## NEW THIENOPYRIMIDINE DERIVATIVES, A PROCESS FOR THEIR PREPARATION AND PHARMACEUTICAL COMPOSITIONS CONTAINING THEM

[001] The present application claims priority from French Patent Application No 13/63500 filed 23 December 2013, the entire contents of which are hereby incoproated by cross-reference.

## Field of the Invention

[002] The present invention relates to new thienopyrimidine derivatives, to a process for their preparation and to pharmaceutical compositions containing them.
[003] The compounds of the present invention are new and have very valuable pharmacological characteristics in the field of apoptosis and cancerology.
[004] Apoptosis, or programmed cell death, is a physiological process that is crucial for embryonic development and maintenance of tissue homeostasis.
[005] Apoptotic-type cell death involves morphological changes such as condensation of the nucleus, DNA fragmentation and also biochemical phenomena such as the activation of caspases which cause damage to key structural components of the cell, so inducing its disassembly and death. Regulation of the process of apoptosis is complex and involves the activation or repression of several intracellular signalling pathways (Cory S. et al., Nature Review Cancer 2002, 2, 647-656).
[006] Deregulation of apoptosis is involved in certain pathologies. Increased apoptosis is associated with neurodegenerative diseases such as Parkinson's disease, Alzheimer's disease and ischaemia. Conversely, deficits in the implementation of apoptosis play a significant role in the development of cancers and their chemoresistance, in auto-immune diseases, inflammatory diseases and viral infections. Accordingly, absence of apoptosis is one of the phenotypic signatures of cancer (Hanahan D. et al., Cell 2000, 100, 57-70).
[007] The anti-apoptotic proteins of the $\mathrm{Bcl}-2$ family are associated with numerous pathologies. The involvement of proteins of the $\mathrm{Bcl}-2$ family is described in numerous
types of cancer, such as colon cancer, breast cancer, small-cell lung cancer, non-small-cell lung cancer, bladder cancer, ovarian cancer, prostate cancer, chronic lymphoid leukaemia, lymphoma, myeloma, acute myeloid leukemia, pancreatic cancer, etc. Overexpression of the anti-apoptotic proteins of the $\mathrm{Bcl}-2$ family is involved in tumorigenesis, in resistance to chemotherapy and in the clinical prognosis of patients affected by cancer. Notably, Mcl-1, an anti-apoptotic Bcl-2 family member, is overexpressed in various types of cancer (Beroukhim R. et al., Nature 2010, 899-905). There is, therefore, a therapeutic need for compounds that inhibit the anti-apoptotic activity of the proteins of the $\mathrm{Bcl}-2$ family.
[008] In addition to being new, the compounds of the present invention have pro-apoptotic properties making it possible to use them in pathologies involving a defect in apoptosis, such as, for example, in the treatment of cancer and of immune and autoimmune diseases.
[009] The present invention relates more especially to compounds of formula (I):

More preferably, $\mathrm{R}_{8}$ and $\mathrm{R}_{8}{ }^{\prime}$ represent a methyl group, or $\left(\mathrm{R}_{8}, \mathrm{R}_{8}{ }^{\prime}\right)$ form together a 4-methyl-piperazinyl group or a 4-ethyl-piperazinyl group. In a more preferred embodiment, $\left(\mathrm{R}_{8}, \mathrm{R}_{8}{ }^{\prime}\right)$ form together a 4-methyl-piperazinyl group. In another preferred embodiment, $\mathrm{R}_{8}$ and $\mathrm{R}_{8}{ }^{\prime}$ represent a methyl group.
[030] Advantageously, $\mathrm{R}_{9}$ represents $-\mathrm{Cy}_{1}$, $-\mathrm{Cy}_{1}-\mathrm{alkyl}\left(\mathrm{C}_{0}-\mathrm{C}_{6}\right)$-O-alkyl $\left(\mathrm{C}_{0}-\mathrm{C}_{6}\right)-\mathrm{Cy}_{2}$ or $-\mathrm{Cy}_{1}-\mathrm{alkyl}\left(\mathrm{C}_{0}-\mathrm{C}_{6}\right)-\mathrm{Cy}_{2}$. More particularly, $\mathrm{R}_{9}$ represents $-\mathrm{Cy}_{1},-\mathrm{Cy}_{1}-\mathrm{O}-\mathrm{CH}_{2}-\mathrm{Cy}_{2}$, or $-\mathrm{Cy}_{1}-\mathrm{Cy}_{2}$.
[031] $\mathrm{Cy}_{1}$ preferably represents a heteroaryl group, particularly, a pyrimidinyl group, a pyrazolyl group, a triazolyl group, a pyrazinyl group or a pyridinyl group. More preferably, $\mathrm{Cy}_{1}$ represents a pyrimidin-4-yl group, a pyrazol-5-yl group, a triazol-5-yl group, a pyrazin-2-yl group or a pyridin-4-yl group. In the preferred compounds of the invention, $\mathrm{Cy}_{1}$ represents a pyrimidin-4-yl group.
[032] In another embodiment of the invention, $\mathrm{Cy}_{1}$ represents a heteroaryl group which is
substituted by an optionally substituted linear or branched $\left(\mathrm{C}_{1}-\mathrm{C}_{6}\right)$ alkyl group, an optionally substituted linear or branched ( $\mathrm{C}_{1}-\mathrm{C}_{6}$ ) alkoxy group, a - NR' ${ }^{\prime}$ '" group, or a linear or branched $\left(\mathrm{C}_{1}-\mathrm{C}_{6}\right)$ polyhaloalkyl group, it being understood that $\mathrm{R}^{\prime}$ and R " independently of one another represent a hydrogen atom or an optionally substituted linear or branched $\left(\mathrm{C}_{1}-\mathrm{C}_{6}\right)$ alkyl group.
[033] $\mathrm{Cy}_{2}$ preferably represents a phenyl group, a pyridinyl group, a pyrazolyl group, a morpholinyl group, a furanyl group or a cyclopropyl group. More preferably, $\mathrm{Cy}_{2}$ represents a phenyl group, a pyridin-2-yl group, a pyridin-3-yl group, a pyridin-4-yl group, a pyrazol-1-yl group, a morpholin-4-yl group, a furan-2-yl group or a cyclopropyl group. In the preferred compounds of the invention, $\mathrm{Cy}_{2}$ represents a phenyl group.
[034] Other compounds of the invention to which preference is given are those wherein $\mathrm{R}_{9}$ represents $-\mathrm{Cy}_{1}-\mathrm{Cy}_{2}$ in which $\mathrm{Cy}_{1}$ represents a pyrimidinyl group and $\mathrm{Cy}_{2}$ represents a phenyl group, a pyridinyl group, a pyrazolyl group, a morpholinyl group, a furanyl group, or a cyclopropyl group. Even more preferentially,

in which $\mathrm{R}_{13}$ and $\mathrm{R}_{14}$ independently of one another represent a hydrogen, an optionally substituted linear or branched $\left(\mathrm{C}_{1}-\mathrm{C}_{6}\right)$ alkyl, optionally substituted linear or branched $\left(\mathrm{C}_{1}-\mathrm{C}_{6}\right)$ alkoxy, hydroxy, linear or branched $\left(\mathrm{C}_{1}-\mathrm{C}_{6}\right)$ polyhaloalkyl, or halogen atom. Prefered $\mathrm{R}_{13}$ and $\mathrm{R}_{14}$ groups are as follows: hydrogen; methyl; ethyl; methoxy; ethoxy; isopropoxy; methoxyethoxy; fluoro; hydroxy; trifluoromethyl. Advantageously, $\mathrm{R}_{14}$ represents hydrogen and $\mathrm{R}_{13}$ is located at ortho position of the phenyl group.

[096] Unless otherwise specified, most of the compounds of Preparation 3aa to 3br were obtained using General Procedures 3A, 3B or 3C described below.

## General Procedure 3A:

## Step A:

[097] 1.0 eq. ethyl ( $2 R$ )-2-acetoxy-3-(2-hydroxyphenyl)propanoate (Preparation 3aa$(\boldsymbol{R})$ ), 2.0 eq. of the appropriate alcohol and 2.0 eq. triphenylphosphine were dissolved in dry toluene ( 0.2 M for the phenol), then 2.0 eq. di-tert-butyl azodicarboxylate was added. The mixture was stirred at $50^{\circ} \mathrm{C}$ under nitrogen. After reaching an appropriate conversion the volatiles were removed under reduced pressure, the crude intermediate was purified via flash chromatography using heptane / EtOAc as eluents.

## Step B:

[098] The obtained intermediate was dissolved in ethanol ( 0.5 M for the Step A product) then sodium ethoxide solution ( 1.0 M in ethanol) was added ( $2-5 \mathrm{~mol} \%$ ). The resulting mixture was stirred at room temperature. Additional sodium ethoxide solution was added if conversion was not complete. The mixture was concentrated to half of its volume, then water and brine was added, and it was extracted with ethyl acetate. The combined organics were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated under reduced pressure then it was purified via flash chromatography using heptane / EtOAc as eluents or other solvents, if indicated.

General Procedure 3B: (Tetrahedron Lett. 1994, 35, 5205-5208.)

## Step A:

After addition temperature was allowed to reach room temperature. When the reaction reached an appropriate conversion to the oxirane the mixture was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$, the layers were separated, the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the combined organics were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ filtered and concentrated.

## Step B:

In case of a low conversion glacial acetic acid and $\mathrm{Pd}(\mathrm{OH})_{2}$ were added to the mixture and hydrogenation was continued. When the appropriate reduction occurred, the mixture was filtered through a pad of celite, the filtrate was concentrated under reduced pressure and purified via flash chromatography using heptane / EtOAc as eluents (or other solvents, if indicated).

## General Procedure 3C:

## Step A:

## Step A: [2-(Bromomethyl)phenyl]acetate

[0103] 60.07 g 2 -methylphenyl acetate ( 400 mmol ) and $106.8 \mathrm{~g} \mathrm{NBS} \mathrm{( } 600 \mathrm{mmol}$ ) were placed in a 1 L flask. 500 mL cyclohexane was added, and then with intensive stirring 3.284 g AIBN ( 20 mmol ) was added over 30 min . The mixture was stirred at $80^{\circ} \mathrm{C}$ until no further conversion was observed, then cooled to room temperature. The precipitate was filtered off and washed with cyclohexane. The mother liquor was concentrated under reduced pressure, and the crude product was used in Step B without further purification.

Step B: Ethyl 2-acetoxy-3-(2-hydroxyphenyl)propanoate
[0104] 23.10 g anhydrous $\mathrm{LiCl}(545 \mathrm{mmol})$ and 65.36 g anhydrous $\mathrm{ZnCl}_{2}(479.6 \mathrm{mmol})$ were placed in a 2 L flask, then dried at $160^{\circ} \mathrm{C}$ under 0.1 Hgmm for 1 hour. After cooling to room temperature under argon atmosphere, 26.49 g magnesium turnings ( 1090 mmol ) and 1 L dry pre-cooled $\left(0^{\circ} \mathrm{C}\right)$ THF were added. The resulting mixture was immersed into an ice-bath, and then stirred for 30 min .
[0105] 100 g [2-(bromomethyl)phenyl] acetate -crude product from Step A- ( $\sim 436 \mathrm{mmol}$ ) was dissolved in 120 mL dry THF and was added to the precooled inorganics over 15 min . After addition of the reagent the resulting mixture was stirred for 45 min while keeping the temperature between $0-5^{\circ} \mathrm{C}$. To the mixture 64.82 mL ethyl 2-oxoacetate ( $654 \mathrm{mmol}, 50 \%$ in toluene) was added over 5 mins and the resulting mixture was stirred for another 15 mins.
[0106] From the mixture the remaining inorganics were removed by filtration, and then 500 mL MeOH was added to the filtrate. This mixture was stirred until the intramolecular
acetyl group migration from the phenolic oxygen to the alkyl oxygen was completed. To the mixture 30 mL acetic acid was added then the volatiles were evaporated under reduced pressure. To the residue 350 mL water was added and it was extracted with EtOAc. The combined organic layers were washed with saturated $\mathrm{NaHCO}_{3}$ and with brine, and then dried over $\mathrm{MgSO}_{4}$, filtered and evaporated under reduced pressure. To the residue 100 mL hexane was added and it was stirred for 30 mins at $0^{\circ} \mathrm{C}$. The formed white crystals were collected by filtration and washed with hexane yielding Preparation 3aa-(rac).

## Step A: 1-Methyl-2-(2,2,2-trifluoroethylsulfanyl)benzene

[0135] To a solution of 2.357 mL 2-methylbenzenethiol ( 20 mmol ) in 30 mL dry DMF, 8.292 g potassium carbonate ( 40 mmol ) was added. After 5 min stirring 3.168 mL 2,2,2trifluoroethyl trifluoromethanesulfonate ( 28 mmol ) was added over 5 mins . The resulting mixture was stirred until no further conversion was observed. Brine was added and the mixture was extracted with ethyl acetate. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and evaporated under reduced pressure. The residue was purified via flash chromatography using heptane / EtOAc as eluents.

Step B: 1-(Bromomethyl)-2-(2,2,2-trifluoroethylsulfanyl)benzene
[0136] 3.100 g 1-methyl-2-(2,2,2-trifluoroethylsulfanyl)benzene ( 15 mmol ) and 4.005 g NBS ( 22.50 mmol ) were placed in a 25 mL flask. $10 \mathrm{~mL} \mathrm{CCl}_{4}$ was added, and then 49.2 mg AIBN was added over 5 mins. Mixture was stirred at $80^{\circ} \mathrm{C}$ overnight, then cooled to
room temperature; the precipitate was filtered off and washed with hexane. The mother liquor was concentrated, and used in the next step without further purification.

After cooling to room temperature under argon atmosphere 725 mg magnesium turnings ( 29.81 $\mathrm{mmol})$ and 80 mL dry, pre-cooled $\left(0^{\circ} \mathrm{C}\right)$ THF were added. The resulting mixture was immersed into an ice-bath, and then 3.400 g 1 -(bromomethyl)-2-(2,2,2trifluoroethylsulfanyl)benzene ( $\sim 11.92 \mathrm{mmol}$, from Step B) dissolved in 20 mL dry THF and was added to the pre-cooled inorganics over 10 min . The reaction mixture was stirred for 45 min between $0-5^{\circ} \mathrm{C}$. To the prepared zinc organic compound 3.546 mL ethyl $2-$ oxoacetate ( $3.652 \mathrm{mmol}, 50 \%$ in toluene) was added over 5 min and further was stirred for 15 min . From the mixture the remained inorganics were removed by filtration, and after addition of saturated $\mathrm{NH}_{4} \mathrm{Cl}$ the mixture was extracted with ethyl acetate. The combined organic phase was dried over $\mathrm{Mg}_{2} \mathrm{SO}_{4}$, filtered and evaporated under reduced pressure. The residue was purified via flash chromatography using heptane / ethyl acetate as eluents giving the appropriate lactic ester in racemic form.

The mixture was stirred for 30 minutes at the same temperature then 28.0 g (4-bromo-2-chloro-phenoxy)-trimethyl-silane ( 100 mmol ) was added dropwise. After 2.5 hours 21.3 g MeI ( 150 mmol ) was added dropwise then the cooling bath was removed and the mixture was stirred overnight. ## Step A:

[0866] 1.058 g ethyl (2R)-2-[(5Sa)-5-[3-chloro-2-methyl-4-[2-(4-methylpiperazin-1-yl)ethoxy]phenyl]-6-(4-fluorophenyl)thieno[2,3-d]pyrimidin-4-yl]oxy-3-(2hydroxyphenyl)propanoate (Preparation 8a) ( 1.5 mmol ), 982 mg [1-(4-methoxybenzyl)-
$1 H$-pyrazol-5-yl]methanol (Preparation 9dk) ( 4.5 mmol ) and $1.18 \mathrm{~g} \mathrm{PPh}_{3}(4.5 \mathrm{mmol})$ were dissolved in 30 mL dry toluene, then 1.036 g ditertbutyl azodicarboxylate ( 4.5 mmol ) was added. The mixture was stirred at $50^{\circ} \mathrm{C}$ under nitrogen until no further conversion was observed. The volatiles were evaporated under reduced pressure, and the crude intermediate was purified via flash chromatography using dichloromethane and methanol as eluents.

## Step B:

[0867] $226 \mathrm{mg}(0.25 \mathrm{mmol})$ from the obtained intermediate was dissolved in 13 mL TFA and it was stirred at $100^{\circ} \mathrm{C}$ for 1 hour. The volatiles were evaporated under reduced pressure, then the residue was diluted with DCM , washed with saturated aqueous $\mathrm{NaHCO}_{3}$ solution. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure.

## Step C:

[0868] The obtained crude intermediate was dissolved in 6 mL dioxane-water $1: 1$ and 105 $\mathrm{mg} \mathrm{LiOH} \times \mathrm{H}_{2} \mathrm{O}(2.5 \mathrm{mmol})$ was added. The mixture was stirred at room temperature until no further conversion was observed. ## PHARMACOLOGICAL STUDY

## EXAMPLE A: Inhibition of Mcl-1 by the fluorescence polarisation technique

[02545] The relative binding potency of each compound was determined via Fluorescence Polarisation (FP). The method utilised a Fluorescein labelled ligand (Fluorescein- $\beta$ Ala-Ahx-A-REIGAQLRRMADDLNAQY-OH ; mw 2,765) which binds to the Mcl-1 protein (such that Mcl-1 corresponds to the UniProtKB ${ }^{\circledR}$ primary accession number: Q07820) leading to an increased anisotropy measured in milli-polarisation (mP) units using a reader. The addition of a compound which binds competitively to the same site as the ligand will result in a greater proportion of unbound ligand in the system indicated by a decrease in mP units.
[02546] Method 1: An 11 point serial dilution of each compound was prepared in DMSO and $2 \mu 1$ transferred into flat bottomed, low binding, 384 -well plate (final DMSO concentration $5 \%$ ). $38 \mu$ l of buffer ( 10 mM 4 -(2-hydroxyethyl)-1-piperazineethanesulfonic acid [HEPES], $150 \mathrm{mM} \mathrm{NaCl}, 0.05 \%$ Tween 20, pH 7.4), containing the Fluorescein labelled ligand (final concentration 1 nM ) and Mcl-1 protein (final concentration 5 nM ) was then added.
[02547] Assay plates were incubated $\sim 2$ hours at room temperature before FP was measured on a Biomek Synergy2 reader (Ex. 528nm, Em. 640nm, Cut off 510nm) and mP units calculated. The binding of increasing doses of test compound was expressed as a percentage reduction in mP compared to a window established between ' $5 \% \mathrm{DMSO}$ only' and ' $100 \%$ inhibition' ( $10 \mu \mathrm{M}$ Example 38) controls. 11-point dose response curves were plotted with XL-Fit software using a 4-Parameter Logistic Model (Sigmoidal DoseResponse Model) and the inhibitory concentrations that gave a $50 \%$ reduction in mP (IC50) were determined. Results obtained using Method 1 are presented in Table 1 below; $\mathrm{IC}_{50}$ of Mcl-1 inhibition obtained using Method 1 are not underlined.
[02548] Method 2: An 11 point serial dilution of each compound was prepared in DMSO and $2 \mu 1$ transferred into flat bottomed, low binding, 384 -well plate (final DMSO
concentration $5 \%$ ). $38 \mu \mathrm{l}$ of buffer ( $20 \mathrm{mM} \mathrm{Na} 2 \mathrm{PO}_{4}, 1 \mathrm{mM}$ EDTA, $50 \mathrm{mM} \mathrm{NaCl} 2, \mathrm{pH} 7.4$ ), containing the Fluorescein labelled ligand (final concentration 10 nM ) and $\mathrm{Mcl}-1$ protein (final concentration 10 nM ) was then added.
[02549] Assay plates were incubated $\sim 2$ hours at room temperature before FP was measured on a Biomek Synergy2 reader (Ex. 528nm, Em. 640nm, Cut off 510nm) and mP units calculated. The binding of increasing doses of test compound was expressed as a percentage reduction in mP compared to a window established between ' $5 \% \mathrm{DMSO}$ only' and ' $100 \%$ inhibition' controls ( $50 \mu \mathrm{M}$ unlabelled ligand). 11-point dose response curves were plotted with XL-Fit software using a 4-Parameter Logistic Model (Sigmoidal DoseResponse Model) and the inhibitory concentrations that gave a $50 \%$ reduction in mP (IC50) were determined. Results obtained using Method 2 are presented in Table 1 below; $\mathrm{IC}_{50}$ of $\mathrm{Mcl}-1$ inhibition obtained using Method 2 are underlined.
[02550] The results show that the compounds of the invention inhibit interaction between the Mcl-1 protein and the fluorescent peptide described hereinbefore.

## EXAMPLE B: In vitro cytotoxicity

[02551] The cytotoxicity studies were carried out on the H929 multiple myeloma tumour line.
[02552] The cells are distributed onto microplates and exposed to the test compounds for 48 hours. The cell viability is then quantified by a colorimetric assay, the Microculture Tetrazolium Assay (Cancer Res., 1987, 47, 939-942).
[02553] The results are expressed in $\mathrm{IC}_{50}$ (the concentration of compound that inhibits cell viability by $50 \%$ ) and are presented in Table 1 below.
[02554] The results show that the compounds of the invention are cytotoxic.

Table 1: $\mathrm{IC}_{50}$ of $\mathrm{Mcl}-1$ inhibition (fluorescence polarisation test) and of cytotoxicity for $\mathbf{H 9 2 9}$ cells
Note: IC $C_{50}$ of Mcl-1 inhibition obtained using Method 2 are underlined.

## EXAMPLE C: Quantification of the cleaved form of PARP in vivo

[02555] The ability of the compounds of the invention to induce apoptosis, by measuring cleaved PARP levels, is evaluated in a xenograft model of AMO-1 multiple myeloma cells. [02556] $1.10^{7}$ AMO-1 cells are grafted sub-cutaneously into immunosuppressed mice (SCID strain). 12 to 14 days after the graft, the animals are treated by intraveinous or oral routes with the various compounds. After treatment, the tumour masses are recovered and lysed, and the cleaved form of PARP is quantified in the tumour lysates.
[02557] The quantification is carried out using the "Meso Scale Discovery (MSD) ELISA platform" test, which specifically assays the cleaved form of PARP. It is expressed in the form of an activation factor corresponding to the ratio between the quantity of cleaved PARP in the treated mice divided by the quantity of cleaved PARP in the control mice.
[02558] The results (presented in Table 2 below) show that the compounds of the invention are capable of inducing apoptosis in AMO-1 tumour cells in vivo.

## EXAMPLE D: Anti-tumour activity in vivo

[02559] The anti-tumour activity of the compounds of the invention is evaluated in a xenograft model of AMO-1 multiple myeloma cells.
[02560] $1 \times 10^{7}$ AMO-1 cells are grafted sub-cutaneously into immunosuppressed mice (SCID strain).
[02561] 6 to 8 days after the graft, when the tumour mass has reached about $150 \mathrm{~mm}^{3}$, the mice are treated with the various compounds in a daily schedule (5-day treatment). The tumour mass is measured twice weekly from the start of treatment.
[02562] The compounds of the invention have anti-tumour activities (tumour regression) in the AMO-1 multiple myeloma model with $\Delta \mathrm{T} / \mathrm{C}$ (qualification parameter of the activity of a product, which is defined as the ratio tumour volume of the treated group / tumour volume of the untreated control group) ranging from -26 to $-100 \%$. The results obtained show that the compounds of the invention induce significant tumour regression during the treatment period.
