).
8	3F8.5,I3	1-8	XRAK	Axial location of rake.
		9-16	YLO	Y value of first point (lowest point) on rake at XRAK.
(Note: There is one card for each rake)				
		17-24	YHI	Y value of last point (highest point) on rake at XRAK.
		25-27	NY	Number of points in rake at XRAK: Restriction NY ≤ 200. Rake points are equally spaced, ΔY, between YHI and YLO where $\Delta Y = \frac{YHI - YLO}{(NY - 1)}$
9	3F10.2	1-10	TYPBDY	Body number. However, if the inlet is symmetrical, then any body can be input as a mirror image of any other body. That can be accomplished by setting TYPBDY = -M.N where M is the number of the body to be created and N is the number of the body to be copied. ANSEG is set to the Y value of the line about which body N is to be mirrored. No other input is required for this body.

Card	Format	Column	FORTRAN	Description
		11-20	ANSEG	= Number of segments for the particular body, except as stated in TYPBDY.
		21-30	DELNEW	= -1., Delta S spacing is set to original value of DELS. = 0., Delta S is set to value of DELS from previous body. = + number, Delta S is set to value of input DELNEW.
10	3F10.2	1-10	ENREED	Code indicating type of curve to be fitted through given points. = 0., for bisuperellipses. See Table I and figure 11 for available options. Input 4, 5, or 6 (XIN, YIN) points as directed. = 1000. Same as = 0 but with finer point spacing near one end of segment (two such segments required). Usually used to give finer spacing at the highlight. The superellipse going into the highlight and the one coming out should have this flag. For bisuperellipses where the '1000.' option is to be used, the rate at which the point spacing, ds, changes near one end $dS_i = dS_{i-1} - (\text{Rate})(dS_{i-1})$ can be specified on input.

Card	Format	Column	FORTRAN	Description
				The rate (program name = PACE) is entered as the fractional part of ENREED for each such segment. For example, if ENREED were input as 1000.06, the spacing for consecutive points would be evaluated as follows:
				$DS_i = DS_{i-1} - (0.06)\ DS_{i-1}$
				if segment is to go from large-to-small spacing, or:
				$DS_i = DS_{i-1} + 1.5\ (0.06)\ DS_{i-1}$ if segment is going from small-to-large spacing.
				If PACE is entered as zero (i.e., ENREED = 1000.), the default value, 0.05, is used.
				(PACE $\leq$ 0.133)
				*The first '1000' superellipse <u>ON A BODY</u> reduces the point spacing as far as possible, down to a limit of 2 percent of the ds value at the beginning of the segment.
				*All subsequent '1000' superellipses input will increase ds as far as possible up to the input value of DELS.
				*Any number or types of segments may be input between the first and subsequent '1000' bisuperellipses, with the exception of a normal bisuperellipse (ENREED=0).

Card	Format	Column	FORTRAN	Description
				= 1, is a straight line, input 2 coordinates (XIN(1), YIN(1), XIN(2), YIN(2)) (fig. 12).
				The first and last straight lines on bodies 2 and 3 and the last straight line on body 1 will automatically have their spacing increased from approximately DELS near the region of interest to approximately DELSMX away from the region of interest. To get this type of spacing in the first straight line of body 1, ENREED must be specified as 10..
				The first straight segment of a body must be equal in axial length to the last straight segment on the previous body. (If the actual straight lines are not equal in length, the longer should be input as two segments).
				= 10., special straight line used for initial straight line on lower shroud. The straight line starts with large spacing (DELSMX) and ends with small spacing (DELS), (fig. 12).
				= -1., fits a lemniscate between a straight line and a point. Input is three coordinates (fig. 12).
				= -3., fits a cubic between two straight lines. Input 4 coordinates (fig. 12).

Card	Format	Column	FORTRAN	Description
				= -4.0, generates a segment which is a mirrored image of all the points from (XIN(1), YIN(1)) to (XIN(2), YIN(2)) about the line Y = YIN(3). See cards 11 and 12 for XIN and YIN formats.
				= 99., for direct interpolation option over one segment (see input instructions for card 12).
		11-20	REEDEN(1)	(See table I). Input exponent of x-term for bisuperellipse equation. Blank for all other segment types.
		21-30	REEDEN(2)	(See table I). Input exponent for y-term of bisuperellipse.
11	6F12.5	1-72	XIN(I) I=1,2,3,6,4,5	X-coordinate for specified points.
12	6F12.5	1-72	YIN(I) I=1,2,3,6,4,5	Y-coordinate for specified points. Note: If ENREED = 99. instead of cards 11 and 12, input the following cards.

Card	Format	Column	FORTRAN	Description
11a	Namelist/$BODYIN/		Z(I)	Z is a complex array containing the X value (in the real part) and Y value (imaginary part) of each given point along the segment. The namelist will normally be longer than one card.
12a	Namelist/$AUXIN/		DONE	= A logical variable which should be input as = .TRUE.
				Note: If ANSEG=0 and TYPBDY $\neq$ 0, skip card No. 10, and substitute 11a for 11 and 12a for 12.

Figure 13 shows an SCIRCL input form, reflecting the above instructions.

SCIRCL Output

Printed Output

Input file dump (a list of input cards)
Case number and title
Input card 3
Input card 4 (case I. D. and SCIRCL flags)
Input card 6 (number of bodies, DELS, DELSMX, and XRI)
Total number of points for all bodies should not exceed 500.
Total for any one segment of a body should not exceed 200.
An error message will indicate if these limits have been exceeded.
Total number of off-body points must not exceed 200.
Body 1 segment data (actually lower shroud data for two-dimensional case), body 2 segment data (centerbody data for two-dimensional case), and body 3 segment data. For each segment:

ENREED (as input) and type of segment

Data depending on type of segment.

Straight Line

X	X(1)	X(2)
Y	Y(1)	Y(2)

Last point data*

Bisuperellipse

Exponents

P	as read in	X	X(1)	X(2)	X(3)	X(6)	X(4)	X(5)
Q	as read in	Y	Y(1)	Y(2)	Y(3)	Y(6)	Y(4)	Y(5)
P	as used	A	XO					
Q	as used	B	YO	OMEGA				

where A and B = Semimajor and minor axes of transformed superellipse
XO and YO = Center of the transformed superellipse
OMEGA = The difference (in radians) between the slopes of the end point slope lines minus $\pi/2$ (i.e., OMEGA is a measure of the nonperpendicularity of the slope lines).

Number of iterations**

Iteration data***

Last data point*

'Magic triangle' messages refer to the triangle formed by extending the superellipses slope lines toward each other and drawing a chordline between input points number (X2, Y2) and (X4, Y4). Input points (X3, Y3) and (X6, Y6) must lie within this triangle, or, for certain special cases, may lie in a similar triangle on the opposite side of the chordline.

If input points (X3, Y3) and/or (X6, Y6) fall outside the magic triangle, the following message (or messages) is/are printed:

"This point is below the magic triangle ..."

"This point is outside the magic triangle..."

Cubic

X	X(1)	X(2)	X(3)	X(4)
Y	Y(1)	Y(2)	Y(3)	Y(4)
A	B	C	D	

where A, B, C, D are the coefficients of the cubic equation.

Number of iterations**
Iteration data***
Last point data*

Lemniscate

X	X(1)	X(2)	X(3)
Y	Y(1)	Y(2)	Y(3)
THETMX	CALC	ACALC	

where THETMX CALC = angle between line 1 - 3 and line 1 - 2.
ACALC from equation $R^2 = 2(ACALC)^2 \sin 2\theta$ where

$$\theta = THETMX \text{ and } R^2 = [XIN(3) - XIN(2)]^2 + [YIN(3) - YIN(2)]^2$$

Number of iterations**
Iteration data***
Last point data*

*Last point data. This is the coordinate point data for the last point of the segment. It is presented here because it is overwritten by the first point of the following segment and therefore does not appear in the point-by-point array below.

**Number of iterations is the number of iterations required to achieve a satisfactory point spacing for 23Y and have the calculated last point of the segment coincide with the input endpoint (to within a prescribed tolerance of 0.1 DELS). If this satisfactory spacing and end point matching is not achieved within 150 iterations, the following message is printed out above the number of iterations:

"This set of data exceeded 150 iterations. Calculations stopped XBRK YBRK.

X(1), Y(1), X(2), Y(2), X(3), Y(3), X(4), Y(4), X(5), Y(5)."

***Iteration data

DELS IN	Value of ds at end of previous segment
DELS	Value used to start final iteration for this segment
DELS OUT	Value of ds at end of this segment, to be passed on to the next segment
DSTEST	Distance from last calculated point to input segment endpoint
FINAL PACE	The value of PACE at the conclusion (or termination) of the point-spacing iteration for bisuperellipses with ENREED 1000

INPUT FOR THE 2D-COMBINATION PROGRAM

For three body case

NT(1) = , NT(2) = , NT(3) = , NHUBMX = , NSPLMX = NP =

For two body case

NT(1) = , NT(2) = , NHUBMX = , NP =

(See 2D-COMBIN input section)

Body coordinates (a separate set for each body)

Point number

X-axial distance

Y-radial distance

KAPPA-curvature

DY/DX-slope

ALPHA-slope angle in degrees

S-surface distance measured from first point of each body

S- S(2) - surface distance measured from XRI

DELTAS-distance between points

Rake Information

XRAK - axial location of rake

YLO - Y value of first location on rake

YHI - Y value of last location on rake

NDY - number of Y points on the rake, as input

File output. - The file output (UNIT 17), written by SCIRCL, is used directly as input to 23Y. The file is primarily in 6E13. 8 format, consisting of the on-body point coordinates and rake points.

Graphic output. - Standard Calcomp can be produced for each geometry run as follows:

(1) For all cases: an X - Y 'picture' of the inlet with SCIRCL-generated on-body points denoted by the '+' symbol and connected with straight lines; segment end points have a large octagonal symbol; off-body rake points are denoted by a small square symbol (see fig. 7).

(2) For cases with IPLOTC $\neq 0$ (used only for axisymmetric cases): a graph of upper shroud body curvature against axial position (IPLOTC = -1) or against distance along shroud (IPLOTC = +1).

COMBIN-2D Input

English engineering units are used throughout the program.

Length, in.
Velocities, ft/sec
Angles, deg
Pressure, lb/ft^2
Temperatures, $^{\circ}$R
Densities, slug/ft^3
Force, lb
Weight flow, lb/sec

Card	Format	Column	FORTRAN Name	Description
1	3A6	1-18	TITLE	Title card
2	9I4	1-4	NT	Total number of on-body points (for three body input NT(3). For two body input NT(2).)
		5-8	NS1	Number of on-body points on the lower shroud (NHUBMX from SCIRCL).
		9-12	NH	Number of on-body points on the lower shroud plus hub (for three bodies, NSPLMX from SCIRCL -- For two bodies, NHUBMX from SCIRCL).
		13-16	NP	Total number of off-body points (NP from SCIRCL).
		17-20	IW	Flag for type of input through the control station: = 0, weight flow = 1, Mach number = 2, velocity
		21-24	NX	= 1, apply supersonic velocity correction to data

Card	Format	Column	FORTRAN Name	Description
		25-28	KND	Flag for scaling variables. All input lengths are divided by ELND. If KND = -1, ELND = YCU = 0, ELND = 1 = 1, ELND = YCU - YCL = 2, ELND = the read-in value from card 4.
		29-32	ICOMP1	Type of solution to be computed: = 0, compressible = 1, incompressible
		33-36	IHUB	IHUB = 0, no hub input $\neq$ 0, three body input
3	10F8.0	1-8	VC	Average axial velocity at the control station between lower and upper shrouds upstream of the centerbody
		9-16	VS1	Average axial velocity at the control station between the centerbody and lower shroud
		17-24	VS2	Average axial velocity at the control station between the centerbody and upper shroud. Note if IW=2, then two of the three velocities must be input for the two passage case
		25-32	VINF	Free stream velocity
		33-40	ALFA	Angle between free stream velocity and X-axis of the inlet
		41-48	MC	Average Mach number at the control station between lower and upper shrouds
		49-56	MC1	Average Mach number at the control station between the centerbody and lower shroud

Card	Format	Column	FORTRAN Name	Description
		57-64	MC2	Average Mach number at the control section between the centerbody and upper shroud. If IW=1 then two of the three Mach numbers must be input for the two passage case
		65-72	TTOTAL	Total temperature. If TTOTAL = TSTAT=0, then TTOTAL = 518.67 will be used.
		73-80	PT	Total pressure. If PT=0.0 and PSTAT≠0.0, the program will calculate PT. If PT = 0.0 and PSTAT=0.0, PT is set to 2116.
4	10F8.0	1-8	ELND	ELND is the arbitrary length used for scaling or normalizing. Refer to KND input.
		9-16	WDOTC	Weight flow at the control station between the upper and lower shrouds
		17-24	WDOTC1	Weight flow at the control station between the centerbody and lower shroud
		25-32	WDOTC2	Weight flow at the control station between the centerbody and upper shroud. If IW=0, then two of the three weight flows must be input for the two passage case.
		33-40	PSTAT	Static pressure
		41-48	TSTAT	Static temperature. If PSTAT and TSTAT are not 0.0, total temperature and total pressure will be calculated using PSTAT and TSTAT.
		49-56	CUTOF1	If CUTOF1 ≠ 0, then the pressure ratio P_S/P_T on the lower shroud will be plotted against a dimensionless surface distance S/CUTOF1 starting at X = XR1 for a distance of S = CUTOF1.

Card	Format	Column	FORTRAN Name	Description
		57-64	CUTOF2	Same as CUTOF1 except for upper shroud
		65-72	CUTOFH	Same as CUTOF1 except for the hub.
		73-80	VPERIN	If VPERIN is greater than zero then a CALCOMP plot of the inlet showing rake point flow field data will be produced. VPERIN is the value of a unit vector in ft/sec/in.. If VPERIN not equal to zero, card "5" must be input.
4A	6F10.0	1-10	XX	The length in plot inches of the abscissa of the velocity plot.
		11-20	XMIN	Value, in data inches, of far left X-point.
		21-30	EXEP	Data inch per plot inch along X-axis.
		31-40	YY	Length, in plot inches, of the ordinate.
		41-50	YMIN	Value, in data-inches, of bottom Y point.
		51-60	ORD	Data inch per plot inch along Y-axis.
5	3F10.0	1-10	XTEST	Axial location of the control station upstream of the centerbody between lower and upper shrouds
		11-20	YCL	Y on the lower shroud at XTEST
		21-30	YCU	Y on the upper shroud at XTEST
6	3F10.0	1-10	XTEST1	Axial location of the control station between the centerbody and lower shroud
		11-20	YCL1	Y on the lower shroud at XTEST1.
		21-30	YCU1	Y on the centerbody at XTEST1.
7	3F10.0	1-10	XTEST2	Axial location of the control station between the centerbody and upper shroud.
		11-20	XCL2	Y on the centerbody at XTEST2.
		21-30	YCU2	Y on the upper shroud at XTEST2.

Note: Cards "6" and "7" are not used for a single-passage case.

Card	Format	Column	FORTRAN Name	Description
8	3F10.0	1-10	XR1	Axial location on the lower shroud where S = 0. (Must be at the high-light).
		11-20	XR2	Axial location on the upper shroud where S = 0. (Must be at the high-light).
		21-30	XRH	Axial location on the hub where S = 0. Leave blank for two body case. (Must be at the highlight).
9	3F10.0	1-10	YR1	Y on the lower shroud at XR1.
		11-20	YR2	Y on the upper shroud at XR2.
		21-30	YRH	Y on the centerbody XRH.

Figure 14 is the input form for COMBIN-2D.

COMBIN-2D Output

Printed Output

Input file dump
TITLE - followed by 2-D COMBINATION SOLUTION
Version of run (i.e., compressible or incompressible)
A list of the basic flow solutions obtained from 23Y
In the table that follows, several functions of four different velocities are given. The velocities are:

Control: VC, average axial velocity at upstream control station
Lower passage: VS1, average axial velocity at control station between hub and lower shroud.
Upper passage: VS2, average axial velocity at control station between hub and upper shroud.
Free stream: V_∞, free stream velocity

The rest of the table is self-explanatory perhaps with the exception of the terms INC and COMP. INC means calculated from the incompressible equations and COMP means calculated from the compressible equations.

The rest of the output will be defined by its name.

ALPHA	Angle of attack of inlet
VINF/VC	V_∞/V_c
VSONIC	Critical velocity uncorrected for compressibility
VSONICC	Critical velocity
WDOTCR	Corrected weight flow at upstream control station $\dfrac{\text{WDOT} \times \sqrt{\text{THET}}}{\text{DEL}}$
WDOTLCR	Corrected weight flow at control station between center-body and lower shroud
WDOTUCR	Corrected weight flow at control station between center-body and upper shroud
TSTAT	Free stream static temperature
PSTAT	Free stream static incompressible pressure
PSTATC	Free stream static compressible pressure
ASTAT	Free stream static speed of sound
RHOSTAT	Free stream static density
WDOTC	Input mass flow at upstream control station
WDOTL	Input mass flow at downstream lower control station
WDOTU	Input mass flow at downstream upper control station
VIC	Incompressible average velocity at upstream control station
VICL	Incompressible average velocity at downstream lower control station
VICU	Incompressible average velocity at downstream upper control station
TTOT	Free stream total temperature

PTOT	Free stream total pressure incompressible
PTOTC	Free stream total pressure compressible
ATOT	Free stream stagnation speed of sound
RHOTOT	Free stream stagnation density
THET	TTOT/518.67
DEL	PTOTC/2116.22
XRI1	Input
YRI1	Input
XRI2	Input
YRI2	Input
XTEST	Input
YCL	Input
YCU	Input
LND	Length used for scaling
XTEST1	Input
YCL1	Input
YCU1	Input
XTEST2	Input
YCL2	Input
YCU2	Input
HUB-TIP L	Lower passage hub to tip ratio
HUB-TIP U	Upper passage hub to tip ratio

P - S CUTOFF L - CUTOF1	Input
P - S CUTOFF HUB - CUTOFH	Input
P - S CUTOFF U - CUTOF2	Input
NT	Input
NP	Input
NS1	Input
NH	Input
KND	Input
IW	Input
NX	Input
ICOMP1	Input
IHUB	Input
V1	Average axial velocity at specified control station for basic solution 1 from 23Y
V2	Same as V1 except for basic 23Y solution 2
V3	Same as V1 except for basic 23Y solution 3
V4	Same as V1 except for basic 23Y solution 4
V5	Same as V1 except for basic 23Y solution 5

23Y basic solutions 1 and 2 are axial and crossflow solutions. For a three body case, solutions 3, 4, and 5 are vorticity solutions about the lower shroud, centerbody, and upper shroud, respectively. For a two body case, solutions 3 and 4 are the vorticity solutions about the lower shroud and upper shroud. Note there is no 5 solution for this case.

A, B, C, D — Coefficients of combination

VINFP — Incompressible free stream velocity "uncorrected" for compressibility if the input value was compressible

OTHER MESSAGES: "VRESON = ________ IS GREATER THAN VMAX. VCONC = ________." The velocity at a certain on-body point exceeds the allowable value for the local expansion condition so that the isentropic ratio term: 1. - VCONC is less than zero. Where,

$$VCONC = \frac{\gamma - 1}{2}\left(\frac{VRESON}{a_{tot}}\right)^2.$$

"I EXCEEDS 20 ITERATIONS FOR RHOBAR. VBAR = ______, VCOMP = ______, RHOBAR = ______. VBAR HAS BEEN REDUCED TO VCOMP * RHOBAR/RHOTOT". Subroutine VBARIT attempts to find the average density at each axial location using the isentropic density ratio, the stagnation density (RHOTOT) and the average incompressible VBAR (based on weight flow and the cross section). It has failed. VCOMP is the 20th attempt at finding the compressible velocity and has been used to compute the RHOBAR that will be returned. The normally unchanged VBAR is adjusted to agree with these abbreviated results.

For NX = +1, supersonic velocity correction is operating and a message to that effect will appear each time a region of local supersonic flow is encountered on the body, and also when it ends. The body point number where these transitions occur will also be printed.

ON-BODY POINTS

Lower shroud, centerbody or upper shroud

For both compressible and incompressible versions,

I	The index number of the point
X	Axial distance
Y	Height
S	Surface distance from XRI

Compressible version

VCOM	Resultant velocity with compressibility correction applied
VBAR	Average incompressible velocity at a given axial location
MACH	Mach number
CP	Compressible pressure coefficient $\left(\frac{p_i - p_o}{q_o}\right)$
RB/RT	$\bar{\rho}_c/\rho_t$
PS/PT	Static to total pressure ratio, $\left[1 - 0.2\left(\frac{V}{a_t}\right)^2\right]^{3.5}$

Incompressible version

VINC	Resultant incompressible velocity
MACH	Mach number (based on incompressible velocity and compressible flow equations)
CP	Incompressible pressure coefficient $\left[1 - \left(\frac{V_i}{V_o}\right)^2\right]$
PS/PT	Static to total pressure ratio, $1.0 - \frac{1/2\,\rho V^2}{P_t}$

OFF-BODY POINTS

For both incompressible and compressible versions:

Rake number

I	Number of the point (points without numbers are interpolated values at a body)
X	Axial location
V	Vertical location
THETA	Flow angle, $\tan^{-1}\left(\frac{VY}{VX}\right)$
MACH	Mach number
WFRACT	Local cumulative weight flow at a given points on a rake divided by total weight flow at the rake

Compressible version

VX	Axial velocity corrected for compressibility
VY	Vertical velocity corrected for compressibility
VRE	Resultant velocity = $\sqrt{VX^2 + VY^2}$
VBL	Average incompressible velocity at given axial location
RB/RT	$\bar{\rho}/\rho_t$
PS/PT	Same as ON-BODY POINTS

Incompressible version

VX	Incompressible axial velocity
VY	Incompressible vertical velocity
VRE	Resultant velocity = $\sqrt{VX^2 + VY^2}$
PS/PT	Same as ON-BODY POINTS

RAKE WEIGHT FLOW DATA

For each rake the following data are given:

I	Number of rake
X	Axial location of rake
IRAK	Parameter to describe location of rake on the inlet = 1; upstream of inlet = 2; on lower shroud of "scoop" inlet upstream of upper shroud = 3; upstream of centerbody between upper and lower shrouds = 4; downstream of centerbody highlight in upper passage = 5; downstream of centerbody highlight in lower passage = 6; outside and below inlet = 7; outside and above inlet
WDOT	Integrated weight flow for rake
WDOTCA	Specific corrected weight flow at each rake
MACH	One-dimensional Mach number at each rake based on WDOTCA

Graphic Output

Standard CALCOMP plots of PS/PT (fig. 8) and Mach number (fig. 9) distribution against S/CUTOF1, S/CUTOF2, or S/CUTOFH are made for any body whose value of cutoff is not zero. Two curves appear on each plot; one curve is the internal distribution and the other is the external distribution.

If VPERIN not equal to zero, then a plot will be made of the velocity flow field at the off-body points (see fig. 10). At each off-body point a vector will be drawn showing flow angularity and magnitude. Magnitude will be shown by relative size of the vectors (a unit vector will have a magnitude of VPERIN).

DESCRIPTION OF SUBROUTINES.

Figure 15 illustrates the calling relations between the main program and their subroutines.

Program SCIRCL

(A) MAIN SCIRCL — Read all input, call required subroutines for each segment as requested, plot each segment after points are generated by subroutine; list points; test for reworking of geometry if required

Straight Lines

(B) STRAIT — Generate points on a general straight line segment

(C) FNSTRH — Generate points on final straight segment of a body

(D) FRSTSH — Generate points on first straight segment of a body

Bisuper Ellipses

(E) TEST — Test superellipse input to see if mirroring about y-axis is required.

(F) PRELPS — Mirror superellipse input data about y-axis so that slope (1,2) is greater than the slope (1,4) (fig. 11(a))

(G) SUPERC — Generates points on a general bisuperellipse (table I)

(H) FONISØ — Iterate on input conditions to find bisuperellipse exponents

Other Curves

(I) CUBIC — Fit a cubic polynomial between two nonvertical parallel lines

(J) SIMQ	Simultaneous solution of equations to obtain coefficients of the cubic polynomial
(K) LEM	Generates points on a general Lemniscate
(L) MIRROR	Mirror the hub points to obtain the shroud

Direct Interpolation

(M) XYCALC	Executive routine for the following modules: purpose is to generate points "correctly" spaced along the curve defined by a list of input points. Inputs are used to develop double 3-point interpolating polynominal in successive regions along the curve. Polynomals are then used to suggest points, derivatives, etc. which can be tested for spacing as defined by standard criterion (see comments in SPGEN listing)

(N) SGEN
(O) DSTRP
(P) SPGEN
(Q) DNTRPC
(R) FNTRP
(S) FSTRP
(T) FNTRPC
(U) FNTRPA
(V) TLU
(W) LIMIT

Refer to listing for comment card description

Special Calculations; Output to 23Y

(X) WPUNCH	Generate rake points at requested positions; plot rakes
(Y) WRTXY	Write all X, Y coordinates
(Z) AREAA	Compute area
	Picture Plotting
(Z1) DRAW	Plot X-Y meridional plane picture of each inlet segment
(Z2) PLOSIS	Plot frames for inlet picture and label axis
	Utility
(Z3) SINTP	Lagrange three-point interpolation
(Z4) SORTXY	Rearrange the values in an array, x, to increase with increasing index (ascending order); sort y accordingly
	System Library
ERTRAN	Routine which gives FORTRAN access to several UNIVAC 1110 operating system commands. Can be eliminated by defining unit 25 before execution
SYMBOL SCALE LINE NUMBER PLOT	Standard CALCOMP routines needed for all plotting.

Program COMBIN-2D

(A) MAIN COMBIN-2D	Executive calls to INPTR, SEARCH, ANGLEF, SOLVE, OFBDY, and if compressibility correction desired COMCOR. Also, this program calls PLTER if output plots are desired
(B) INPTR	Reads input parameters from unit 5. Also reads 23Y output coordinates and basic flow solution velocities.
(C) CONST	Calculates most constants and intermediate parameters and prints results.
(D) SEARCH	Finds the highlight on each body and calculates areas for all on- and off-body (rake) points. These areas are used in the compressibility correction
(E) ANGLEF	Finds the body surface angle for each point on the inlet
(F) SURF	Calculates surface distance along body as a function of X
(G) SOLVE	Computes linear combination coefficients A, B, C, and D to satisfy input flow conditions. Also calculates the incompressible velocities and average velocity $\overline{V}_i$ (used in compressibility correction) for each point
(H) COMCOR	Applies Lieblein-Stockman compressibility correction
(I) ONBODY	Uses velocities and densities to calculate: pressure ratios, Mach number, flow angles and list all results for points on the body

(J) OFBDY	Same as ONBODY for rakes. Also calculates local fractional weight flows for each rake point
(J) VBARIT	Calculates average density ratio for compressibility correction
(L) INTER	See SCIRCL routine SINTP (duplicate)
(M) SORTXY	See SCIRCL routine SORTXY (duplicate)
(N) INTER2	Calls INTER
(O) INTER3	Calls INTER
(P) INTEG	Performs trapezoidal integration
(Q) CALTIT	Titles plots of pressure and Mach number versus surface distance
(R) PLTER	Plots pressure and Mach number versus surface distance

INPUT/OUTPUT UNITS

SCIRCL	5 - Standard card input
	6 - Standard output list
	4 - Temporary storage; if flag J or E is 1, input to direct interpolation routines is written here
	17 - Saved. If flag A is 0, input for 23Y consisting of X, Y points is written here (6E13. 8)
23Y	5 - Input (= 17 from SCIRCL)
	6 - Standard output list
	7 - Saved. Input for COMBIN-2D is written here (6 E 13. 8) X, Y, V1, V2, V3, etc.
	2-4, 8-18 } Temporary storage

COMBIN-2D 5 - Standard card input, flow conditions, etc.

6 - Standard output list

7 - Input from 23Y

12 - Saved. Input data (for lower shroud) for boundary layer program

13 - Saved. Input data (for upper shroud) for boundary layer program

14 - Temporary storage

C     ..................................................................
C
C        SUBROUTINE SIMQ
C
C        PURPOSE
C           OBTAIN SOLUTION OF A SET OF SIMULTANEOUS LINEAR EQUATIONS,
C           AX=B
C        USAGE
C           CALL SIMQ(A,B,N,KS)
C
C        DESCRIPTION OF PARAMETERS
C           A - MATRIX OF COEFFICIENTS STORED COLUMNWISE.  THESE ARE
C               DESTROYED IN THE COMPUTATION.  THE SIZE OF MATRIX A IS
C               N BY N.
C           B - VECTOR OF ORIGINAL CONSTANTS (LENGTH N). THESE ARE
C               REPLACED BY FINAL SOLUTION VALUES, VECTOR X.
C           N - NUMBER OF EQUATIONS AND VARIABLES. N MUST BE .GT. ONE.
C           KS - OUTPUT DIGIT
C                0 FOR A NORMAL SOLUTION
C                1 FOR A SINGULAR SET OF EQUATIONS
C
C        REMARKS
C           MATRIX A MUST BE GENERAL.
C           IF MATRIX IS SINGULAR , SOLUTION VALUES ARE MEANINGLESS.
C           AN ALTERNATIVE SOLUTION MAY BE OBTAINED BY USING MATRIX
C           INVERSION (MINV) AND MATRIX PRODUCT (GMPRD).
C
C        SUBROUTINES AND FUNCTION SUBPROGRAMS REQUIRED
C           NONE
```

```
C
C        METHOD
C           METHOD OF SOLUTION IS BY ELIMINATION USING LARGEST PIVOTAL
C           DIVISOR. EACH STAGE OF ELIMINATION CONSISTS OF INTERCHANGING
C           ROWS WHEN NECESSARY TO AVOID DIVISION BY ZERO OR SMALL
C           ELEMENTS.
C           THE FORWARD SOLUTION TO OBTAIN VARIABLE N IS DONE IN
C           N STAGES. THE BACK SOLUTION FOR THE OTHER VARIABLES IS
C           CALCULATED BY SUCCESSIVE SUBSTITUTIONS. FINAL SOLUTION
C           VALUES ARE DEVELOPED IN VECTOR B, WITH VARIABLE 1 IN B(1),
C           VARIABLE 2 IN B(2),........, VARIABLE N IN B(N).
C           IF NO PIVOT CAN BE FOUND EXCEEDING A TOLERANCE OF 0.0,
C           THE MATRIX IS CONSIDERED SINGULAR AND KS IS SET TO 1. THIS
C           TOLERANCE CAN BE MODIFIED BY REPLACING THE FIRST STATEMENT.
C

TABLE I. - BISUPERELLIPSE INPUT OPTIONS

[To fit [illegible], $(X/A)^P + (Y/B)^Q = 1$, between two given points (XIN(2), YIN(2)) and (XIN(4), YIN(4)), tangent (except case f) to the specified endlines (lines 1 - 2 and 4 - 5),[a] and [illegible] listed conditions, set the input as indicated. (Do not input P, Q, or N as 1.0.)]

Figure 11	Given [illegible]	Input the [illegible]					
		REEDEN		XIN(3)	YIN(3)	XIN(6)	YIN(6)
		(1)	(2)				
a	One point (X_3, Y_3) (Superellipse)			X_3	Y_3		
b	One exponent, N (P = Q = N) (Superellipse)	N	N				
b	Two exponents, P and Q[d]	P	Q				
c	One exponent P and one point (X_3, Y_3)[d]	P		X_3	Y_3		
c	One exponent Q and one point (X_3, Y_3)[d]		Q	X_3	Y_3		
d	Two points (X_3, Y_3) and (X_6, Y_6)			X_3	Y_3	X_6	Y_6
e	One point (X_3, Y_3) and its slope [illegible]			X_3	Y_3	[illegible]	-100.
f	X-location of inflection point X_3 and its slope $(dy/dx)_3$[b]			X_3	+100.	$(dy/dx)_3$	-100.
g	Curvature CAP at an endpoint (X_E, Y_E) where (X_E, Y_E) may be either (XIN(2), YIN(2)) or (XIN(4), YIB(4))[c]			X_E	Y_E	CAP	200.
h	Curvature at end point (XIN(2), YIN(2)) is to be set equal to curvature at last point of previous segment[c]			XIN(2)	YIN(2)	999.	200.

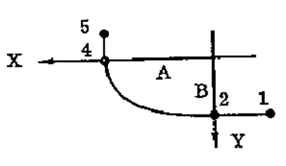
[a]In general, lines 1 - 2 and 4 - 5 need not be [illegible] (fig. 6). If they are not, the bisuperellipse equation is $\left(\frac{X' + Y' \tan w}{A}\right)^P + \left(\frac{Y'}{B}\right)^Q = 1$, where $Y' = Y$ and $X' = X + Y \tan w$ and w is the angle of deviation from [illegible]. The angle w may be positive or negative depending on whether the angle β (fig. 6(a)) between lines 1 - 2 and 4 - 5 is acute or obtuse, $(w = 90 - \beta)$.

[b]For this option: (1) no shear [illegible] is allowed, i.e., the endlines 1 - 2 and 4 - 5 must be [illegible]; (2) one endline must be [illegible]; (3) only one endline is tangent to the curve; the other endline is orthogonal to the curve. See figure 7(f) for detailed restrictions. In general, a bisuperellipse will have an inflection if either P or Q is less than 1 and the other is greater than 1.

[c]For curvature options: (1) no shear [illegible], are allowed; (2) desired curvature, whether via input CAP (g) or previous segment (h), cannot be zero or infinite; (3) for curvature matching option (h) the slope angle at the curvature match endpoint cannot be 90° unless the previous segment is also a bisuperellipse.

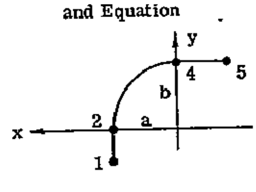
[d]A problem can arise in [illegible] bisuperellipse exponents P and/or Q. The standard SCIRCL orientation is that of a typical inlet internal lip as shown in the sketch:

Standard SCIRCL [illegible]



$$\left(\frac{X}{A}\right)^P + \left(\frac{Y}{B}\right)^Q = 1$$

Typical User Orientation and Equation



$$\left(\frac{x}{a}\right)^p + \left(\frac{y}{b}\right)^q = 1$$

The user's orientation is arbitrary and if different from the standard orientation will be transformed to the standard within SCIRCL by rotation and/or mirroring. For some user orientations the transformations will result in an interchange of exponents [illegible] P = q and Q = p. Since the curvature at point 2 is controlled largely by P and at point 4 by Q, the user must input p as Q and q as P to get the desired curvature [illegible] (Whenever P = q and Q = p then X = y and Y = x and A = b and B = a; however, A and B as such are not input but the output will reflect this interchange.)
The important factor in determining the relationship between P, Q and p, q is the angle of rotation required to bring the user's line 1-2 to a horizontal position. If that angle is an odd multiple of 90° then P = q and Q = p. If the angle is an even multiple of 90° then P = p and Q = a and there is no problem.

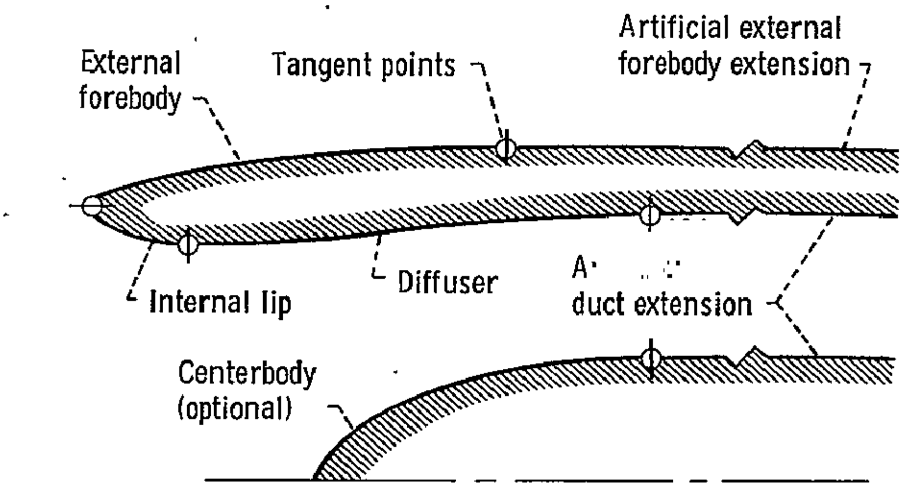

Figure 5. - Typical inlet segmentation.

At any point

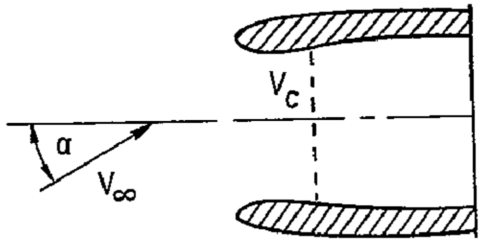
$$\overline{V} = A\overline{V}_1 + B\overline{V}_2 + C(\overline{V}_3 - \overline{V}_4)$$

where A, B, and C are determined by specifying values of:

V_c average axial velocities at the control station

V_∞ free stream velocity

α direction of free stream velocity relative to inlet axis



(a) Single passage inlet.

At any point

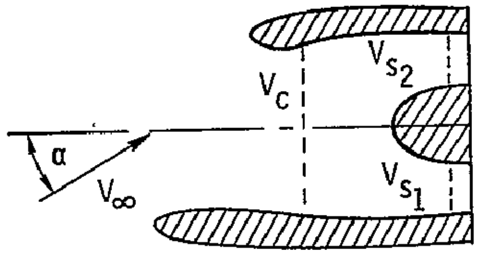
$$\overline{V} = A\overline{V}_1 + B\overline{V}_2 + C(\overline{V}_3 - \overline{V}_4) + D(\overline{V}_5 - \overline{V}_4)$$

where A, B, C, and D are determined by specifying values of:

V_c, V_{s_1}, V_{s_2} average axial velocities at any two of the three control stations

V_∞ free stream velocity

α direction of free stream velocity relative to inlet axis



(b) Two passage inlet.

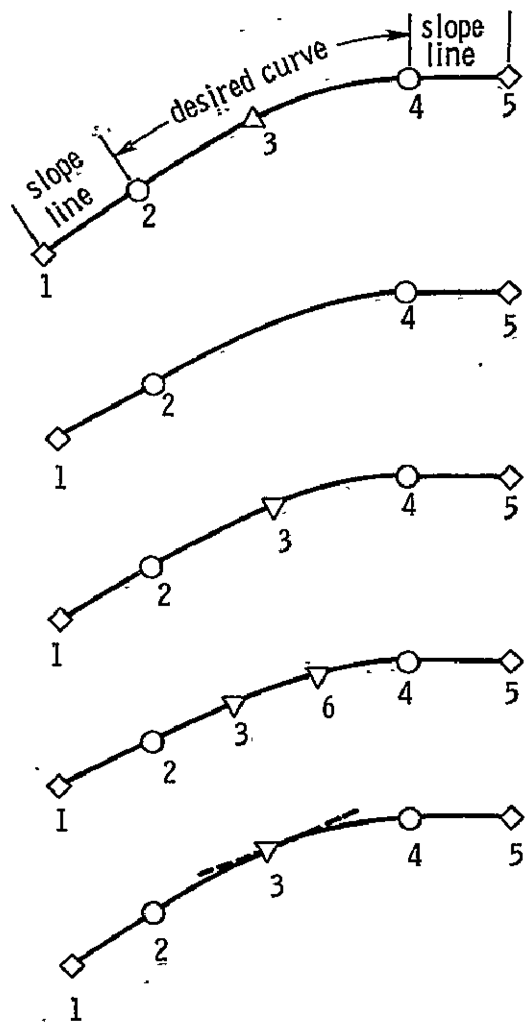
○ Segment endpoints
◇ Slope line endpoints (length of slope line is arbitrary)
△ Optional superellipse point
▽ Optional bisuperellipse point
◺ Optional bisuperellipse inflection point



(a) Superellipse optional point (X_3, Y_3) specified. Exponent N calculated.

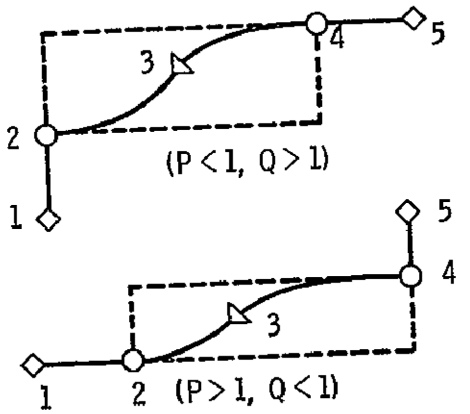
(b) Superellipse exponent N or bisuperellipse exponents P and Q specified.

(c) Optional point (X_3, Y_3) and exponent P or Q specified. Exponent Q or P respectively calculated.

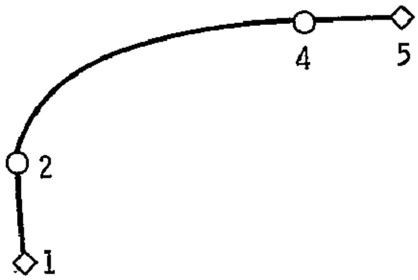
(d) Optional points (X_3, Y_3) and (X_6, Y_6) specified. Exponents P and Q calculated.

(e) Optional point (X_3, Y_3) and slope $(dy/dx)_3$. Exponents P and Q calculated.

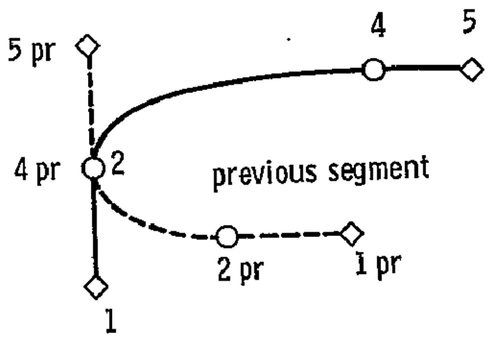
Figure 11. - Sketches for SCIRCL input. Bisuperellipse options.



(f) Bisuperellipse with inflection point. Axial location X_3 and slope $(dy/dx)_3$ of inflection point specified. Note that the slope line requirements for this option are different from all other options. One slope line must be perpendicular to curve and one must be tangent, thus there are two possibilities as shown. Both lines must lie away from and outside the 'box' surrounding the desired curve. Also, shown are the exponents that will result in each case.



(g) Curvature at either point 2 or point 4 specified.



(h) Curvature at endpoint 2 matched to internally calculated curvature at endpoint 4 pr of previous segment.

15. Supplementary Notes

16. Abstract

Computer programs to calculate the incompressible potential flow, corrected for compressibility, in two-dimensional inlets at arbitrary operating conditions are presented. Included are a statement of the problem to be solved, a description of each of the computer programs, and sufficient documentation, including a test case, to enable a user to run the program.
