Subject : Contract for the Consultant Services for
Surakarta Water System No. 01/WS.S/I/AID/78
dated 28 October 1978 as Amended 23 July 1981.

Dear Sir,

In accordance with Section 4.12 and Appendix I of the
subject Contract, we are pleased to submit fifteen
copies of the Monthly Report No. 41 for the month of
February 1982.

We trust that this report will meet with your approval.

Very truly yours,

BURNS & MC DONNELL ENGINEERING CO.

SECTION I
GENERAL

I-A NARRATIVE SUMMARY

Identification of the final forty three public latrines was provided by DPU and the drawings have been revised accordingly. The Consultant has proposed that the Phase III contractor be assigned two of the new units to upgrade for the one that was razed by DPU shortly after he began work (see Monthly Report No. 38) as the total cost for the two would be less than that for the one torn down. Tender Documents for the balance of the public latrines upgrading are being prepared.

The distribution main contractors are nearing completion of their work. The replacement of the old transmission main along Jl. Kol. Sutarto has been completed and test approved. During the test some of the old piping within the pipe gallery shifted and the Surakarta Water Enterprise is taking the opportunity to undertake repairs to the reservoir while it is out of service. Other replacement piping is being laid as indicated on Appendix V. The contractors are still working the stream and drainage span work and one of the contractors has paid to the Railway Enterprise costs for his crossing.

Notice to Proceed was issued by the Director General Cipta Karya on 04 February 1982 for the procurement of Operations and Maintenance tool and equipment list reported as approved in the

previous report. The Consultant has issued the purchase orders and is preparing a draft for an amendment to the Contract in order for Cipta Karya to obtain the necessary proforma letter of credit which will be used for import tax exemption.

Meetings were held 17 and 18 February 1982 in the offices of Cipta Karya for the evaluation of quotations received for the water well pumping equipment obtained by the Consultant in the United States (see Appendix VI.) An agreement was reached in the latter meeting to purchase the lowest responsive bid for the various items on the list. It is anticipated the Director General will issue his Notice to Proceed with that procurement by mid March.

Approval was also provided to purchase from local suppliers the proposed radio equipment and a shop air compressor for the Surakarta Water Enterprise. By months end, the radio equipment was being used.

The leak survey was again started as expected the first of the month but was hindered during the month for various reasons. Primarily due to the Kali Pusur which overflowed its banks at Cokot tulung on the evening of 17 February 1982. This flood was not as high as those of December 1980 and February 1981 but was much more destructive. A report was made and is included herein as Appendix VII.

The Surakarta Water Enterprise is starting to install a section of the new distribution pipe along Jl. Jajar in order to supply the housing area assigned for the City management which is under construction in Kecamatan Laweyan. The

Project will reimburse the installation costs when the FY 1982/1983 DIP is made available. Tender Documents are being reviewed for issue to the prospective contractors for Phase III distribution mains in the very near future.

I-B PROBLEMS AND PROPOSED SOLUTIONS

Excessive leakage around Surakarta has been the subject of various means of communication and continues to be a major problem. Prime consideration must be devoted to rectifying the situation by the Surakarta Water Enterprise without further delay. With the employment of radio equipment, it is believed the most severe leaks can now be reported to the Base Station operator by any other radio equipped organization provided the Surakarta Water Enterprise uses it 24 hours per day as they are supposed to.

Poor workmanship continues to be evident in the Surakarta Water Enterprise regarding the new service connections being made. Several tests were delayed on the Phase I & II work because of the service connections made by personnel of the Surakarta Water Enterprise leaked. Sometimes it was found new service clamps were of the wrong pipe size so rubber straps were used by the installer in an effort to stop the leak, also concrete. Sometime, for the lack of a proper tool, the man tried to punch a hole through the distribution main instead of drilling - that broke the pipe and again rather than properly fixing the damage it was covered up. Personnel of the Surakarta Water Enterprise should be terminated for cause when such conditions are found when it is known who does the work and that he has been through O & M training (see Appendix VIII for photograph of such work).

SECTION II
ADMINISTRATION

II-A SUBMISSIONS/APPROVALS.

Consultant's Invoice No. 41 for January 1982 U.S. Dollar reimbursable expenses was submitted to Cipta Karya on 06 February 1982 and was approved by Cipta Karya on 09 February 1982.

Consultant's Rupiah Invoice No. 26 for January 1982 submitted to Cipta Karya on 12 February 1982 was approved on the same date.

These submittals are in accordance with the Contract Appendix II, Page II-15.

II-B CONTRACT STATUS.

Appendix I shows the continuation of Consultant's effort in man-months from the beginning of the Contract.

Appendix II shows the billings of approved expenditures to date.

II-C PERSONNEL.

The Surakarta Office personnel in February 1982 were as follows :

E x p a t r i a t e s

- James F. Baucom, Acting Chief Engineer
arrived 26 September 1979

- Albert G. Ringler, O & M Specialist
arrived 09 May 1980

Indonesian Professional and Technical :

- Mohammad Khalil, Materials Coordinator
arrived 09 October 1978

- Mohamad Syarif Lembah, Construction Supervisor
arrived 01 May 1979

- Gatot Bramono, Inspector
arrived 19 November 1979

- Soewanto, Inspector
arrived 11 March 1980

- Abdul Rasyid, Inspector
arrived 11 June 1981

- Susena, Draftsman
arrived 20 October 1980

Administrative :

- Dradjat Atmardjo, Office Manager
arrived 02 October 1978
- Haryani Pudiyastuti, Secretary
hired 17 November 1980
- Rubiyo, Clerk
hired 01 November 1978
- Pamudji Rahardjo, Driver
hired 02 October 1978
- Sutrisno, Driver
hired 02 April 1979
- Puranto, Driver
hired 17 October 1980
- Tukino, Office Boy/Labor
hired 10 November 1980

Bids were received and evaluated by the Consultant for the water well pumping equipment. Two meetings at the offices of Cipta Karya provided agreement on the selection of equipment and the best responsive bid (see Appendix VI). Approval to proceed will be forthcoming during the month of March.

III-B CONSTRUCTION SUPERVISION

The Phase I contractor installed his pipe under the railroad tracks along with various stream crossings.

He has successfully tested the new ø 450 mm AC pipe installed to replace the old transmission main along Jl. Kol. Sutarto. After it is flushed and Surakarta Water Enterprise is finished with repairs to the Jenabres reservoir, the replacement main will be put into service. This same contractor is fabricating the bridge crossing over the Kali Anyur. When in place it will be connected to the branch tee at the new transmission main thus completing a replacement from Jl. Tagore north to the Pasar Nusukan (see Appendix V). The Phase I contractor has installed approximately 5 % more pipe than was scheduled. His total contract completion stands at 76.257 %.

The Phase II contractor has devoted most of the month of February installing fire hydrants, pipe along miscellaneous Jalans and stream crossings. His pipe installed totals presently approximately 2 % more than was scheduled. His total contract completion stands at 70.39 %.

The Surakarta Water Enterprise has been requested by the Mayor of Surakarta to do what is necessary to provide water to the new housing area being built to accomodate the City employees in the western part of the City. They have selected to do part of the Phase III work by installing ø 200 mm PVC pipe from the Section "C" transmission main terminal up Jl. Jajar. The Project will reimburse them when the FY 1982/1983 funds are available.

Activities that relate solely to the installation of pipe, valves and fittings have been done as is noted below :

<u>PHASE</u>	<u>KELURAHAN</u>	<u>INSTALLED</u>	<u>TESTED</u>
I	Jebres	91.2	63.7
I	Manahan	100	100

II	Panularan	100	64.7
II	Misc. Jalan-Various		
	Loc.	88.6	14.6
II	Replacement - Various		
	Loc.	10.8	-o-
	TOTAL PH. II	97.9+CO	75.9

Both contractors will endeavor to complete all remaining work during the month of March as is the policy of the Project. Some work which was to have been given to them as a change order is now most probably going to be held for the next phase of the distribution network to be tendered. The tender documents for Phase III are presently being reviewed and will be issued to prospective contractors as advised by the Project. Present overall completion status of the distribution piping construction stands at 63.9 %.

Progress on the bath houses and public latrines was not as great as it should have been because of financial situations of the contractors. It was necessary that they complete 20 to 25 % of their work before submitting their first bill. Most waited until 30% had been done before doing so and it proved to be too long when they were faced with the administrative delay regarding handling payments. All three contractors are to have received their first payment by the end of February so work should pick up again. The Surakarta DPU returned the list of the balance of 43 public latrines with new identifications and the drawings were modified accordingly. It was found that two of the 43 locations could be upgraded for the value of the one previously razed by DPU for a street widening project. It is anticipated approval will be received to make the change. The remainder 41 public latrines will be offered for bids as soon as possible. The anticipated budget will exceed the U.S. Dollar 100,000.00 by slightly over ten percent. As funds were not completely spent for the water well pumping and O & M equipment, it will be presented for approval to reallocate funds from one "DRA" to allow all of the available public latrines to be upgraded.

The entire bath house/public latrine construction work is considered to be 42.2 % complete at this time. The bath houses overall are considered to be 61 % as compared with 12.3 % completion of the planned 103 public latrines. Completion status of the individual contract phases is as follows :

<u>PHASE</u>	<u>ITEM</u>	<u>ITEM</u>	<u>\$ PER</u>	<u>\$ TOTAL</u>
I	BH 3-4	75.6	17.127	
I	BH 3-6	98.4	30.526	
I	BH 3-8	51.5	13.073	
I	14 Public Latrines	12.2	2.540	
TOTAL PHASE I				63.266
II	BH 3-1	53.3	10.377	
II	BH 3-3	65.8	11.186	
II	BH 3-5	19.7	3.515	
II	BH 3-7	62.7	11.018	
II	15 Public Latrines	34.6	9.711	
TOTAL PHASE II				45.807
III	BH 3-2	61.6	10.469	
III	BH 3-9	62.0	9.542	
III	BH 3-10	56.5	8.802	
III	31 Public Latrines	10.9	5.691	
TOTAL PHASE III				34.495

Work on bath house No. 3-5 was halted after the adjacent river flooded the area but it is thought work may be able to start again with the addition of 80 centimeters of fill to the area and raise the walls a like amount. There is excess fill now from the replacement transmission main work in the nearby area of Jebres which has been offered by the Consultant as a solution for both cleanup and fill.

III-C GROUNDWATER EXPLORATION AND WELL DEVELOPMENT PROGRAM

Completed.

Completed.

III-E O & M TRAINING AND ASSISTANCE PROGRAM

The leak survey was started again first of February but only minimal effort was made to repair any of the deficiencies recorded. As with previous areas canvassed most if not all meters had not been read in many months. Several locations were found in a very small area to be receiving water from previously cut distribution pipes which were not properly capped or plugged when the service was discontinued. Appendices IV and V indicate the areas covered by the leak survey and the work underway or completed with regard to the replacement program.

The Consultant received a Notice of Award to proceed with the procurement of all O & M equipment and tools. Before months end all Purchase Orders were written and sent to the various suppliers. The items designated to be procured locally were also handled in a manner so that USAID can reimburse purchase of the shop air compressor and radio equipment. The radio equipment was received and in use before the end of February on funds provided by the Surakarta Water Enterprise. The Project has been asked to temporarily finance the purchase of the shop air compressor.

Several days of productivity were lost as a direct result of the flood on the night of 17 February at Cokrotulung. A good bit of damage resulted to Surakarta Water Enterprise property. The emergency pipe which spanned the Kali Pusur was des-

troyed along with the bridge on which it was installed. Also lost was several cubic meters of the south embankment. The falls also receded to the encasement of the ϕ 450 mm transmission main stream crossing. That pipeline is two meters from the centerline of the new ϕ 500 mm pipeline which was installed under this project and which lays upstream of the older pipeline. Neither of the two pipelines failed however a void did result and river water coursed under both so that remedial work is required. The Surakarta Water Enterprise was given recommendations immediately by the Consultant and a report confirming those recommendations is included her in as Appendix VII. The Mayor of Surakarta is to be commended for his actions and concern during the emergency. Appreciation of the people of Surakarta was extended to the Military and Boy Scouts who worked to shore up the area around the pipelines and to the Citizen Band Radio Club who set up a radio at Cokrotulung 24 hours per day monitoring the river and coordinating activities between there and Surakarta through use of the designated emergency Channel 37.

During the test on the replacement ϕ 450 mm at Jebres the valve inside the pipe gallery of the reservoir was closed. Although this was previously tested to 7 atmospheres, during this test the tee adjacent to the valve moved 3 centimeters north. The space which was in the sleeve coupling at that location was taken up completely so the pipe could not separate but did cause a leak. The pipe will be disassembled at the affected joint and repositioned a spacer will be installed within the sleeve coupling to prevent a reoccurrence.

To facilitate testing the asbestos cement pipe the Consultant wrote a special test procedure. Past experience has shown the pipe will absorb water to some extent and will swell as does wood when wet. By allowing the pipeline to absorb water without pressure for at least four days, there resulted a good test.

The Consultant has requested the Project to proceed with the necessary modifications to the existing O & M Facilities by building the warehouse shelving, bins, shop tables and the equipment foundations. As of this writing nothing has been done.

III-F METER REPAIR TRAINING PROGRAM

Completed.

III-G NEW WATER DISTRIBUTION NETWORK DESIGN

Completed.

III-H CONFERENCES

02 February 1982 : Coordination meeting with the two distribution main contractors and SWE wherein it was pointed out SWE was to make an exploratory excavation near Pasar Legi to determine exact condition of the existing main to verify need to replace it. The Contractors were cautioned to not use more than one gasket per flanged joint.

03 February 1982 : Coordination meeting with the three contractors involved with bath houses and public latrines wherein it was stated the latrine work should be completed prior to starting another. It was also suggested Phase II and Phase III contractors submit their invoices.

09 February 1982 : Coordination meeting with the two distribution main contractors wherein Phase I contractor was instructed to complete connections to the ϕ 500 mm transmission main first priority as the northern part of the City needs supply of the water from it. After that, the replacement of the ϕ 450 mm pipe along Jl. Kol. Sutarto may be done. Phase II advised there is a greater quantity of stream crossings than scheduled - he was referred to Page II-3 of the Contract Documents.

10 February 1982 : Coordination meeting with the three contractors involved with bath houses and public latrines wherein approval was given to the use of a bronze ground key stop at the service connections provided by the contractor along with the submitted floor drain. It was stated the new float valves must be one inch size. The faucet as submitted by Phase II was not approved - it was suggested he use same as was installed at BH 3-6. The Phase II contractor was given approval to use an existing foundation found at PL III-Ci-1 while excavating for the septic tank as one of the walls of that septic tank.

11 February 1982 : Site visitation by representatives of USAID including the Director - Office of Project Development - Bureau For Asia out of Washington and the Deputy Director of The World Bank, Jakarta. A briefing of the Project and goals/accomplishments was provided followed by a tour of the Bath Houses

under construction and Public Hydrants already in use by the public.

16 February 1982 : Coordination meeting with the two distribution main contractors wherein Phase I contractor advised he had paid for his crossing of the railroad and the other contractor was advised to do the same.

17 February 1982 : Coordination meeting with the three contractors involved with bath houses and public latrines wherein it was indicated a time extension would be requested due to problems as have been encountered with DPU. All contractors were cautioned to coordinate service connections to the distribution mains with SWE.

Meeting in the offices of Directorate of Sanitary Engineering - Logistics, Jakarta to review bids received for the water well pumping equipment. Of the six main items of the Tender Documents, it was agreed in this meeting that all parties could accept those submitted lowest for items 2, 3, 4 and 6. Item 1 and 5 were submitted by a company which handled pumps of which part originated outside the USAID approved Code 911 Countries. The Consultant was requested to obtain more information from the supplier regarding the percentage of the pump parts value which was imported to the United States in relation to the total offered price for the item for export from the United States. Question of spare parts was also raised. Regarding the lower price to use Indonesia Flag carrier for the generator sets, USAID approved it. Final decisions on all items was tabled to the next meeting scheduled for 18 February 1982.

18 February 1982 : Meeting at the Conference Room of the Directorate of Sanitary Engineering in Jakarta to complete review of proposals submitted for the water well pumping equipment. It was agreed in this meeting to proceed with the lowest responsive bid for each item regardless of the circumstances with the understanding information would still be obtained for USAID on the pumps so that they can proceed to obtain necessary waivers if required. It was further agreed to purchase one spare pump unit for each well which consisted of pump, motor and cable. For the generator sets, the spare parts were established and agreed to be of approximately ten percent of the value of the original bid. All agreements were confirmed by the Consultant (see Appendix VI).

22 February 1982 : Meeting with SWE regarding the Flood damage at Cokrotulung and the Consultant's recommendations for corrective action (see Appendix VII for the complete report).

23 February 1982 : Coordination meeting with the two distribution main contractors wherein final items of work were discussed. It was stressed that all work should be complete by the end of March.

III-J ACTIVITIES PLANNED FOR NEXT MONTH

Continue with all construction activity. Follow up on water well pumping equipment procurement. Prepare Tender Documents for the balance of public latrine restoration work. Prepare Tender Documents for Phase III distribution main work. Hold final inspections where Phase I and Phase II contractors call for them. Continue with leak survey and replacement programs. Train SWE people in the proper use and care of the radio equipment as part of the O-J-T of the O & M training.

RECEIVED

Ir. H. Sosanto Martodiningrat,
Director,
Directorate of Sanitary Engineering,
Directorate General Cipta Karya,
Ministry of Public Works,
Jalan Pattiura, 20,
JAKARTA, SULTAN.

Dear Sir,

Subject : Request for approval to proceed with Procurement of well water pumping equipment for
Bumdesita letter ref. No. 100 dated 10 February
Reference : 1. Our letter No. 71/BM/TPL/2 dated 10 February
1982 of the same subject
2. Meeting at Office of BM Logistics in Jakarta
17 February 1982
3. Meeting this date in BM Conference Room with
members of your staff, Tender Committee, BMID,
BM-1, PEAMBILO and the underlined.

The results of referenced meetings has been to procure subject equipment identified in section A and enclosure of our
reference (3) letter above with your approval as follows :

- A. THE PLUMBER - A Division of GMA Inc., P.O. Box 489,
Wilmington, North Carolina 28477 - Mr. John May
to supply three 1 ton. 3 plus one extra pumping unit
for each well (4 units total) for a total price of
approximately US. dollars fifty thousand three hundred
ninety (US. \$50,390.00).
- B. MAGNA EQUIPMENT - 73 Loring Street, San Francisco,
California 94108 - Mr. C.L. Wittersen to supply Items
2 and 3 for a total price of US. dollars
Eighty thousand two hundred ninety four and 00/100
(US. \$80,294.00).

 Our Ref. : b3/14/112/82

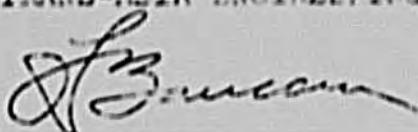

18 February 1982

- C. CHLORINATOR INCORPORATED - 733 Northeast Dixie Highway, Jensen Beach, Florida 33457 - Mr. Joseph P. Hentz to supply Item 3 for a total price CIF Semarang of U.S. Dollars Four Thousand Six Hundred Thirty (US\$ 4,630.00).
- D. CUMMINS MID-AMERICA, INC. - Industrial Division, 1203 Czark, North Kansas City, Missouri 64116 - Mr. Frank Parish to supply Item 4 for a total price CIF Semarang of U.S. Dollars Seventy Four Thousand Nine Hundred Twenty Five (US\$ 74,975.00) to be shipped via PT Djakarta Lloyd Ship Lines plus air to U.S. Dollars Seven Thousand Five Hundred (US\$ 7,500.00) in reconditioned spare parts.

By proceeding with all of the above, of the two hundred thousand dollars allowance for those things per Implementation Letter No. 8, the total budget will be US\$ 156,439.66 (U.S. Dollars One Hundred Fifty Six Thousand Four Hundred Thirty Nine and 66/100).

We trust this will keep you well informed and look forward to receiving your early approval to proceed in this manner.

Very truly yours,
 BURNS & MCDONNELL ENGINEERING CO./

Item #4 - Generator and Transfer Switch

CUMMING MID-AMERICA, INC. INDUSTRIAL DIVISION proposes to deliver to you the machinery described herein, f.o.b. of origin at prices stated in accordance with the terms and conditions on the back of this quotation.

We are pleased to submit the following spare parts list for NT 855 GC rated 155 K.W. and NTA 855 GC rated 200 K.W.

Parts listed below are applicable to both units.

1	AR 07110	Main bearing set
1	3006737	Rear cover seal .
1	3004316	Accessory drive pulley seal
2	204586	Thermostat
2	186780	Thermostat seal
2	215356	Water pump belts
2	178703	Fan belts
1	200519	Alternator bolt
12	214950	Rod bearings
12	WF 2051	Corrosion resistor
6	FS 1201	Fuel filter
1	3008101	Cylinder head
1	3000886	Water pump
1	3014456	Engine gasket set

Parts listed below are applicable to NT 855 GC (155 K.W.) unit only.

6	3018329	Injector
3	3014602	Cylinder kits

Note: 3014602 cylinder kit contains the following part numbers that are common to both units:

3	213740	Liners
3	215091	Packing
3	183049	Packing
3	215090	Crevice seals
2	P10-6632	Air cleaner element
2	P10-6641	Air cleaner element

Parts listed below are for the A.C. generator.

1	3020009	Regulator
1	3020020	Rectifier assembly
1	2020..1	Surge suppressor

Full price C.I.F. Port of Semarang.....\$7,430.00

Note: Above parts list is for spare parts only. It does not contain enough parts to overhaul units.

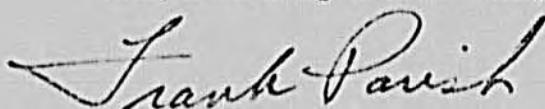

Delivery: 120 - 180 days from date of approved order

Terms: Per your Bid Solicitation

Note: Above price does not include taxes if applicable.

Note: Above price is firm based on order within 60 days from date of this document.

Respectfully submitted,

Frank Parish:jc

Manager - Generator Sales

R E P O R T
KALI PUSUR FLOOD DAMAGE TO THE
SURAKARTA WATER PROJECT SOURCE
AT COKROTULUNG SPRINGS

FEBRUARY 1962

A. General

On Wednesday February 17, 1962 at approximately 19.00 hours the Kali Pusar reached flood stage at Cokrotulung flowing over the riprap protective embankments on both north and south sides. The turbulence caused as a direct result thereof began to undermine foundations to the bridge and led to the destruction of said bridge, pipe carried by said bridge for emergency purposes, drainage structures, riprap retaining walls and seriously endangered the entire water supply to Surakarta by the erosion of the riverbed to and under the two transmission lines which cross to the City side of the Kali Pusar from the Spring.

The attached photographs indicate the condition of the area in February 1961 following a similar situation and the present condition.

Based upon site investigations beginning the day following the flood, the following damage occurred and is recapitulated herein.

B. Damages

1. Erosion

1.1. Picture No. 1 shows the aerial view of the area from down stream of the falls towards the west and Mt. Merapi.

1.1.1. Picture No. 1A is the same picture with the eroded areas superimposed in red ink.

1.2. Picture No. 2 shows the aerial view of the area from up stream of the falls towards the east and the Surakarta/Yogyakarta airport.

1.2.1. Picture No. 2A is the same picture with the eroded areas superimposed in red ink.

- 1.3. Picture No. 3 is from the north embankment upstream of the falls and shows soil erosion around air valve vault and concrete cutoff wall of new Ø 500mm transmission main stream crossing. In the background is a complete view of the south embankment erosion.
 - 1.4. Picture No. 4 shows the collapse of the upstream riprap and exposed pipe encasement of the new Ø 500mm transmission main on the right.
 - 1.5. Picture No. 5 is a closeup view of the flow of water under the new Ø 500mm transmission main and cutoff wall with riprap still good atop of the pipe encasement.
 - 1.6. Picture No. 6 is a closeup view of the most southern end of the concrete pipe encasement and erosion near the new Ø 500mm transmission main.
 - 1.7. Picture No. 7 shows the erosion of the waterfalls from where they were on the right to the pipe encasement of the Ø 450mm transmission main plus the depression beyond the new Ø 500mm transmission main which allowed flow under the pipe encasements and cutoff wall.
 - 1.8. Picture No. 8 is a closeup view of the void between the Ø 450 transmission main concrete encasement and the riprap protection above.
 - 1.9. Picture No. 9 shows the balance of erosion of the south embankment past the drainage structure from the diversion chamber.
2. DRILLING STRUCTURES AND PIPING
 - 2.1. Picture No. 10 shows the square drainage pit broken from drain line at 11 o'clock from it to the diversion chamber and discharge drain to the left towards the hydroelectric plant.

3. Bridge and Emergency Ø 300mm Piping

3.1. Picture No. 11 shows the remains of the bridge and Ø 300mm pipe which crossed the Kali Pusur from the pump adjacent to the main spring to the Grit Chamber.

3.2. Picture No. 12 shows the emergency pipe and its support beam and large tree to the left which may have been involved as its exact origin is unknown.

3.3. Picture No. 13 Shows only water where the south side of the bridge once stood, and at the level from which this photo was taken.

C. Salvage

1. Emergency Ø 300mm mechanical joint pipe and fittings may be reused after some means of support is provided.

D. Facts of the Project

1. The present Sorakarta Water Supply Project is funded by a loan from the United States (U.S.A.I.D.) to the amount of U.S. \$6,300,000 for materials and services and from DIP, ABP funds for installation/construction contracts.

2. The total Project completion in February is 89.9% with 86% of the total funds expended.

3. Work on new Ø 500mm transmission main and all required modifications to the structures at Cokrotulung Springs was accepted from the construction contractor in October 1989.

4. The Kali Pusur crested at 210.10 meters above sea level (MASH) on 28 December 1989.

5. The Kali Pusur crested at 210.25 "ASH on 93 February 1990 and Consultant recommended that PDAM-Sorakarta build a protection wall inside division chamber to protect drinking water.

5. The Kali Pusur crested at 209.92 MSL on 17 February 1982 and was kept from mixing with the Surakarta drinking water supply by the protection wall built by PDAM in the Division Chamber.
6. The new transmission main was put into service from Cobrotulung Springs to the Kartasura reservoir on 08 December 1980.

E. Causes of Problem

1. The rainy season of the area extends for a period of approximately six to seven months. The three floods noted above all occurred from 28 December to 17 February - the latter half of the rainy season when soil is at its highest saturation point.
2. The Kali Pusur receives its water shed on the slopes of Mt. Merapi and the foothills therefrom.
3. The Kali Pusur at Cobrotulung is narrowed to approximately twenty meters; at the area affected by this report which causes water to back up when the volume is increased by heavy rains upstream.

F. Recommendations of the Consultant

1. Immediate

- 1.1. Fill voids in stream channel and riprap with mass concrete including the area under the transmission main pipe encasement.
- 1.2. Construct a cutoff wall downstream of the old # 450cm transmission main adjacent to its concrete encasement using the design of the newer transmission main of this project.
- 1.3. Replace embankment riprap on south side of Kali Pusur with the intent of completely replacing the work during the dry season.

1.4. Replace emergency β 300mm pipe across the Kali Pusur using a cable support anchored at the wall of the spring and the tunnel.

2. This Year in Dry Season

2.1. Remove all riprap and straighten the south embankment so that the Kali Pusur will be at least thirty meters in width.
2.2. extend the two transmission main stream crossings further south at the lower elevation to accomodate wider stream.

2.3. Construct a reinforced concrete wall on the south side to protect area from erosion and to contain spring waters to the south of it.

2.4. Construct an ogee curved wall at the face of the falls along the entire width with reinforced concrete to prevent future undercutting of the river bed.

2.5. Inspect the riprap upstream of the transmission main stream crossings for voids and fill with mass concrete where found.

2.6. Inspect all other stream crossings from Cokrotulung to Surakarta and repair as may be required. This to become annual standard procedure for PDAM.

3. Future

3.1. Refrain from placing any material in the river bed that may create turbulence.

3.2. Conduc periodic river cleaning activities to remove collected debris in the affected area.

3.3. Reconstruct a permanent pedestrian bridge.

3.4. Reshape river upstream and install restraint structures at intervals to break velocity of conter s of Kali Pusur and catch debris.

4. Budget

4.1. Preliminary projections of the work involved would indicate a budget of at least rupees ONE HUNDRED SEVENTY SEVEN MILLION TWO HUNDRED SIXTY THOUSAND (Rp. 177,260,000/-) would be required.

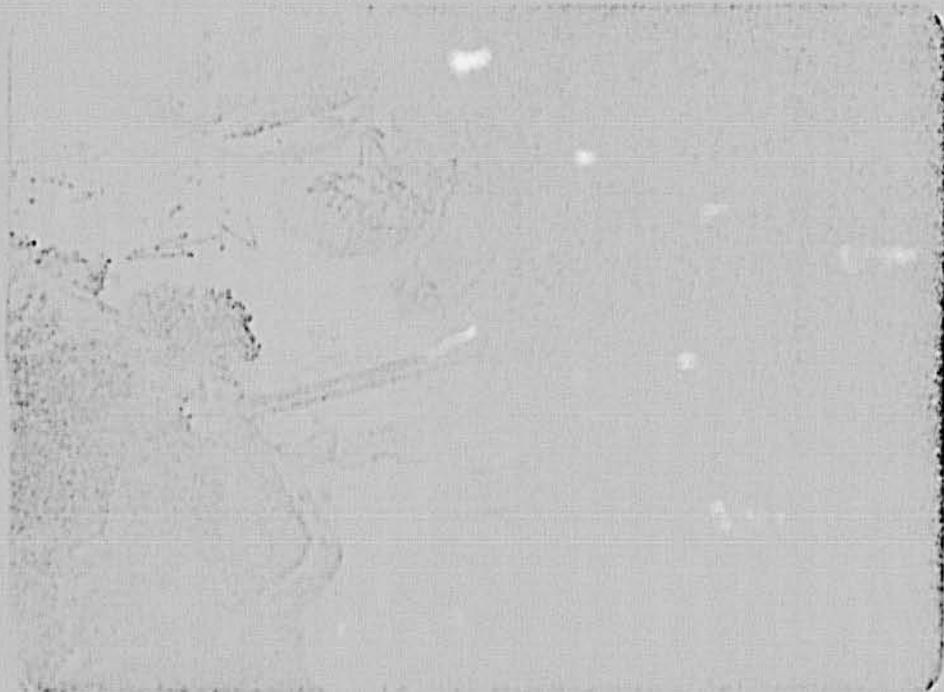

Picture 1 : Aerial view of the area from down stream of the falls towards the west and Mt. Merapi.

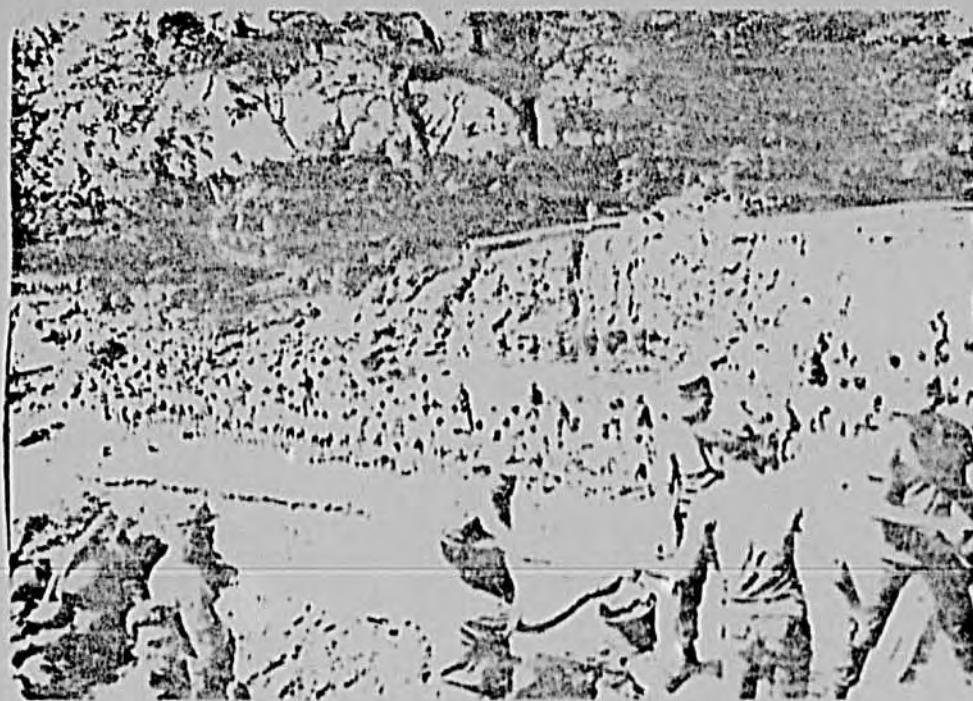

Picture 1 A : the same picture with the eroded areas super imposed in red ink.

Picture 2 : Aerial view of the area from upstream of the falls towards the east and the Sungkarta/Togjakarta highway.

Picture 2 A : the same picture with the crooked road after imposed in red ink.

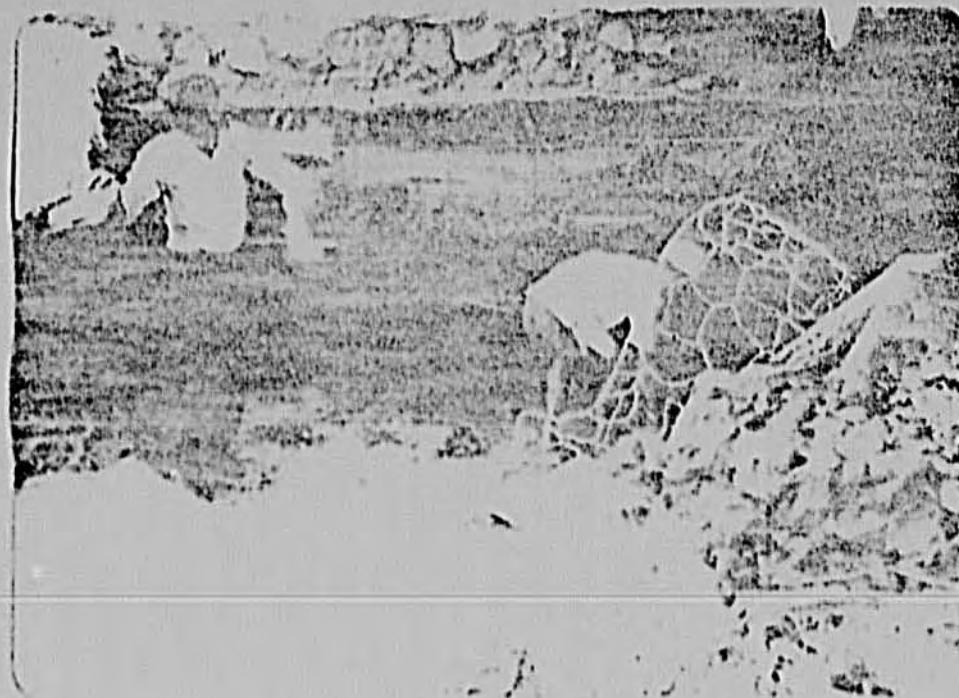

Picture 3 : north embankment upstream of the falls, shows soil erosion around air valve vault and concrete cutoff wall of new ϕ 500 mm transmission main

stream crossing.
In the background is a complete view of the south embankment erosion.

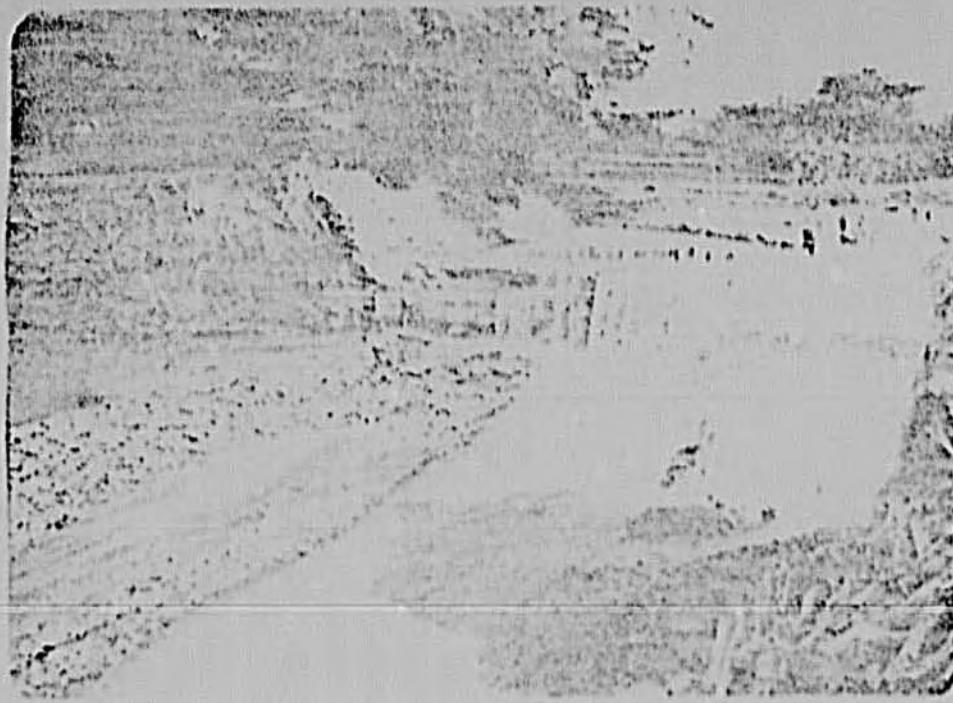

Picture 4 : the collapse of the upstream riprap and exposed pipe encasement of the new ϕ 500 mm transmission main on the right.

Picture 5 : a closeup view of the flow of water under the new \varnothing 500 mm transmission main and cutoff wall with riprap still good atop pipe encasement.

Picture 6 : a closeup view of the rest southern end of the concrete pipe encasement and erosion near the new \varnothing 500 mm transmission main.

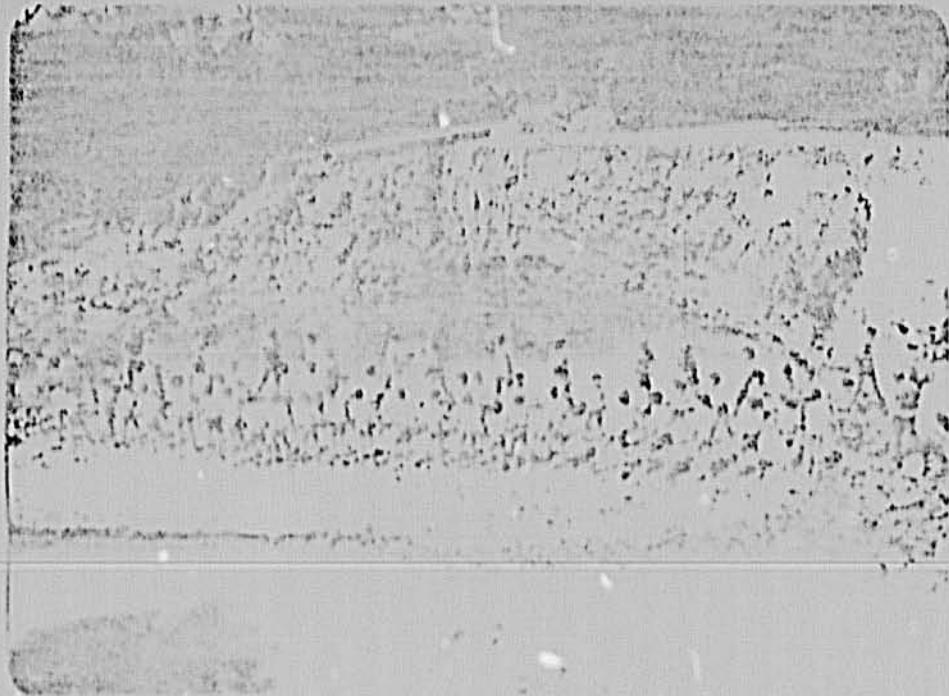

Picture 7 : the erosion of the water falls from where they were on the right to the pipe encasement of the ϕ 150 mm transmission main plus the depression

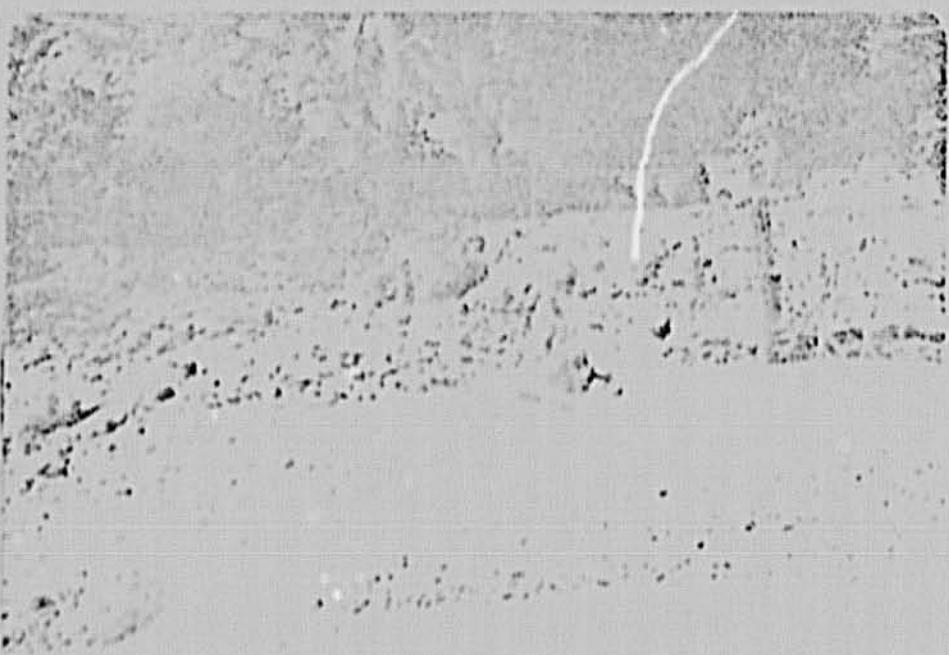

beyond the new ϕ 500 mm transmission which allowed flow under the pipe encasements and cutoff wall.

Picture 8 : a closer view of the void between the ϕ 150 mm transmission main concrete encasement and riprap protection above.

Picture 9 : shows the balance of erosion of the south embankment past the drainage structure from the diversion chamber.

Picture 10 : shows the square drainage pit broken from drain line at 11 o'clock from it to the diversion chamber and discharge drain to the left towards the hydroelectric plant.

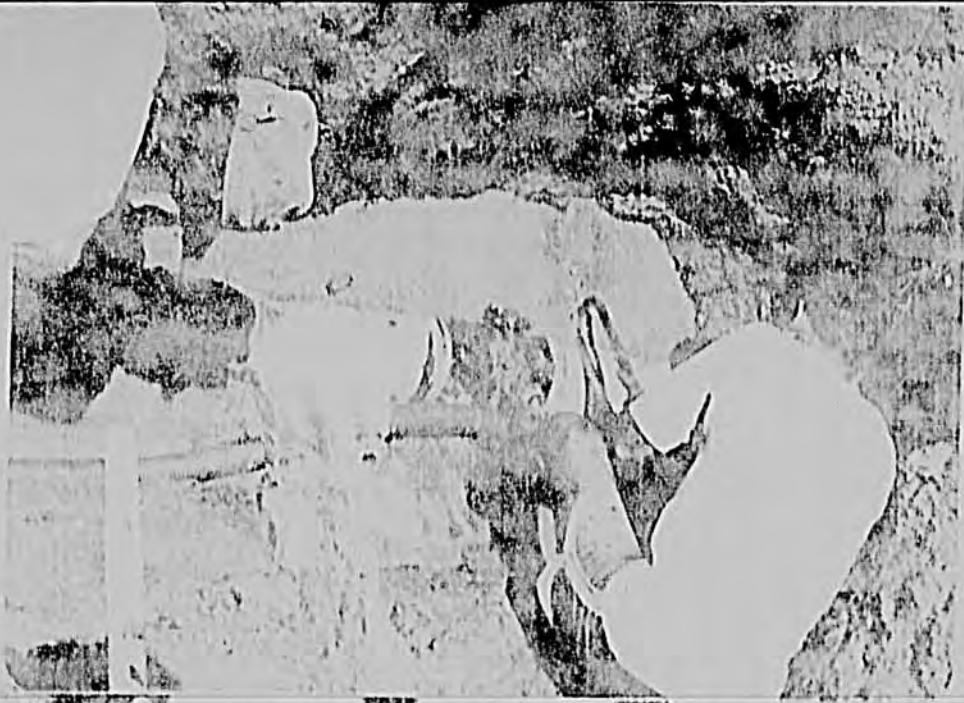

Picture 11 : shows the re-
mains of the bridge and 300
cm pipe which crossed to Kali
Tang from the pump adjacent to
main spring to the Grit Chamber.

Picture 12 : shows the over-
gency pipe and its support
beam and large tree to the
left which may have been in-
volved as its exact origin
is unknown.

Picture 13: shows only water where the south side of the bridge once stood, and at the level from which this photo was taken

TOP PHOTO: BWL 600 mm split pipe section fitted with rubber wrapped service clamp.

MIDDLE PHOTO: Close-up of removed section of pipe shows a Ø 200mm service clamp installed upon a Ø 150 mm PVC pipe. Failure was an attempt to stop leak which was followed by placing concrete over the rubber wrapping.

BOTTOM PHOTO: It is suggested to use the same metric sized service clamp on a new pipe joint after stopped and backfilled again to use metric sized clamp and rewrap.
